#### THE TREND OF THINGS

WHAT It's All About is a series by Mark Sullivan in *Collier's* dealing with that "something in the atmosphere, largely spiritual and frankly emotional," which expressed itself in tangible form in the 5,000 word platform of the Progressive Party. Mr. Sullivan attempts to point out by concrete examples some of the causes of this new spirit of industrial justice. At present he is hammering away at the Ives decision which he believes to have been chiefly responsible for the workmen's compensation plank in the new party's platform. Incidentally, he retells this story which had currency in the press dispatches last summer:

When the Titanic went down one of those drowned was Robert L. Barker, a Middlesex young man who had spent fourteen years in the White Star Company's service. In due course Barker's widowed mother applied to his employers for her compensation, £250 (\$1,250), under the British Workmen's Compensation Act. The employers replied that she was not entitled to any compensation because her son had been receiving over £250 (\$1,250) a year. (The British law doesn't give compensation to the family of an employee who earns over \$1,250 a year—presumably on the theory that out of such salary the deceased ought to have saved up an independent estate. But let's not sneer at the British law; we shall see soon that it is better than our own law by exactly as much as something is better than nothing.)

Barker's mother wrote back in some indignation. Her son had not got \$1,250 a year; his pay was \$75 a month while on sea and half pay while in port, amounting to between \$800 and \$850 a year. "But," said the company—however, let us not paraphrase or condense their letter. We

might do them injustice. Let us quote their exact words:

"... The purser is privileged to take his meals in the first-class saloon, a fair cost for which we have estimated at 5 shillings (\$1.25) a day. . . ."

And by this adroit calculation the company figured that Barker's pay was just above the legal limit.

Pause now, reader, and look once more at the picture which was put on this page to call your attention more forcibly than plain type could. Doubtless, when your eye first struck it, you thought it was a somewhat sensational journalistic exaggeration. Very well, read this extract from the further correspondence between the lawyers for a widowed mother and the managers of the White Star Line—Messrs. Ismay, Imrie & Co. (Oh, yes, you have guessed right; it was the same Ismay who filled most of the newspapers after the Titanic went down last April. But read):

"... If Mrs. Barker's case is in any sense a necessitous one, we feel sure it would receive sympathetic consideration on the part of any one of the committees which have been organized for the distribution of the very large relief funds that have been raised throughout the country."

Get out and hustle for alms; we don't owe you anything. But save a little of your indignation for a moment. Ismay, Imrie & Co. are capable of depths a little more incredible yet. They wrote that Barker "had at the time of death £500 (\$2,500) on loan from the company." The company took unctuous credit to itself for having "no intention to claim for this on his estate." But yet, of course, if the widow continued to be obstreperous, they might. This £500 was merely a fund intrusted to each purser for the convenience of changing money on board, and, of course, with its custodian, went down with the ship.

\* \* \*

**H. J. SMITH'S** "Letter from the Middle West" has become an interesting feature of the *Metropolitan Magazine*. The Middle West town is Chicago this month, where the "Good Reporter" tells how he featured a pure milk campaign and how the question of credit, as between newspaper and citizens' committees came to an issue when the campaign won:

In two weeks the committee—my committee—had "swung" twenty-seven votes. They had given Chicago inspected milk, with the alternative of pasteurization, and stalled the procession of white hearses.

As I was beating it to catch the first edition a pompous member of the committee reached for my hand.

"I should like to be permitted to thank you," he said, "for what I must call valuable assistance."

"Much obliged," I grunted.

"May I ask," he went on, "to whom you

intend to ascribe the credit for this victory, —to the committee, or to the—er—the journal you represent?"

"Oh, I guess I'll take all the credit myself," I drawled, and left him staring.

I wrote the head for my story that night. It was "Babies win victory; pure milk bill passed."

Did you get that? "Babies win victory?" Very well.

**T**HE New York State Charities Aid Association, started in November, the *S. C. A. A. News*, a bulletin designed primarily to keep its 10,000 co-operating membership abreast of its activities. Its problem of inter-communication and its method of solution will be of interest to similar organizations:

The problem constantly confronting us, is how best to aid these widely-scattered committee members, to keep them informed of what is going on in other parts of the state, to keep alive that sense of co-operation and joint effort which is the essence of effective committee work.

Heretofore we have depended chiefly upon two agencies—the circular letter and the personal representative. Each has been valuable, but both together have become insufficient. With so large a membership it is impossible to communicate frequently and personally, with each member. The number of occasions on which we can send a personal representative to attend a committee meeting is still more sharply limited.

We are therefore proposing to send each month to each member of the association, something which we trust will measurably take the place of a personal letter and a personal visit. The *S. C. A. A. News* will bring you each month messages as to what is going on throughout the state in the lines in which we are all deeply interested.

It will not publish treatises or extended reports, but will be, first of all, a news bulletin. It will aim to tell you in the briefest possible manner, and with the greatest economy of your time, those things which seem likely to be helpful in your work as a committeeman.

Many of our members have identified themselves with us because of some special interest—tuberculosis, children, mental hygiene, almshouse improvement, etc.

Each member will find in each number of the *S. C. A. A. News* the latest happenings in his field.

We are sure, however, that no member of the State Charities Aid Association limits his interest in good work to any one line; even if his activities are chiefly in one direction, he wishes to know of the good work going on in other lines. We believe that whatever your particular interest may be, you can not afford to miss looking through all portions of each issue of the *S. C. A. A. News*.

whisky advertisements (and a few years earlier patent medicines and palmists).

In 1902 nine-tenths of the editors and public men in the country were riding on railroad passes and assuming the obligation implied.

So let's be charitable. It's an age of quickly changing standards. What was merely a cry in the wilderness in 1902 is the criminal statute of 1912. Who knows but for what we do today in the bosoms of approving families we may yet be crucified by some austere young moralist of 1922?

\* \* \*

**P**ROGRESS, the organ of the Progressive Party, which published its first issue the month before the election, announces itself as a periodical permanently devoted to political, social and economic betterment. George Howe at 525 Fifth avenue, New York, is editor.

The Progressive cause, which is only in its infancy now, needs journals which will fearlessly voice its hopes and ambitions. It needs newspapers and magazines which will truthfully record all news of progress, and in which Progressive doctrines may be discussed. *Progress* has the distinction of being the first monthly magazine to devote itself unreservedly and entirely to the Progressive cause. It will fight along these lines with its whole heart and soul; it will lend its columns to every Progressive thinker who desires to have his voice heard, and it sincerely hopes that its efforts will meet with the approval, the co-operation, and support of all loyal Progressives.

Here's to the Cause, and the  
years that have passed,  
Here's to the Cause, it will  
triumph at last.  
The end will illumine the  
hearts that have braved  
all the years and the fears  
that the Cause might be saved.  
And though what we hoped for,  
and fondly have groped for,  
Come not in the manner we  
prayed that it should,  
We will gladly confess it  
And the Cause may God  
bless it.  
Shall find us all worthy  
who did what we could

Governor Johnson's verses, adapted from Gelett Burgess, and written the Sunday night before election, show that the Progressive movement, which injected hymning into politics is not without its "poets of high rank." They are reproduced here as they appear on the cover of the *California Outlook*.

**S**IMEON STRUNSKY in the *Atlantic* records in humorous vein a discussion on eugenics between two friends—one, a eugenicist dyed in the wool, thinks it all a problem of heredity; the other, of environment.

The upshot is a quarrel, there being no common ground, but the reformer has the last say. He gracefully admits, as his friend suggests, that perhaps he is an ass and unfitted to discuss so scientific a subject, but says he

"likes to believe that we are born into the world with no irremediable doom upon us. It seems a much more manly thing to wipe out slums, and suppress child labor, and pension widowed mothers, than to blame it all upon one's grandfather."

\* \* \*

**T**HE *Filipino People*, a monthly of which three issues have appeared, is, according to its editorial announcement,

devoted solely to the interests of the Filipino people, whose name it bears; and to the fair and truthful exposition of the relations between the Philippines and the United States, with a view to hastening the ultimate establishment of Philippine independence upon a self-governing republican basis, by the aid and with the recognition of the United States.

The editor is Manuel L. Quezon, resident commissioner from the Philippine Islands, 1342 13th Street, Washington, D. C.

\* \* \*

**T**HE most distinctive instalment of Honore Willsie's series on American Immigration running in *Collier's* is that which throws light on the common labor problem from the various angles of efficiency and quick profits under present conditions. Bad work often pays best, he claims, and for this reason slipshod unskilled labor can often be used to the best advantage. Mr. Willsie, in the person of one "Ames," interviews an assorted collection of workmen and employers. Soon after talking with a responsible American workman in the Building Trades he falls in with a foreman who complains of his foreign laborers:

"I'd like to get hold of a good bunch of American laborers. Still, I don't know. They know too much."

"How's that?" asked Ames.

"Well, you see, you've got to bid so close these days for a job that you can't afford to put but just so much in it, work or material, either one. So I often think it's just about as well to have ignorant workmen. You take an American, he'll take some pride in his job. All these fellows think about is the quitting whistle and their pay envelope."

"I wonder," said Ames, "if competition wasn't so close, if the bosses would put better work and material into their job."

"Nix," answered the boss. "While there's all this cheap labor coming over, and nobody caring how bum the work is as long as they

don't get killed themselves, nobody's going to do any better work than they have to."

"What are you?" asked Ames. "An American?"

"Sure," said the boss. "My father and mother was both Irish. I was born in New York."

"What do you think is the American standard of efficiency?" asked Ames, seriously.

"Say that again, slow," said the boss, blinking.

"What," repeated Ames, "amount of honest hard work and effort do you think a man ought to put into his job?"

The boss scratched his head. "You mean like in the old days when if a man built a house or made a shoe he made it on honor?"

"Exactly," answered Ames.

"They ain't no such thing any more," answered the boss. "Look here. They's fifty men waiting for my job. I ain't going to do anything but what the contractor tells me to. Those old days are gone. Folks won't pay for work that's done on honor. I won't and you won't."

\* \* \*

AMES next interviewed a factory manager he knows. He found this friend with a piece of paper in his hand, looking puzzled.

"What's the matter, Jim?" asked Ames.

"Well," said Jim, "I'm always howling for competent workmen, but—I don't know—most of my men are south Europeans, and I've fussed a good deal because the general run of 'em take no pride in their work, not like an American or a German does, you know. But I hired an American a few weeks ago. First thing he does is to report to me on a paper like this when any of the covers he finishes are defective."

"Good!" said Ames.

"Theoretically, yes," answered Jim. "But actually, we can't afford to make good on our defective covers and put them out at the price we do. He's a good workman. I'd like to keep him, but—"

"See here," asked Ames, "if you were in a trust and had no competitors, would you make good your defective covers?"

"Well," said Jim slowly, "I don't see that that would make any difference. There certainly would be no reason at all then, except the public demand, for perfect covers. And it's always easy to fool the public. I tell you when a manufacturer has on one side an unlimited supply of ignorant labor and on the other a public that hasn't any high standard of quality, you can't expect too much of the finished product."

"What's your idea of a standard of efficiency?" asked Ames.

Jim, whose hair was beginning to turn gray, looked for a long moment out of the factory window into the dirty street.

"Jack," he said, "I haven't got one. And I'll tell you why I haven't. I never was

taught one when I was a kid. That's the time to teach your public—when they are kids. All I can remember was being told to make a success of myself. And in America, making a success means making money. We roast these Slavs and Dagos for coming over here just to make money. How are we Americans any better. Well, I'm going down and have it out with Bill. He's the American with a standard of efficiency! I'll bet his dad licked it into him. Competition ought to give it to a man, but in business nowadays it don't. I don't know why not, though."

Light on the subject comes next from a group of Italians working on a building. He walks along with one of the workmen who carries a carpenter's kit.

"Did you learn your trade in Italy?" asked Ames.

"No, I getta it here," said the Italian. "I joina da union. I getta good mon."

"How long did it take to learn?" asked Ames.

"Oh, I getta odd job, maybe six mont'. Then I pay twenty dollar; joina da union."

"You like the work?" asked Ames. "Hard to make boards straight, make good stair-cases, good porches?"

The Italian laughed richly. He had the face and throat of the singer. "Oh, good enough! Who care? 'Merican, all they want is good show. Sticka da putty and paint in da crack, sticka da pine board where da oak oughta be. Nobody know different in 'Merica. Nobody care!"

## THE GIST OF THREE CONFERENCES

### SOME LIVE ISSUES IN NEW YORK

Just as the race has strains of scholars, of military men, of lazy sots, so too it has strains of paupers, of sex offenders, of feeble-mindedness and of epilepsy, said Charles B. Davenport, director of the Carnegie Laboratory at Cold Spring Harbor, speaking before the recent New York State Conference of Charities and Correction. There are strains with strong tendencies toward larceny, assault and lying, he added, and strains with a lack of resistance to tuberculosis, cancer and excessive nervous activity. These assertions were made on evidence gained from an intensive study of numerous families at various state institutions and by field workers of the Eugenic Record office. The inference drawn by Dr. Davenport was that the element of hereditary cause in social problems is a large one and must be reckoned with by those who seek to ameliorate conditions. He urged two general methods for the prevention of procreation of defective or weak strains: education and moral suasion for those who can be affected that way, and state or county interference for those who cannot.

Stephen B. Smith, president of the conference, declared in his opening address, that the institutions for the care of the various classes of state dependents, especially the insane, have come down to the dead level of custodial homes—the very atmosphere of which paralyzes the sense of responsibility for the cure of the inmate. This, he said, was due to two features of their management; first, the rate of discharge of the inmates is small compared to the rate of admission, and second, the inmates contribute to the support of the institution but a negligible fraction of their cost. Mr. Smith referred to two organizations which, in his judgment, will probably revolutionize the treatment of the criminal and mentally defective classes of the state.

The first is the proposed clearing house for mental defectives in the Department of Public Charities of New York. This clearing house will include all organizations having supervision of children in order to separate defectives and place them under proper care and treatment. The second scheme is that being worked out by the laboratory for social hygiene at Bedford Reformatory. This has already been described in *THE SURVEY*.<sup>1</sup>

In giving the report of the committee on children, Henry Bruère argued that the services of the institution should be so planned as to lead to its own elimination. The institution, he said, must abandon any fatalistic attitude it may have toward poverty and undertake aggressively measures for its diminution and prevention.

Frances A. Kellor, for the Committee on Immigration, recommended the extension of the state protective policy, including:

1. A division of education, which shall urge the establishment of night schools for teaching English and civics in all communities where

fifty or more persons petition for such instruction, and trade schools adapted to immigrants; establishment by law of modern sanitary requirements in all labor camps; the approval of all housing accommodations before their occupancy by laborers; the regulation of foreign law offices and collection agencies; prevention of desertion of families in foreign countries and re-marriage of the husbands and establishment of new families by the husbands in this country; establishment of free labor agencies and extension of the employment agency law to all labor agents within the state, and

2. The co-ordination and consolidation of all immigrant activities under a commission of immigration, such as was recommended by Ex-Governor Hughes' Commission on Immigration.

Robert W. Hebbard, secretary of the State Board of Charities in speaking on the development of state institutions, said that it was estimated that there are 200,000 persons in the state more or less defective. Of these about 20,000 are idiots or in the imbecile class, some 6,000 of whom being dependents in state and other institutions. There are probably 3,000 mentally defective men and 1,000 mentally defective women in the prisons and jails, he thought. For the care of such of this class as become dependent or prove delinquent, Mr. Hebbard advised a large increase in the facilities of the state institutions. He also urged the importance of preventing the feeble-minded, or those of defective germ plasm ancestry, from becoming settled in this state either through immigration or interstate migration. Furthermore, he recommended that poor law officers, and other public officials dealing with the dependent and delinquent classes, be trained to detect those having mental defects, and be instructed in the best methods of dealing with the feeble-minded classes.

The report of the Committee on the Care and Relief of the Poor in their Homes made by the chairman, Charles F. McKenna, urged that the conference favor the relieving of widows with children directly in their homes. He argued that there is a distinction between general distribution of public relief monies to the poor and the relieving of widows.

Mrs. John M. Glenn, of New York, argued that in the adequate treatment and adequate relief of dependent families, it is necessary to do four things: to face facts, to prepare for redress, to meet the cost and to unite effort. The definite result to be obtained is to help the individual really to live his life and not to depress the individual efforts of other members of his community. A spirited discussion followed led by Anna B. Fox of the Buffalo Charity Organization Society. Mr. Hebbard sharply challenged Mrs. Fox's statement that the Buffalo Society is caring adequately for its widows.

John A. Kingsbury, general agent of the Association for Improving the Condition of the Poor, showed that the rate of income is not

<sup>1</sup>See *THE SURVEY* for December 7, 1912 and May 18, 1912.

keeping pace with the necessary rate of outgo, and that this is placing increased burdens on institutions and relief giving societies. Frederic Almy said that the Buffalo Charity Organization Society, of which he is secretary, recently found it necessary, after careful investigation, to increase its budget for food 10 per cent.

Needed changes in the state penal and reformatory system were summed up as follows by Frank E. Wade.

These included giving the State Commission of Prisons power to close all insanitary and indecent places of detention; both city and state hospitals and farms for inebriates; one custodial institution for mentally defective male criminals and another for females; assumption by the state of control of the penitentiaries; the building by cities of the first and second class of reformatories providing industrial education for wayward women, and by the state for women committed from other places; the practical reconstruction of Sing Sing, the cell blocks of which were built in 1837, or the erection of a new prison elsewhere; the development of prison schools, and supplementing them with correspondence and reading courses in the cells; and the payment to prisoners of increased wages for their labor.

#### JAILS AND DEFECTIVES IN KANSAS

"Some other states may have a worse jail system than Kansas, but I have been unable with travel and research to find any," began Warden J. K. Coddling, of the Kansas state prison, before the recent joint meeting of the State Conference of Charities and Correction, the Association of Probate Judges and the State Society of Criminal Law and Criminology. He added that so many of the prisoners had ascribed their first knowledge of crime to their association in jails with older and hardened criminals that he felt impelled to learn something about the jails of Kansas.

Six thousand two hundred and eighteen inmates he said, were reported from 99 county jails, 5,761 males and 457 females. Of this number 460 were insane, 1,113 convicted of liquor law violations, 979 misdemeanors, leaving a balance of 2,131 not guilty or cases settled without trial. The sentences served were equivalent to at least 343½ years for one person. A man who has had considerable experience in and around jails in commenting on this "time in jail" said, "That means 343½ years devoted to smoking cigarettes and playing poker with matches for stakes during the day and killing bed bugs at night." Warden Coddling added:

"It is costing the state of Kansas eighteen cents per day to feed its prisoners in the state penitentiary, but six cents of this is raised on the prison farm, so that the actual cost, to the taxpayer is twelve cents.

"Compare this with fifty-five cents per day, which it costs to feed a jail prisoner. Consider that 12,000 (counting an equal number for the 500 city jails) prisoners passed through the county and city jails last year, that at least 4,000 of them served sentences averaging forty days each.

And consider further that this entire body of jail prisoners was in utter idleness while the prisoners (about 900) in the Kansas Penitentiary, costing only twelve cents per man per day to feed, are credited with having turned into the state treasury in coal and brick and money \$240,000 and you then get a little idea of the enormous loss we suffer from our inadequate jail systems. When we realize that this cost in money is but a very little in comparison to the cost in morals and manhood and citizenship—because these same jails, maintained upon a wasteful and extravagant plan are crime breeders, are making criminals, the destroyers of young boyhood and manhood—we commence to have an idea of what we are doing by maintaining the worst jail system in the world."

Superintendent Charles of the Boys' Industrial School of Topeka, declared that by applying the Binet tests in his institution he discovered that "of the entire number examined 16 per cent were normal, in 66 per cent the mental age was two or more years below the physical, in 20 per cent the mental age was five or more years below the physical: while in 7.3 per cent it was eight years below the physical age." Some of his conclusions were that in the case of his boys, (1) the physical development and control is below the normal boy, due probably to early malnutrition and poor hygiene, (2) instincts are strong and uncontrolled, (3) there is general retardation of mental life of from one to eight years, (4) there are many special mental abnormalities, such as lack of perceptive powers, defective memory and imagination, special or no interest in certain activities, scattered attention, dissipated energies due possibly to poor parent stock, bad social and family conditions and other evil influences in early life. (5) many boys are characterized by abnormal emotional experiences, lack of social impulses, uncontrolled religious or emotional outbursts.

It was pointed out that probably the present population of the school is of a lower physical and mental type than it was before the juvenile courts sifted out those reformable without sentences to the school.

#### SOME REFORMS NEEDED IN FLORIDA

As an outgrowth of the second Florida Conference of Charities and Correction, a bill will be pressed upon the next legislature asking for an appropriation for a school for both feeble-minded adults and children. Alexander Johnson, general secretary of the National Conference of Charities and Correction, who stirred the Florida gathering to a sense of the state's responsibility for providing for all defective and dependent classes, will be urged to go to Florida to fight for the measure.

A State Child Labor Committee was formed to co-operate with the National Child Labor Committee in securing a good child labor law at the next session of the legislature. F. M. Hudson of Tallahassee was chosen chairman, with Marcus C. Fagg as secretary and Mrs. J. W. McGriff, of Jacksonville, as membership secretary. Owen R. Lovejoy, secretary of the national body,

outlined the need for and nature of such a measure.

Perhaps no state in the Union has a greater problem caused by the non-resident applicant for aid than Florida, especially during the winter months. The state farm for vagrants suggested by R. T. Solensten, of Jacksonville, seemed to many the best way of solving it.

Like many southern states, Florida groans under the lease system of convict labor, at which Governor Donaghey aimed a deliberate blow in Arkansas last week.<sup>1</sup> Some of its evils were exposed by Frank E. Jennings, of Jacksonville, and an effort will be made to wipe it out at the next session of the legislature. An attempt will be made also to secure a compulsory education law.

Family homes instead of institutions for all normal children were endorsed, following a strong appeal by Marcus C. Fagg, secretary of the conference. Three of the five orphanages of the state are now placing out their children in homes through the Children's Home Society of Florida.

## COMMUNICATIONS

---

### APPEALING AWAY FROM HOME

TO THE EDITOR:

Every now and then we find that our subscribers in Paterson are receiving appeals from organizations in both New York and Brooklyn. No doubt many people respond to these appeals and then, forgetting that the call came from out of town, refuse requests from our local organizations. This is a hardship to which we should not be put. We do not, so far as I have been able to ascertain, appeal to residents of New York or Brooklyn, except in one or two instances which are justified because the person has business in our city.

Last year one of the largest New York charities sent out many appeals and recently a large Brooklyn society has followed the example. We are carrying on here the same work as these organizations and are finding it increasingly hard to secure sufficient funds.

Is it fair for the larger societies to hamper the smaller ones struggling in neighboring towns? I have not the least doubt that other large centers are equally guilty of this thoughtlessness.

W. L. KINKEAD.

[Director, Charity Organization Society.]

Paterson, N. J.

### PRISON LABOR IN NEW JERSEY

TO THE EDITOR:

In a communication in *THE SURVEY* of November 30 William Phillips dwelt at some length upon the subject of prison labor in New Jersey. It is very evident that he does not know anything about existing conditions or, if he does, has wilfully misrepresented things.

In the first place, Mr. Phillips states "that the

Prison Labor Commission has been in existence for one year and a half and has absolutely nothing to show." The truth is that this commission was appointed not, as Mr. Phillips says, by Governor Wilson, but by the New Jersey Legislature, in April, 1912. The commission organized July, 1912, and has met weekly, except the week taken in visiting institutions where the state use system is now being successfully carried on.

It is very evident that Mr. Phillips has not read the law of 1911, or he would not say that "the old system goes merrily on." If he did he would have seen that the contracts entered into by the state and the contractors could not be abrogated, and these contracts do not expire until January 1, 1914.

However, let us get down to the reason why this commission sees fit to answer Mr. Phillips, who needs some one to set him right upon a subject which he should have looked into before rushing into print. He says that "In making these appointments the governor [who did not make same] showed very little sagacity, or else, to be slangy, let his advisers 'put one over' on him. The commission is dominated by one Mr. Kirkbride, who has lobbied in Washington against legislation inimical to the contract system." Mr. Kirkbride has authorized me to state that he has not been in Washington in the last three or four years. It is true that as the supervisor of the Trenton prison he appeared at a hearing on the bill of 1911 and spoke on the matter of the cost to the state to put the state use system into operation, but from what he has learned from visiting other institutions where state use is in vogue, Mr. Kirkbride is an ardent enthusiast on the subject.

As to the rest of the make-up of this commission, I would respectfully invite Mr. Phillips to attend one of our meetings. Personally, I want to say to Mr. Phillips that I am one of the labor leaders of New Jersey, for six years treasurer of the New Jersey State Federation of Labor, and for over ten years have been endeavoring to abolish contract labor in the prisons of New Jersey and feel that Mr. Phillips has been a bit hasty in his reference to the make-up of this commission.

Quoting Mr. Phillips further: "The only thing done by this commission is to inspire occasional press items in opposition to any form of labor except the contract system." Wrong again, Mr. Phillips, as I refer you to the *Newark Evening News* of Tuesday, November 12, which published two columns of a report which we intend to make to the governor of New Jersey in favor of the state use system. It might be interesting to Mr. Phillips to learn that this commission has paid all of the bills incident to the workings of same out of their own pockets, the legislature which appointed them not having appropriated one penny toward the carrying out of the provisions of the 1911 act. However, the incoming legislature will no doubt make an appropriation sufficient to carry out the law.

In conclusion, let me assure Mr. Phillips that he is entirely wrong as to the intention of the commission not to carry out the law. Every

<sup>1</sup>See page 383.

man on this commission is against the contract system and it is our intention to follow out the wishes of Governor Wilson to drive out the contractors in the state prison when the present contracts expire on January 1, 1914.

JOSEPH P. O'LONE.

[Secretary Prison Labor Commission of New Jersey.]  
Hoboken, N. J.

#### TO THE EDITOR:

Answering the communication of Mr. Phillips in regard to the law designed to abolish contract labor by inmates of the state prison of New Jersey, would say that Governor Wilson appointed an absolutely fair commission to carry out the provisions of this law.

This commission was composed of two members of the State Federation of Labor of New Jersey and two disinterested citizens. The legislature, which was Republican, by joint action increased the commission and added to it Samuel W. Kirkbride and William H. Tonking.

The governor refused to approve this commission and vetoed the bill. The legislature, however, having the legal power, that is, the constitutional power, to do so, passed the bill over his veto. It was thus that Messrs. Kirkbride and Tonking became members of the commission. Governor Wilson did all in his power to carry out the spirit and purpose of the law. I repeat as suggested in my advertisement in THE SURVEY before the national election, that this law abolishes the odious contract labor system and prevents competition between free and prison labor.

If the legislature sees fit to circumvent its operation, then it is up to the people to deal with the legislature.

FRANK P. WALSH.

[Chairman Committee on Social Service, Wilson Presidential Campaign.]  
Kansas City, Mo.

### BURNETT LITERACY TEST APPROVED

On December 18 the House passed without amendment the Burnett Immigration Bill, the object of which is to exclude from the United States alien immigrants over sixteen years of age who are unable to read their own language or dialect. In order that there might be no doubt about Hebrew and Yiddish being considered as either a language or a dialect, they are expressly included in the bill. Exemption is made of persons who come to the United States to escape religious persecution. The vote stood, yeas 179, nays 52, answered "present" 8, not voting 150. The bill then went to conference with the Senate, and it is expected that it will be reported to both Houses early in January. The text follows:

"Be it enacted, etc., That after four months from the approval of this act in addition to the aliens who are by law now excluded from admission into the United States the following persons shall also be excluded from admission

thereto, to wit: All aliens over 16 years of age, physically capable of reading, who can not read the English language, or the language or dialect of some other country, including Hebrew or Yiddish: *Provided*, That any admissible alien or any alien heretofore or hereafter legally admitted or any citizen of the United States may bring in or send for his father or grandfather over 55 years of age, his wife, his mother, his grandmother, or his unmarried or widowed daughter, if otherwise admissible, whether such relative can read or not; and such relatives shall be permitted to land.

"SEC. 2. That for the purpose of ascertaining whether aliens can read or not the immigrant inspectors shall be furnished with copies of uniform slips, prepared under the direction of the Secretary of Commerce and Labor, each containing not less than 30 nor more than 40 words in ordinary use, printed in plain type in the various languages and dialects of immigrants. Each alien may designate the particular language or dialect in which he desires the examination to be made, and shall be required to read the words printed on the slip in such language or dialect. No two aliens coming in the same vessel or other vehicle of carriage or transportation shall be tested with the same slip.

"SEC. 3. That the following classes of persons shall be exempt from the operation of this act, to wit: (a) All aliens who shall prove to the satisfaction of the proper immigration officer or to the Secretary of Commerce and Labor that they are seeking admission to the United States solely for the purpose of escaping from religious persecution; (b) all aliens in transit through the United States; (c) all aliens who have been lawfully admitted to the United States and who later shall go in transit from one part of the United States to another through foreign contiguous territory.

"SEC. 4. That an alien refused admission to the United States under the provisions of this act shall be sent back to the country whence he came in the manner provided by section 19 of 'An act to regulate the immigration of aliens into the United States,' approved February 20, 1907.

### THE DEMAND FOR PURE MILK

Secretary of Agriculture James Wilson, in his last report to the President, has given some interesting information as to the activities of the federal government in respect to the pure milk question. It is not generally known that the authorities at Washington are co-operating with twenty-one cities and eleven states in investigating the conditions surrounding the milk supply. Mr. Wilson makes this statement concerning the work:

"Some of the handicaps to obtaining a milk supply of good quality are that municipalities fail to provide sufficient funds, the inspection work is sometimes made inefficient by political domination, and consumers fail to appreciate the fact that the production of clean milk involves additional expense. In campaigns for better milk the attempt is too often made to place the entire

cost of improvement on the producer. Some incentive ought to be offered the producer to supply the higher grades of milk. The fact is that most consumers are not demanding a high grade of milk, especially when this involves additional cost. It is well recognized that the health authorities of the country generally are seeking to give the public a higher grade of milk than the public is demanding or is willing to pay for."

#### NEW YORK FIGHTS POISONOUS MATCHES

Fearing that the "tremendous pressure," to use the words of General George O. Eaton of the Municipal Explosives Commission, brought to bear to secure the repeal or amendment of the new and progressive match law of New York might at the last moment succeed, social workers representing organizations and societies throughout the city met last week to protest against any change. Under authority granted by a change in the charter of the city, which was passed last year, the Municipal Explosives Commission has formulated regulations which provide that after January 1, 1913, it shall be illegal to manufacture or sell within the city matches made of poisonous phosphorus. The new rules of the commission also provide that match sticks must be impregnated to prevent the afterglow which has been responsible for many serious fires.

Match manufacturers have pleaded to have the enforcement of the ordinance against the retail sale of poisonous matches postponed until July 1, when the federal law prohibiting the use of white or poisonous phosphorus goes into effect. Representatives of the Diamond Match Company also protested against the requirement that match sticks be impregnated before that date.

The meeting was called because of rumors that an amendment was to be brought forward in the Board of Aldermen to nullify the regulations of the Municipal Explosives Commission. By a unanimous resolution Rev. John Haynes Holmes, who presided, was authorized to appoint a vigilance committee of twenty-seven members to fight any action against the regulations.

#### AN INSURANCE POLICY FOR EACH EMPLOYEE

According to an announcement made by Charles C. M. Thomas, vice president, each employee of the New York and Queens Electric Light and Power Company received last week a Christmas gift in the shape of a life insurance policy in the Equitable Life Assurance Company. The policy is for the full amount of his yearly wage, or salary, good for one year. It will be paid to the family or nearest relative of the employee should he die, or be killed by accident the coming year. The full amount of salary will be insured to all employees up to those who receive \$3,000 a year.

There are 350 employees. The company has executed a blanket insurance policy with the Equitable company for more than \$300,000, the premium on which will be paid by the company.

"We have been in the habit of giving our employees 'turkey' money at Christmas," said Charles C. M. Thomas, vice president, "but we believe this policy of insurance will be much more satisfactory to them."

#### BANK PENSIONS EMPLOYEES

The National City Bank of New York also announced last week that the pension system, death benefits and gratuities in which officers and clerical force will benefit would go into effect on Christmas Day. This is said to be the first time a financial institution has entered upon a pension scheme without asking contributions from its employees. An amount equal to two year's salary is to be paid to the family or dependents of each employee, the sum not to exceed \$10,000 in any case, however.

#### SERUM AS A TYPHOID PREVENTIVE

Feeling that the value of typhoid inoculation and immunization has been conclusively demonstrated on a great scale through the tests of the United States Army, the Department of Health of New York has decided after January 1 to administer serum as a preventive. Practically all authorities, the announcement of the department declares, now agree that the practice offers a notable immunity against typhoid infection. Inoculations will be made at the homes of applicants or at the central office of the department and the culture will be furnished free to physicians for their own use.

#### PRESENT SUFFERING IN THE BALKANS

"The war that has devastated the Balkan Peninsula has brought in its wake untold suffering," reads a statement by the American Constantinople Relief Committee. It continues: "Constantinople has become the center of dire misery unknown in our day. The battles of a million men have brought there the wounded of nine weeks of conflict. A quarter of a million refugees have been swept in from a wide territory, including a great multitude of women and children. Cholera, typhus, famine and cold have come, with tens of thousands of victims. Individuals of all faiths and of all the races of the Ottoman Empire are in the utmost need.

"The Red Cross, with international impartiality, divides its aid between five belligerents. The Red Crescent is the channel for the relief extended by all those in Constantinople able to work and to give. All classes of society from the highest to the lowest are nobly co-operating to assuage this misery to the measure of their power. But it is evident that these resources will be insufficient to cope with the demand that has so suddenly come. Even though active hostilities seem to be at an end it must be remembered that the misery and want that follow in the wake of war are often more severe and trying than they are during actual hostilities."

The statement is signed by Henry O. Dwight, Robert W. DeForest, Richard Gottheil, Lloyd C. Griscom, Adolph Lewisohn, Oscar S. Straus, Talcott Williams, and Cleveland H. Dodge. Con-

tributions are requested to be sent to Jacob H. Schiff, treasurer of the American Red Cross, 52 William St., New York.

#### LOOKING FOR FARM COLONY HEAD

The New York State Civil Service Commission announces an examination to be held on January 11 for the position of superintendent of the recently authorized State Industrial Farm Colony. The salary is \$3,500 and maintenance. The location of this institution will probably be in the southeastern part of Dutchess County. The colony is established for the detention, humane discipline, instruction and reformation of male adults who may be committed to it as tramps and vagrants. The superintendent will be the executive head of the colony, which is under the control and management of a board of seven managers appointed by the governor.

It is announced that candidates between the ages of thirty and forty-five years are preferred, and that they must have had an experience of at least five years in institutional work of a kind calculated to prepare for the position in question. The subjects of examination and their relative weights are as follows: general questions relating to institutional work and organization and management of institutions, 1; education, experience and special training, 1. This examination will be open to all citizens of the United States, residents or non-residents of New York, on an equal footing.

#### THE SCHOOL AND THE CHILD

Traditional topics gave way for a time at the Rhode Island Conference of Charities and Correction last month to a six-angled discussion of the school and the child. The necessity of vocational schools that would remedy the defects in the present curriculum was urged by Herbert W. Lull, superintendent of schools at Newport. How the school environment may be made healthful was described by Wallace Hatch, secretary of the State Tuberculosis Association. Other speakers discussed the subject from the standpoint of the parents, the girl, the boy, and Woonsocket, the place of meeting. Helen Emery, probation officer at Newport, described the situation of the girl who at fourteen leaves school only to find that no desirable position awaits one of her age. Miss Emery urged that girls be trained into intelligent home makers and mothers.

#### IN MEMORIAM: HENRY S. NASH

Memorial services in honor of Henry Sylvester Nash, professor of the literature and interpretation of the New Testament at the Episcopal Theological School, Cambridge, will be held in Grace Church, 804 Broadway, New York, on January 12. Rev. Chas. L. Slattery is rector.

## COMING CONFERENCES

#### JANUARY CONFERENCES.

CHARITIES AND CORRECTION, Nebraska State Conference of, Lincoln, January, 1913. Sec'y, Charlotte Templeton, State House, Lincoln.

PROBATION, Illinois State Conference on, January. Further information may be secured from John W. Houston, Chief Probation Officer, 226 Court House, Chicago, Ill.

#### LATER MEETINGS.

##### INTERNATIONAL

BLIND, Fourth Triennial International Conference on the, London, England, 1914; probably July 20. Sec'y, Henry Stainsby, 206 Great Portland St., London, W.

CHILDREN'S WELFARE, International Congress for, Amsterdam, Netherlands, 1914. President, Dr. Treub, Huygenstraat 106, Amsterdam.

PRISON CONGRESS, Quinquennial, London, Eng., 1915. Sec'y, F. Simon Van der Aa, Groningen, Holland.

RELIEF, Committee on Public and Private, London, Eng.

SCHOOL HYGIENE, Fourth International Congress on, Buffalo, N. Y., Aug. 25-30, 1913. Sec'y Gen., Dr. Thomas A. Storey, College of the City of New York.

UNEMPLOYMENT, International Association for Fight Against, Ghent, Belgium, 1913. American Corres. Officer, John B. Andrews, 1 Madison Ave., New York.

##### NATIONAL

BOYS, General Assembly of Workers with, Culver, Ind., May 17-30, 1913. Information may be secured from the Boys' Work Dept., Y. M. C. A., 124 E. 28th Street, New York.

CHARITIES AND CORRECTION, National Conference of, Seattle, Wash., July 5-12, 1913. Sec'y, Alexander Johnson, Angola, Ind.

MEDICINE, AMERICAN ACADEMY OF, Thirty-eighth Annual Meeting, Minneapolis, Minn., June 13, 14, 1913.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION of the United States of America, Fourth Biennial Convention of, Richmond, Va., Apr. 9-15, 1913. Gen. Sec'y, Mabel Cratty, 600 Lexington Ave., New York.

##### STATE AND LOCAL

BAPTIST CONVENTION, NORTHERN, Detroit, Mich., May, 1913. Cor. Sec'y, Rev. W. C. Blitting, St. Louis, Mo.

CHARITIES AND CORRECTION, New Hampshire State Conference of, Concord, February, 1913. Sec'y, Mary P. Remick, Concord.

CHARITIES AND CORRECTION, Ohio State Conference of, Akron, O., October 1913. Sec'y, H. H. Shiner, 1010 Hartman Bldg., Columbus, O.

## FOOD IN HEALTH AND DISEASE

By N. S. Davis, Jr., M.A., M.D.  
Northwestern University, Chicago.

Octavo. Cloth - - \$3.50 Postpaid

The first part of this book reviews the underlying principles concerning the nutritive and other qualities of different kinds of foods, discusses briefly their relation to the digestive organs, and traces the changes that food must undergo before it can be appropriated to the needs of the human system. This is followed by detailed consideration of the proper diet indicated for the various conditions of health and disease, each condition being taken up seriatim with concise, plain directions, and diet lists.

## THE COMMON WELFARE

### BREAKING INTO THE NEW YEAR

With ten southern state legislatures in session this winter, with a Democratic administration in the saddle at Washington for the first time since the early '90's, with well toward thirty other state legislatures convening in other parts of the country,—1913 promises to be an exceptional year in those fields of social concern where law is a factor or where governmental action will be up for enlargement, retrenchment or rehabilitation.

More than most years the question of striking balances between public and voluntary effort, a question raised by Dr. Patten on page 421, will be discussed.

THE SURVEY starts the year with a "bumper" sheaf of articles. In the field of charity—the oldest field to which it bears responsibility, fundamental and live issues have been raised by the agitation for "widows' pensions," and here Mr. Carstens puts forth the results of the first inductive study yet made of the operation of new types of public aid in Illinois, California, Missouri and Wisconsin.

The rapidity with which changes may come about because of or in spite of our manifold halls of legislation is illustrated by the industrial accident campaign of the last five years. (P. 425). The visit to this country of Dr. Thomas Oliver, the leading British authority, may give equal impetus to the movements for the prevention and compensation of occupational diseases, and in this issue THE SURVEY presents Dr. Oliver's first formulation of the impressions gained in his remarkable tour last fall of American industrial centres.

The nib of his serious challenge to the United States, as to our reckless consumption of the health and strength of working women, is pictured on pages 426 and 427. At the left is a peasant girl at work in the out-doors of the Old World. At the right is the badly-lighted workroom in a modern loft industry—a room which is lent a mocking touch by the fact that it is part of the largest manufactory of *artificial* flowers in the New World.

The nib of his serious challenge to the United States is equally fortunate in presenting Professor Common's rounded interpretation of the work of the Wisconsin Industrial Commission. The success of the safety boards under this Wisconsin system, on which employers and employees work not at loggerheads, but in co-operation, gives point to the widening protest against the President's appointments to the Industrial Relations Commission—on the ground that as a whole the board of inquiry named fails to carry conviction that it will do more than beat time, or muff the constructive opportunity before it. At the holiday conventions in Boston last week of economists, sociologists and political scientists, over one hundred signatures were attached to a statement protesting against the nominations before the Senate—not as individuals, but as a group.

To turn from the field of industry to the complementary sphere of American livelihood, Mr. Wells presents a striking recapitulation of the forces at work in village and open country, and the need for their shaping in broader and more effective molds.

CHILDHOOD'S HAPPY HOURS

As a result of testimony given the past few weeks by expert investigators before the New York State Factory Investigating Commission, the cartoonists have been busy portraying some of the incongruities in child life. The titles above are those which appeared under the cartoons when originally published.

## DONAGHEY, THE LEASE SYSTEM AND THE PRESS

As was to be expected, the action of Gov. George W. Donaghey, of Arkansas, in pardoning 360 prisoners in one day as a means toward the abolition of the convict lease system in his state excited considerable editorial comment throughout the country.<sup>1</sup> Not so easy of foretelling, however, has been the fact that most of the comment has been favorable. The press has not given much notice to the news that on the day following the governor's action the penitentiary board made arrangements to move all convicts, as fast as received, to the state farm. This farm, situated at Cummins, has to be maintained, and no prisoners can be leased to private individuals until there are enough at Cummins to maintain it.

Those who read Miss Barnard's article on p. 459, will appreciate the strategy of Governor Donaghey's performance. He anticipated a request for renewal of the lease, which it was expected would be made on January 1, by wiping out of existence the leasable surplus of prisoners. The action of the penitentiary board is taken as meaning that it will not oppose the governor's plan of abolishing the lease system. It is also expected that when the legislature meets in a few weeks it will pass laws forbidding the hiring of the state's prisoners to contractors.

Governor Donaghey, who retires this month after four years in the governor's chair, will recommend to the legislature that a commission of three be appointed to make recommendations

to the governor in the matter of pardons that have been applied for. The affairs of the penitentiary are managed at present by a board consisting of the governor, secretary of state, attorney general, state auditor and commissioner of mines, manufactures and agriculture. These men, he says, have not the time to give penitentiary matters adequate attention.

Newspaper comment has not all been directed at Governor Donaghey personally but has used his act as a text from which to preach the evils of the lease and contract systems. The New York Sun, after declaring that Donaghey's order "can hardly be regarded as a crime against society when the horrors of the sordid business of hiring convicts in other Southern states are recalled" mentions some of the stories that came out in the Georgia investigation four or five years ago:

"In a Fulton county camp a young white woman was gagged and lashed with a heavy strap 110 times. A negro convict who refused to work was wrapped in blankets, tied into a box, and kept near a red hot stove until the sweating trick was overdone and the poor wretch died. A white boy of 15 received fifty blows from a sanded lash for spilling a cup of coffee on a hog. Negroes of both sexes were bound to their bunks at night and Sundays, with not so much slack of chain as a watchdog would have. A negro convict too sick to work was beaten to death; and the same fate befell a white boy who was serving a sentence for stealing two cases of potted ham. Larceny, often of things of little value, especially in the case of negroes, was the common offence for which men, women and boys suffered degradation, starvation, maiming and

FROM 4 A. M. TO 8 P. M.

A LIKELY PROFIT-MAKER

PLAY

One of the witnesses before the commission testified that children begin work in the canneries of New York at 4 o'clock in the morning and continue until 8 at night. In the center cartoon Robinson imagined the canner asking, "Why don't you put this boy to work in the factory with your other children?" To which the mother answers, "I thought I would try to raise this one."

even death in the convict camps forty-five years after Abraham Lincoln issued the Emancipation Proclamation. And with inhuman cruelty, graft among State employees in connection with the bids made for convicts was proved. On March 31, 1909, the iniquity ceased. Georgia convicts now work on the State roads, the prison farms and on public works.

"The great seal of Arkansas bears the motto, 'Mercy, Justice. Regnant Populi.' Now it is a fact that the people have repeatedly protested against the convict camps. Evidently they do not rule at Little Rock, and Governor Donaghey to demonstrate that, if the Latin part of the motto is a flaunting lie, mercy and justice shall prevail in Arkansas, had no alternative but to pardon several hundred wretches out of peonage that is worse than plantation slavery."

Declaring that Governor Donaghey "has unquestionably his own people behind him in what he has done, and all right-thinking people in this country," the New Orleans *Times-Democrat* says in part:

"Governor Donaghey has taken every precaution to prevent the public from suffering injury from his wholesale turning loose of criminals. He has pardoned only those whose crimes are not heinous, who have already served a large part of their terms, and who are reported as having improved if not reformed, and the pardon is conditional, the convicts being treated as 'ticket-of-leave' men, for if any of them gets into trouble again with the law he is to be sent back to the penitentiary to serve out his entire term.

"Another abuse almost as great is noted by the governor, although he does not dwell on it at equal length—the gross miscarriage of justice in sending men to the county convict farms for long terms on trivial offenses. This abuse

of power Governor Donaghey declares is so great as 'to stagger into amazement' those who have not investigated it; but whether this excessive punishment is due to brutality or to a desire to provide more convicts for the lessees is not stated."

The Harrisburg (Pa.) *Patriot* thinks the governor's pardon "is bound to force action by the legislature," and the Boston *Globe* says his "drastic action seems both reasonable and necessary." The New York *Times* takes a different view. Nobody, it admits, can fail to share the hatred and loathing expressed by Governor Donaghey for the contract system of prison labor. But it goes on:

"In doing this the Governor has passed, if not beyond the letter of the law, certainly beyond its spirit, for he has misused the power of Executive clemency with which he was intrusted. That power was not given to him in order that in the exercise of his discretion he might annul laws, even bad ones, and put others of his own devising, even better ones, in their place, but that he might, in some degree and measure, remedy or mitigate hardships which the laws unintentionally inflict. He is expected to be just, or equitable, rather than clement—a fact which all Governors by implication recognize when they carefully explain any pardon in which there is anything of public interest.

The day before Christmas Governor Cole Blease, of South Carolina, who had previously complained that Governor Donaghey had "laid him in the shade," pardoned or paroled seventy-six prisoners. This brought his pardon record for the two years of his administration above the 500 mark.

## COMPENSATION AND THE STATE LAW-MAKERS

During the past four years, fifteen states have passed workmen's compensation laws of one sort or another, and many other states have appointed commissions to study the subject. A dozen have shown indifference. With such a balance sheet and such opportunities ahead the National Civic Federation has been laying plans for legislative activity during 1913. The federation has not been discouraged, but rather stimulated to greater activity by the fact that its federal bill, fathered by Senator Sutherland, and the Congressional Commission, passed only one house last winter. -At the opening meeting of its campaign held recently, to which delegates from all national and state bodies interested in compensation were invited, the Compensation Department of the federation made report along the lines both of accident prevention and of compensation. In the former field, which was designated by most of the delegates as the more important, Louis Schram, chairman of that committee of the federation which has framed a model safety law, announced that the International Association of Factory Inspectors have both endorsed and suggested valuable improvements to a model act and to a "Minimum-Essential" accident report blank prepared by Mr. Schram's committee. The International association also conferred with the federation's committee last summer, and through plans made at this conference three states, New York, New Jersey and Illinois, have arranged to compare inspections of similar types of factory and to profit by each other's experience in making safety provisions. This is one very practical result of the effort of the federation to standardize safety. Mr. Schram made the encouraging announcement that this year shows twenty states with some form of safety laws, as against thirteen last year.

Strictly speaking the sessions on compensation were "experience" meetings. Since most of the fifteen states which have passed laws have been actually working under them for several months or a year, it was possible for the delegates to compare results and point out elements of strength and weakness. As always, much discussion centered around the relative merits of state insurance and compulsory compensation of the exclusive form favored by the federation. The federation has now under consideration a new compulsory bill drafted last summer in co-operation with committee of the American Bar Association and the Legislative Drafting Association.

Chief among the specific problems outlined by August Belmont, chairman of the Compensation Department and discussed by the several delegates were the constitutional difficulties to be

met by a compulsory law, and the means of insuring the solvency of an employer.

The constitutional question has been answered decisively so far by only two states. Since 1902 Virginia has had a constitutional amendment under which a compulsory compensation law would be secure and California passed such an amendment last winter, and will this year introduce a compulsory bill to supersede its present elective bill. On account of its industrial importance, New York was felt to be the critical state, and the fate of the amendment which passed last year and must come before the legislature again this winter, was the occasion for much discussion, as was the form of bill to be introduced. Since these national meetings, the New York State branch has taken steps to secure a new alignment on state legislation.

The question of solvency is one which vitally concerns the families of dead and injured workmen. In the discussion, the importance of insurance in some form was brought out. The advocates of state insurance believed that safety lies in a state fund. Among other suggestions were mutuals, compulsory insurance in a reliable company, a guarantee fund to be held by the state, the payment of lump sums in death cases and the guaranteeing of other payments by bond.

## THE REPORT OF THE IOWA COMMISSION

An addition to available literature on liability legislation is the report brought out in November by the Iowa Compensation Commission. The report proper, aside from extensive appendices covering statistics and legal and other opinions on compensation legislation, consists of a majority bill and a bill proposed by one dissenting member.

The majority bill, which will be presented to the 1913 legislature, proposes a pseudo-elective law much like that of Wisconsin. It contains the important provision that in case of the death of a man having no dependents, killed through the employer's disregard of safety laws, the full amount of the death benefit—sixty per cent of wages for three hundred weeks—shall be paid as a forfeit to the Workmen's Indemnity Association. In this all employers coming under the act are required, to insure. Compensation for injury, which begins after two weeks, is sixty per cent of wages or of wage loss. A commission of three appointed by the governor administers the fund.

The following schedule was compiled for their own information in framing a bill on the coming legislature by the second Minnesota commission. It shows the maximum and minimum value of a man's life set by all the existing compensation laws except that of Arizona. In this list California shows the widest range:

## WORKMEN'S COMPENSATION.

State:	Minimum.	Maximum.
Wisconsin .....	\$1,400	\$3,000
Rhode Island .....	1,200	3,000
New York .....	.....	3,000
New Jersey .....	1,500	3,000
New Hampshire .....	.....	3,000
Kansas .....	1,200	3,600
Illinois .....	1,500	3,500
California .....	1,000	5,000
Nevada .....	2,000	3,000
Ohio .....	1,500	3,400
Michigan .....	1,200	3,000
Massachusetts .....	1,200	3,000
Maryland .....	.....	1,500
Montana .....	.....	3,000

TOWN AND GOWN IN  
THE MIDDLE WEST

Urbana, Ill., recently presented the spectacle of "Town and Gown"—two towns in fact—co-operating in a "grand rally" for co-operation in social work. When the last annual meeting of the United Charities of Champaign and Urbana was announced, the members of the University of Illinois band—one of the best college bands in the United States—expressed a unanimous desire to get into the game and play for charity. They played well, too, giving generous measure.

They were not, however, the only performers, for most of the social agencies in the two towns took part, and in all their talks brought out their need of each other as co-operators held together by the United Charities.

The judge of the county court, who is also a member of the Urbana Board of Education, Judge of the Juvenile Court, and a director of the United Charities, showed the increased efficiency due to co-operation between the court, the probation officer, the county supervisors, and truant officers. The school nurse pointed out several crying needs of school children which only the federated efforts of all philanthropic agencies could supply. The president of the Ministerial Association emphasized the fact that organized charity offers a common meeting ground for all church people regardless of denominational distinctions. The president of the Anti-Tuberculosis League in laying before the audience the urgency of his cause constantly reminded his hearers that the problem of tuberculosis could not be solved without the aid of a co-ordinating agency. The treasurer of the Dorcas Society, a successful merchant, presented the results of co-operation in the shape of a substantial 'balance on hand,' and called for an increase over last year's subscriptions to increase the effectiveness of this federated goodwill. A detailed analysis of two complicated cases treated co-operatively gave the secretary an opportunity to drive home the lesson that prevention of misery and destitution is possible and saves in money, time, and human suffering; and that such prevention can only come through the widest and heartiest co-operation.

"FUNDS TO  
PARENTS"

"Funds to parents," "governmental aid," "mothers' compensation," "home assistance," "home aliment," "widows' pensions"; a variety of terms, which are fast finding place in the newspaper headlines, all used to describe proposals which have this much in common—a plan to give regular public assistance to needy families in which there are children.

In three states, Illinois, Missouri and Colorado, such proposals have crystallized into law. In San Francisco and Milwaukee they have been put into effect in a small way without special enactment, while in at least ten states they are being discussed by social workers and others. In this latter list are Massachusetts, New York, Pennsylvania, Ohio, Indiana, Iowa, Nebraska, Minnesota, Michigan and Washington. Massachusetts has investigated the proposal through a special commission, and in New York City a special committee made a report on the subject last spring to the city Conference of Charities and Correction. The Colorado law was passed by popular referendum, under the championship of Judge Lindsay. The *Delineator* is making a journalistic campaign, and various organizations have sprung up to further legislation.

For the sake of ascertaining the facts as to the practical operation of such pensions, the Charity Organization Department of the Russell Sage Foundation has had an investigation made in San Francisco, Chicago, Kansas City and Milwaukee, by C. C. Carstens, general secretary of the Massachusetts Society for the Prevention of Cruelty to Children. As already noted *SURVEY* readers are fortunate in securing in this issue a first summary of his report.

Both the existing laws and those that are proposed vary widely as to the families falling within their scope. In all, there must be children and in the judgment of the authorities there must be need. Illinois may pension a family of husband and wife living together. In practice, however, such families are not now being pensioned. In Kansas City the woman who is pensioned must do no work outside her home. Mr. Carstens describes these and other variations of procedure quite fully. The variations which appear in the bills which are now being proposed are even wider. In all such bills as have reached *THE SURVEY* there must be at least one child; the New York proposal is for two children. In most states the woman qualifies if this one child is under sixteen years of age, but by the more rigid rule of one of the Pennsylvania bills the child must be under fourteen years of age. In the latter bill also, the woman must do no work outside her home. An Iowa plan would limit aid to widows; the Pennsylvania bill referred

to includes also women whose husbands are in prisons or insane asylums. Pennsylvania follows Illinois in allowing the Juvenile Court to grant the pensions, but divides responsibility by leaving the detailed administration in the hands of the overseers of the poor, while the Iowa plan leaves the administration to its Board of Control of State Institutions. For New York, the conference committee's report referred to, would create a new city department, a "Department of Home Assistance." A limit of \$10 per month per child is sometimes fixed, but the New York proposal fixes no limit. The New York plan referred to would provide that the pension be given by private societies, the new city department giving for each family double the amount that the private society has already given, provided the private society's application for the family is approved. State funds are the exclusive source of the money by the Pennsylvania bill, but by the Iowa proposal, the state would pay only half and county funds half.

These variations indicate the many opinions even among those who are in favor of public mothers' pensions of some sort; there is, of course, a formidable body of opposition to the general run of such schemes as a recurrence or extension of public out-door relief; and perhaps a larger group which desires first of all, more adequate information both as to actual needs and as to actual results likely to follow the methods proposed.

#### STATE INVESTIGATION OF LITTLE FALLS STRIKE

The strike of the textile workers at Little Falls, N. Y., that has been on since the first week in October has not been without its sensational developments. These have caught the public eye and to an extent have obscured the underlying issues of a strike which has been very similar to the Lawrence strike of a year ago, although very much smaller. Now, however, the facts are to come out, for on December 26, at the beginning of the eleventh week since the trouble began, the state Department of Labor has begun an investigation into its causes. It has developed from the investigation of this board that some of the employes have been making only from \$5 to \$7 a week and have worked eleven and thirteen hours a day.

The immediate occasion which set off these low-paid workers into a revolt, in which the lead has been taken by the I. W. W., was the attempt of the employers to reduce their earnings proportionate to the cut in working time called for by the new fifty-four-hour law. The announcement has been made that, in contrast to the laundry strike investigation of a year ago, a comprehensive report will be given to the public by the Labor Department immediately upon the termination of its investigation.

#### THE DYNAMITING CASES END IN CONVICTIONS

A later issue of THE SURVEY will present a review of the three-months-long trial which culminated at Indianapolis on Saturday, December 28, when a jury in the Federal District Court brought in a verdict of guilty with respect to 38 of the 40 defendants. Nearly all of the convicted men have been officials in the Bridge and Structural Iron Workers' Union. The list includes the president, the vice-president, the former secretary and all the members of the executive board of the union except one. The others are either former members of the executive board or business agents, except two, Olaf A. Tveitmoe, a cement worker and secretary of the California Building Trades Council, and Hiram R. Kline, of Muncie, Ind., a former organizer of the United Brotherhood of Carpenters and Joiners. The two men acquitted are Herman G. Seiffert of Milwaukee and Daniel Buckley of Davenport, Iowa.

The charges against the defendants, of which the jury found them guilty, may be reduced to two specific counts: the entering into a conspiracy to carry dynamite and nitro-glycerine on passenger trains from one state into another, and the carrying out of this conspiracy by aiding and abetting those who actually accomplished the deeds named. These are acts over which Congress has jurisdiction as entering into interstate commerce. With the destruction of property by dynamite or any other explosive, it has nothing to do. The government introduced in evidence, however, testimony and exhibits showing that such explosions had occurred all over the country during the last half dozen years, in order to show a motive for the conspiracy and to connect them in point of time with the transportation charged.

Just one year ago the McNamara trial in Los Angeles came to its dramatic close. It was at that time that there was turned over to the federal government the evidence collected tending to show that a wider conspiracy had existed than one directed against the Times Building and the Llewellyn Iron Works. A federal grand jury was convened in Indianapolis, the headquarters of the iron workers' union, and indictments were returned against fifty-four men, of whom forty finally went before the trial jury.

Ortie E. McManigal, who had testified at Los Angeles that he had blown up many bridges and buildings, confessed in the Indianapolis Court to having caused some twenty-three explosions, and Edward Clark admitted that he had caused one. The evidence against the other defendants consisted chiefly of statements in letters written by them which the prosecution declared could refer only to dynamitings or other deeds of violence.

On December 30 Judge Anderson sentenced President Ryan to seven years imprisonment. Eight men were sentenced to six years, two to four years, twelve to three years, four to two years, six to one year and one day and five were released under suspended sentences.

The Boston *Evening Transcript*, commenting

on the case the week before expressed the hope that every convicted man would be given the maximum sentence possible, which was thirty-nine years and a half in the penitentiary. The *New York Times* stated with apparent regret that "their lives cannot be taken," and added that "a life-time in prison cannot expiate their wickedness and their crimes." The *New York World* pointed out that "although the guilt in these cases is personal, organized labor cannot shirk its share of the moral responsibility. The lesson of this verdict strikes home to every honest union man."

## UNITED ZONES OF AMERICA

Since January 1 we have been—speaking from a parcels post point of view—not the United States of America, but rather the United Zones. Technically the new parcels post is merely an enlargement of the fourth class of mail matter; but stripped of its technicalities the law which went into effect New Year's day means that the government of the United States is making its first experiments in the field of carrying goods. Obviously the compromise measure which was enacted last summer does not satisfy either the opponents of a government transportation service or its more militant advocates. The latter maintain that the act is about as imperfect as a parcels post law can be, comparing it with the extensive service of European countries and citing its limitations as to weight, contents, etc., and the fact that, beyond certain distances it will continue to be cheaper to patronize the express companies. Obviously the provisions of the act do not allow anywhere near as easy an economical exchange of things as two-cent postage allows of ideas and messages. How far the system will be developed, now that a start has been made, is the subject of much political speculation and controversy, ranging from those who hold that we are witnessing a social revolution of the most far-reaching importance to those who see all the administrative difficulties involved, and the building up of a huge federal machine.

The social reactions of the experimental law will be watched with great interest—on table necessities and the family budget; on market-gardening and congestion; on the competition between country store and mail-order house, and the integrity of village life. In a recent interview, Postmaster General Hitchcock said:

"Every place in the country big enough to have a post office will have the advantage of this service. We have estimated, after inquiry, that no less than 20,000,000 persons who do not have the advantage of express company service will be reached by the government in its capacity as an express carrier. Take the case of Silver City,

N. M., for example. It is ninety miles from a railroad, but it has a post office, and parcel post packages will be carried there.

"Another thing that the parcel post will do will be to reduce the cost of living. It will give a better and cheaper means of transportation to places where prices are high on many articles because of the high charges for carrying them. With the government transporting parcel post packages at cost, the reduction in the carrying charges will naturally tend to reduce prices to the consumer.

"One of the best, if not the best features of the parcel post service will be the tremendous advantages it will confer on people living in rural communities. It will bring them in close touch with stores in the city whose goods they will receive at their doors at comparatively little, if any, extra expense. And the farmer will find an added advantage in the fact that he will be able to ship his farm produce in packages up to eleven pounds at the lowest possible cost.

"While the mail order houses in the big cities will benefit, the small merchant in the town will find that the system will operate to his advantage also. The zone system which we have established is to be utilized for his protection. He will operate within a smaller territory, that is, within a narrower zone than the big house doing a mail order business. Therefore the postage rates he will have to pay on parcel post packages will be less, and this will enable him to compete with the city houses.

"The benefits of the parcel post will extend throughout the country and to all the possessions of the United States. It is bound to stimulate trade and necessarily will work to the prosperity and general advantage of the people. Up to this time the Post Office Department was able to give the advantage of cheap rates on material that appealed merely to the intellect. Now, however, we shall be able to furnish dwellers in remote hamlets with creature comforts which had been denied them through high charges for transportation."

## SENTIMENTAL NEW YORK

SONYA LEVIEN

The Peoples' Institute

How near sentiment stands to sociology is almost excitingly shown by New York's first civic Christmas tree, and one might give the sentiment in a few words and then the sociology in fewer.

"Why not have a Christmas tree for the lonely ones?" This was the wild sentimental thought of an idealist, carried out by a handful of dreamers, and its message of music and light has awakened dormant feelings in thousands of practical New Yorkers, who, a week ago, would have denied with emphasis the existence of even a moth-eaten sentimentality.

The plan to have a Christmas tree in a public park for the lonely rich and poor was originated

by a woman. The idea was inspired by an incident told her by a young man.

In a reminiscent conversation she had with him of holidays and lonelineses, he was reminded to tell of his first Christmas in Germany. He was a student there, recently arrived from America. The holiday season came around, and German windows, alight with Christmas trees, radiated a spirit of self-centered happiness. The young man was very lonely and walked the streets. His stoic American training did not help, and he found himself horribly homesick and the possessor of a forgotten piety; worse still, he found himself philosophising on the relative cruelty of empty stomachs and hungry souls and of the two visitants he chose the first for the kindlier. "Next year," he said, "I shall get me a Christmas tree and invite all the lonely folk I know." And he did.

He related this incident to the woman to prove the argument that there comes a time in the lives of the hardest of men when they reckon with primal feeling and offer no apology for tears; and the way the New York people welcomed the message of the public Christmas tree shows that the young man's contention was not without wisdom.

But to go back to the history of the tree. The woman who heard this young man's confession thought,—Why not a Christmas tree in a public place, with music and light for the lonely ones of New York? With faith in the young man's philosophy, she voiced her thoughts to a few friends and the response was immediate. It was decided to have a tree in the heart of the city, and Madison Square Park, the crossway of thousands of workers and the outdoor home of the destitute, was chosen.

The plan was circulated among a few and contributions poured in from rich and poor for the "lonely ones' " Christmas tree, with earnest requests that the names of the donors should not be disclosed. The necessary funds were raised in forty-eight hours but donations continued, and the few who were in charge of arrangements found themselves embarrassed with unsolicited funds; this, although the plan was strictly guarded against all publicity so that the tree would come unexpectedly, in keeping with the mystery of the season.

An immense tree, sixty-six feet in height was brought from the Adirondacks, and the Edison Company was asked for an estimate on the electric decorations. The estimate was sent, but with it came a representative to ask that the lighting be accepted as the company's contribution to the program.

Every night from sun down to dawn the tree was kept alight with thousands of varicolored bulbs, thickly clustered in snow-capped branches and topped with the brilliant Star of Bethlehem. Prominent singers and choirs volunteered to sing

carols. The appreciative crowds the "Tree of Light" attracted—there were ten thousand people gathered around it at midnight, Christmas Eve—and the unanimous participation of the audiences in the songs, have given courage to many shy idealists, and festival plans for future holidays are rampant.

Many are trying to interest Charles B. Stover, park commissioner of New York city, in a plan to transplant fir trees in the center of city parks, which in coming years will serve as Christmas trees. Boston and Hartford heard of New York's scheme in time to follow its example, and Chicago and Pittsburgh are already planning public Christmas trees for next year.

Now for the sociology. When the Russian village community is transplanted, man by man or family by family, and tossed into the American city, there is more social tradition suddenly wasted than a hundred years of orderly transformation could effect. Social tradition is carried essentially by the community. It is only secondarily a family inheritance and scarcely at all an individual possession.

The American cities represent the *debris* of Europe's social tradition. It can never be resurrected in any literal way, but by community action as such it can be recreated in far richer and deeper kind. New York has dealt with recreation heretofore as if it were an individual matter. Where people recreate in the New York schools, parks or theaters, they recreate in a casual or individual way. They are dealt with as individuals, not as social groups.

In past years some success has been had in the attempt to create community habits founded on patriotic holidays. This is well. It will be better when we invite our people to look onward to a romantic future rather than backward to colonial and constitutional history.

But the old world peoples have given us festival days that are more than political in their meaning—that are racial, poetic in the highest sense. Christmas is one of these days, as Hallowe'en is another and Easter a third. There are no races, or native strains, who either do not have deep personal associations with these feast days, or have at least analogous feast days that can be translated into them.

Back of the sentimental Christmas tree is moving this deeper social thought. When the American city, through an effort, that must be community-wide, rediscovers the community tradition, the community sentiment and fantasy, it will rediscover the community life. There was never in all the world such a sowing of seed as has taken place in the American social soil. These community habits of gladness and friendliness, and these symbolic days of the community, are the warm South wind which may bring the seed to life.

## FINGER PRINTS

FRANZ<sup>1</sup>

GERTRUDE SEYMOUR

Franz was in a fair way to spend his fourteenth year in the penitentiary when we reached the court room. Sullen, frightened, he gave the judge no word of answer save, "I wanted to see how it worked"; and a verdict of "incorrigible" impended.

And why not? Automobile stealing was but the latest item on his long list of misdemeanors. All his life he had been in mischief. Did his mother ever try to use her sewing-machine, he was sure to "monkey" with the strap, trying to see how it made the wheels go round. Not a clock in the house was safe from his investigating fingers. Wheel by wheel, spiral by spiral, he would take it carefully apart, to be not always successful in readjustment!

"I couldn't keep anything safe from him," wept the mother. "He took to pieces one day even the fader's watch before he got away." For Mr. Smitz had departed a year ago, and had remained in parts unknown. He had tried to discipline his son—"make him do what he don't like while he is young; then when he is grown he will better know to do what he likes." Such was the code. But the process of administration proved difficult. And so Mr. Smitz departed, leaving to his wife a large problem and a small amount of money.

From his mother Franz coaxed a hundred dollars, invested it bit by bit in the parts of old automobiles, hid his accumulating treasure in an old barn, and there began the study and construction of a car. For several weeks all went well. Then he found a queer little rod with a screw on it that did not fit anywhere. What that rod did or ought to do, where it ought to go, became the puzzle of his days and the worry of his dreams. He scrutinized cars that stood by the street sides; he asked all the questions he dared; but still no light fell upon his problem. Then, one afternoon, he quietly seated himself in a vacant car, threw on the power, and rode quickly off to a secluded alley, where, removing the hood and parts familiar to him, he lost himself in a search for the twin of his perplexing rod with the screw on it.

Quite absorbed, he fell an easy prey to the pursuing owner and the detectives. They failed to sympathize with the scientific nature of his researches, and the penitentiary loomed large over Franz. He only "wanted to see how it

worked"; but "it" was private property. Then came a letter from the nearly distracted mother:

"I have heard how that in hospitals they do an operation that cuts out of the head all bad thoughts. Could you not get them to cut out of Franz's head this machine nonsense. Then Franz will be no more crazy, and the judge will not send him to jail, and I shall have no more trouble with my boy."

Trepanning for mechanical genius! Rather, the prescription that Franz needs is not the operating-table, but the work-bench; not surgeon's instruments, but workman's tools.

He has them now. In the Pontiac Reform School he is well, happy at last and doing excellent work in the machine shop. The institution is giving him that technical training which the public school failed to offer. He had to become a prisoner of the state before he had a chance to work at the things he likes best to do.

## A HOSPITAL ORPHAN<sup>1</sup>

ELIZABETH ROSS, R. N.

The bare, clean hospital ward was a poor substitute to Tony for the home he had left. It was only one room, to be sure, in a tumble-down house, where the dust from the coal yard filtered in through every crack, since it could not come in through the never-opened window that admitted a little light. He missed the bits of broken furniture and the one piece of magnificence, a great brass bed, hung with protecting lace curtains and always made up with lace-trimmed sheets and pillow-cases and a wonderful lace spread, all brought from Italy, and almost as sacred in his baby eyes as the shiny pictures of the Virgin and the Holy Family, that had also come from Italy.

He missed his older brother and sister, too, and the fun of tumbling into bed just as he came from the street—dirty, but happy. But, most of all, he missed the pretty girl mother, with her soft, brown eyes, curly, dark hair and bright cheeks, and he missed her play and petting. The white-capped nurses who never had time to play with him were a poor substitute. They did not even know, with their endless bowls of bread and milk, that bananas are the proper food for little sick boys.

Tony had been so very sick that he could not remember much about it. He had quite forgotten the attack of measles, shared by his brother and sister, with which his sickness began. He did not remember the terror of the little mother when she found that instead of romping again as the others did, he lay gasping for breath, panting and coughing. He did not even remem-

<sup>1</sup>The data as to "Franz" was all drawn from a "case record" in the files of the Juvenile Protective Association, Chicago.

<sup>1</sup>A sketch which hints at the need for hospital social service such as builds up families in their homes as well as patients in their beds.

ber the big, kindly voiced doctor who seemed to fill the tiny room—nor even how he had been carried to the hospital, wrapped in his mother's big shawl. But he did remember how his mother had cried and begged in vain to be allowed to stay with him that one night.

He was a happy boy when the day came that he could go home again. His mother came for him, but poor little Tony found that he was no longer her baby. Another little brother had taken his place in her arms. He must take his chances with the older brother and sister.

Soon he came back to the hospital again, almost as sick as before, after a few weeks of unwholesome home life. But this time the mother did not fret. He was a little hothouse blossom, and she understood only the sturdy garden flowers.

After another long fight Tony was as well as he would ever be, and fond of hospital life, doctors and nurses. When his mother was sent for she refused to take him home until forced to by a policeman. She did not want him; he was always sick.

In a short time he was again returned to the hospital, dirty and sick. By the time he was nursed back to a feeble kind of health it was found his family had left town, nor could they be found. There were too many children to feed and the father was out of work. There was no place for Tony.

The nurses tried by sweets and toys to give pleasure to their deserted pet, but, after all, he was but a patient to them; they could give him neither home nor mother. And so Tony must go to the other kind of "Home," the kind with a capital H.

Poor little fragile baby! What has life in store for him? And whose the blame? Surely not Tony's.

## EIGHTY CENTS<sup>1</sup>

KATHARINE ANTHONY

Mrs. Grubinski came as usual at eight o'clock on Thursday morning to do the washing. As she sorted the linen on the kitchen floor she remarked:

"It is a bad day for drying the clothes. It was raining already at four o'clock when I stood up. No, we do not stand up at four o'clock every morning, but at five. But last night we

<sup>1</sup>The substance of a conversation with a Slavic woman of the West Side of New York. Many of the Slavs of this district speak German. Some of them have learned this language in New York and are still unable to speak a word of English.

were weaving the chair seats that my man brought home from the factory.

"At six of the afternoon we begin, my man and me and Die Gretl. Die Gretl can already weave good, though she is but twelve. Yes, she goes in the school, but it is no good. I think she cannot learn any more. Her mind is always on the children—we have so many, eight *Stück* [pieces]. She is always like this."

Mrs. Grubinski's fingers began to fly at some imaginary task and she watched them intently, now and then snatching a hasty glance at an imaginary book lying open on the corner of the kitchen table.

"At ten o'clock Die Gretl puts the little ones to bed—Heini, Marie, Wally, and Conrad. Then she works till eleven.

"At twelve o'clock my man says to me, 'You go to bed and sleep. At four I will call you to work and then I will sleep.' So I went to bed and left him still working in the kitchen by himself. At four he woke me up and said, 'Now you can finish while I sleep. It is raining.'

"Then he laid himself down on the bed with his clothes on and I stood up and finished the weaving. At six o'clock he must get ready to go to the factory at seven. That was two hours that he slept. In so much time I finished the weaving, and it was all ready for him to carry to the factory when he went to work."

"But why did your husband take a job like that to do over night?"

"The superintendent says when he gives it to him, 'I need it to-morrow.'"

"But he must have known that your husband would have to sit up all night to complete it."

"*Das geht ihn nix an!*" (That doesn't concern him!)

"How much do you get for the night's work?"

"One dollar. But then the cane—that costs twenty cents. We come out with only eighty cents. The customer, he pays two dollars, and the factory keeps one dollar."

"And so your husband worked all night for eighty cents. You will kill yourselves at that."

Mrs. Grubinski shrugged her thin shoulders and gathered together the great heap of clothes she was taking down to the laundry.

"I say that to *him*. But he is like a man crazy to buy a farm. I want the farm, too, as bad as he does. In Hungary we lived on a farm. The fruit and vegetables would just fall on the ground, and lie there sometimes! One would take a bite out of an apple and throw it away. Fancy! But I say to my man we will be dead before we get that farm in this country."

## EDITORIAL GRIST

### PEN AND BOOK AS TESTS OF CHARACTER

JANE ADDAMS

The House of Representatives by its recent affirmative vote upon the Burnett Bill reported from the Committee on Immigration and Naturalization, registered itself in favor of the literacy test for immigrants arriving in the United States. Much of the discussion in the House and in the press was particularly objectionable because of the emphasis placed upon racial differences. The old and new immigration were frequently contrasted with the traditional odiousness resulting from comparisons. The epithet of "inferior races" was constantly applied to certain peasant groups who, as the result of isolation and lack of opportunity are doubtless backward, but who do not therefore belong to an inferior stock, and who exhibit no greater differences to other groups of their own race than those which often obtain between branches of the same family. Striking differences are certainly found between certain family groups in America, one of which has remained for five generations stranded in the mountains of Virginia or Tennessee, in contrast to their cousins whose forefathers crossed over the mountains into fertile valleys. Many mountain whites of America are illiterate and totally unacquainted with the advances of civilization, but they do not thereby change their race nor their capacity for development.

After all, literacy is neither a test of character nor of ability; it is merely an index of the educational system of the community in which a man has been reared. The literacy test will always work in favor of the man from the city and discriminate against the man from the country. On the face of it, it would seem safer to admit a sturdy peasant from the mountains of Calabria than a sophisticated Neapolitan, familiar with the refined methods of police graft which have made the Camorra famous. In addition to that, the peasant finds work waiting for him, the educated man "above manual labor" often has a pitiful struggle to keep himself from starvation. Our experience at Hull House is similar to that of the friends of the immigrant everywhere. We recall an Italian editor, a Greek professor, a Russian medical student, an Armenian Master of Arts, for whom it was impossible to obtain anything but manual work which they finally undertook in bitterness of spirit and with insufficiency of muscle. A settle-

ment constantly sees the deterioration of highly educated foreigners under the strain of maladjustment, in marked contrast to the often rapid rise of the families of illiterate immigrants.

One of the most gifted boys ever connected with Hull House, who is now a rising man in his profession and in the civic life of Chicago, is the son of immigrant parents who can neither read nor write, while one of our most baffling cases is the refined and educated son of a Greek clergyman who can find no work which he does not consider beneath his educational qualifications.

The only service America is universally eager to render to the immigrant and his children, and moreover the only one it is thoroughly equipped to offer, is free education. By the same token, so eager are the immigrants to avail themselves of America's educational opportunities for their children, that the census figures show greater illiteracy among native whites of native parentage than among native white of foreign parentage. The average illiteracy of native white of native parentage is 5.7 per cent and of native white of foreign parents 1.6 per cent. In the light of these figures it would seem clear that illiteracy is the one defect most easily remedied and that American experience does not justify the use of literacy as a fair test for entrance.

Throughout the discussion concerning the literacy test the "oversupply of unskilled labor" was constantly referred to although no comprehensive inquiry has ever been undertaken which could demonstrate this. We have no national system of labor exchanges which might show how much of the apparent unemployment is maladjustment of the supply to the demand and how much is oversupply. Certainly underemployment, casual work, long hours, poor wages, unsanitary shops, are found in industries in which the "unskilled immigrant man" is not employed. Limiting the supply by restricting immigration will cure none of these, and it merely confuses the issue to claim that it will. Until industrial conditions in America are faced, the immigrant will continue to be blamed for conditions for which the community is responsible. There is no doubt that America has failed to make legislative provisions against those evils as other countries have done, partly because the average citizen holds a contemptuous attitude toward the "foreigner" and is not stirred to action on his behalf.

In line with this lack of clear thinking and even of definite information on the subject, is the constant assertion commonly made that one million immigrants a year are coming into this country; yet Secretary Nagel's annual report for the fiscal year ending June 30, 1912, shows that in the year 838,172 immigrants and 178,983 non-immigrant aliens entered. The total of these is

1,017,155. But during the year there departed from the country 615,292 aliens, of whom 333,262 were of the emigrant and 282,030 of the non-emigrant class. The net or actual increase in the alien population for the fiscal year 1912, therefore, was 401,863; the corresponding increase in 1911 was 512,085, averaging less than half a million a year. Before Congress legislates further upon this subject of immigration should it not provide that copies of the valuable report issued by the Immigration Commission be given to the country that we may at least be supplied with accurate information.

## THE NON-EXCEPTIONAL CITIES

ROBERT A. WOODS

South End House, Boston

The spread of business-like organization among the agencies of charity through the whole class of progressive smaller cities is having the effect of stimulating new effort in such centers in the direction of positive community reconstruction. The initiative is coming in large degree from two of the most powerful forms of association, the church and the chambers of commerce. The method is a two-fold one: that of covering the city as a whole with certain specialized services, such as the regulation of sanitary evils, with particular reference to housing; and that of specializing upon given local communities with a comprehensive range of service, after the settlement plan.

The latter motive is bringing the settlement, in one shape or another, into a new field of great significance. The need and the opportunity for the rehabilitation of neighborhood life is quite as apparent in most cities of the second magnitude as in any sectional metropolis in the country. And so far from the necessity of a transfusion of citizenship being less with the possibility of the new resources of charity and education—such as specialized child saving or playgrounds and school centers—the initiative, the administration, the complementing, the supplementing of all such effort by a systematic and penetrating contagion of responsible neighborliness is indicated more urgently than ever.

In the same way, the broader human reach and touch extending from neighborhood to neighborhood, and traversing the grilling lines made by distinctions of race and creed, are decisively called for in those cities which have not yet wholly lost their village sense. In many a growing urban center, almost unconsciously to themselves, the original nucleus of families have lost their hold upon a quality of social life which largely made them what they are, and insured to their city what has been best in its progress. There are encouraging signs that this loss will

be substantially recouped by approved methods for creating a network of neighborhood loyalty in each local section of the city, with a substantial working acquaintance from neighborhood to neighborhood among all people of good will.

It is doubtful whether any phase of the advance in social work has in it the germ of larger promise than is found in the rising spirit of realistic democracy in the non-exceptional cities. As they go, so goes the manhood and womanhood and childhood of the nation.

## BOYS—"RECORD WEEKS"—AND THE 12-HOUR DAY

WILLIAM H. MATTHEWS

*[There is a contribution to THE SURVEY which tells its own story. It comes from the former head worker of Kingsley House, Pittsburgh, who was secretary of the Stockholders' Committee of the United States Steel Corporation which reported on labor conditions last spring. As a result of that report the Steel Corporation appointed a committee to consider practical plans for cutting down the twelve-hour day. In this spontaneous letter Mr. Matthews gives some human experience that backs up the progressive plant managers at Granite City who have gone on to the eight-hour shift.—Ed.]*

I have just read Mr. Fitch's article in THE SURVEY on the experiment<sup>1</sup> going forward with the eight-hour day in the steel mills. As to the point as to whether a shorter working day would mean an increased efficiency and increased output, I am reminded of an interview I had last winter with the general manager of one of the biggest steel mills in the Pittsburgh district. He had, some four months previous, ordered the seven-day week cut out absolutely in all blast furnace work, which means, as you know, the adding to the blast furnace crews one extra man for every six at work. The bosses and foremen came to him when he ordered the change, deploring the fact that such a change would mean the end of making new records. He replied by telling them that it would mean bigger records than ever.

"And," said he to me, "it has worked out as I knew it would. Last week was our record making week. And we hung up new figures. What is more, I noted none of the stress and strain among the men last week that was always so noticeable among them when we were working for new records on the old seven-day week schedule."

I remember another general manager in the Chicago district, an open champion of the eight-hour shift, in continuous process work at least, who asserted with confidence that he could, with such a schedule in operation for two years, "beat all production records in the country."

One of the objections made to the adoption of the eight-hour shift is the impossibility of securing sufficient skilled and semi-skilled men. That, I believe, would gradually right itself.

<sup>1</sup>See THE SURVEY, November 16, 1912, p. 108.

During my years of settlement work in Pittsburgh I knew many old steel workers who had left the mills *because* of the brutally long hours that they had to work. Again, I almost invariably found that the Americans who were at work in the mills refused to have their boys follow them in their trades because of the long hours involved in the work. They wanted their boys to "go at something where they wouldn't have to work twelve hours out of every twenty-four." I have always believed that with a decent working day many of the boys of the steel workers would turn to the mills. One first helper on open-hearth furnace work I remember. He was making big wages—felt sure of a foreman's job a little later on. Three boys he had—one of them working in a store, the other two in school. I asked him if he would not later take them in the mills, where they could probably make more money than elsewhere. The question itself angered him. "I'd work the flesh off every finger before I'd risk my boys in this business," was his answer. And the risk was, I found, in his mind, the one involved in the schedule of hours he had to work.

## THE RELATION OF VOLUNTARY TO POLITICAL ACTION

SIMON N. PATTEN

University of Pennsylvania

One of the first articles I read after returning this fall was by Jane Addams. My attention was held not so much by its argument as by the light it threw on her epoch-making personal development. She says her interest has gradually changed from social to political action. To start in philanthropy and end in politics seems to her the normal trend of progress. I state her position not to refute it but to contrast it with my own.

I started a rank coercionist. At twenty I had on my program a dozen prohibitions which I meant to spend my life in imposing on the American people. Like Miss Addams I cannot say when I began to alter my views, but changes in them have gradually come until to-day there is not a coercive measure in which I have faith. Public action, I still see, is a stage of progress, but it is a stage that comes after the victory has been won. We can only coerce a remnant, a degenerate remnant, hiding in caverns after the sun is sending its rays over the open hills and valleys. It is a futile task killing microbes one by one in the dark. If all of us went at it the failure would be only the more conspicuous. Progress does not come by dozens of little coercions, but by doses of freedom. It alone evokes forces dormant in maladjusted individuals. The real problem is to start the internal budding which better conditions bring. If the seed is

sound, the plants will grow in the open air better than in hot houses.

This is not a new philosophy. Miss Addams has it as well as I and probably saw it earlier than I did. The difference between us is in the emphasis we give to its various elements. Shall we move from freedom to coercion or from coercion to freedom? How much of any social movement lies in each of these fields? It is here where programs vary and friends part. As I see it the initial stages in progress are first, to see accurately; second, to describe clearly what is seen; and third, to find a group of persons who see the same things and who use the same words to describe them. This seems formal but no one makes an effective start until he realizes its difficulties. Tradition and emotion blind us to the events going on about us. And if at last we see, the English language fails when we attempt to describe them. There are thousands of words we don't want and none we need. We see as individuals; we socialize as we use a common language.

The uniting force in any group is the words they use. No voluntary group is held together in any other way, and with each new group comes new words and new expressions of feeling. The great advance in the past decade has been the growth of social expression. Reform is at last able to talk the English language. We could not have had political conventions to advance the cause of social justice if social workers had not coined words that reshaped the sentiments these conventions evoke. The victory is not won when a majority of the American people cast their ballots in favor of reform; it was won when the first group of social workers saw the real facts and found words to convey to each other what they saw. The movement then became socialized and from this to victory is but a step, a formal step that would come almost as quickly without agitation as with it. Social movements like plants grow of themselves if put in the sunshine. The right seed gives an abundant harvest even if the sower sleeps while it grows. These seeds are words conveying to others what we see and feel. And words are such filthy things, each of them carrying more microbes than are to be found in a pail of drinking water. We wash our food, but who thinks of sterilizing his words? Everyone also feels free to steal words or to alter their meaning. Think of a coercionist calling himself a *Socialist* and of an emotional revivalist calling himself a *Methodist*. Of far greater importance than the power to see ourselves as others see us is the power to express ourselves so that others understand our thought.

I shall apply this in a field where Miss Addams and I are interested. What are the hindrances to the uplift of woman? I would reply that the cause is advanced not by advocating suffrage

but by creating in men's minds a clear idea of women. The trouble is primarily one of language and description. All the virtues have been observed and emphasized as they appear in men's action. There are no female virtues: the so-called female virtues are negative qualities due to restraint. When a man thinks of a virtue he thinks of a man doing something in a masculine way. Since we have no words to describe a womanly way of doing the same act he ascribes sex to the virtue and thus makes the act unwomanly for a woman. In all languages the word feminine is used to describe the weak and defective. This oldest and crudest contrast of the good and the bad has become a fundamental characteristic of masculine thought. With ideas and words that classify the feminine as defective a man cannot help attributing to women the qualities or the lack of them that his language imposes. Give a man a better way of contrasting the good and the bad, the perfect and the imperfect, the strong and the weak and he will begin to judge women in these new terms and find that they have the same qualities men have. To call bad qualities feminine prejudices the case. Men dimly see the difference and sometimes use a better language, but in ordinary life they still think in the old, crude terms and thus misjudge women.

If in regard to two opposing views one is held by 51 per cent of the women and 49 per cent of the men, while the other is accepted by 51 per cent of the men and 49 per cent of the women; the first is dubbed feminine and the second is lauded as masculine. This sex consciousness is the most difficult of prejudices to disregard. Women are swayed by it as much as men. They view as feminine those finer sentiments more often held by them and instinctively call that masculine which appeals to our coarser nature. Such views and terminology can be removed only by an improvement in language giving to each contrasted character an appropriate name. Then we can say what we mean without depreciating the opposite sex.

In such a situation, what is worth while, a suffragette agitation or a clearer vision? I feel that the cause will be won when men think of women not as defective men, but as beings with the same qualities they have mixed in a somewhat different proportion. This means much elementary work in morals, economics and art so that contrasts can be made and personality pictured in terms not involving sex. Voting is but an incident in the rising appreciating of women. In this, as in other causes, the first steps are the hard ones. When a tenth of the men see and measure the qualities of women accurately, converts to the new faith will come in droves.

All this is equally true of social propaganda. Words, contrasts, art and song are the elements out of which movements come. All these are

formed by individuals long before they are socialized. If they are clear nothing can resist the on-coming of the new epoch. If they are hazy, vague and ineffective no amount of coercion can carry the movement to its goal. How is the first third to be converted. Certainly it is not by coercion. And if clear ideas, good art and deep emotion will convert one-third of the people why can not the same agencies convert the second third? The natural expansion of clear ideas and social emotions are checked only when the degenerate, defective or dependent classes are reached. In such cases coercion has a definite but limited field to which it should be strictly confined. Voluntary effort must, however, precede this coercion, and is the force back of every social uplift.

I have written the foregoing to ask a question of social workers. What coercive measures have you on your program? Are they increasing or decreasing in number and are they to be applied earlier or later in the upbuilding of new standards? I fear we are dividing into two schools. Is not the present a good time to clear up our ideas and see if the next steps cannot be taken along paths we all can go?

## THE CASE FOR THE VOLUNTEER

MARY E. RICHMOND

In these days of expert investigations, social surveys, training schools for social workers, and all the rest of our elaborate machinery, where do the volunteers come in? Not all of the case in their favor can be stated here—editorial grist cannot be ground too fine—but they have a case and a very good one.

There are violent rushes from one side of the ship to the other; we cry "Lo here!" and "Lo there!" but still the ship does not sink; it was built to float and, in fact, it does. We have seen the professional worker put forward as a complete and satisfactory substitute for the volunteer, and we have seen the careless and wasteful use of volunteers do whatever it could do to discredit their service altogether. But the issue will not down; the deeper it is buried the more alive it becomes, and so we have also seen, during the last few years, in cities large and small, strong renewal of interest in the right utilization of this great social asset.

The relation between the trained worker newly arrived and the volunteer in possession of the field had to be settled, there had to be a period of readjustment, and out of this now has come the clear conviction that there is no continuity of purpose in the social program that leaves the non-professional group of social servants out of account. The volunteers, as one of the younger professionals puts it, "are the real sons and

daughters of the community, while the paid worker, though she may be a loving daughter, is often an adopted one." And changes, moreover, in the paid staff are all too frequent. It is the responsible volunteer alone who assures continuity.

But how is he or she to be made responsible? By avoiding the exploitation of the new recruit. He should be given training, should be provided with tasks of graded difficulty and of sufficient variety to develop his native gifts, should have very definite demands made upon him, and should be treated as seriously, in fact, as one would treat a paid assistant. Will the volunteers rebel? Decidedly not; those agencies have the largest number of them that give them the most to do and see that they do it well.

"There are trained workers who have a genius for the use of volunteers; there are others who have not, so that there will always be great unevenness in the work, but there is a technique that can be mastered."

Some social agencies are now organizing classes for their volunteer staff, and are adding beginners' classes for the young people soon to be fitted for active service. But classes are the minor half of this training; the major half comes chiefly through daily contact with the trained workers of the staff (volunteer and paid) who believe that time, skill and patience invested in the new recruit is thoroughly worth while.

A trustee of an associated charities in one of the smaller cities finds many eager to undertake the field service of the society, but "mere willingness to help is not in itself a qualification. Intelligence, discretion, and general dependableness are as indispensable here as elsewhere. Therefore it is better to have it understood at first that, paradoxical as it may sound, volunteers are not expected to volunteer, but that they will be asked to work as they are needed. To be asked to volunteer, then, becomes something of a distinction, and any possible sentiment of doing the society a favor by serving it is eliminated." As to the value of the service she adds:

"Volunteers working in the associated charities come to know their town as they have never known it before; they see sides of it they have never seen, and come face to face with problems they never knew existed. And because their town is like a large family their interest and their social enthusiasm are caught by other members of the large family, and so on and on."

There is danger that recruits may be drawn too exclusively from the college, the profession, or the social set already well represented in the society's volunteer group. The wholesomeness of the other policy, of drawing in from the community, that is, representatives of as many different community groups as possibly is self-evident.

Let a veteran testify for her part to greater and greater dependence upon the volunteer's point of view for that elasticity and insight without which our tasks become as lead. Dr. Osler advises his professional brethren who are over forty to keep their faces turned resolutely toward the rising instead of the setting sun; our faces are so turned not resolutely but instinctively when our work is done in a company of devoted volunteer workers, many of whom are of the younger generation. They know the community in ways that we are too busy and too old to know it; they interpret it to us and, through their many points of contact, pass our message on to all sorts and conditions of men. If, at any time in the past, the volunteer has been a Lady Bountiful who ruffled our democratic temper, she is this no longer, but an earnest seeker, rather, after relations of human helpfulness that, through all the imperfect social adjustments of our time, shall still be without condescension or self-righteousness.

Against a certain opinionated and self-righteous attitude in some of the trained social workers themselves we have to be especially on our guard. This world is not a stage upon which we professional workers are to exercise our talents, while the volunteers do nothing but furnish the gate-receipts and an open-mouthed admiration of our performances. Social work is a larger thing than that. When Balaustion recited the moving drama of the aged Athenian upon the steps of the temple at Syracuse, she recited it to an audience to whom the story of Alcestis was far more than a legend, and to whom some of the tragedies of Euripides were known by heart. It is such an audience—a *participating* audience—that is needed for all the finer developments of social work. When we look back over the line of pioneers in social work who held this faith and made it a living thing, who never were content just to do the work themselves but patiently kept step with the beginner, we can say of them, as Balaustion said of her own great countrymen,

"Ah, that brave

Bounty of poets, the one royal race  
That ever was, or will be, in this world!  
They give no gift that bounds itself and ends  
I' the giving and the taking: theirs so breeds  
I' the heart and soul o' the taker, so transmutes  
The man who only was a man before,  
That he grows godlike in his turn, can give—  
He also: share the poets' privilege,  
Bring forth new good, new beauty, from the old."

We too can share the privilege of our masters, if we share their secret; we too can "bring forth new good, new beauty, from the old."

SIR THOMAS OLIVER

# WHAT I SAW IN AMERICA

THOMAS OLIVER, M. D., F. R. C. P.

PROFESSOR OF PRINCIPLES AND PRACTICE OF MEDICINE, UNIVERSITY OF DURHAM  
COLLEGE OF MEDICINE, NEWCASTLE-UPON-TYNE

**A**FTER the close of the Congress of Hygiene in Washington in September last

I had the opportunity of visiting some of the cities of the eastern states and of seeing therein something of the labor conditions and industrial life of the people. Although I visited a considerable variety of factories the number seen was too small to enable me to make a comparison and draw conclusions between American and British manufacturing plants. Besides being a foreigner perhaps it was my privilege, or misfortune, to have seen many of the best and few of the worst factories.

Despite the larger number of labor-saving devices in use in America than in England there are in both countries still some industries, e. g., the iron and steel, in which the work is too hard and the hours are too long. Working a twelve-hour shift week after week and month after month frequently is beyond the limits of human strength. In some of the rail-making shops in England where the men work on two shifts, the work being continuous during the week days, the men rest for ten minutes at the end of every two hours and they are allowed twenty minutes for breakfast and the same for dinner. As the meal times coincide with ordinary rest periods there is thus given to the men seventy minutes' rest during a twelve-hour day. With the exception of these short intervals of rest the men are kept hard at work all the time.

Equally long hours are found in some of the processes in iron works in the United States. At several of the blast furnaces in the north of England the hours have been reduced from twelve to eight with the result that the amount of iron produced is greater than in Staffordshire where the twelve hours still prevail. Not only in the North of England is production greater but the men receive higher wages, although working fewer hours. The time has come when in the United States, England and elsewhere Sunday labor in iron works should be abolished. So far as blast furnaces are concerned experience and experiment have demonstrated that Sunday labor is not the economic and technical necessity it has hitherto been believed to be. The day has dawned when there should be a respite from all Sunday toil. It has no direct bearing upon the point that the Poles and Slovaks in the States are only too glad to

work on Sunday in order to secure the extra day's wages.

It is a well known fact that in the United States few American-born workmen undertake hard, disagreeable and dangerous work. This is left largely to the foreigners from eastern Europe for whom, and I refer here especially to the Poles and Slovaks, it seems to me too little personal consideration is shown. Many of these men are literally beasts of burden in American factories today. Without these foreigners it would be extremely difficult for much of the factory work in the United States to be carried on.

From what I have seen and heard of foreign laborers in the States I feel that I must advance a plea on their behalf. They are frequently given extremely dangerous work without being instructed as to the risks they run. These men are ignorant and they have not reached the stage of civilization of the American, but notwithstanding they are men capable of aspiring to higher things while many of their children will become citizens of the republic.

A little more humane treatment of these foreigners and more sympathy extended to them would do much to lighten the burden of their toil and make life more agreeable. Employers are willing to pay and even to pay well for unskilled labor, but they do not, so far as the ordinary laborer is concerned take sufficient cognizance of the physical limitations of the human machine.

The large number of foreigners employed in factories adds to the difficulty of management and is one of the causes of accidents. Regulations have to be printed in several languages. With such employees factory owners find it easier to do all they can by all sorts of devices to prevent accidents rather than take the trouble to instruct the work people how to protect themselves. The importance of education cannot altogether be overlooked, for by it the workman is taken into the employer's confidence, his intelligence is awakened and he is given the opportunity of co-operating with the owners so as to make regulations effective.

Apart from accidents in no industry is instruction more called for than in the manufacture of white lead.<sup>1</sup> In factories where white lead is made

<sup>1</sup>See The Lead Workers, *THE SURVEY*, November 23, 1912, p. 229.

WORK IN THE OUT-OF-DOORS (ITALY)

TYPES OF THE FACTORY GIRL IN AMERICA

or lead compounds used factory regulations, such as those in Great Britain, do not appear generally to be in force. There is no *compulsory* periodical medical examination of the workers nor of the workmen when first taken on, and yet in some of the white lead factories which I visited employers have of their own accord drawn up regulations and they require their work people to be medically examined just as in England. Where health can become so readily impaired and life endangered as in the manufacture of lead it should not be left altogether to employers to draw up regulations for the work people. There should be a minimum state requirement which employers might improve upon if they chose. So long as there are no periodical medical examinations of the workmen with power of suspension given to the doctor the health of the men will be menaced.

From my visits to white lead factories in the States and to town hospitals, also from my conversations with medical practitioners appointed to particular factories I did not find plumbism more prevalent in the lead works of America than in England, but I am disposed to think, judging from Bulletins of Labor and the careful and searching inquiry into this subject by Dr. Alice Hamilton that, owing to the comparatively brief time at my disposal in the States and the limited ground I covered, probably the white lead works I visited were among the best in the country. From statistics it would appear, however, that all is not right in American lead works. Fires may be smouldering which I had no opportunity of seeing.

It is an extremely creditable feature of the white lead industry of the United States that the manufacturers have never employed women as was formerly and is still partially the case in Great Britain. This circumstance has prevented the outbreak of those more severe forms of plumbism—the cerebral type known as saturnine encephalopathy, so rapidly fatal and destructive to young life. In Great Britain lead poisoned patients ultimately find their way to infirmaries and workhouse hospitals or they remain under the care of the works' medical officer, but the number of persons suffering from plumbism in any district can always be readily ascertained since all cases of lead poisoning must be notified to the chief inspector of factories. Until America has in all the states adopted compulsory notification, no accurate estimate of occupational plumbism is possible. In some respects it might be advisable for compulsory notification to precede a Workmen's Compensation Act, since it would reveal the extent to which plumbism is more prevalent in some trades compared with others, and would then be of some assistance to insurance companies in arranging terms with employers.

### *Unrealized Dangers*

Possibly there may be in the United States a larger percentage of concealed and unrecognized cases of plumbism than in Great Britain. With us the incidence of lead poisoning runs parallel with the amount of casual labor employed. In the United States with its enormous foreign immigration many of the men who become white lead workers do not follow the occupation long enough to become really ill. Once they have had an attack of colic they, instead of returning to the lead work on their recovery as the men do in England, become frightened and seek other employment. Change of occupation at the earliest opportunity thus creates a condition of things which is misleading. This summer while visiting a white lead factory in France I found such wretched conditions prevailing that I was certain there must be much sickness among the workmen. On carefully inspecting the register of the workmen employed, however, there appeared to be, practically speaking, no sickness among the men as testified to by the visiting medical officer. Where sickness did occur it was of an extremely mild nature. On pointing out these facts to the manager of the works and discussing them with him he drew my attention to the equally interesting fact that the men did not follow the occupation long enough to become ill, that there was a constant stream of men passing through the factory, a circumstance which added considerably to the cost of production but which gave the works a clearer bill of health than it otherwise deserved.

In European as in American lead works casual laborers are replacing the more constant workmen, but in England the men on the average, stay longer with their employers so that when plumbism occurs the type of the malady tends to be more serious. There must, therefore, be in the United States the dispersion into other trades of a considerable number of unskilled workmen, many of whom may just have become the subjects of the minor forms of lead poisoning so that the nature of their complaint on becoming ill, when following other occupations, may not at first be readily recognized.

Some of the white lead and color factories which I saw in the United States are of more modern construction than those in England and Scotland. It is our experience that in old factories with wooden floors and where heavy machinery is running as in the grinding department of white lead works the joints of the floors become loosened, they harbor dust, allow it to fall through to underlying workrooms and by thus distributing the dust add to the dangers. Wherever possible cement floors ought to replace those made of wood. The mechanical stoving or automatic methods adopted for drying white lead, also electrical haulage, which I

saw in at least one of the white lead works in the States, are steps in the right direction.

This is not the occasion on which to discuss what are the legislations which should be in force in a white lead works. Although it is not always easy for a medical man to anticipate the development of plumbism in a lead worker, yet there can be no question as to the benefit of medical inspection and the advisability of suspending workmen who look as if they were sickening from lead poisoning. Owing to the amount of labor which it would entail upon state paid officials, medical inspection might, at any rate for the present, be just as well discharged by doctors appointed by employers so long as these give the medical officers full power to suspend suspected workmen. Employers must recognize that it pays them better to keep their work people well, better too for the trade generally.

I need hardly remind American readers that wherever possible in the manufacture of pottery, leadless glazes should replace those made with lead, that the use of raw lead or white lead should be discarded and its place taken by a fritted lead compound.

#### *Brass Poisoning*

How to get rid of the harmful influences of the fumes which arise during brass-pouring is as difficult a problem in the United States as it is in the old country. Brass pouring is the cause of considerable bodily discomfort to, and of severe abdominal pains in, those who follow the employment. The men suffer from what is called "brass founder's ague." The malady has no connection with malaria, it only resembles the classic disease in so far as it also has three stages—the shivering, hot and perspiring. Fortunately the illness does not last long. It is over in the course of two or three days but, although of short duration, the headache and the fever tell upon the men since they are left weakened and nervous for a day or two afterwards, and besides the malady may recur twice or thrice in the course of a summer. Colic and constipation are also complained of.

There is an enormous loss of brass in the fumes which escape into the shop and the open atmosphere. Tons of metal must thus be lost annually in large brass works so that it would well repay the owners of such establishments to devise means for the collection of the fumes and the recovery of the metal.

#### *Fire Hazards*

As regards protection of life by fire escapes and fire drills the United States is undoubtedly in advance of Great Britain. It is to be hoped that the adoption of the measures at present in force in New Jersey and some of the other states will become more general.

I had the opportunity of seeing the employees—men, women and girls—leave two large factories in Trenton on the fire alarm inside the factories being sounded. Within two minutes the work people, about 1,000 in each instance, were out of the buildings. I was particularly impressed by the discipline and good order which prevailed at both of the demonstrations attended by Colonel Bryant and myself. Under all such circumstances panic is the one thing to be dreaded. The best way to prevent panic is by discipline to be prepared for it.

#### *Constitutions: Legal vs. Human*

One sees in the limitations of the written constitutions of the United States, some of the difficulties which lie in the way of industrial legislation, and yet it cannot but be admitted that the health of the working classes and through it the physique of future generations transcend in importance all freedom of contract between employer and employed. There are many large questions in regard to which state rights should be sunk. Upon such problems as Sunday labor, kinds of trades permissible to women and young persons, hours of work not only for women and children but for men as well, protection of machinery, regulations for dangerous trades and bright illumination of dark places in factories, there should be little or no difference of opinion in one state or another. Mutual confidence and co-operation between state and state would make the path of industrial legislation easier.

Generally speaking, work is rushed too much and life is lived at too high pressure in the United States. There is no reason for either. Work and the love of work for the monetary gains it brings are more characteristic of American than of most other people and yet what is the gain if life is shortened by the strain imposed upon it in trying to obtain these? A nation whose working men are old at forty is certainly not only not rich in men but is not doing its best for them. American prosperity runs too much on one line and it seems likely to go on doing so. Alertness caught on years ago and is still a striking feature of the people. Nations like individuals cannot give themselves up exclusively to the pursuit of wealth without the amenities of life suffering. To be intense in one direction is to lose by the exclusiveness. In this utilitarian age not only in America but in Great Britain and the nations of western Europe literature and the arts find little encouragement. It is the day of the application of science to human needs and the development of society. Time alone can tell whether out of what we boastfully call the improved conditions of modern life human society will rise to a higher level than it has as yet attained, whether philosophy will reach a loftier realm, and poetry soar

to greater altitudes as the result of the influence of the so-called better environment. Without disparaging all that a comfortable environment may give it yet remains that the greatest events of life have never been the outcome of leisured care but of strife.

### *The Young Women of the Factories.*

Two things particularly struck me in my visits to American factories—one is the fewer old workmen seen therein compared with England, a state of things not to be wondered at since the principal aim of factory enterprise is to get the utmost out of the human machine, and the other is the enormous employment of female labor. It is, I admit, extremely pleasing in going through a factory to see hundreds of young women, aged from seventeen to twenty-five and upwards, clean and neatly dressed when the nature of the work permits of it, and one cannot but in a sense join in the pride which a manager feels in showing to a casual visitor to his factory such an army of young womanhood; but apart from the circumstance that the women are earning their livelihood and in some instances lightening the call upon the family exchequer, is there no other side to the question which calls for thoughtful consideration?

Factory life does not tend to the development of those traits which make home attractive. It does not encourage marriage and by it maternity is discouraged. What is to become of the women when they reach the age of fifty? Replaced by

younger hands and with no longer a place for them in the factory or office, with memories only of good wages spent neither wisely nor with a view to the future for such women as remain unmarried will the discontentment be greater or less than is the experience of middle age generally? For those who have saved and been thrifty the years after fifty may well become the enjoyable evening of a well spent and active life, but for those who have not saved, occupation gone, family ties broken and no home life available, the prospects are anything but attractive and reassuring.

The American nation too will have lost considerably by having utilized in the production of mere material wealth the best years of a great part of its available womanhood when the nation itself is so much in need of sons and daughters born under the flag and reared in the traditions of all that has made the United States powerful, progressive and enduring.

There is more than need therefore for a reconsideration of many of the social and industrial problems which exist in the United States today.

So far as industrial hygiene is concerned there is room for a National Institution of Labor which would deal with the prevention of accidents, welfare of the employees, occupational diseases, reforms generally including better working conditions, better and cheaper housing, definition of men and women's work, the employment of young persons and all such kindred subjects as belong to labor, health and welfare.

## CASE WORK<sup>1</sup>

MARY WILLCOX GLENN

THE relation between shopper and salesman tends to become so impersonal that it is with relief one turns at times from the big department store to enter the small specialty shop. In one such shop, that of a watch-maker, I got recently the refreshing sense of easy relationship. The watch I had taken to have repaired called for such slight adjustment that I explained my own inability to set it straight by professing that I was no mechanic. "Not everyone can be a mechanic," said the clock-maker with grave courtesy, "but I am sure that you have a line." In face of his definite skill attested to by the varying tones of the clocks and watches that stood about the narrow room, I felt free at the moment only to answer "I am much occupied." Nevertheless, I do represent a line of effort as positive in its way as is the making and repairing of clocks; a line, more-

over, that lends itself to definition and offers analogies which my Swiss watch-maker, with his philosophic bent of mind, could grasp with surety.

To those of us who believe that case work is a distinctive and fundamental part of social work its definite purpose is such treatment of the case of need as will help the individual to live his life fully, and help him in such a way as not to depress the independent efforts being made by other members of his community. It involves, furthermore, such use of the experience gained in the service of the few as will help not only to determine the needs of the many, but will ascertain the probable reaction of the greater number to general preventive and curative efforts. To man these four service outposts means to face facts, to prepare for redress, to meet the cost, and to unite effort.

1. *Face facts.* Let me put the matter in terms of the family; not a generalized or typical family, but an individual family with idiosyn-

<sup>1</sup>Based on a paper delivered before the New York State Conference of Charities and Correction at Syracuse.

cracies that make it distinct from any other family that one has met or can meet; a family, however, that, in spite of its individuality, is dependent on the conditions of living that surround it. Its conceptions of work, definite or elusive, are held in common with others of its own neighborhood, as are in the main its religious and educational convictions and its attitude to the uses of leisure and to desirable forms of recreation. It, as well as its neighbors, is being played on by forces good and evil; it becomes the subject of legislative restrictions and safeguards; it is suffering with others a changing conception of what home implies and family relationships mean.

Mrs. Flynn, when left a widow with a family of young children, acted on her conviction of what was right when she looked for work and took what was easiest to get. The work in a large office building meant long hours under poor conditions, and was of a kind that she, with her "bad leg," was especially unfitted for. The charitable society which learned to know her later, when she was striving to make good financially at such heavy odds, withdrew her from work and urged her to accept medical care so that she might become sound physically. Mrs. Flynn co-operated by making good use of the money help, but she could not be brought to admit the importance of radical treatment for her swollen leg.

The neighborhood in which she lived is a poor one in which to rear children, but in it she was reared and lived her married life, and in it she found the friends who believed that in their neighborhood she had the best chance to live her widowed life to advantage. When her oldest daughter, just under sixteen years of age, got beyond her control and, though made the subject of patient and considerate effort on the part of settlement, probation, church and charity workers to change the tendency of her young life, became the mother of an illegitimate child, the staunch neighborhood friends still felt that it was not the wretched environment, but Carrie's natural recklessness, that made her go wrong. To have insisted on a change of residence for the widow would, in their judgment, have been to put an unwarranted pressure on a mother who was doing her best by her children and, with the exception of the one black sheep, was meeting with success.

These few facts of Mrs. Flynn's life are not set down here in order to lead up to a decision as to whether relief in money should have been made conditional on change of residence or on Mrs. Flynn's submitting to proper medical treatment, or as to whether she was fitted in any event to cope with Carrie. The meagerness of detail gives no fair basis for decision. But they are given to illustrate the point that in order to

make any headway with the particular case, one is forced to gather all the facts which have a bearing on it and to give each due and comparative weight. Also, that in considering the particular case one must bear in mind that the facts revealed by its study have a distinct relation to the lives of other men, women and children. To withdraw Mrs. Flynn from her job is not sufficient of itself, but should lead to the protection of other such women from the long hours and poor conditions to which she submitted unquestioningly. Whether Mrs. Flynn should have been forced to leave her neighborhood or not does not lessen the importance of making the conditions on the street and in the tenement less threatening to the morals of impressionable, pleasure-loving boys and girls. Whether Mrs. Flynn should have been given relief conditional on her accepting the medical aid advised does not affect the importance of the work that lies ahead in educating the people of her neighborhood to make use of the opportunities offered by hospital and nursing forces, or of the task laid on the medical fraternity of making its work for the individual so thorough that suspicion is disarmed.

Gorham, a longshoreman, is in a hospital ill as a result of exposure and of physical overstrain. McGibbon is suffering from the effects of lead poisoning. Neither he nor Gorham, though each is the husband of a young wife and father of small children, can ever again become the full provider for his family. Why are these men, young in years, forced to see their wives become wage-earners, or to lean on the help of relatives or of outside agencies? To get an answer, which may include points relating on the one hand to the industry and on the other to the industrial efficiency of the man, to his physical inheritance and environment and to his previous manner of life, calls for a facing of many facts and for a recognition of their complexity.

The suffering and the indignities borne by those who are being worsted by the hard conditions of the industrial world should burn the hearts of those who assume responsibility for righting wrongs. They should burn the heart, but at the same time fire the brain to activity. To face the facts revealed by case study should move one to act not emotionally, but with painstaking deliberation. So little knowledge is held as to the reaction of the individual or of a body of individuals to preventive and remedial efforts that the time should be counted as gained which deliberately is given to the study of cases before generalizing and definitive action is taken. Cases must be reviewed, however, not only to learn what they can reveal as to the probable reaction of individuals to the rehabilitating efforts made in their behalf, but, also, to gauge the actual

value that the work done on them has for the families treated.

2. *Prepare for redress.* There will be no real redress until those of us who believe in case work really consider the size and the equipment of the force called for to man our second outpost effectively. There must be established a force capable of working for a standard of investigation and treatment of general family disabilities comparable at least to the force that the medical profession at its best would be willing to offer for the diagnosis and treatment of general physical disabilities. To build up an effective force of investigators means preparation for a form of service which is as distinctive in character as is any other service in the whole range of social experimentation. The student must on the one hand give such loyalty as assures balance and persistency in effort, and must on the other be reasonably sure that in the exercise of his profession he will not be so laden with a bulk of cases as to have no time to make good with any one. To protect the competent case worker from having to lower his standard because he is swamped by numbers is a task to which the executives of our charitable societies and their boards of management should set themselves.

Could any one measure the real needs of Mrs. Flynn's family who was not trained to take as seriously the economic and moral problems evoked by her widowhood as would a conscientious physician the physical condition resulting from her bearing of children? Could any one be in any genuine way a help to Mrs. Flynn who had not learned to think of her as a mother of potential citizens? To see the service of the immediate hour in relation to the long succession of days which may be marked by partial dependence on charitable aid, or aid qualified by any other name, is a steadying vision.

Gorham and McGibbon, victims of bad industrial conditions and of poverty of opportunity, though worsted early in the struggle for existence, are not out of the game. The case worker who cannot conceive of these men as still ready to make partial support for their families is doing them and their neighbors a serious injury. They are not done for; their lives are not lived. The task is to adjust the labor of their future to their physical endurance and to keep clearly in view that if their wages must be supplemented they must be supplemented in such a way as not to depress the will of the family to be economically independent. The family, moreover, should not be considered as made up only of the members commonly in sight, but also of those relatives who do help to determine the point of view of the family group as a whole.

Dennis was twenty-one when he married, his wife was eighteen, and never was there a couple less prepared to make a stable home. When at

each crisis in their married life he returned to his mother for food and shelter, his deserted wife, with their babies, made a sure appeal to the sympathies of the charitable giver. The worker whose task it is to try to construct a home from what seem to be mere fragments of human relationship needs to read some of those long standing records of couples now old in years, who when young also made their first appeal for aid. I have in mind one such family, the Gordons, which more than twenty years ago began its long history of desertion, intermittent arrests and workhouse sentences on the part of the man; work, intermittent because of child bearing, on the part of the woman; charitable aid, also intermittent, from various charitable agencies. The sorry fact which stands as the patent result of these years of wasted effort is that the sons of the ne'er-do-well are ne'er-do-wells themselves, and that the woman is at work for the younger men, her sons, as in her early days she worked for the older man, their father. They will marry women who in their turn will scrape along with insufficient means won at heavy cost and supplemented by charitable aid. It is the record of such a family which makes it imperative that the worker who is in a measure responsible for the Dennises should be prepared at least to make a clear-sighted attempt to bring the young couple, whose relatives are decent people, through to some other point than that now held by the Gordons.

The Clarks are newly arrived in the United States. They have used what money they got from the sale of the small homestead in the old country and have naturally not learned how to make the \$50 monthly wage of the man meet, in New York, the needs of a family of five, three of whom are small children. They came to the big city against the advice of relatives, and should go back to the nearby smaller city where some of their own people are, and where living is cheaper and prospective wages no smaller than in New York. It takes no little time and no small amount of case experience, however, to unravel the tangled skein of their life and then work with them so as to be reasonably sure that, in spite of Mrs. Clark's temporary ill health and Mr. Clark's tendency to drink, they will come through economically independent.

So many problems of individual lives come to mind, problems with which a case worker is called on to grapple. Each is stamped with individuality, each presents complexities to be faced when any trial is made to rehabilitate or to modify conditions of life. If redress is to take root, can any degree of preparation on the part of the social worker be too great?

To meet the demand of the field, case work must draw to itself college men and women who have native abilities which make them capable

of taking foremost places in the professions of the ministry, law, medicine and education. Men and women of such calibre are needed to help determine the technique of a profession in process of finding itself. Does not the case of Carrie Flynn call for the nicest treatment that can be devised by an ardent student of applied psychology? Can any task be more worth while than to learn how the craving for the joy of life may be made to lend itself to developing a woman rather than to wrecking a girl? Can any humanitarian study be more worth while than to find out how to make foolish young Dennis carry the responsibilities he has assumed, any effort be more remunerative than that directed to shaping opportunities for his children so that they can have a preparation for living which will give reasonable assurance of their being in their turn able to make stable homes?

I wish to emphasize, however, the need of a growing body, not only of equipped regulars, but of volunteers. There is not time to define the place and purpose of the volunteer, but if case work is to include treatment which sees a family through a period of acute depression, safely on the road to permanent recovery, there can be no fulfilling of its aim unless there be drawn into service a steadily growing body of persons, men and women, who meet a share of the cost of effective case work by giving a portion of their time to considered and persistent service in behalf of individuals in need. It was comparatively easy to meet the immediate necessities of the Carters, necessities that grew out of the fact that father and mother were dying of tuberculosis after lives in which drink had played a devastating part. It was far from easy to make provision for Jim and Frank which would carry promise that they, injured young to a low standard of living, would become manly men. The grip of a friendly visitor has loosened the hold that the mean city neighborhood had on them, and under new and favorable conditions they are getting a real chance to make good.

3. *Meet the cost.* If the first two outposts are adequately manned, we shall be able to hold our other two. To face the facts growing out of case experience so as to be unwilling to submit to partial redress, and to develop a force trained to grasp inherent needs, is to be ready to win equipment. It needs no saying that to carry through any adequate program of treatment for families, means sufficient are needed to provide a staff of trained workers who, to repeat in different form, measure their work by a qualitative not a quantitative rule. Emphasis is laid advisedly first on the need of money to provide a sufficient force of persons equipped to aid in the rehabilitation of families, because without the right force the providing of money alone can-

not get the results in view. Money may be adequately provided and relief be after all inadequate, because useful disposition of the means is not furthered by adequate case treatment. When knowledge of the family is held, not its present status alone, but its past history and its potential power, the money cost of making provision, not for material relief alone, but for forms of relief not commonly termed material, such as varied institutional care, will be met as never before. Money relief will be seen to be valuable only as it has vital relation to family life, with its spiritual, mental physical and temperamental sides. The holding of knowledge of the family will be recognized as futile if knowledge is not translated into a rehabilitating effort, ready to face the price of its program. Mrs. Schneider, the widow of a builder, had not only what might be called a bourgeois attitude towards labor, but a wrong conception of business obligation. When she came broken in health and fortune to the attention of a charitable society, she and her four intelligent children needed more than mere money—they needed to be trained to have a new outlook on life. As a first step, they had to submit to temporary separation so that the harassed woman might be nervously braced to start with her children on the difficult road to future independence. That they finally reached that destination is due to Mrs. Schneider's gradually increased co-operation with a carefully conceived plan.

Clarity in perceiving the need of the widow, the fatherless, the aged, the maimed, the defective, will make patent the fact that in no generalizing way can the measure of a family's need be taken; that by following no mere arithmetical rule can it be determined what should be the minimum or maximum of relief in money allowed to a specified class of persons. Do not misunderstand me. I do not wish to make the impression that money is not hard to get for the rehabilitation of family life; only, that it is much easier to get when the appeal carries conviction that real benefit will accrue from the giving. Also, that to use the money genuinely to help is, in the last analysis, a more serious task than it is to get the money. To work hard to get money for classes of cases before making careful preparation for the expenditure of the money is, in my judgment, to put the cart before the horse, to the lasting crippling of the horse.

And may I add, that to change the name of a thing does not change the essence of a thing, and that to shift a responsibility from one set of shoulders because they have carried their burden with questionable adroitness on to another set does not necessarily give promise of more adroit portage or of the ability to carry a bigger load.

4. *United effort.* When case work is searching, effort is in process of being united. Co-operation need not be sought as an end, when the spirit of service has found it as a means.

Meakin is at last a self-respecting foreman of a gang, after twenty years of casual work and neglect of his family, because a charity worker and a Catholic priest determined to make a united effort to pull him through. Stone has got the better of the inebriety that was wrecking him, because charity worker, employer, physician and pastor united to effect cure. Jansen is back in New York supporting the family he deserted because the charity worker and the court official together brought him to see that there was nothing else for him to do. Without some deliberative effort to measure what each

stands ready to give, and to learn where each is getting results, the case worker will be carried along a futile trail.

"Straw for his tale of bricks he tried to get, but straw or no straw, he faithfully made his bricks" closes in a current magazine a brief description of a social worker. We see the process. The workman knows that his brick calls for straw to ensure tenacity, but time presses and the demand is for immediate delivery. His bricks without straw can make a wall; whether the wall stand or not, he has delivered his tale. If we case workers leave unmanned any one of our four outposts, we may build barriers to keep out devastating foes, but our walls, lacking tenacity, will fall before the enemies we have tried to hold at bay.

## ELLEN COLLINS

LOUISA LEE SCHUYLER

*[Readers of THE SURVEY, many of whom are especially interested at this time in Red Cross work, will be glad to read the following account of what was done in war-times fifty years ago for emergency relief, before there was any Red Cross in this or any other country.]*

*It is of interest to know that the State Charities Aid Association, founded by Miss Schuyler in 1872, and which has recently celebrated its fortieth anniversary, was in a sense a direct successor of the Woman's Central Association of Relief. Miss Schuyler brought into its original membership a large number of women in New York City and throughout the state, who had been fellow workers with her during the war.*

—Ed.]

AT COOPER UNION, 1861-1865.

Miss Ellen Collins writing. From left to right: Miss Gertrude Stevens; Miss Louisa Lee Schuyler; Mrs. William Preston Griffin; Mrs. d'Oremleux.

**I**N a modest house in West Eleventh Street in this city there lived, for over sixty years, and there died, last July, in her eighty-fifth year, a lady whose name should not be allowed to pass without further notice.

For Miss Ellen Collins played no inconspicuous part in New York City during the Civil War, from 1861 until 1865, and for many years afterwards. Her father, Joseph B. Collins, of the So-

ciety of Friends, was a well known and much respected citizen. Abhorrent as war was to their creed, the moral issues at stake, the antislavery element involved, the preservation of the nation, so appealed to them that Lincoln had no more staunch supporters than were to be found among the Friends. Ellen Collins fully shared in this sentiment. It was a pure spirit of patriotic devotion which led her steps, day by day,

during the four years of the war, from the little house in Eleventh Street to the office of the Sanitary Commission, in Cooper Union. The slight, active little figure, the bright, sweet face were well known to the many who came and went, while her cheerfulness, her force of character and self-restraint, and her sustaining faith through the dark days of the terrible conflict were unfailing. Once only does the writer of these lines remember a time of deep depression. The news had come of Lincoln's assassination, and the iron seemed to have entered her soul. Silently she went about her work, but the look in her face told the story.

As chairman of the Committee on Supplies of the Woman's Central Association of Relief, the New York branch of the United States Sanitary Commission, Miss Collins was, all through the war, in charge of the incoming and outgoing of the large quantities of supplies given to the sick and wounded soldiers, through the Sanitary Commission, by the loyal women of this and adjoining states. These came, almost entirely,

from New York, Connecticut, Vermont, Rhode Island and northern New Jersey. Every day old Roberts, the faithful porter of No. 11 Cooper Union, would place the boxes in a long row and raise the lids; every day would come a corps of young lady "Volunteer Aids" to unpack the miscellaneous articles, sort and place them in designated bins, stamp them with the stamp of the Sanitary Commission, and repack the same boxes (one kind of article only in each box now), after which they were nailed up by Roberts, appropriately marked, and wheeled off to the store house, ready to be shipped at shortest notice.

A system was adopted whereby each box could be identified and traced. Miss Collins saw to it that each was acknowledged; conducted a large correspondence; made out and sent weekly lists of supplies in hand to the headquarters of the Sanitary Commission in Washington, from which orders for shipment were received. On week days, and often on Sundays on the eve of a battle, would come an urgent telegram from

**HEADQUARTERS WOMAN'S CENTRAL ASSOCIATION OF RELIEF**

New York Branch United States Sanitary Commission. The association was organized April 20, 1861; dissolved July 7, 1865.

Washington to forward specified hospital supplies without delay. Then teamsters were summoned and, under the supervision of Mr. Bridgham, in an incredibly short time, the heavily laden drays could be seen wending their way to railway station or steamship pier.

Large shipments went by sea to southern ports, as these were successively occupied by the Union forces; among others to City Point, Va.; Newbern, N. C.; Beaufort and Port Royal, S. C.; and to New Orleans; but the largest consignments went to Washington, for the Army of the Potomac. Floating-hospitals and hospital-cars were also supplied.

In a very complete statistical table, giving itemized receipts and distributions of hospital supplies, compiled by Miss Collins as her final report at the close of the war, and covering the four years (the association was dissolved July 7, 1865) we find the names of forty different places to which supplies were sent, and 1,920 different towns and villages (these including centers of collection) from which supplies were received. To give some idea of the magnitude of the supply department of this one branch of the Sanitary Commission, we quote a few items only, from Miss Collins' figures. Of woolen and cotton shirts, there were received and distributed, 291,475; drawers, 166,000 pairs; of socks (knit by the women at home), 125,818 pairs; wrappers, 16,808. Of sheets and pillow cases, 130,581; blankets and quilts, 33,766; pillows and cushions, 66,815. Of towels, over 120,000; handkerchiefs, 169,811. Barrels of lint, bandages, old linen and cotton numbered 1,695. Of home-made delicacies from the farms are jellies, jams, dried fruits, pickles, raspberry vinegar, syrup and the like. And those who have unpacked those boxes well remember the many little things put in by loving hands, "comfort bags" filled with buttons, thread and needles, with which the awkward fingers of the soldier boy might mend his clothes, or a book of poetry, or an amusing story, an illustrated paper, or a Bible or Prayer Book. Surely the Sanitary Commission has been justly described as "the bearer of the people's love to the people's army."

Systematic and methodical, and enjoying the business side of the work which appealed to her, and which she did so well, Miss Collins had also a tender heart for the women at home, for those who kept on sending their hospital boxes through the long years, often at great personal sacrifice. In one of her reports, she writes (May, 1862): "Throughout the heat of summer and storms of winter, seed time and harvest, the little sewing circles of twelve or fifteen members have kept up their weekly meetings. One

letter says: 'Ours is a little village and we are poor, but if anything more is wanted, do not hesitate to call upon us again.' Only those who have seen these letters, all breathing the same spirit of love and patriotism, from the little villages and towns hundreds of miles away, can appreciate the sacrifices and the noble spirit of those true-hearted, loyal women."

Miss Collins had a strong, abiding affection for her fellow-workers—for the friends made during the war. On her own Committee on Supplies she was most ably sustained by Miss Gertrude Stevens (now Mrs. William B. Rice), Mrs. d'Orémieux and Mr. Samuel W. Bridgham, all of whom worked with her through the four years, Mr. Bridgham coming daily to the office to direct the work of porters and teamsters. Other members, among her friends, who were actively engaged at the same time on other committees (for providing hospital nurses, special relief, raising money, correspondence, organizing soldiers' aid societies, etc.) were Mrs. William Preston Griffin, Dr. Emily Blackwell, Mrs. John A. Swett, Mrs. Hamilton Fish, Miss Angelina Post (now Mrs. C. Wister Hodge), Miss Louisa Lee Schuyler, Mr. Howard Potter and Dr. William H. Draper. Miss Josephine Shaw, until her marriage to Colonel Charles Russell Lowell, in 1863, was a member of Miss Collins' committee; while, among the Volunteer Aids, one recalls Miss Agnes Irwin, later dean of Radcliffe, Miss J. L. Field (now Lady Musgrave) and Miss Ellen Shaw (now Mrs. Francis C. Barlow).

Miss Collins had great admiration and regard for the president and founder of the United States Sanitary Commission, the Rev. Henry W. Bellows, D.D., who was also the organizer of the Woman's Central Association of Relief and always deeply interested in its work. For many years it was her great pleasure to meet with her fellow-workers on the anniversary of the founding of the association, April 29, 1861. Of the original managers and their successors—twelve men and twelve women—the first mixed board so constituted, it is believed, in New York city, only four are now living.

The war being over, Miss Collins turned her activities to the improvement of tenement house conditions—an account of which has already been given by another pen; to the visiting of insane asylums, and to working for the Freedmen. But the cause nearest her heart, and to which she gave her best efforts, was that of serving her country in the ranks of the United States Sanitary Commission during the days of the great War of the Rebellion.

# PRE-NATAL CARE OF THE NEXT GENERATION

MRS. WILLIAM LOWELL PUTNAM

**T**HE first step is the most important for everyone of us whether it be the first step into life or into any undertaking of our maturer years. For if this be a misstep, the lameness caused by it will make our progress halting; and if it be in the wrong direction each subsequent step will increase the evil.

The pre-natal period cannot literally be called for any man the first step in his career, because antedating that is the initial act of his creation. Yet until we are ready for drastic measures in preventing unfit reproduction we may reasonably characterize as our first step that period in which, although we have begun to be ourselves, we have not yet crossed the threshold of conscious existence.

It was to demonstrate what gain would result from taking this first step rightly that the committee on infant social service of the Women's Municipal League of Boston began in April, 1909, an experiment in pre-natal care. The results have proved so satisfactory that last year the Boston Lying-In Hospital established a pre-natal clinic with a visiting nurse to carry on the work previously done for their house patients by the Women's Municipal League. The Boston Board of Health also began in 1911 to send two nurses throughout the city to care for mothers and babies before as well as after birth. They have now increased the number to ten. A permanent committee consisting of obstetricians, social workers and trained nurses has also been formed in Boston to standardize and co-ordinate all pre-natal work being done in the city, to the end that it shall become as customary for all women as care is now at the moment of a child's birth. As the methods worked out by the Women's Municipal League are those adopted by this permanent committee it seems desirable to give them in some detail.

The principle of the league has been that pregnancy is a normal function and should not only be entered upon but carried through under as normal conditions as possible, not in a rest house, but in the woman's home, and that if the home conditions are wrong the remedy lies not in removing the woman but in improving the home. A woman is peculiarly susceptible when she is carrying a child and there-

NINETEEN MONTHS OLD

This baby boy was under the care of the committee on infant social service of the Women's Municipal League of Boston during the full term of pregnancy. He was the only one of his mother's three children to live. The first child was under the committee's care only a short time and died of cerebral hemorrhage in the first week of life, delivery being by high forceps. The child in the picture was delivered by the Caesarian operation. The third child had no pre-natal care by the committee and the mother suffered miscarriage at five months.

fore at this time she can be led more readily than later, to make all the influences—both physical and spiritual—surrounding her baby, as nearly perfect as it is possible for her to make them. This works for the good of the whole family, though naturally most of all for the two lives immediately concerned. The character of the nurses doing this work is therefore even more important than that of other nurses.

The number of patients cared for thus far has been between 1,200 and 1,300 and they have been ordinary women living under ordinary conditions. Most of them are of the working class, which has but little or no margin in money matters, dependent wholly on daily work for daily bread. They have come under the care of the Women's Municipal League in various ways, reported by maternity hospitals, dispensaries, charitable agencies and individuals, and a few by private physicians.

We insist that all shall be under medical care for neither nurse nor layman should assume medical responsibility, and the committee consists entirely of one or the other.

The routine of the committee calls for a visit at least every ten days, however well the patient may be, and if anything untoward arises visits are made as much oftener as may be necessary. The nurse advises the patient with regard to diet, clothing, fresh air, the free use of water both for drinking and bathing, rest, recreation, and work, but she never goes beyond these natural safeguards or trespasses on medical preserves further than to prescribe cascara internally or to strap an aching back for external relief. At every visit she takes the blood pressure and tests the urine, in the hope of thus discovering and warding off cases of possible eclampsia. These tests have been made regularly only since February, 1912, and the statistics of the blood pressure are kept on carefully prepared charts as a piece of research work which was exhibited recently in Washington at the International Congress on Hygiene and Demography.

The result of the care in reducing the number of cases which show symptoms of threatened eclampsia, or Bright's Disease as the layman calls it, has been most gratifying. During the first year of the work the percentage of cases

which showed symptoms of this dreaded disease was 10.2 of the total number cared for, which is about the general average; the second year this was reduced to 4.8 per cent; and last year it was only 1.7 per cent. This with a constantly increasing number of patients.

With one nurse this number has amounted to 1,297 carried to confinement, besides a large number who, for one reason or another, it has not been possible to watch to the end of the term. There is a certain class of family which seems to have a predilection for moving away and leaving no address—it is a painful but universal experience. By methodical arrangement of visits from eighty to one hundred patients can be carried on the books of one nurse without allowing more than ten days to pass between the visits.

No patient has died during pregnancy, and only three at confinement in the whole period. Of the four cases where eclampsia developed, all of the babies and three of the mothers were saved by the promptness of the measures taken. The fourth died a month after the birth of her child of puerperal septicemia.

In the first year there were two miscarriages, only one in the second, and none in the past two years. The percentage of still births has been 2.7 per cent as against a usual average of 3.8 per cent where no pre-natal care has been given. The babies born prematurely are also relatively few—2.1 per cent of the total number. Counting even these premature infants, the average birth weight of the babies for the full time of the work has been seven pounds eight and one-half ounces, and for the last year seven pounds fifteen ounces, the general average weight of a baby at birth being seven pounds two and one-half ounces. It seems as if this additional weight must be of help to the child in giving it more capital to draw on while getting adjusted to the difficult conditions met at birth, yet it is not sufficient to make childbirth more difficult for the mother.

The cost of this help to mother and child has been only \$2.61 per patient, a sum so small that many of the women can easily pay it. The effort is made to have them do so when it is possible, for the committee feels that it promotes the self-respect of the patients to pay the expenses of their care, and also that a self-supporting work is much more valuable to the community than one supported by charity. This is true whether the charity be made possible through public or private philanthropy, for work which is self-supporting has an unlimited power of growth. It is well to try experiments with money given for the purpose but this help should be withdrawn as soon as the work has proved itself of sufficient value to stand alone.

The patients are under the care of the committee on an average between two and three

months, but many have been cared for six and seven months, and in one case for the full known term of pregnancy. This length of care is what is most desired, for it enables the patients, both mother and baby, to avoid many pitfalls. This is shown graphically by the case just referred to. The mother had lost her first baby from a contracted pelvis which necessitated the use of instruments and caused the death of the baby from cerebral hemorrhage during its first week of life. With the second child she put herself under the care of the committee as soon as she thought that her longing for another baby was about to be realized. For eight months she was watched most closely and at the end of the time by Caesarian section she was delivered of a boy, weighing seven pounds six ounces, in perfect condition in every way. She had not wholly understood the importance of care in the early months, however, and so when she became pregnant for the third time she failed to apply to the committee for the nurse's help because "every one said to wait till the sixth or seventh month." At five months she miscarried.

The patients are almost without exception grateful for the help and comfort given them by the nurse's visits, and many of them are thoroughly appreciative. One woman after her confinement begged the nurse to come and see her baby because she said she felt that the nurse had a share in him (with her first baby she had had much trouble, whereas with this one all had gone well). "Nurse, after your visit I feel so much better," she often hears, or "Nurse, I keep my questions to ask you." "My husband thinks it fine having a nurse call, and he wants me to ask you"—and then follows a string of questions about the mother or the coming baby that all young couples would like to have answered. Often she has a chance to correct old wives' tales poured into the ears of her patients by neighbors whose qualifications for the position of advisor are like those of the old woman found by a settlement nurse feeding her grandchild by hanging a fountain syringe full of milk from the mantelpiece and putting the end of the tube in the baby's mouth as it lay in its basket on the floor. This process had the result that should have been expected, and to the nurse's objections the grandmother replied, "Shouldn't I know how to feed a baby, haven't I buried fourteen?"

The effect the nurse's visits may have on the entire household is (rather amazingly) illustrated by the case of a young husband who changed his diet to that advised for his wife and thought his health distinctly improved by the change. The absurdity of this tickles the fancy yet it indicates what influence the nurse can have.

The results are usually most satisfactory in cases of women about to bear their first child

because they realize their ignorance and are apt to be eager for advice. Yet one patient who was cared for in her sixth pregnancy wrote afterward that she had done everything the nurse had told her and had never before had such an easy time. One very valuable result of the work has been that a good many women who were planning to board out their babies have been persuaded to keep them.

The spiritual possibilities of the work are great and to develop them the nurse must become a real friend to the women. A member of the committee is herself a nurse in a settlement house and gives to her neighbors the best kind of pre-natal care because it fills their spiritual as well as their physical need. She gathers them together by the firelight for weekly talks. She has stamp savings books for their pennies, and pastes them over with pretty little lambs and flowers and babies' heads, because these stand for the sweetness of life. On Easter morning at seven o'clock she had a party for these neighbors. The breakfast table was set for Easter and for babies. Little white chickens and bunnies gamboled over the table-cloth under a bunch of tiny white and yellow blossoms. In a tall vase close by horse chestnuts uncurled their furry buds like opening baby hands, and beside each plate was set one white crocus growing in a little pot, and a tiny white candle, which to these women is the symbol of the light of the little life to come forth. Everything was perfect except that Mrs. McSweeney had had something stronger than her early cup of tea. This filled Mrs. McSweeney with that spirit with which we are all sadly familiar, and she uttered it forth, declaring that she wasn't going to "get caught that way again," etc. The spirit of the little party flickered, it was going out, but Miss Strong had an inspiration. As they sat down at table she asked Mrs. McSweeney to say grace. Such a thing had never been done before and Mrs. McSweeney's tongue clave to the roof of her mouth, but though her tongue refused, her soul rose up above the strong drink. With bowed heads each said her silent grace and the spirit of Easter returned to the twelve women there gathered together. Miss Strong had succeeded and the babies had their Easter.

One of the great benefits to be derived from

pre-natal care is the education of the prospective mother not only in the proper way to care for her coming baby after it arrives, but also at the time of its arrival. It should do much to reduce the number of women employing ignorant practitioners and midwives, and to substitute for them proper medical obstetrical care, which would be of untold advantage to the present and to future generations.

If pre-natal care is to become, as we trust it will, a regular accompaniment of pregnancy, it could most cheaply be given by a trained nurse working under a physician, rather than by the physician himself. Such care given to private patients would of necessity cost more than when the patients are hospital cases, because more of the nurse's time would be taken up in reporting cases to different doctors than where she can report them all at one place. It should not cost, however, more than \$5 or \$6 per patient. For this price the best possible care should be assured to those women who cannot afford to call in the doctor except in case of illness. Even among the rich the method would be desirable, for it is unnecessary and wasteful for a doctor to spend his time in visiting a patient who is perfectly well merely to see that she continues so when this object can be accomplished satisfactorily and at greatly reduced cost by employing a trained nurse who shall report to the doctor the slightest sign of trouble. For the rich it is desirable, for the poor it is essential, because among those of moderate means this is the only way in which they can receive pre-natal care.

This system has three advantages over anything except equally frequent doctor's visits. First, the patient would be assured good care, for through the nurse's visits a doctor would often be called in in cases where the patient herself is usually too ignorant of the danger of her condition to summon him. Second, it would increase the physician's practice for the same reason. Third, the nurse would be supported. Its advantages over such frequent visits by the physician himself lies in its greater cheapness. The plan of having a nurse keep the doctor in touch with all of his patients, yet calling him in only when he is really needed is the efficient and business-like way of caring for them.

## EUGENICS

MARY VIDA CLARK

*We got a queer disease, my sister 'n I,  
That makes folks allers give us the go-by,  
'Tain't nothin' like the measles nor the mumps;  
It don't come out in spots, nor yet in bumps.  
It's cuz o' somethin' 't happened long ago,  
When we was home with Ma an' Pa, yer know,  
An' Pa was out o' work fer most a year,*

*An' Ma was sick. O my, you'd oughter hear  
Her cough! 'Twas fierce! An' Pa, he useter say:  
"The kids 'd do well if we was out the way."  
So then he up an' shot hisself an' Ma.  
Folks said 'at he was kinder crazed—poor Pa!  
An' somehow 'n other that give Meg an' me  
This queer disease they call "heredity."*

# CONSTRUCTIVE INVESTIGATION AND THE INDUSTRIAL COMMISSION OF WISCONSIN

JOHN R. COMMONS

MEMBER WISCONSIN INDUSTRIAL COMMISSION

[*The Wisconsin Industrial Commission represents a new and promising stage in the development of public supervision of industrial conditions. The commissioners are in constant receipt of inquiries as to its plan and workings. Professor Commons' article may be called the first rounded statement as to its scope and work. In THE SURVEY for December 21, the general movement toward rehabilitating the work of factory and labor departments throughout the United States was set forth by Mrs. Andrews. Together, these two articles make an exceedingly noteworthy contribution to the industrial literature of the year.—Ed.*]

EMPLOYERS of Wisconsin paid \$1,025,000 to liability insurance companies in 1911; scarcely \$300,000 of it reached the pockets of the employees or their dependents. Ten thousand industrial accidents occur in Wisconsin each year; 100 of these are fatal; the others cause disability of seven days or more. But scarcely 10 per cent of the injured received any share of the \$300,000.

This is the big problem of the Industrial Commission of Wisconsin—to reduce the \$1,025,000 paid by employers, to raise the \$300,000 received by employees, and to distribute it among 10,000 instead of 1,000 employees. The commission has a margin of \$725,000 to work upon, and a great margin of public welfare to promote. It can reduce the \$1,025,000 by reducing accidents and improving the health of employees. It can increase the \$300,000 and distribute it better by fixing definitely the compensation for all employees.

Instead of creating a commission to administer the compensation law, and then leaving the factory inspector to enforce the safety laws, as other states have done, the Wisconsin legislature of 1911 consolidated the two departments in a single commission. And instead of specifying the many details of factory inspection, the legislature boiled them down into one paragraph, requiring the employer to protect the life, safety, health and welfare of employees, and authorizing the commission to draw up rules and orders specifying the details as to how it should be done.

## *What the Commission Is*

The commission is a fourth branch of government combining, but not usurping, the work of the three other branches. It is a legislature continually in session; yet the power of legislation is not delegated. It is an executive sharing with the governor the enforcement of laws, but

also enforcing its own orders. It is a court, deciding cases that the judiciary formerly decided, but not assuming the authority of the courts.

This fourth function of government is sometimes designated as the administrative function. But administration, as usually understood, is merely the details of execution. Administration and execution are synonymous. The real distinction which entitles the commission to its position as a fourth branch of government, is not administration, but investigation and research. But its investigations are not the academic research of the laboratory and study, nor the journalistic investigation of the agitator, but the constructive investigation of the administrator. It is this constructive investigation that gives to the commission its lawful position in government and its effective position in the enforcement of law.

## *Function of Constructive Investigation*

Constructive investigation should tell us whether the damage to the employee is public in its nature, requiring legislation, or only private, requiring exhortation. It should reveal the nature and cause of the injury, its cure and the practicability of its prevention. It should lead to such administration of the law that those enjoined to obey it would respect and support it.

We concede that in legislation and administration for the protection of health and safety of employees, we are behind the nations of Europe. This is due partly to ignorance through lack of investigation, partly to piecemeal legislation that hits one evil at a time when it gets sufficiently exposed, partly to the veto of our courts. To those who, perhaps, look upon Americans as materialistic, we might protest that we have put into practice Plato's ideal of government by philosophers, for we have set apart a faculty of sociological philosophers in each state and the nation, who have the last word on our laws and

their administration. Their vetoes often expound the philosophy that preceded the French Revolution, numbering such sages as Grotius, Rousseau and Montesquieu, and such doctrines as the law of nature, natural rights and the general will. In harmony with the latter, and in conformity with constitutions framed during the vogue of that philosophy, they separate the body politic into three departments—the legislative, representing the general will, the executive, physically enforcing it, and the judiciary, the intellect over all.

Recently some dissatisfaction has arisen over this division of functions. It has shown itself in threats to "recall" the judges or to "recall their decisions." For some time, too, the executive departments, from president down to policeman, have not been content blindly to follow the legislature as the sole custodian of the general will, and have taken to themselves considerable discretion in enforcing the laws. Citizens, also, take liberties with the general will, trusting to slip through somewhere between the three branches of government.

But the courts have begun to recognize another branch of government. This branch has come forth especially to provide for that extension of the police power required to meet the rapidly changing and widely varying conditions of modern life and business. It, therefore, combines to a certain degree, the activities of legislation, execution and judgment; but its peculiar activity, which gives it a separate place as the custodian of the police power in the body politic, is that of investigation. It is upon the validity of its investigations that it is allowed to execute the general will and to survive the scrutiny of the courts.

### *The "Reasonableness" of Investigation*

The doctrine which the court applies to this function of investigation is both the noblest and the most practical of legal doctrines—"reasonableness." By this doctrine the court applies its philosophy to the particular facts, but requires that all of the facts be taken into account. The drastic program of disciplining the courts by the recall, on the ground that they are removed from acquaintance with the common life and are living in an eighteenth century philosophy, might be somewhat modified if advantage were taken of this exalted doctrine. It may be that the critics of the judiciary have not performed their part in bringing before the court all of the facts of the modern development of industry and society which the doctrine of reasonableness requires. Counsel often leaves the court in the predicament of falling back on its own knowledge of what is "common knowledge." Often this kind of knowledge is several years behind the times, because a serious injury to the com-

mon good usually arises and spreads extensively before the scientific experts and the journalistic agitators are able to make it a matter of common knowledge. The investigative branch of government should be the one that furnishes the court with judicial knowledge of injury to the public in advance of common knowledge. Being also an administrative branch, it should carry over promptly the results of scientific investigation into their practical application. Its function of the police power is the power of reasonable regulation through constructive investigation.

The legal doctrine of reasonableness provides ample opportunity for protective legislation if once its principles and procedure are complied with. It requires that all of the facts must be considered and weighed "as may be just and right in each case." It prohibits class legislation but permits classification. The one is based on merely private or class benefit, the other on public benefit ascertained by investigation. While permitting reasonable classification it requires equal treatment of all in the same class. Its conclusions must be practicable under existing conditions.

The procedure for securing these standards are well known to the law. They center on the main requirement that all parties affected shall have opportunity to be heard, and when this is complied with, the findings of the properly constituted board or commission become *prima facie* the facts of the case and the reasonable regulation to be enforced. Its findings are the conclusive results of constructive investigation.

Thus, in addition to the legislature expressing the general will, the judiciary testing it by its political philosophy of the constitution, and the executive enforcing it, we have the administrative branch of government investigating its application to existing conditions in the light of existing science and practice, for the information of all branches of government.

The several states and the federal Congress have recently sought in various fields to elevate this work of investigation to the high position in our frame of government that the courts had assigned to it in the procedure of government. The legislatures had previously from time to time broken up the executive department by creating separate departments to execute specific commands of the legislature. Usually a single officer was placed at the head of each of these departments, until a great variety of minor executives had arisen, such as the health officer, the factory inspector, the railroad commissioner, and so on.

At the same time the legislature attempted to enumerate in detail the things that each officer should do and each citizen obey. Two difficulties appeared. The courts often declared the

elaborate laws unconstitutional, as being unreasonable, and the executives were restrained from dealing with any specific evil that the legislature had failed to enumerate. These difficulties first appeared in the health department, and the legislatures proceeded to change the character of that department by creating a board of physicians, with power to issue orders based on their expert knowledge, and having the force of law, though not enumerated in the law. Next, in the regulation of railroads, instead of the detailed schedules of rates that characterized the early granger laws, the legislatures advanced to the position which culminated in the railroad and public utility laws of Wisconsin,—of merely declaring (what the courts had already declared) that rates and services should be "reasonable," but creating a commission with powers of investigation equal to those of the courts, to discover and announce in each case as it arose what was the reasonable rate or service. Where the investigations of the courts are limited by the technical rules of testimony, the commission can investigate, on its own initiative and in its own way, all the circumstances that it considers relevant. In fact, the commission is made a kind of standing referee of the court, directed by the legislature to report all of the facts that go to determine what is reasonable. Instead of a referee appointed by the court, usually a lawyer with the lawyer's limitations as to the relative value of different facts, the commission is a body of men compelled by their duties to give weight to social and economic facts that otherwise do not get before the court.

### *Extension of This Principle*

Wisconsin now has ventured to adopt this same principle in matters of labor legislation. The occasion grew out of the adoption of a workmen's compensation law, wherein it was deemed necessary to create a state Industrial Accident Board with power to decide all disputed claims for compensation. These claims, in the Wisconsin law, are not specific amounts for enumerated injuries, but are a certain proportion of the loss in wages. The accident board was made the investigating body to ascertain the actual loss in each case where appeal was made, and to make an award on that basis.

At the same time it was realized that compensation should not be merely a new kind of employer's liability, but should be an additional means of preventing accidents. Consequently, the legislature proceeded to abolish the old bureau of factory inspection, as well as the industrial accident board, which it had just created, and to merge the two into a new administrative and investigating board, to be known as the Industrial Commission. Instead of the long list of wily dangerous points, such as set screws, belts, fire

escapes, dust, etc., which successive legislatures had accumulated during the past thirty years, the new law expresses the general will in the most general way, as the duty of the employer to safeguard the life, health, safety and welfare of employes and frequenters, and the duty of employes to co-operate with their employers.

The law applies as broadly as possible, not to enumerated factories, shops, etc., but to all "places of employment," except agricultural and domestic employments not using mechanical power. In effect, all physical property used to furnish employment to labor is declared to be "affected by a public use," and must be so managed as to promote the public welfare in the persons of those who come within its zone of danger.

The definition of safety is not that of the "ordinary" safety of the common law, but "such freedom from danger to the life, health or safety of employes or frequenters, as the nature of the employment will reasonably permit." The definition of welfare is "comfort, decency and moral well being."

### *Field of the Commission*

Here, then, is the field of investigation assigned to the commission. It must call to its aid scientific experts in engineering and hygiene. It must ascertain where danger lies and where life, health, safety and welfare are menaced. It must discover the devices, processes and management that will avoid these dangers, and must ascertain whether they are practicable. This is the constructive investigation that conforms to reasonableness. Once ascertained and published as an "order" of the commission, the conclusions of its investigations have the force of law, the will of the legislature is executed, the philosophy of the court is observed.

As a matter of economy to the state and convenience to employers, as well as recognition of the wide scope of administrative investigation, all of the departments dealing with employes and employment were consolidated under the same commission. These include the state employment offices, the board of arbitration, child labor, street trades, truancy, women's hours of labor, apprenticeship, etc. In the matter of employment the commission is authorized to use all of its power to eliminate unemployment, by the establishment of free offices, supervision of private agencies, co-operation with agencies for vocational and industrial education, etc. In the matter of arbitration it is limited to voluntary conciliation, with powers of compulsory investigation. The legislature did not go so far as to authorize the commission to investigate and determine reasonable hours of labor for women and children, apart from the rigid limits laid

down in the law, so that the procedure described in this article applies mainly to life, health, safety, welfare and compensation, with limited application to unemployment, conciliation and street trades.

In the matter of organization, such a combination of duties as deliberation, investigation, hearings, findings of fact, and execution of laws, suggests a board or commission of more than one member, acting jointly, instead of the single head of an executive department. Although each matter is determined jointly, yet each requires to be handled from the three standpoints of legality, investigation and execution. The members cannot be experts in all the technical fields of engineering, hygiene, sanitation and so on, but they certainly must be capable of conducting investigations and determining their scope and the legality of their action, as well as organizing and handling a field force of inspectors and deputies. The industrial commission law leaves to the governor and senate a wide range of selection, in that the specific qualifications of commissioners are not prescribed, but the selections actually made at the inauguration of the present commission have been made with this threefold division of law, investigation and execution in mind.

#### *Decisive Factors in Administration*

It goes without saying that the selection of commissioners and the selection of subordinates are the two decisive factors that determine the success or failure of administration. Wisconsin has had for seven years a Civil Service Commission, and nearly all of the employes of the Industrial Commission were placed under the provisions of the civil service law. This has worked to advantage, although the industrial commission law has required a reversal of the original theory of civil service examinations. Instead of classified positions and salaries fixed by the legislature, the Industrial Commission fixes the compensation of its employes, makes its own classification and transfers employes from one class to another. The legislature creates but two positions, that of "deputies" and that of clerks. The intention is to substitute for the competition of candidates for a job fixed by the legislature, the opposite process of competing against other employers for the services of employes fitted for positions which the commission creates. The civil service law is indispensable, in that it offers a permanent tenure similar to that of private employment. It obstructs, if conducted in such a way that those who are doing the best work for private employers are unwilling to become candidates in a formal examination for a public office. The Civil Service Commission of Wisconsin adapts its examinations to these conditions, so that through co-

operation of the two commissions, the deputies of the Industrial Commission are coming to have the full confidence of employers and employes as practical men.

This, it will be seen, is essential in the conduct of investigations and the administration of orders that shall comply with the doctrine of reasonableness. When the commission began its work of selecting its staff it had entertained the idea that it should place at the head of its safety and sanitation work engineering and medical experts. But after interviewing a number of these experts, it was discovered that they considered their problem to be that of drawing up ideal or standard specifications, which the commission should then go out with a "big stick" and compel employers to adopt.

For two reasons, this was decided to be impossible. A monarchical country, like Germany, with its executive independent of political changes, might call in its experts and be governed by them, but a democratic country would not consent to be ruled by those whose ideal standards might be removed from the every-day conditions of business. This decision of the commission also conforms to the doctrine of reasonableness, which requires practicability adapted to existing conditions. It was found that most of the successful work in safety and sanitation during the past ten years had not been in charge of technical engineers, but had been in charge of shop men or even claim agents of the corporation; and their success had come about, not mainly through their knowledge as mechanical experts, but through their ability to get the services of engineers and medical men when needed, and especially their ability to get the co-operation of superintendents, foremen and workmen in a united effort to stop accidents and preserve health. In other words, they were experts in arousing the spirit of "safety first" and in organizing the shop so as to keep that spirit on top. For, scarcely a third of the accidents can be prevented merely by mechanical safeguards—at least two-thirds must be prevented by attention, instruction and discipline.

#### *The Technical Expert*

It is also this spirit of safety among the shopmen that brings out the most effective safeguards—effective in the sense of full protection without interfering with output. The engineer can devise safeguards—he needs the shop man to safeguard the output. The "safety expert" is the one who can bring these two elements together and thus work out the practical rules for the commission to adopt. He guides the investigators who determine what is "reasonable" both in the shop and in court. It is for this reason that the Wisconsin Commission has not been

able to follow the remarkable and extensive safeguards devised and enforced in Germany. They seem to lack that element of practicability, which the shopman, as distinguished from the technical expert, insists upon.

But in the arrangement finally decided upon, the scientist, the engineer, the physician, the sanitarian, who are the technical experts, are called in and utilized, just as they are in private employment, when their services are needed and when the practical men have problems beyond their technical knowledge. If, however, the scientists dominated the investigations, their results, however brilliant and conclusive, might not be reasonable. Their investigations are indispensable and fundamental, and must be taken into account, and should be liberally provided for. But, unless they lead to practicability, which only can be supplied by the practical man, they run the risk of unconstitutionality. It is for this reason that the representative of the Wisconsin Commission, at the meeting of the section on hygiene of occupations of the recent International Congress on Hygiene and Demography, resisted the proposed resolution of turning over all investigations of industrial hygiene to medical men. A similar resolution had been adopted, naturally enough, at a previous session held in Europe. The American delegates were willing to accept the substitute that investigations in physiology and pathology should be entrusted to medical men, but this substitute was not approved by the permanent commission. Constructive investigation differs from scientific investigation in that it must be guided towards practical ends under existing conditions. The distinction is vital in America, if not in Europe, for that which is scientific may be unconstitutional, because not reasonably practical.

### *The Use of Advisors*

But the selection of a proper staff is not enough to insure practicability. The Wisconsin law authorizes the commission to appoint "advisors" without compensation, to assist the commission in any of its duties. Acting on this authority the commission invited the Wisconsin Manufacturers' Association and the Merchants' and Manufacturers' Association of Milwaukee as well as other associations of special trades, such as the master bakers, the woodworkers, etc., to name representatives; also the State Federation of Labor, the employers' liability insurance companies and the Mutual Employers' Liability Association organized in Wisconsin after the German model under the compensation law; and in addition the commission invited certain corporations which had done the best safety work in the state to permit their safety experts to meet with the committees. The commission also secured the assistance of physicians on special subjects, of the chief sanitary officers of

the cities of Milwaukee and Chicago, of the State Board of Health and the State Hygienic Laboratory, and representatives of the Consumers' League and the State Federation of Women's Clubs. These various representatives were grouped into a main Committee on Safety and Sanitation, with sub-committees on boilers, elevators, bakeries, sanitation, and so on, and deputies of the commission were assigned to work with them. In this way the commission has had the assistance of scientific experts, of representatives of the interests affected by the orders to be issued, representatives of the public as consumers, representatives of overlapping agencies such as insurance companies and boards of health, and its own experts.

This has brought to the commission the assistance of some of the leading men of the state in their several lines of work. These men have given an astonishing amount of time, at their own expense, which, if paid for at commercial rates, would have required an expenditure far beyond the appropriation which the legislature allowed to the commission. Such men have looked upon their work not merely as a public service, but mainly as a vital matter in the future conduct of manufacturing in the state. The following partial list of these advisory committees indicates the wide range of representative expert and practical men to whom the commission and the state are indebted for this fundamental part of its work:

Committee on Safety and Sanitation: representing Wisconsin State Federation of Labor: Joseph Gressler, machinist, Milwaukee; George Krogstad, patternmaker, Milwaukee.

Representing Milwaukee Merchants & Manufacturers' Association: Charles P. Bossert, Pfister & Vogel Leather Company; Edward J. Kearney, Kearney & Trecker Company (machinery), chairman of committee.

Representing Milwaukee Health Department: Joseph Dertfus, chief sanitary inspector.

Representing Wisconsin Manufacturers Association: Thomas McNeill, Sheboygan Chair Company, Sheboygan; H. W. Bolens, Gilson Manufacturing Company (engines), Port Washington.

Representing Employers' Mutual Liability Company, Wausau: W. C. Landon (lumber), Wausau.

Representing Industrial Commission of Wisconsin: John W. Mapel, Pfister & Vogel Leather Company; Fred W. McKee, Fairbanks-Morse Company (engines), Beloit; Ira L. Lockney, deputy to the Industrial Commission; C. W. Price, assistant to the Industrial Commission and secretary of the committee.

Sub-committee on Elevators: C. F. Ringer, inspector of buildings, City of Milwaukee; Otto Fischer, inspector of elevators, City of Milwaukee; P. Jermala, Otis Elevator Company; F. A. Barker, inspector of safety, Aetna Life Insurance Company; G. N. Chapman, inspector of safety, Travelers' Insurance Company; John Humphrey, deputy to Industrial Commission; C. W. Price, assistant to Industrial Commission.

Sub-committee on Boilers: Theodore Vilter, superintendent Vilter Manufacturing Company (boilers); W. D. Johnson, secretary, Milwaukee Boiler Company; H. F. Bowie, boiler inspector, Hartford Steam Boiler Insurance & Inspection Company; J. Humphrey, deputy to Industrial Commission; R. Kunz, chief examiner and inspector of stationary engines, Board of Examiners of Milwaukee.

Sub-committee on Electricity: Walter Nield, chief electrician Illinois Steel Company, Milwaukee; Charles Dietz, chief electrician, Commonwealth Power Company, Milwaukee; Thomas E. Barnum, chief electrician of a company making controlling apparatus, and chairman of the Electric Engineers' Society of Milwaukee; P. A. Schroeder and W. S. Gute, State Federation of Labor.

Sub-committee on Sanitation: Fred Swartz, Pfister & Vogel Leather Company, Milwaukee; H. W. Page, Sturtevant Company; A. W. Ruttan, Metal Polishers' Union, Milwaukee; C. B. Ball, chief sanitary inspector, Board of Health, Chicago.

Committee on Safety Exhibit: Walter Goll, factory manager, Fort Wayne Electric Works, Madison; Hobart S. Johnson, vice-president, Gisholt Machine Company, Madison; Frank C. Niebuhr, Carpenters' Union, Madison.

Committee on Bakeries: Frank Schlifer, Association of Master Bakers, Milwaukee; August Schmitt, Association of Master Bakers, Milwaukee; M. H. Carpenter, Wisconsin Association of Master Bakers, Milwaukee; R. Colvin, Wisconsin Wholesale Bakers' Association, Janesville; C. B. Ball, chief sanitary inspector, Board of Health, Chicago; C. J. Kremer, bakery inspector, Industrial Commission.

These committees proceed to make their investigations, to draw up tentative rules and to submit them to the commission for public hearings. After the hearings, the rules are referred back to the committee for further investigation, and finally, as rapidly as completed, are issued by the commission as "General Orders" applying to the entire state, and are published in the official paper and in the bulletins of the commission.

The commission has also been greatly aided by the federal Bureau of Labor, which made investigations of laundries and pea canning establishments in the state, availing itself of contemporaneous investigations made by the commission. The bureau's investigation, of course, had reference to the adoption of rules that would be applicable to all the states. These investigations suggest an invaluable arrangement that might be made by which the federal bureau could furnish scientific experts and investigators whose work would be at the disposal of the states. The latter are not always in position to carry on systematically this line of investigation, and if they should do so the great object of uniformity throughout all the states would not be sufficiently cared for. Besides, the federal bureau, not being encumbered with administrative duties, is in a position to carry on scientific investigations, which would be all the more valuable when directed towards the constructive needs of the state departments.

#### *Educating the Bad Employers*

The fact that both the law and the commission contemplated the co-operation of employers and employees, has resulted in a code of rules which are not only reasonable in law but reasonable in the minds of employers. It is an application of the well-recognized principle of political economy that the competition of the worst employers tends to drag down the best employers to their level. In this case, however, the corollary law is brought into play. The most progressive employers in the line of safety and sanitation draw up the law, and the business of the commission is to go out and bring the backward ones up to their level. As a matter of fact, it has been found that the employers on the committees have been more exacting in their search for the high-

est practicable standards than the representatives of labor on the committees. As a consequence, the work of the commission in bringing other employers up to their level has been almost entirely transformed from what they consider an irritating and arbitrary interference in their business, into a work of instruction and education. The employer who resists the adoption of safeguards and processes approved by his fellow employers is not only unreasonable in the opinion of his peers, but *prima facie* unreasonable in court.

The work of education which the commission has naturally resorted to has been that of bringing to the attention of employers not only the rules but the devices and methods which will comply with them. A safety exhibit, or rather a triplicate exhibit, after being passed upon by an advisory committee, has been inaugurated. It consists of photographs and blue prints, and is transported with the inspectors on their rounds over the state. This exhibit is installed in a public place during the period of local inspection, and one of the exhibits is kept permanently in the rooms of the Merchants and Manufacturers Association of Milwaukee. It is found that these photographic exhibits have a certain advantage over the "museums of safety" of European countries, where the actual machines with safeguards are installed permanently in a building, because, not only is the expense reduced, but the exhibit can be carried almost to the doors of the employer and his superintendents, foremen and mechanics. The commissioners and their deputies usually arrange for an evening of lectures in connection with the exhibit, when the various laws are explained and questions answered. These are attended by representatives of practically all the employing establishments in the town and surrounding country. The exhibit itself is built up and improved by photographs which the deputies take on their rounds, and the main object is to arouse the "safety spirit" and to show how practicable it is for establishments to devise and install their own safeguards without depending too much on patented articles.

The way in which this conversion of an executive department into a department of investigation and education appeals to the employers of the state, may be judged by the following extract from a speech recently made by George W. Bruce, secretary of the Merchants and Manufacturers Association of Milwaukee, before the National Congress on Safety and Sanitation, October 1, 1912:

"The success which has been attained in Wisconsin on the subject of safety and sanitation is due not only to a good law, but also to a wise administration of the same. The authorities approached their difficult task in a spirit of abso-

lute fairness. But, they did more. They drew the manufacturers into their confidence and secured their loyal co-operation in the administration of the law.

"They assumed that the manufacturer is a law-abiding citizen and that if he were asked to give meaning and force to the new law he would respond. The attitude which the Industrial Commission maintained through the introductory period of their exacting and herculean task was bound to be followed by success.

"But, the commission practiced wisdom also in bringing to its work experts of character and efficiency. Favoritism was cast to the winds. The men best fitted for the task were selected.

"Men like Mr. Crownhart and Mr. Beck of the commission realized that an antagonistic or arbitrary spirit would be resented and cause difficulty. They were tactful and discreet, but made it absolutely plain that both the spirit and the letter of the law must be carried out. Would the manufacturer lend his co-operation? And he did.

"Men like Price, capable and judicious, formerly at the head of similar work with the International Harvester Company, were chosen to perform the delicate and difficult task of working out, together with the manufacturer, a reasonable and workable program.

"They not only succeeded in creating a co-operative attitude on the part of the manufacturer, but they also secured much valuable time and effort at the hands of some of the most important manufacturers in the state.

"Thus, I am safe in saying the work of industrial safety and sanitation in Wisconsin which is progressing in a most successful manner, has the good will and support of the manufacturing interests of the state."

#### *Legal Effect of Commission's Orders*

The legal effect of the commission's orders turns upon the constitutional position which belongs to constructive investigation. These orders are not a delegation of legislative power, but an investigation and publication of facts. The courts have long held that the legislature may determine that a given law shall go into effect at a future date on the occurrence of a specified event. The law in this case is the obligation placed on employers to protect the life, health, safety and welfare of employees. The future occurrence when it takes effect is thirty days after official publication of the findings of the commission.

Neither are the commission's investigations and findings a usurpation of the authority of the courts. This is cared for by the procedure. Formerly a factory inspector issued orders on the spot, and prosecuted for disobedience in the trial courts. The court was at liberty to raise the question whether the order was necessary, or whether too expensive or confiscatory, or whether the manufacturer was not as competent as the inspector to determine the effectiveness

of his safeguards. Now these questions of reasonableness cannot be raised in the trial court. Only the fact of compliance or non-compliance can be raised. If the question of reasonableness is raised it must come up in an action against the commission in the county court at the state capital, and thence in the Supreme Court of the state. Furthermore, if the petitioner introduces evidence which was not before the commission, the case must be remanded back to the commission with the new evidence, and the commission must be given opportunity to change its order if it so determines. The case can then go back to the court.

In this way, the commission's complete power of investigation is protected, its orders are made *prima facie* reasonable, and the burden is on the petitioner to break them down in court. The court retains all of its powers of investigation and philosophy, as far as it chooses to use them. But the commission's investigations are not limited by the strict rules of evidence prevailing in court. It can consider all of the facts without objection. It can initiate investigations. It is, in fact, a body of social and economic investigators, rather than a tribunal restricted to technical rules of evidence. The Supreme Court of the state has sustained the commission, so far as it affects procedure under the compensation law. The procedure respecting safety and health is similar, but has not as yet been passed upon, although in the case of the Railroad Commission, with similar procedure respecting reasonable rates and services, its findings of fact have been held to be conclusive.

#### *Commission an Administrative Court*

The Industrial Commission is also made an appellate administrative court in all cases of local boards of health, common councils or other local bodies that issue orders on places of employment. Their authority to issue such orders has not been infringed upon, but they are protected against court injunctions by the requirement that appeal shall first be made to the Industrial Commission. The latter, on investigation, may affirm the local order, or may substitute a "reasonable one," and the petitioner must then proceed against the commission as above explained, in place of the local authority. The commission has endeavored to bring about agreement with local boards by securing their representatives on the advisory committees and it is expected in this way that state and local inspectors will not issue conflicting orders on employers.

Advisory committees of employers and employees have also been enlisted in the administration of the free employment offices. The Milwaukee committee consists of representatives of the manufacturers' association and repre-

representatives of the trade unions. They assist the Civil Service Commission in the examination of applicants, and have thus overcome the two greatest obstacles in the way of successful operation of such offices by the state—politics and trade unions. The superintendents and assistants of these offices are not only removed from political influence but are removed from all suspicion of using their position for or against employer or employe in the case of strikes. The growth of business transacted by the Milwaukee office has been phenomenal during the first year of this method of management, and its transformation from a mere charitable agency to find work for unemployables, into a labor exchange bringing employer and employe together, is evidenced by the following statement made by the chairman of the committee and representative of the employers, A. T. VanScoy of the International Harvester Company:

"I was not particularly enthusiastic at first over this movement, but have changed my views in regard to it, and believe it has been of great benefit to the working people in that it has, through what might be called a clearing house, enabled them to obtain employment quickly and without expense, and it has also been equally valuable to the employer, in that it has enabled him through this employment bureau or clearing house to obtain, usually without effort on his part other than telephoning his wants, the help desired. Its work is broadening all the time, employers learning that an effort is made, and generally successfully, to furnish them with the kind of help desired, instead of sending men promiscuously, and employes learning that the quickest and most expeditious way for them to obtain employment is through the bureau."

The opinion of the trade unions is represented by the following statement of the representative of the Federated Trades Council:

"Without blare of trumpets the free state employment office in Milwaukee is doing one of the best works at present going on in the city. It is supplying a head center where men needing work may go and where work seeking men may also apply. Its offices on Fourth Street, just north of Grand Avenue, always present a busy scene. . . . While the work of such offices seems local, the unemployed problem is a state-wide problem and even more, and can best be met and handled as it is now being handled under the Industrial Commission with co-operating offices in the principal cities of the state. One praiseworthy thing that the free employment office has done must not be overlooked. It has cut down the crowds of hundreds of work-hungry men at the factory gates mornings. This sort of a scramble, often by men almost despairing, with families waiting to learn of the success or failure of the quest, is not only a pathetic sight, but often downright tragedy. The free employment office provides the better way, and the manufacturers themselves have come

to realize it. It is certainly more humane for the men, saves them a lot of tramping, and is a great convenience in the securing of workmen. Nay, more, it saves his feelings, for it is found that the rebuffs that he gets at factory gates has a souring effect on a man in spite of himself."

A peculiar use of advisory committees has been undertaken in the administration of the street trades law in Milwaukee. The law is supplementary to the child labor law in that the children concerned are mainly not employes but are merchants, and therefore without employers who can be held liable for violation of the child labor and truancy laws. The newsboys, numbering about 4,000, have been organized in the "Newsboys' Republic" for the purpose of enforcing the law. The Republic itself, including certain adults chosen jointly by the boys and the commission, constitute a lively advisory committee to the commission. The plan is only now in process of installation, after careful investigation had been made of the administration of similar laws, and especially of the similar organization in Boston.

In the administration of the new apprenticeship law, supplementing the industrial education law, the commission is aided by a committee of the Manufacturers' Association.

#### *Service of Advisory Committees*

Wherever practicable, the commission has found that these advisory committees are invaluable in the enforcement of laws under its charge. They are being extended wherever it is found that the commission needs the co-operation of the classes affected by the administration of the law or their judgment upon the reasonableness of its orders. It will be seen, too, that this practice meets the political objection against the multiplication of commissions and "government by commissions." The Industrial Commission consolidates what otherwise might be three or four commissions and executives, thus reducing the expense. It does not remove government "from the people" and place it in the hands of "experts," for it necessarily and actually, both in full compliance with the doctrine of reasonableness and in securing full co-operation of the public in understanding and enforcing the laws, brings the government directly into the hands of the people. It is certain that the state must have executives in order to enforce the labor laws, as well as other laws. To object to them is like urging your son to learn to swim but forbidding him to go near the water. The real question is not how to avoid commissions, but how to organize them, how to do away with overlapping commissions, how to make them efficient and economical, how to keep them near to the actual life of the people, in short, how to

make them the branch that fills the gap of constructive investigation in our scheme of government.

It has been suggested by inquirers from other states, and it might be inferred from the emphasis here laid on investigation, that the executive part of the commission's work should be kept separate with a single head, as it has been in the past, in order to center responsibility for the enforcement of laws. In that case a board of experts might be created for the purpose of investigating and drafting the rules, which the independent executive would be required to enforce. For several reasons, this separation of departments would probably be impracticable. The most valuable agents for the kind of investigation required are the inspectors, whose duty it is to enforce the rules. By associating them with the advisory committees, they enter into the spirit of co-operation, they learn the principle of reasonableness, and they acquire the virtue of tact. If they have no knowledge of the reasons for the rules, and therefore no particular interest in bringing about their enforcement through patient instruction of employers and superintendents, their attitude is likely to be that of the typical factory inspector who says to the employer, "Well, I didn't make the law—there it is, and you've got to obey it." Instead of inspiring the "safety spirit" throughout the state, they stir up needless opposition and friction between the factory inspector and the board of experts.

Furthermore, no system of general rules laid down in advance can anticipate all of the special conditions or obstacles in the way of enforcement. The Wisconsin law cares for this by means of "special orders" in addition to "general orders." But these special orders can only be issued on investigation and public hearing, precisely the same as the general orders. The inspector, therefore, instead of insisting upon something impracticable, can join with the employer in asking for a special order before proceeding to prosecution. If the inspector is subject to an independent executive, desirous of making a reputation for the enforcement of law, not only is he tempted to discredit the work of the expert commission, but he is under no obligation to join with the commission in perfecting its orders so as to conform to the rule of reasonableness. The deputies of the Industrial Commission are continually reporting omitted points or impracticable applications, and the execution of the law becomes a continuous investigation and progress towards reasonableness. With separate departments for investigation and execution, the investigations

would doubtless fall into the hands of experts not familiar with the great variety of conditions to be met, and the execution would be that perfunctory and blind enforcement which has already brought discredit on much of the American factory inspection.

Finally, the commissioners themselves cannot divide their work into the separate fields of law, investigation and execution, especially where, as with the Wisconsin commission, such a wide range as fourteen departments are brought together under one head. Each commissioner must take his share in the executive work of different departments, and each must carry on continually the constructive investigation that the law implies. It is only by this means of administration and investigation combined in a single commission that friction and antagonism between overlapping officials can be avoided, co-operation with employers and employees secured, and obedience to the authority of the judiciary observed.

#### *Distinction between Industrial and Railroad Commissions*

While the Industrial Commission is modeled after the law creating the Railroad Commission, its field is widely different. The Railroad Commission regulates monopoly—the Industrial Commission regulates competition. It endeavors to enforce "reasonable" competition in so far as dealings with employers are concerned, by raising the level of labor competition. The distinction offers a practicable suggestion for the creation of a commission by the federal government for the regulation of "trusts." Such a commission need not have the power to regulate prices, as the Railroad Commission does, on the theory that monopoly is inevitable, nor to give special privileges to so-called "good" trusts that accept federal incorporation or federal license, and agree to abide by the commission's orders. Rather should a federal commission be a "free trade" commission, controlling all interstate trade so far as necessary, for the purpose of investigating and prohibiting all kinds of "unfair competition." It would take the place which the federal courts now assume, of dissolving and regulating corporations. But instead of committing this power to lawyers it would be committed to a body of men representing the every-day life of all the people, equipped to conduct constructive investigations, to prosecute for violations of the anti-trust laws, to prescribe and enforce rules of reasonable competition and so to raise the level of business competition.

# IS AN ORGANIZED COUNTRY LIFE MOVEMENT POSSIBLE?

GEORGE FREDERICK WELLS

CHAIRMAN COUNTRY CHURCH COMMISSION,  
METHODIST FEDERATION FOR SOCIAL SERVICE

LIBERTY HYDE BAILEY

Dean State Agricultural College of Cornell University—the statesman of the country life movement in America. Dean Bailey is editor of encyclopedias of agriculture and horticulture, but it is in personal leadership that he is making his greatest impression on American conditions.

SIR HORACE PLUNKETT

The Irish statesman who has organized co-operative rural movements throughout Ireland and brought in a new era of prosperity and communal life. He is now on a visit to this country, and may be called the prophet of the reconstruction of the American rural movement.

**I**T seems to me that the underlying problem relating to country life at this moment is economic. The extraordinary growth of our factory system and consequent disproportionate development of city life will have to be counterbalanced by a development of agriculture and its allied activities if there is to be a sound basis

in the future for life in the country. The educational, social and religious problems of country life are ultimately all related to this fact."

Such is the judgment of one of the leading editors in the United States in response to one of two thousand inquiry bulletins sent out by THE SURVEY in co-operation with the Federal

Council of the Churches of Christ in America. The purpose has been to get correct knowledge of the rural problem and of a comprehensive means of solving it.

No person in this country today who is in any sense alive to the nation's welfare fails to recognize that we have a rural problem. If one can not see the whole range of it and its sources, he at least sees some phases of the need. Most of us know precisely what is to be done in order to cure the disease. If we do not know, all that is necessary is to read the report of Theodore Roosevelt's Country Life Commission which makes recommendations that will not be outworn for a quarter of a century. If that is not sufficient two other books by practical statesmen are available. One of these is *The Rural Life Problem of the United States* by Sir Horace Plunkett. The other is *The Country Life Movement in the United States* by Prof. L. H. Bailey. Each of these books has the rural problem solved—on paper.

Possibly we yet have need for more visions and theories. We have had some specialization and much short-sighted generalization. But these have hardly touched the problem practically. It is imperative that we have at once more study and work. We must have a practical campaign, directed by a comprehensive leadership, which shall work from without inward and from within outward, so as to stimulate and conserve every force of the entire rural movement.

So two of the forces which are afield to secure a better rural United States have turned their telescopes to the numerous agencies at work among the rural folk to see if an effective organized country life movement in America is not within the range of possibility.

What of the search?

The directory used, while far from complete, was representative especially of the religious agencies for rural work. By co-operation with the Farmer's National Congress, the Grange, and the Carnegie Foundation for the Advancement of Learning which is just completing an investigation of farm and rural schools in the United States, it has been unnecessary to question the distinctly agricultural and educational agencies and leaders as thoroughly as the religious. So the directory included the recognized leaders among country pastors of all denominations. An equally large list of individual leaders in rural social service was compiled. The theological seminaries and social service periodicals, national home mission boards and reform associations were given place. All the state missionary secretaries and superintendents of the Baptist, Congregational and Disciples churches; the presiding elders and district superintendents of the Methodist, United Brethren and the Evangelical churches; and the stated clerks in the Presbyterian churches were addressed. Emphasis has

also been placed upon two other classes of organizations. The first of these was the American Bible Society, the Young Men's Christian Association, the American Sunday School Union, the International Sunday School Association, the Religious Education Association, the Missionary Education Movement, the Church Brotherhoods, the Christian Endeavor Society, the sabbath observance leagues and many others. Then several special committees, departments and associations which have arisen to meet the rural situation have also had close attention.

Such a study as this has not been without its

KENYON L. BUTTERFIELD

President of Massachusetts Agricultural College, who has built up in his staff at Amherst a work which is revitalizing New England.

romance. The first of these was the task of forming the set of questions which should elicit the desired information from so many and diverse sources. Questionnaires are terrible things. The correspondence questionnaire, in fact, is a public nuisance. The dean of an agricultural college remarked: "One comes to my desk every few minutes. They drive me to drink."

Our country life questionnaire was not less terrible than the average. It covered the following points: nature and object of work, problems of the field, problems of administration, informational help needed, things accomplished,

products available for public service, possible assistance volunteered, and leaders developed.

If the search had its points of interest, the findings many times more so.

Of course, we recognize that there is already a country life movement in America. I do not mean the process which has been in motion for the last fifty years—the movement of populations and interests cityward—for that is just the trend we deplore. That is the nation's funeral procession. But there is a movement to counteract this mad rush to the cities—in spirit, in vision and on paper. The question is, can it be organ-

ized? The solidarity of rural America is in the air. We feel it, but can we make the nation see it and recognize its force?

Let us look first at the literary side of the situation. Our fourth question was: "On what subjects have you published literature which you would like given extended notice and usefulness?" In spite of the fact that our directory did not include publishing houses some answers were of interest. One standard book was mentioned—Wilbert L. Anderson's *The Country Town*. Prof. William A. McKeever of

Kansas Agricultural College enclosed an announcement of his eight home-training bulletins. The county department of the Young Men's Christian Association mentions *Rural Manhood*. No less than six writers mentioned books which they are now preparing for immediate publication. Several persons who had published nothing themselves mentioned such things as Warren H. Wilson's *Community Studies* and *A Social Survey for Rural Communities*, which should be made available for the whole field. The fact is that the socially valuable literature of the country life movement consists of more than one hundred books, two or three hundred pamphlets and reports, and many hundreds of significant periodical articles. But the movement, such as it is, is as little able to turn this literature to local educational use as rural America is in need of just such education.

These answers referred to existing products. Questions ten to fifteen looked toward the call for printed matter which is not now at hand. For instance, we do not have a directory of the leaders and agencies comprising the soldiers, generals and armies which need to be mobilized into a real rural movement. We have no comprehensive bibliography of the writings on rural subjects. The last six months have brought us five or more guides for making rural surveys, but each of these has its bias. We have manuals on chicken raising and on growing fancy turnips, but none on organizing rural social federations or on the movement as a whole. So six of the questions of our list touched our 2,000 addressees to test their need of such characteristic standard rural publications. The majority of the respondents not only want them in some cases for immediate use but all are willing to pay from three to ten times what they would actually cost, and some not only volunteered to aid in preparing such standards but wished to publish and distribute them by the thousand and ten thousand. Here surely is a plea and promise of an organized rural movement.

Perhaps the most important single question in rural social progress is that of personal leadership. In answer to the request: "Name what seem to you to be the outstanding problems or needs of the country and rural districts of the United States," no answer is oftener given than "Leadership." "The greatest problem is efficient leadership for the local community," says Professor McKeever of Kansas Agricultural College. A home missionary in the far West calls for "specialists who will touch the pockets as well as the hearts of the people." "The chief difficulty is to find efficient, consecrated leaders," says the secretary of missions of the American Sunday School Union. L. H. Goddard, chief of the department of co-operation of the Ohio Agricultural Experiment Station, says: "I have

WILLIAM DE WITT HYDE

President of Bowdoin College, whose articles twenty years ago on impending paganism in New England first led to the serious study of American rural problems.

abundant confidence in the rural church to furnish that which the rural communities need above all things—rural leaders.” “So far as the country life problem has developed here,” says a secretary in the West, “the great need is leadership.” Nearly all the missionary secretaries, denominational superintendents and administrators of the great associations are seeking trained men as leaders. “From my point of view and in my work a chief difficulty or problem in these fields is the lack of competent leadership; leaders of keenness and power within the community,” says Rev. I. J. Cahill, of the Disciples Missionary Society in Ohio. This is the common plea which perhaps may well be summed up in the comprehensive statement of a national brotherhood leader.

“The outstanding problems and needs of country and rural districts are social leadership. The merchant preacher must be displaced by the agricultural social leader who has been trained for social and religious leadership. New life must be developed in rural communities; new ideals, new standards, new judgments, new hopes, and new desires. These cannot be preached into a community by an occasional visit of a circuit rider. A man with high ideals and the Christ vision must live among the people. The church must prepare men to meet the needs of the country community, the same as she is now preparing missionaries for the foreign field.”

But there is another side to this question. In a personal interview, Henry Wallace recently expressed the opinion that we are not now ready for a successful country church movement because of too few leaders for the work. What are the facts? Our directory has the names of 2,000 religious leaders, a majority of whom are giving all of their time to work in country districts or to organizations which are vitally concerned with rural work. The directory is by no

means complete for the religious leaders even. Should we add to them the industrial, educational and numerous other classes of leaders, the list would be increased several fold. More than this, our sixth question is, “What persons among your officers, members or friends have gained leadership in some phase of country life improvement?” The eighteenth question requests the names of leaders to whom the questionnaire might be sent. In answer to these, ninety persons give the addresses of more than three hundred leaders, all ready to be called upon for service in improving rural life.

There is more local leadership available for solving the rural problem than there is guidance from the top in the assignment of tasks and the general marshalling of the vast army which is waiting to be called into the mightiest and most strategic campaign for national welfare which we have yet seen.

Literature and leadership are two great factors in the country life movement. Perhaps the institutional factor is even greater still. In fact, it is so important that in it centers the whole rural problem as far as a movement for its solution is concerned.

We are aware that there are already a large number of organizations each one of which is seeking to solve the rural problem or some part of it. Let us study their purposes to see what light is thrown upon the question of a central rural clearing house. It is surprising to note that the purpose of each is so comprehensive that it has so much the social point of view, that it might well be adopted as the purpose of the one inclusive national organization.

One country pastor, for instance, states as his objective the following: “I am endeavoring to conceive the purpose of my church work to be in the broadest sense the uplift of the total life of the community; and, specifically, the supply

**MYRON T. SCUDDER**

of whatever of religious motive may be essential to a complete realization of the highest type of country life." This is, by no means, the exceptional objective for a country church.

Another country pastor says that the purpose of his church is "to serve the whole community all the days in all possible ways and, at the same time, be a local station of the heavenly realm in our country and among the nations."

There seems to be a wide difference between the purpose and the personnel of some organizations. For instance, one of the most specialized of organizations, which restricts its work to the rural portions of the United States and its membership to a minute proportion of the rural population, states that it stands

"for the recognition of the inherent value of country life in and for itself; for the maximum development of constructive forces in rural communities; for trained leaders for community enterprises; for the creation of a new social consciousness in village and in the open country; for deliverance from the enervating paternalism of the city; for stemming the tide which sweeps toward the city; for adequate preparation of those who must go to the city; for better health and sanitation in farm homes and country communities; for a redirected educational system which will fit for life in the country; for a more scientific type of crop production and farm administration as essential to greater satisfaction in rural life; for a wholesome development of the recreative life; for the increased power of the church; for the dominance of Christian ideals in the character of the manhood and boyhood of the country."

If an organization and its objective were identical we might infer that that organization were rural United States itself.

The conditions which we are trying to describe cannot be set forth without more concrete statement. At the present time the Home Missions

Council, the Federal Council of the Churches of Christ in America, the American Sunday School Union, the International Sunday School Association, the American Bible Society, the Women's Christian Temperance Union, the Missionary Education Movement, the county work department of the Y. M. C. A., the rural work of the Y. W. C. A., and the Department of Church and Country Life of the Presbyterian Board of Home Missions are among the religious organizations which are in the field for rural social work. There is much duplication and unspoken intolerance among these organizations. There is much co-operation, but it is accidental and personal rather than official and comprehensively planned by adequate overhead administration. Some of them assume functions which belong to the Department of Agriculture at Washington, to the grange and to the agricultural colleges, as well as to the churches. No denominations are or ever have been more thoughtless of each others' rights or of the interests of society in general than are these propagandists among whom co-operation often has as its chief motive the gaining of ascendant glory for the organization which exercises it. Such things ought not so to be, but they are inevitable in rural work until a national organized movement makes so fundamental and complete a study of rural needs as to be able to assign to each of these and many other forces specific tasks the performance of which will yield 100 per cent of good, and will heal rather than enhance the curse of organized civilization.

It is more useful to deliver a whole lecture in a single town than to utter one syllable in every town in the United States. Likewise it may be as useful for an organization to respond to all forms of social need in a single community, as to respond to one special need in every community in the nation. The organization doing

Secretary of the Rockefeller Sanitary Commission, which in campaigning against the hook worm is giving every town, county and state health agency in the South a new lease of life.

the former would be horizontally narrow while vertically broad; that doing the latter would be horizontally broad but vertically narrow. In the first case it would be intensive; in the latter extensive.

What is needed for rural America is an organization which shall be on a national scale what the Pennsylvania Rural Progress Association is on a state scale. "The purpose of our organization," says a member of this association, "is general improvement of rural conditions." It is both specialized and inclusive in both its horizontal and vertical aspects. Such should the national country life movement be.

If this brief study of the motives of the various organizations which are seeking a better rural America teaches us anything, it is that the social spirit of our age, which is the sum total of the social spirit of all our institutions, is sufficient to warrant the integration of them all at the earliest possible moment into a fellowship more real than that of mere proximity of geographical location. To express truly the sum total of the motives of all these would be to organize the rural life movement.

The chief problem of organizing the entire country life movement of the United States lies in the task of bringing the organizations which already exist into intelligent co-operation. Our study of the purposes of these organizations would tend to indicate that such co-operation and integration is entirely possible and extremely desirable.

A general view of the rural situation shows a problem infinitely serious and though many organizations and leaders are seeking its solution they are hardly holding their own against the difficulty. This general view would indicate that there are too few rather than too many agencies at work, that there is no energy to be lost in

overlapping and competition. There is both room and work to spare.

But this general view is not conclusive. What are the findings of our investigation touching the relations between existing organizations? Are there no difficulties to be overcome?

The state Baptist secretary of New York reports an "unwillingness to subordinate local desires or interests for larger good, showing itself in the difficulty of combining two churches under one pastor, as both churches wish morning services." A Colorado leader calls for "a new spirit of co-operation and federation on the part of religious organizations, the elimination of the waste that comes from overlapping, and a general move-up all along the line." A country pastor in the central West says: "My great difficulty is a 'sister' church which has changed ministers six times while I have been here—less than seven years; and a public school which has had an equal number of principals in the same time. Co-operation and progress are obstructed by such disorder of things." "R— needs federation of church life," says another country village pastor. "Bitter strife, jealousies and contention have obtained for twenty years. No spirit of co-operation or willingness to unite can be felt or aroused as yet. Unheard-of feuds among church people of rival communions no longer produce surprise on the part of people residing in this town."

It is needless to enumerate the cases of this sort of strife between local congregations. Competition is not confined to the churches. There is not only theological bigotry and exclusiveness but organization bigotry and exclusiveness, which is a more modern curse. "What the country needs is not a federation of the churches alone but a federation of all its betterment forces. The overlapping is not fundamentally a fault of the

churches, but it is a fault of all the agencies for community uplift in the rural districts," says an intelligent rural leader. "If the churches ought to unite, the reform agencies more so," says a country pastor. A more concrete instance is taken from the letter of a county Y. M. C. A. secretary on the Pacific Coast. He says: "One of our chief difficulties is to get the ministers in the country churches to really back up our work. Ministers will tell their laymen to put in all their time and money on their own churches. This is what the laymen tell us who approve of our work and who go back on their ministers. This is especially true of the young preacher who wants to do something striking in his town and is jealous of any organization not directly connected with his church."

It is not pleasant to dwell upon the negative side of this question. The problem of strife and contention has been so great that several state organizations of church federations, and broader federations for social service, have been organized. That the problem is recognized as a need and that there is on the part of our leaders very generally a real comprehensive unity both in ideal and purpose is evident from representative statements like the following:

Wilbert L. Anderson says:

"The country needs confidence in its own attractions and possibilities. It needs the vision of its own felicity, as those who discern the coming form of civilization apprehend it. It needs, East and West, a new contentment with farm life and the farm home, so that the young people shall be rural-minded and willing to seek their fortune and their happiness on the land."

Another statement is from a Methodist leader in Montana:

"The chief need is the development of a communal consciousness on the part of people who

are thrown together from all parts of this country and from other countries and who with the exception of maintaining public schools, pay little attention to things of social significance."

William Shaw of the United Society of Christian Endeavor further says:

"We feel that the great problem in the country districts is to secure a common community sentiment and co-operation. The chief difficulty usually comes from the fact that the religious and moral forces are divided, their financial resources are small and it is difficult to secure effective co-operation in any community plans for social betterment."

The ideal and purpose to bring about the co-operation of agencies seeking better rural life is so great that one of the reports brings us the following statement, in which there is a clue to this problem of inter-organization relationship:

"The Y. W. C. A., in its newly developed rural work, has been grateful to recognize its entire allegiance to the church from which it draws its inspiration and whose work it constantly seeks to advance and has been glad to adopt as its basis that which the Evangelical Churches themselves decided upon as the basis upon which they could co-operate in full accord and which resulted in the formation of the Federal Council. We should be especially glad, therefore, if the Federal Council could make it plain to the churches that the Young Women's Christian Association is an arm of the church and that it stands ready to do work for them whenever they need help in specialized work for the women in a community."

Our studies of the literature, leadership, organization purposes and organization relationships of the country life movement, such as it is at the present time, bring us face to face with the demand, first of all, for discriminate thinking. From top to bottom, from the city office of

G. FREDERICK WELLS

Chairman Country Church Commission of the Methodist Federation for Social Service.

the most representative organization down to the loneliest rural unit, comes the loud call for a clear definition of the functions of each fundamental organization working in rural life.

How can this need be met apart from an inclusive national organization? And not only so, should not this national organization lend its leadership to marshalling the army of organizations each to know and to perform its own functions?

Let us take our bearings. Both telescopes and microscopes will probably be needed to see how far we have traveled toward the possibility of a national organization for rural improvement.

It is undoubtedly true that the situation is practically identical in township, state and nation. Socially, and I believe, practically as well, the outlines of one unit are parallel to those of the others. The difference is chiefly one of size.

If the federation of rural social forces—that is, of farmers' organizations to secure economic welfare, of the school for education, and the

church for religious idealism—can be attained in country townships, as it already exists in many of them, why is it not possible for state and nation? The Hartford forward movement in Vermont is one good example of such a local federation. The Pennsylvania Rural Progress Association which is practically a federation of economic, educational and religious federations, is a splendid example of a new state organization. The Illinois Federation for Rural Life Progress is another which may have attained even greater results. Why not a national association on these same models? Has not the hour arrived when our idolatry of names and organizations may subside and when each of our numerous denominations, departments, associations, councils, educational systems, farmers' organizations and federations may cease trying in and of itself alone to be the national organized country life movement, in order to bend its efforts toward becoming the self consistent and efficient part of the organized country life movement in America?

## THE BLAST-FURNACES

DEEMS TAYLOR IN *LIFE*

Brooding and grim,  
Sullen beneath its sooty skies,  
Drugged with the fumes of gas and coke,  
The sprawling, blackened city lies  
Wrapped in its pall of smoke.  
The darkness falls, but mark you, still  
Against the sky a crimson light,  
Where, on the crest of yonder hill,  
Our watch-fires pierce the night.

We never sleep.  
Fire is our life—a life that came  
And passes with its molten breath.  
We may not still that leaping flame;  
We dare not sleep—'tis death.  
More! Give us more! Unceasing boil  
The fires within us—feed us, then!  
Give us the blood and sweat of toil;  
Give us the lives of men.

In Babylon  
Long years ago, a god of flame,  
Dread Moloch, took his daily toll.  
This fire within us is the same  
That once was Moloch's soul.  
Nay, curse us not; for, good or ill,  
Ours is the task, but not the plan.  
The toil we waste, the men we kill  
Concern us not. We serve the will  
Of him who made us—Man.

# FIGHTING THE LEASE SYSTEM WITH PARDONS

KATE BARNARD

COMMISSIONER OF CHARITIES AND CORRECTION OF OKLAHOMA

*[When, just before Christmas,<sup>1</sup> Gov. George W. Donaghey of Arkansas pardoned 360 state prisoners as a blow at the convict lease system, none of the telegrams which reached him meant more than that from the state commissioner of charities and correction of Oklahoma, whose investigations three years ago struck at the abuses in the prisons of several western states. Miss Barnard's reasons for her approval of Governor Donaghey's act are given in the following article—Ed.]*

I HAVE been in the state penitentiary at Little Rock and have seen personally many of the men confined there. The percentage of illiteracy in that prison and throughout the prisons of America is a silent rebuke to the world. Gray heads and eyes dim with age bend over primers learning the a b c's. If civilization has given these men no chance in the morning of their lives to come into contact with the best thoughts penned by the scholars of the world, no chance to read of the ideal and beautiful, no chance to read God's Holy Book, what right has that civilization to punish these men if in weakness they resort to crime? Yet there are men at Little Rock with eyesight made feeble because their mothers burned the midnight oil to produce bargain counters for America. Their children were born with a bad vision which prevented them from securing honest livings in the industries of the world. There are men there whose mothers toiled in arsenic factories until the babes were poisoned before they were born. There are feeble-minded men in that prison whose mothers lacked the food which makes nerve tissue. Those men have no red corpuscles in their blood; the feeble mind has no will power with which to obey man-made laws.

In Arkansas they have taken these helpless men, more sinned against than sinning, and they have coined their unfortunate bodies into gold through the most amazing lease system. These unfortunate prisoners have first been leased for one dollar a day and then leased for a dollar and a half a day to build railroads and other public works. They have stood waist deep in swamps which were covered with green stagnant pools of water, draining the swamps for a state that did almost nothing for them in the morning of their lives. Under the hot burning sun, breathing miasma and pestered with myriads of mosquitoes, those men have become anti-social in their ways.

I can find no words to express the horror I feel for the convict lease and the convict con-

tract labor systems of America. Those who fought in previous battles for liberty would do well to enlist for this. I wish that we could have large prison farms where our prisoners could learn scientific farming, poultry raising, dairying, etc. In order to show my belief in this plan I have donated 160 acres of Oklahoma land, and have taken out articles of incorporation to build a prison farm upon which to receive men when they come homeless, friendless and penniless from the prisons of this country.

It is because I know these things about the lease system of prison labor that I telegraphed Governor Donaghey my commendation and encouragement when I learned that he had pardoned 360 convicts as a blow at that system in Arkansas.

The primary object of civilization is to promote human progress. Human progress is best conserved by upbuilding a sense of justice and honor among men. Before organized society can expect individual honor and justice, it must first be just and honorable itself. Today there is a great injustice in our civilization. This injustice lies mostly in our failure to regulate our industrial and commercial life. Our laws for the conservation of industry are almost perfect. There are almost no laws for the conservation of men. The result is society works a great injustice against working men. And until society is just to its working men, it cannot expect its workers to be just and honorable in their individual lives.

Society is largely responsible for crime, and we in the United States paid last year something between \$100,000,000 and \$300,000,000 for crime. I have said that society is responsible for a large percentage of this crime, and since this outlay would educate every child in America and feed and clothe it, it behooves society to see who is responsible.

First, society is responsible because it kills its bread winners. Last year it maimed 500,000 of them. Yet we have almost no public protest from organized Christianity, and almost no agi-

<sup>1</sup>See THE SURVEY, December 28, 1912, p. 383.

tation for a national organization and employers liability law, such as protects the workers of Germany. Had a half million cattle been slaughtered, or a half million acres of land loosened by the tides fallen into the sea, the public interest would have been aroused.

With maimed and neglected bodies the workers go forth to find their places in industry. They must have bread, and I find hundreds of their maimed bodies in our penitentiaries and jails, forced to turn from a civilization which received them strong from the hand of their Maker, maimed them, and then refused them a chance when they would have re-entered industry to pursue once more their former natural and honest life. Has not society sinned against these helpless men? Does not society owe them another chance?

Again, there are 6,000,000 working women and girls in America who are mothers, whose one business in life should be "building bodies and souls of little children." Many of them are mothers of unborn babes. They are working in sweatshops for a pittance which will not supply sufficient food, so that the child is starved under the mother's heart before it is born. This is happening now while you read and we are doing nothing for them. The long hours exhaust the vitality of the mothers and rob the child of its natural birthright—the right to be born strong.

If civilization owes anything to anybody, it must be the right to a child to be well born. These weak, anaemic, little ones are "born tired"—without sufficient energy for industry. No man will hire them, they cannot do a day's work; but they must eat. So they drift from place to place and "pick up" a living by petty crime. After a while we put them in our penitentiaries and thus give state aid in the evening of a man's life because we have refused to give him a chance to be well born.

In Oklahoma we have passed a compulsory education law under which the state pays to the mother the wages the child would make from three to six months in the year. Thus Oklahoma helps her child in the morning of its life. There are 4,761 children in the schools whose wages are paid by the tax payers. We have thus a better way than to pay for them after they have been in jails and prisons.

In other states where they have not this law, children are working in glass factories breathing glass dust into their lungs, expectorating blood and dying. Four thousand of them are working in cotton mills, breathing cotton dust into their lungs and inviting St. Vitus's dance and other diseases into their frail bodies. Over one thousand are toiling in the black dust of the coal breakers.

Our first effort should be at race efficiency.

Industrial efficiency must take care of itself. With two million children toiling in unhealthy conditions, crime will inevitably be the result. And until this nation adopts as its dominant keynote the conservation of human life, society will be called upon to make appropriations for the ever increasing problem of crime: for it is a law of life that men seek happiness. When they can get happiness honorably, they prefer it that way. But when there are large numbers of unemployed in this country and no provision for public work, society is responsible for what ensues. Just so long as society provides no compensation for motherhood, so long will society be responsible for crime.

Now Governor Donaghey knows something that the public should know, namely: the fundamental thing in a man's life which causes him to commit crime. A man's body does not commit crime. There is therefore no use of punishing the body. The body is simply an instrument. The brain says to that instrument "go here" and it goes; "come here" and it comes; "do this" and it does it. When the brain says "hunger" the body goes forth for food. When the brain says "rebellion" the body rebels. When the brain says "stick that man with a dirk knife," the body does it. What, then, is the object of prison discipline? It is to change the view point of the brain. If you neglect men in their childhood and punish them bitterly and cruelly, or hold their bodies in cages of steel for twenty years, you have only embittered the mind and as soon as the body is liberated it will go out to get vengeance.

When Governor Donaghey pardoned 360 convicts in order that they might be liberated from conditions which tend to make them anti-social; when this great man representing the organized power of society reached his hand down to 360 men and said "Here! the state of Arkansas will give you one more chance," he changed the view point of those men from an anti-social condition of anarchy to one of gratitude to their Maker and a feeling of interest in their country's welfare. He appealed to the honor which lies deep in the human soul, despite the fact that the body may have been degraded through civilization's injustices and prison pens. He probably saved for human society 360 citizens, and who knows but what he saved for heaven 360 souls? And I say to Governor Donaghey: "For this good which you have done for these helpless ones, may God bless you." And I as one of those who pray daily "forgive us our trespasses as we forgive those who trespass against us" would remind those who criticise Governor Donaghey that the Saviour of the world was crucified between a murderer and a thief, and his last words were those of forgiveness for an erring man.

# PUBLIC PENSIONS TO WIDOWS WITH CHILDREN

C. C. CARSTENS

SECRETARY OF THE MASSACHUSETTS SOCIETY FOR THE PREVENTION OF CRUELTY TO CHILDREN

*[For the three months beginning August 1, 1912, Mr. Carstens was commissioned by the Russell Sage Foundation to study the actual working of public pensions to widows with children in certain western communities. He spent several weeks in San Francisco, six weeks in Chicago, and much shorter periods in Kansas City and Milwaukee. The full report of his findings will soon be issued in pamphlet form by the Foundation. Meanwhile, that portion of the report which deals with Chicago pensions and also its general conclusions are given in advance to the readers of THE SURVEY in the following pages.—Ed.]*

THE most important experiment in widows' pensions has been undertaken under a statute which was passed in Illinois and came into operation on July 1, 1911, but, as far as known, has not been taken advantage of in any of the counties of the state except Cook County in which Chicago is situated. The text of the law, which is an amendment to Section 7 of the Juvenile Court Law, is as follows:

"If the parent or parents of such dependent or neglected child are poor and unable to properly care for the said child, but are otherwise proper guardians, and it is for the welfare of such child to remain at home, the court may enter an order finding such facts and fixing the amount of money necessary to enable the parent or parents to properly care for such child, and thereupon it shall be the duty of the county board, through its county agent or otherwise, to pay such parent or parents at such time as said order may designate the amount so specified for the care of such dependent or neglected child until the further order of the court."

## *Theory of Legislation*

The theory upon which pension legislation was based in this state, as in the others, was that children were being separated from their mothers for reasons of poverty only, and that children were coming before the Juvenile Court for forms of waywardness or delinquency which the court believed were due to the lack of the necessary care which the mother was capable of providing, but which she was prevented from giving because of the necessity of going out to earn the support for herself and her children.

The term "dependent children" does not have the same meaning in every state. In most states, the class of dependent children includes neglected as well as dependent children, and in certain states it includes a considerable number of those that in other states would be classed as way-

ward. When, therefore, it is stated that children have been committed to institutions, before one can reach a conclusion regarding the number of children that have been taken from homes because of poverty only, it is necessary to separate from this total the number that have been removed because of the neglect, crime, cruelty, drunkenness or other vice of the parents, so that they might have a better home than the parent has been able or willing to provide. We must also deduct the number that were removed because of the children's own waywardness, with which the home was unable to cope.

## *Poverty as a Single Factor*

This lack of distinction between neglected, wayward and dependent children is at the foundation of much loose thinking on this subject, and at final analysis the number of children who have been removed from their mothers because of poverty alone is found to be only a very small percentage of those in these various institutions. That there are children in institutions or in the care of children's societies because of poverty alone is unquestionably true, but it is essential that one should have a fairly clear idea of their number, so as to determine the advisability of developing an entirely new form of public aid to provide against this evil.

In Illinois the term "dependent children" includes also such neglected children as are placed before the court because their homes are so bad that the court steps in and requires their removal to institutions or to other homes. It is interesting to note the number of commitments made during the six months ending June 30, 1911,—the six months just preceding the enactment of the Funds to Parents Act—by comparison with the commitments in the same months a year later. There were committed to the various pri-

vate institutions of Cook County in the first six months of 1911, 125 fewer dependent children than during the corresponding months of 1912, which, since the pension law went into effect, were the months in which the granting of pensions was the most active. While it is not reasonable to suppose that the granting of pensions has had the effect of increasing the number of dependent children in institutions, on the other hand it is at least clear that the number of commitments of dependent children to societies and institutions has not been reduced by the pensions. The increase of commitments was due to other causes and the number was but slightly, if at all, affected by the granting of pensions.

*Investigation of Applicants*

From July 1, 1911, to January 16, 1912, there were 335 applications for pensions. From January 16, 1912, to September 30, 1912, there were 1,115 applications, making a total of 1,450 applications to September 30 inclusive. The number of pensions granted up to September 30 was 522, which affected 1,769 children. Of this number, 156 children in 41 families were no longer pensioned on September 30, the number on September 30 therefore being 481 families and 1,613 children. These numbers had been increased to 503 and 1,700 respectively during October. The amount expended for pensions during September was \$10,922 and during October, \$11,713. This last amount would make an average pension expenditure of \$6.89 per child and \$23.28 per family. It is estimated that the cost of the pensions, exclusive of cost of administration, will be, during the next year, not less than \$200,000.

When the plan for pensions came in force, the Chicago Juvenile Court was not at once equipped with sufficient probation officers to make the necessary investigations, and it was not until after a large number of applications for pensions had been accumulated that enough probation officers were appointed to make the investigations necessary to determine the advisability of granting a pension, and to supervise the family intelligently when a pension had been granted. The amount of investigation and supervision grew so rapidly toward the end of 1911 and the force of probation officers was so inadequate that the judge of the Juvenile Court asked the assistance of a group of citizens not connected with the court to organize themselves into a citizens' advisory committee; and, when the judge also asked the co-operation of private agencies in sifting the facts in the pension cases, a pension case committee of seven was organized, consisting of the chief probation officer and his deputy, representatives of the United Charities and a group of other private non-sectarian societies interested in the work of the Juvenile Court, together with representatives of the Jewish Home-Finding So-

ciety, the St. Vincent de Paul, and other Catholic agencies interested in children. The chief probation officer was chosen the chairman of this committee but he and his deputy were not given a vote. At the beginning, a representative of the county relief agent, through whose office the payments are approved, also sat with this committee, but when important differences of opinion on the advisability of pensioning certain families arose, the county agent's representative withdrew and preferred to present his facts directly to the judge—a procedure which has been continued throughout the year.

*The Case Committee and the Judge*

Since January 16, 1912, this case committee has held semi-weekly meetings. Their recommendations have been based in most cases upon the facts presented by the probation officers to whom the individual applications for pensions had been assigned for inquiry. The committee has not hesitated to make certain inquiries itself through its members when it has not been satisfied with the facts presented, but, as a rule, the decision for pension has been made on the probation officer's presentation. The committee's recommendations have been of great help to the judge in deciding what families should be pensioned, and he has been largely guided by them in his decision both as to whether the pension should be granted and as to its amount.

Whenever this case committee has decided to recommend to the judge that he pension a certain family, the name and address are given to the county relief agent's representative, to give him an opportunity to satisfy his department of the advisability of a pension. For this ten days are generally allowed.

When the case comes before the judge for a hearing, the mother and children who are prospective beneficiaries of the pension come before him; the probation officer who has made the investigation presents the case; the deputy chief probation officer presents the recommendation of the case committee, and the county agent's representative adds such data as he has gathered through his independent investigation. On the facts from these three sources the judge generally reaches his conclusion without much difficulty. The county agent's representative has often added materially to the information regarding the family's financial status, the financial status of the relatives, and their ability to help. In some instances also the county agent's department has furnished more or less reliable information regarding the family's moral character. If the judge decides that a pension should be granted, he charges the mother with the duty of keeping accurate account of her expenses and promises visits by a probation officer, whom she is to acquaint with her financial expenditures in detail

It is generally arranged that the supervision of the family remain in the hands of the one who has made the original investigation.

#### *Kind of Investigation Made*

From an intimate acquaintance with the work of this case committee for a period of six weeks and from a patient hearing of the presentation of cases by the various probation officers, the writer did not acquire much confidence in the kind of investigation that the probation officers make. In many instances the probation officer, after a meager investigation, presented certain facts which were wholly inadequate for determining whether or not a pension was advisable, and the case was then referred back to the probation officer for additional inquiry on certain specific points. Not infrequently it was necessary to refer the case a second and a third time. Not infrequently meetings of the case committee were held at which deferred cases were the order of the day, only to have them deferred again and again. The committee's work was delayed, their time was spent in mere technical criticism, and the families were kept from a week to a month longer without the definite and prompt answer which they anxiously awaited and to which they were entitled.

The separate investigation made by the county agent's department, while contributing materially to the facts about the family, was found to be made frequently with a brutality to which no applicant for assistance should be exposed. Insinuations were made regarding immoral conditions in the neighborhood inquiry about the widow which were based upon neither facts nor suspicions, but which the county representative threw out to arouse interest in his inquiry, and by means of which he hoped to get incriminating information.

#### *Character of Probation Officers*

With some exceptions, the group of thirteen probation officers were political appointees of the president of the county board for periods of sixty days, in contravention of the civil service law. They inspired no confidence in their ability to make the necessary inquiries with such tact and insight as to determine the wisdom of pensioning, or in their ability to supervise a pensioned family in such a way that their work would develop any reasonable plan or any good results for the family. Not only were a considerable number incapable, but more serious charges could be made against certain members of the staff which would entirely unfit them for important public service. Much of their time was spent in dawdling in the office, aside from the great waste of time which their inefficiency and inexperience made necessary at the meetings of the case committee, and in securing additional facts on the same family by repeated visits. The office direction of their work was very

meager, much time and energy was lost in that way, and a good deal of their undirected work was done to little purpose.

In certain instances the probation officers made an investigation sufficiently complete to answer the question whether a pension should be granted or not, but wholly inadequate for any constructive and supervisory work with the family. It must be conceded that, where an average of \$23.28 is provided for each family, temptations come to spend money recklessly or foolishly, even in some of the better families. A pension plan of this sort requires careful following up, so that appropriate suggestions in regard to the health of mother and children, employment of older children, difficulties in discipline, an improved diet, and many other matters that come up in family life, besides advice on expenditures, may be made. The probation officer's investigation, however, seemed to develop into espionage instead of friendly supervision.

#### *Study of 100 Pensioned Families*

By means of a small staff of trained investigators, an inquiry was undertaken by the writer, with the cordial and helpful co-operation of the judge, the chief probation officer, and his deputy. The circumstances of one hundred pensioned families chosen at random were looked into. These families were visited in their own homes and a patient and painstaking statement was had from them regarding their present situation, the health, schooling, and work of the children, the mother's health, work and fitness to care for them, the adequacy of the pension, the items of the budget, and the individual expenditures per week. Inquiry was also made with reference to the family's condition before the death of the breadwinner, and after the breakdown had occurred and before the pension began. In addition, other inquiries were made in verification if it seemed necessary.

The results of this inquiry are summarized in the following table:

	Yes.	No.	Doubt- ful
Was the probation officer's investigation adequate? .....	36	64	
Is the probation officer of the type to render the necessary service, and is the relationship developing between mother and probation officer satisfactory? .....	14	80	6
Is the probation officer's supervision over health, training and diet of the children, and over the family budget, adequate? .....	11	89	
Is the probation officer's supervision resulting in a development of any plan and in good results for the family? .....	7	88	5
Is the relief adequate? .....	61	39	
Is school attendance of the children satisfactory? .....	72	18	10
Is the mother with her children a reasonable period of time? .....	86	13	1
Is there evidence in the mothers' and children's attitude of undue dependence? .....	24	74	2
Have the church, relatives, employers or private societies become less interested, or ceased their interest altogether, since the pension began? ....	51	19	30

Are the standards of the family such that the home should be maintained for both mother and children?.....	81	10	9
Are improvements noted over the care that the family had previous to the pension period? .....	58	35	7
Are there conditions in the family that need remedy by court order if the pension is to be continued?.....	32	55	13
Was the application due to the existence of a pension plan from public funds? .....	34	64	2

This study of one hundred cases has led to conclusions that cannot but have weight in determining the value of the pension plans in force in Chicago.

*Meaning of Word "Pension"*

The term "pension" is not a new one in the vocabulary of agencies which work with needy families. It implies an accurate analysis of the conditions and needs of the family and a knowledge of the resources that are available and that may be made available. In addition it suggests that the whole need not covered by the family's own resources be met by the payment of sums per week or month, so that the family may feel the assurance of having the budget complete and of knowing just what amount they may count upon receiving in a given period. It further implies the principle that under those circumstances the family is much more likely to develop the elements of self-respect, self-confidence and thrift which result in total family rehabilitation. It is interesting to observe that this use of the word "pension" is no different from the use of the word "relief" as it exists in the more enlightened policies of societies in various cities and commonwealths. Therefore, while to call the sum a pension may be a matter of convenience, no vital distinction can be drawn between sums that are said to come as a matter of justice and those that come as relief.

*Testing Probation Officer's Work*

The probation officer's investigation was one test to which the records were subjected, and, giving the officers the benefit of the doubt, the inquiry shows that of the 100 cases 36 had an adequate investigation, while 64 of the investigations were not reasonably satisfactory. With exceptions, the probation officers were entirely unequipped for the task. Several who possessed intelligence and the best of intentions failed because of their lack of training and experience. The investigations in some cases were adequate only because they had been again and again returned to the officers, until all the necessary facts had been gathered.

When we turn to the probation officer's work in after-care, we find that they had even less fitness for this task than for investigation. Supervision that will be of value presupposes an intimate knowledge of the family circumstances, so that it may not develop into espionage. This knowledge did not exist except in rare instances, and hence friendly and effective supervision

could not result even if there had been time for it. Most children were attending school regularly, but some of the probation officers were unaware as to whether they were in school or not. Other children were out of school or were going irregularly without the probation officers' knowledge of it. Of the 100 cases looked into, in 72 families the school attendance was satisfactory; in 18 it was not satisfactory; in 2 families the children were too young for school attendance, and in the case of 8 no inquiry was made. Inquiry as to whether the officer's supervision over the health, training, and diet of the children, and over the other members of the family was adequate, led to the conclusion that only in 11 families was this the case, while 89 did not have sufficient supervision to affect the family in these important matters.

*Little Planning Ahead*

When we come to study the results of the supervision with the idea of seeing whether any planning for better home conditions was resulting, we find that only in seven instances does there seem to be any looking ahead on the part of probation officer or family to a period of self-support or to a better plan for the family life, while 88 families seemed to be living on without the development of any plan for the future. These conditions were mostly due to the fact that the probation officers did not seem to be of the type to render the necessary service and to develop the relationship between mother and children and officer which would bring positive results. In only 14 families are wholesome results apparent from the supervision, while in 80 they are lacking. In 2 other instances the probation officer is of the right type, but it is too early to see results, and in 4 instances the results are doubtful.

Of the 100 families visited, the pension granted was deemed adequate in 59 cases; inadequate in 39, while in 2 it might be considered doubtful. This inadequacy is apparent to the court, and the judge has done what he could to remedy it. In October, 1912, of the 522 families pensioned, 52 that were receiving the maximum amount granted by the court were inadequately aided, while a considerable number of other families in the same condition were not receiving the maximum. This group of 52 families the court has induced the private societies to provide for on their merits, since their greater flexibility of plan permitted more generous relief to be given in such cases.

*The Maximum and Supplementary Aid*

Such a division of labor was not originally intended when the pension law was passed, but the administration of the law in Illinois has convinced its friends that some maximum was needed. A more flexible plan seemed

the doors wide for undue pressure upon the administrators of the fund. Until December 1, 1912, this maximum was \$10 per month per child, but after that date the judge was willing to consider recommendations for \$15 per month for girls and \$10 per month for boys as before. This change was not an index of any greater need, but was due to the fact that \$15 a month is the amount paid from the public treasury to institutions for dependent girls, while \$10 a month is paid for dependent boys.

When it was found necessary that a maximum be established, it also became necessary, in the case of families where there are few other resources or where there are but two or three children, to have some supplementary aid. Whether the public pension in such cases should be supplemented from private sources or whether the aid should all come from one source became thereupon an important question. In this matter the various relief agencies came to a substantial agreement to the effect that the pension should preferably come from one source, whether public or private. Out of this situation grew the court's arrangement with private societies by which they provide on their merits for the 10 per cent inadequately cared for by the court.

#### *Keeping the Family Together*

The purposes of the pension doubtless included the demand that the mother should remain a reasonable period of time with her children. It was believed that because of the mother's going out to work either every day or most of the days of the week, the children did not have that oversight and care, training and discipline, which would result in good family life and in well trained children. We find that 87 per cent of the mothers were with their children a reasonable period of time under the pension system; that either the inadequacy of the pension or the failure to insist on the mother's remaining at home when the resources were ample, led to 13 per cent not being with their children as much as they should be.

While the case committee carefully passes on all cases that come up for pension, the inadequate investigation evidently has led to the pensioning of families in conditions that would not be approved if all the facts were known to them or to the court. In 32 per cent the conditions seemed to be such that they needed a rehearing and a remedy by the court if the pension was to be continued. In 55 per cent conditions were apparently satisfactory; 4 cases are doubtful, while in 9 others the remedies are doubtless in the hands of probation officers who could apply them if they were of the right sort and if time were given them for a careful study of the situation.

On the other hand, it should not be supposed from this test that all of the 32 families men-

tioned as having conditions that need remedying are such that the family should not be kept together. In fact, in only 10 families are the standards clearly such that the home should be broken up, while in 9 the decision is doubtful, leaving 81 per cent with standards that, while they might require some remedy, are on the whole good. This speaks well for the careful work of the court and of the case committee in sifting out those that should not be pensioned.

#### *Pension vs. Church, Employers, Friends and Relatives*

The effect of the pension upon the generosity of relatives, and upon the development of private aid through church, employers, friends or societies is a thing which will be keenly watched by all who are interested in the care of needy families. It is a subject of large concern to know whether, through such a large relief fund as a widows' pension fund, churches, relatives, employers or private societies will become less interested or cease their interest altogether at the point where the pension begins. On this subject 51 per cent of the cases examined show either that less interest began to be felt as a result of a pension plan or that these agencies ceased their interest altogether. In 19 instances there seems to have been no effect, but in some of these no other agencies or individuals were at any time interested. In 30 instances it was impossible to measure just what effect the pension had had. In 34 instances it was believed that the application for the pension was due to the existence of the pension itself, while 64 applications did not seem to have originated in that way, and 2 were doubtful.

Under these circumstances one would expect that there would be evidence of undue dependence in the families. We find, however, that the number showing this attitude is not as large as the number of applications due to the existence of a pension, for 74 showed no evidence of such dependence. In 26 families, however, the fact that this sum was granted from public funds by the court and called a widows' pension either had not prevented the development of a pauper spirit or had not removed it in instances in which it had previously existed. It is evident that pensions have the same effect as relief.

A few general conclusions from the study of the 100 Chicago pension cases may be of value:

#### *Types of Families Dealt With*

The administrators of pension funds in Chicago, as well as those in the other cities visited, find that in common with administrators of other relief funds they are dealing with at least two types: first, families who, because of their receiving generous aid, rapidly deteriorate, become less energetic, less self-reliant and less moral than before such aid was given; second,

families who, because of more generous aid, feel that economic security which becomes for them the basis of family rehabilitation. Most of the families visited are now better off financially than before the pension was granted, and are also better off than during the period preceding the death or last illness of the chief breadwinner, or whatever other cause led to economic breakdown. In some instances the family has never been as prosperous as it is now.

It was interesting to find that in a large majority of the families visited there was no evidence of wanton recklessness, extravagance or foolishness in the expenditures. There are many in the total number who have a large measure of family life and whose care of the children is most excellent, but a few of the mothers were clearly intemperate women, and there was a tendency to keep family groups together that had better be broken up. In one family, for instance, the mother was making capital of her crippled child and was interfering with its proper care. In another a patient in the highly contagious stage of tuberculosis was being kept at home under conditions detrimental to the two children. In another the family was syphilitic. In still others, the moral tone was low and the children unlikely to prosper, no matter how adequately relieved.

#### *Inflexibility of Pension Funds*

There are various indications of a lack—a necessary lack—of flexibility on the part of pension funds. None is more unfortunate than the requirement made in Chicago that if there is even a small sum left in the bank or any equity in a piece of property, however small, it must first be spent before a pension can be considered. The woman who has a small property, however much encumbered, or who has a bit of insurance left, is practically told, "Go spend what you have and then come back." This certainly leads to extravagance and dishonesty, and prevents any development of thrift.

In a number of the families visited the improvement that was evidenced came through a larger family income rather than through good administration and friendly oversight, and in a number of other families, where there had not been much improvement, it seemed equally clear that it was mainly because of unwise and ignorant management. A county that assumes as important a task as the pensioning of 1,700 children is guilty of flagrant neglect when it gives them over into the hands of a corps of visitors who are largely unfit for such serious responsibilities.

Such intelligence as is being shown in the administration of the Illinois law in refusing to consider the pensioning of families in which the father has recently deserted, in which there is but one child, or in which the children would for

various reasons be injured rather than benefited by remaining with the mother, is due to the careful consideration given each case by the case committee, and to the staunch way in which the judge has supported their work. The law itself requires no such safeguards. The committee is there only at the request of the court, and it is doubtful whether a community can for any length of time withstand the application of a much broader interpretation to a law so loosely drawn, a law which does not even limit its benefits to mothers, but permits the pensioning of both parents.

#### *General Conclusions*

1. The present resources and methods of procedure in caring for women with dependent children are so diverse in diverse communities that it is impossible to enact state-wide legislation that will meet their needs successfully. This diversity has been shown to some extent in this study. It is often found in the different cities of a single state. It is, for instance, true that while Boston, through its public and private charitable agencies, is largely preventing the breaking up of families for reasons of poverty alone, in other cities in Massachusetts the care of dependent children and their mothers is not as adequately provided for as in Boston and its immediate vicinity. When to all this is added the fact that in some cities and states subsidies are granted to private institutions for the support of children at public expense, while in others subsidies are forbidden, it becomes apparent that it is impossible to legislate wisely in any one state by merely copying laws that are on the statute books of another. In California the support of dependent children in private institutions at public expense has been in existence for many years, and no plan of outdoor relief obtains in San Francisco. These circumstances are not typical, however, of many American communities. The circumstances of Kansas City are also individual. With no public outdoor relief and only small sums being paid to private children's societies from public funds, and with private relief societies inadequately equipped to meet the needs, the situation was one to encourage the development of a new form of public aid.

On the other hand, neither of these sets of circumstances prevailed in Chicago or Milwaukee. While the general opinion prevailed in Chicago that widows' needs could not be promptly and fully met, it is worthy of note that the Illinois law did not grow out of a conviction born of careful study of the relief situation in Chicago. It was urged by those who had but an imperfect knowledge of the resources available for women with dependent children, of the difficulties that had been occasioned by the merging of the two large private institutions available

societies, or of the increasing success and adequacy with which the new agency, the United Charities, was coping with the problem.

These varying circumstances certainly do not create a presumption in favor of widows' pensions to be provided in every state in the country without considering, in the case of each state where the question comes up, how many dependent children are unprovided for, what the state has already done, and how each community is meeting the need.

#### *Necessity of Adequate Relief*

2. The idea of adequate relief is a new one for most charitable agencies. Agencies public and private are still quite generally in the habit of calculating the amount that can be given any one family by dividing the probable total number of families under care into the probable total amount available for relief. Great strides, however, have been made in private agencies, particularly in their ability to recognize the value of assuming the responsibility for aiding only such families as can be fully provided for, and of developing, within the families themselves, within their immediate circles, or from natural sources, such aid as will wholly and best meet the need. Public agencies have only partially as yet felt this influence, and they recognize only imperfectly or not at all the many forms of service which can be rendered those in distress aside from the granting of money. Progress has, however, been made even among them.

#### *The Duplication of Machinery*

3. The creation of new administrative machinery without doing anything with the old is a common enough error, which leads often to conflicting policies and authorities. The duplicate investigations for the granting of Chicago pensions are an illustration of this. In most of the cities and towns of this land the public relief officers, under various designations, are the last resort for aiding women with dependent children. By creating new bodies to deal with the pensioning of women with dependent children, the experience of these officers is disregarded, and the problem of a new form of relief is turned over to a new group, a group more likely to work in antagonism than in co-operation with the established relief authorities.

#### *Burdening the Juvenile Court*

4. With the exception of St. Louis, the administration of all the plans for pensions that have been considered is vested in the Juvenile Court. The work of the Juvenile Court is so important that it is extremely hazardous to its proper development to add to its judicial functions the function of pensioning and the supervision of pensioners. The judges of the Juvenile Courts represented in this study are men of integ-

rity and intelligence, and their very interest in the social problems of their community, which they felt were not being successfully met by existing agencies, has led them either to encourage widows' pension plans or to originate them. Most of them do not themselves feel that the Juvenile Court is adapted to this task.

Says Judge Baker of the Boston Juvenile Court: "I want to warn the communities that are going to try any experiments with widows' pensions or relief to parents not to administer them through the juvenile courts." To which Judge Pinckney of the Chicago Juvenile Court adds: "When Judge Baker says that the administration of this relief ought not to be left to the Juvenile Court of Chicago, or to any juvenile court, I say Amen! Amen!"

A study of the pension administration of the various juvenile courts does not give one that confidence in its success which would justify its further extension. If widows' pensions are needed in our various states, some other agency than the juvenile court should be charged with their administration.

#### *Effect on Commitments*

5. Those who expected that pensions to mothers with dependent children would reduce the number of commitments to institutions materially are doomed to disappointment, judging from the experience of the cities where pensions are in vogue. The number of children committed because of poverty alone is much smaller than is generally supposed, and only a careful case-by-case examination of the reasons leading to the commitments would bring out the facts. Most of the dependent children committed in Chicago were neglected by their parents and had no homes to which they could safely be returned.

#### *Creating New Dependents*

6. The passage of new laws for the pensioning of widows with dependent children who are in need will inevitably create a new class of dependents in our communities. Thirty-four of the 100 cases examined in Chicago seem to be due to the fact of the existence of a pension plan. In communities where the forms of co-operation between the juvenile court and the private relief agencies are not as carefully worked out as they are in Chicago, this number will be materially increased. Any legislation that seeks to aid new groups of dependents without at the same time guarding against the creation of such dependents is dangerous.

#### *Preventing Widowhood*

7. The enthusiasm in favor of widows' pensions must not be underestimated and undervalued. It is born of a desire to have justice done to the mother who is attempting to keep her brood of children together under trying cir-

cumstances. A number of the states of the Union have, however, begun to meet this question in a more logical way, and are pointing the way to a better solution. They have discovered the causes of some of the deaths which have brought about widowhood, and have passed laws for their prevention. They have discovered that deaths from accident and from industrial and other preventable diseases constitute a considerable proportion of the total number.<sup>1</sup> They have better protected the living so that there might be fewer widows and dependent children. They have passed workmen's compensation and employers' liability laws, so that the industry and the consuming public might carry the expense that comes as a result of the risk involved in the production of goods. They have passed insurance legislation which has decreased premiums and encouraged thrift.

When, in addition to measures that look toward the prevention of accident, disease and death, the community has also recognized the importance of a strict enforcement of legal responsibilities, still less will remain to be done through the pensioning of a new dependent class. There are few states that have laws to deal at all adequately with desertion, bastardy, and support by relatives in line of descent, and where such laws are reasonably adequate their rigid and intelligent enforcement is rare. The en-

thusiast in favor of widows' pensions is indifferent to the rigid enforcement of responsibilities. He is apt to hold lightly the ties of kinship and of those natural community relations which find their most beautiful expression in the service which one person may render to another in a time of distress. He is apt to turn easily toward the payment of a lump sum from the public treasury as a substitute for family and neighborhood responsibility, and as a remedy for all social ills.

The existing public and private agencies for home assistance should be adapted, standardized and used to meet the present needs as far as their purposes and their methods make this practicable. When, in addition to these, the preventive measures that have been mentioned have been instituted, a large part of the dependence in most of our cities and states will have been met. If, however, social and economic conditions, upon careful inquiry, are found to be such that large groups of families are left in poverty or destitution, it were better that a plan of social insurance be adopted than that these families should, group by group, be added as dependents to our communities. Such plans of insurance against widowhood, unemployment, invalidism or accident are now in vogue in England, Germany and other European countries. The state provides the whole support or asks the breadwinner to contribute from his earnings a portion of what will be paid him as a pension when some unavoidable misfortune has come upon him.

<sup>1</sup>In another study of the Russell Sage Foundation now about completed 29 per cent of the husbands of the 799 widows studied died of tuberculosis, and 9 per cent were killed by industrial accidents.

## THE MACHINE

HELEN M. BOARDMAN

The Machine is kept in a little hut not far from the factory. Each morning it propels itself over to its proper place in the factory. It is a wonderful Machine but it is not worth much. There are so many such Machines in the world.

As the sun peeps over the horizon, the factory whistles blow and the Machine starts out. Other gray Machines are going through the early light to the same place. They are used to make hats. What would the world do without hats? Indeed, hats *must* be made.

One day the scream of the whistle is heard before closing time. The great wheels stop for a moment as something silent and gory is carried out and taken away in a wagon. A Machine is broken. Never mind, there are other Machines to be had at the same price. Toot, whistles! Turn, wheels! What if a few Machines wear out? Hats must be made!

JANUARY 11, 1913

## THE COMMON WELFARE

### CHANGING NEW YORK'S CHILDREN'S COURTS

On January 1 the children's courts of New York underwent some marked changes. The practice was inaugurated of having one judge sit continuously, with the exception of vacation periods, and becoming responsible for the direction of the work in that court. This is in strong contrast with the principle which formerly prevailed of having a large number of the judges of the Court of Special Sessions, which has adult criminal jurisdiction, rotate for a short period, usually one month in the children's courts. Four judges were selected from the total number and it was arranged for them to do all the work in the four children's courts. Under the old plan these four judges sat in the different children's courts and in no one court did they sit continuously for a period longer than three months. The new arrangement obviates the necessity of turning over large numbers of probationers from one judge to another. The courts in the boroughs of Richmond and Queens sit only twice a week and can readily be covered by one judge. This leaves a fourth judge free to correlate and unify the work of all of the courts by sitting in each of them.

The twenty probation officers who, selected by civil service examination, took up their duties in the children's courts last March were practically the first ones in the children's court work to be paid by the city. So effective has their work been thought that the city has made provision for doubling the number of officers for this purpose, beginning January 1.

Plans have been drawn and excavations al-

ready made for a new four-story children's court building for the borough of Manhattan. It is said that additional provision must be made in the near future for mental clinics in connection with the courts and for a municipal detention home.

### BETTER DAYS FOR THE CHICAGO JUVENILE COURT

Those who have shared the country-wide interest in the crisis through which the Juvenile Court of Chicago has been passing<sup>1</sup> will rejoice with all Chicago's public spirited citizens in what is deemed a decided turn of its affairs for the better. During the past two years, under the administration of county affairs by a president of the county board who is described as incompetent and self-assertive, determined efforts were made to discredit and demoralize the probation service of the court. These were temporarily successful. Civil service appointees were either forced to resign by hardships and abuse heaped upon them, or were dismissed on charges declared to be trumped up. The membership of the civil service commission was repeatedly changed until it did the president's bidding. Vacancies thus created were filled by "sixty-day appointments" of those who, it is said, could pass no examination whatever. The judge vigorously protested, as did almost the entire press and intelligent, right-minded citizens generally, but all were helpless. The November election was the last and only recourse of good citizenship. The former regime was overwhelmingly defeated by

<sup>1</sup>See THE SURVEY, March 30, 1912.

the election of Alexander A. McCormick, to the presidency of the county board.

As president of the Immigrants' Protective League and a former resident of Hull House, Mr. McCormick showed himself a capable representative of the better citizens and social workers who had received scorn and malice as their portion. Meanwhile, however, the state courts added to the confusion by deciding that the probation officers of the Juvenile Court were not included among the officials under the civil service law, and were to be appointed by the judges of the circuit court. This decision is regarded as temporarily advantageous, pending efforts to strengthen and extend the merit law in its application to the Juvenile Court officials. The appointment of probation officers has been entrusted to the judge of the Juvenile Court, Merritt W. Pinckney, by his associates on the circuit bench. Judge Pinckney has selected a committee to examine and pass upon all applicants, consisting of Louise De Koven Bowen, president of the Juvenile Protective Association; Rabbi Emil G. Hirsch of Sinai Temple; Leonora P. V. Meder, president of the Federation of Catholic Women's Charities; the Rev. Father C. J. Quill, superintendent of the Working Boys' Home, and Sherman C. Kingsley, director of the Elizabeth McCormick Memorial Fund. Twenty-two new officers are to be added so that the court will now have seventy-four in addition to the police probation officers. For the thirty-eight vacancies there are more than 500 applicants.

According to the annual report filed in the circuit court, the total number of children brought before the Juvenile Court of Cook County during the thirteen years from July 1, 1899 to October 31, 1912, was 44,407.

#### WILL CONGRESS CAUSE JAIL INVESTIGATION?

One of the measures before Congress, the progress of which is being watched anxiously by its friends, is the Clayton bill to appoint a commission to investigate the treatment accorded federal prisoners in jails and other places of detention. It will be remembered that Attorney General Wickersham recommended such a commission in his annual report last year. Mr. Wickersham declared that many places in which federal prisoners are confined are "wholly unsuitable for the detention of any human beings and are shocking breeding places of crime." Representative Clayton's bill has been favorably voted by the Judiciary Committee of the House and is among the measures for which consideration by the present Congress is thought not unlikely.

In this connection it is interesting to compare how a foreigner sums up his adverse judgment of jails, and the general run of our places

of incarceration. Writing to the *London Daily News*, Canon Horsley says:

"It is the local government, allowed to become a local iniquity, that sustains such a system and ignores or tolerates conditions, which seem incompatible with enlightened humanity or even the self-protection of the state.

"I have never found an American to deny or to excuse this state of affairs, of which yet I have read yearly for the last thirty years."

#### RESULTS OF PAROLE LAW IN INDIANA

Even farther along is the bill which extends the benefits of the federal parole law to prisoners serving life terms. It has passed the House and is before the Senate on a favorable report from the Committee on the Judiciary. Fifteen states have already set the example by permitting any prisoner to be paroled after he has served a considerable period, provided his record warrants. As long ago as 1909 a committee of the American Prison Association reported favorably upon the idea. Attorney General Wickersham advocates this measure as well as the one authorizing a jail investigation.

In this connection it is worth while to see what have been the observable results of the Indiana indeterminate sentence and parole laws, which have been on the statute books since 1897. They apply to all men over sixteen years of age and all women over seventeen years, unless convicted of treason or murder in the first or second degree. Between the minimum and maximum terms of imprisonment prisoners serving indeterminate sentences may be conditionally released by the parole board. At the Jeffersonville reformatory and the state prison this board consists of the trustees; at the woman's prison it consists of the trustees, the superintendent, the chaplain and the physician. Paroled prisoners may be held under supervision until the expiration of the maximum term. In actual practice those who have complied with the conditions of their release are usually discharged at the end of one year.

Up to September 30, 1912, the reformatory, the state prison and the woman's prison had granted conditional releases to 6,945 prisoners. The reports to the board of state charities indicate that 4,000 of these completed the parole period satisfactorily and were released from supervision. An additional 449 were discharged because the maximum limit of their sentence had been reached. At the close of the fiscal year 573 were under supervision and 120 had died. These make a total of 5,142. The remaining 1,803 are the failures, those who are known to have broken faith. They constitute 25.9 per cent of the whole number paroled. Up to September 30, 779 of these were still at large.

To give the figures for the separate institutions, the reformatory had paroled up to the close of the year 4,171 young men and its unsatisfactory cases numbered 1,087 or 26 per cent; of the 2,580 men paroled from the state prison, 659 or 25.5 per cent proved delinquent; the woman's prison paroled 194 women, of whom 57 or 29.3 per cent proved delinquent.

The prisoners during the time they were under supervision, never less than a year, reported earnings for themselves amounting to \$1,886,995.53 and expenses amounting to \$1,568,466.66. These reports were certified by their employers. These ex-prisoners, therefore, not only were self-sustaining, but had on hand or due them when they ceased reporting a total of \$318,528.87. Had they remained in prison, their maintenance for one year would have cost the state, at the average per capita expense, the additional sum of \$1,152,555.80.

#### ALL ABOARD FOR SEATTLE

All aboard for the specially arranged and personally conducted visit to the Canadian Rockies, the Alps of British Columbia, where for over 600 miles a continuous panorama of bewildering magnificence presents to the enraptured vision of the spellbound tourist wondrous glacier fields, beetling precipices, snow-crowned peaks, bottomless canyons, umbrageous forests, crystal lakes, roaring torrents and peaceful valleys, all thrown together in grand confusion by the witching hand of Nature.

Don't forget your ear muffs and Alpine stock (nor, if you're a woman, your bloomers) for a week's travel through that quintessence of modern mountain myriorama, which in the words of Edward Whymper, conqueror of the Matterhorn, with whom Parker B. Field, superintendent of the Boston Children's Mission, agrees, is "sixty Switzerland rolled into one."

Special tourist car leaves North Station, Boston, June 19, at 10 a. m. Destination, the National Conference of Charities and Correction, Seattle. Make-up of party, the Monday Evening Club of Boston, together with any of their friends and enemies who can beg, steal or borrow the \$162.50 necessary to the round trip. No immunity guaranteed to those who steal it. Leader, the aforesaid Parker B. Field, who has been over the entire route, has climbed the mountains of Switzerland, and as member for seven years of the excursion committee of the Appalachian Mountain Club has conducted many a tour of equal magnitude and importance. Purpose, the chance to compare Nature's cataracts with the cataracts of oratory which will pour down from Seattle platforms during conference week; Nature's gleaming peaks with the bald heads of conference octogenarians, and Nature's conven-

tion-breaking and custom-destroying prodigies with the radicalness of conference benmarshes and wilburphillips.

Toot, toot! All aboard! Tickets, please!

#### ILLINOIS ENDORSEMENT OF CHILDREN'S BUREAU POLICY

The personal tribute to Julia C. Lathrop was not more hearty than the endorsement of her policy for the Federal Children's Bureau when 200 of her Chicago fellow workers hastily gathered to welcome her home from Washington for a brief holiday visit. Doctors, teachers, women's club leaders, social workers and officials such as the president of the state board of health, the chief of the department of factory inspection, the superintendent of the department of compulsory education, and the county clerk, vied with each other at this city club meeting in showing the fundamental need for the registration of births which is the object of the initial campaign of the children's bureau. While the present Illinois law was conceded to be a dead letter, some of these officials accounted for the fact by its failure to provide for either the responsibility or the expense of conveying information to public prosecutors regarding failure to comply with its requirements. Others thought that the lack of an appropriation to cover the fee of 25 cents for reporting each birth accounted for the failure to do so. But the county clerk stated that a recent appropriation of \$5,000 for this purpose had not been exhausted and that more midwives than doctors turned in claims for fees with their reports. Through the urgent efforts of the county clerk's office, however, the registration of births in Chicago has risen from 19,000 in 1908 to over 43,000 in 1911. All agreed that while the present law had been inoperative through the lack of official enforcement and of the public sentiment to demand it, new and more exacting legislation would be required to secure statewide registration of births.

The opinion was strongly urged by some that the responsibility for reporting births should be placed primarily upon the parents and that the fact of the birth should be registered immediately without waiting for the naming of the child. Waiting for the name in order to complete the registration frequently delays the report for a year. A physician emphasized the fact that a registration that will help parents save the life or the sight of their child is too late to do so if reported even a few days after birth. The "model law" endorsed by the American Medical Association, the American Bar Association, the National Federation of Women's Clubs and the American Federation of Labor, was favored by all the speakers.

Miss Lathrop's statement of the policy and plans of the Children's Bureau met with hearty

response, especially the endeavor to gain the good will of parents, utilize all existing health agencies and to secure the active co-operation of women's clubs and other social agencies. A strong representative committee was appointed to round up sustained co-operation with the bureau, to secure the registration of births in Illinois by more effective legislation and administration.

#### RESEARCH BUREAU FOR BALTIMORE

The Maryland Bureau of State and Municipal Research which has opened offices at 728 Equitable Building, Baltimore, differs from research bureaus created elsewhere, in that it expects to study the work of state as well as municipal departments and institutions. The bureau is under the direction of a board of trustees, representing a small group of Baltimore men who have contributed sufficient funds to give the municipal research idea a trying out in Maryland. W. H. Maltbie, an attorney of Baltimore, is director.

Its first investigation in Baltimore is being made in connection with the inspection of weights and measures. Under the Baltimore city charter this inspection constitutes a sub-department of the work in the comptroller's office. Work on other investigations will begin shortly.

#### AMERICA'S PIONEER MINIMUM WAGE BOARD

Although handicapped by the illness of one of its members, the Massachusetts Minimum Wage Commission, appointed recently by Governor Foss, begins work July 1, 1913. Its personnel is a matter of interest to both friends and opponents of the principle of the minimum wage. H. LaRue Brown of Boston is chairman and Arthur N. Holcombe of Cambridge and Mabel Gillespie of Boston are the other two members. Mr. Brown is a lawyer and has for many years been interested in the legal questions affecting labor. He is author of a special report on labor injunctions, issued by the Federal Bureau of Statistics as their Bulletin 70. A supplementary report by him on the Litigation Arising from Labor Disputes and Their Related Causes in the Massachusetts Courts was issued as Bulletin 78. These reports are considered by many to be authoritative upon the subjects treated and have been in great demand, many law classes using them as text-books in their courses. Mr. Brown has been interested also in savings bank insurance, and has lectured widely in its behalf.

Mr. Holcombe is one of the Harvard faculty, is secretary for the Massachusetts Society for Labor Legislation, a co-ordinate branch of the national and international societies, and has written numerous works on this and related questions.

Miss Gillespie is at present secretary of the Women's Trade Union League of Boston. For four years she was secretary of the Consumers' League of Buffalo, and has been an investigator for the Russell Sage Foundation.

#### FIRST PUBLIC MENTAL HYGIENE CONFERENCE

That the number of patients in the insane hospitals of the country is greater than the whole strength of the United States army, navy and marine corps, and greater than the number of students in all our colleges and universities, was one of the striking facts brought out at the first public conference on mental hygiene ever held in this or any other country. Despite this testimony of the numbers afflicted with insanity a hopeful tone marked the discussion. It was shown that more than one-quarter of all the cases of insanity so serious as to bring the sufferer into an asylum, are later discharged as cured; that more than one-half of all incipient cases can be remedied and that a very large percentage of mental troubles arise from entirely preventable causes.

The conference which recently closed its sessions was held at the College of the City of New York. The exhibit which was set up will be sent to other cities and to leading educational centers throughout the country. It was prepared by the National Committee on Mental Hygiene while the conference was planned by the Committee on Mental Hygiene of the State Charities Aid Association. The conference and its companion exhibit mark the beginning of a nation-wide campaign of public education on the possibilities of preventing and curing mental troubles in their earlier stages.

Homer Folks, secretary of the State Charities Aid Association, voicing his satisfaction at the results, said:

"The movement for the prevention of insanity is fully as important as that for the checking of tuberculosis, and many of the methods which have proved effective in that great contest will be used in this. The mental hygiene movement is a great campaign of public education. In the way it brought the facts as to insanity and the possibilities of its prevention and cure home to a great body of people, the conference exceeded our expectations.

"Many of the 21,000 visitors at the conference, lectures and exhibit came because of active or suspected mental trouble in their friends or relatives. It has been a splendid thing to give these people the sensible, hopeful view of insanity which is the modern view. We have convinced our visitors, at least, that insanity is not a disgrace to be concealed as long as possible. They know that it is a disease, which should have early attention from skilled physicians like any other disease, that it is often curable, that still oftener, it can be prevented.

How much all this has meant already is suggested by the fact that since the conference opened the number of patients who have applied for advice at our mental clinic in Henry Street has more than doubled."

The widespread ignorance regarding insanity was curiously illustrated by a lady who told Dr. Thomas W. Salmon, of the National Committee for Mental Hygiene, that she had previously supposed that insanity was never cured, that it was always hereditary and unavoidable, that all insane persons were violent and often had to be confined by straight-jackets or manacles, and that insanity was rapidly increasing. This woman was a member of the faculty of a New York college.

Perhaps the most general of these misunderstandings is the supposition that a great many insane persons are tied up in straight-jackets or kept in padded cells. As a matter of fact, neither straight-jackets nor any sort of bands are used in the modern insane hospital. When a patient becomes excited he is treated by hydrotherapy; that is, by prolonged baths, packs and showers. In every modern hospital for the insane there is a nurses' training school and "keepers" have been replaced by trained attendants.

### PROGRESS IN THE NEW YORK CHILDREN'S COURTS

ISAAC FRANKLIN RUSSELL

Chief Justice Court of Special Sessions, New York

Municipal government in New York is a thing so vast that any one particular institution, however important, is apt to be overlooked. The public school system costs in the neighborhood of \$40,000,000 per year; the city is preparing to spend on subway construction a sum approximating \$250,000,000; the port itself and the water front, stretching about three hundred miles, is and always must be the chief asset of the metropolis. The suppression of vice and crime, including the organization of the municipal police, is always of momentary interest to the public. Presidential and other elections and the fortunes of prominent politicians furnish the main themes for newspaper discussion. In this way it is easy to note how a conspicuous and wonderful advance in the treatment of juvenile delinquency has escaped public attention.

On July 1, 1910, there were but two children's courts in New York, one in Manhattan, about

ten years old, and one in Brooklyn, about eight years old. Both of these were inadequately housed and inefficiently manned and conducted. The court in Manhattan, at 66 Third Avenue, was lodged in a building, which, at best, had never been more than a temporary makeshift. The same is true of the Brooklyn court, at 102 Court Street. The judicial force and chief clerical equipment was, on the other hand, such as to leave little to be desired.

Many voluntary organizations, charitable and religious, established co-operative relations with these courts and have done faithful and effective service.

The municipality, however, like all great bodies, was moving very slowly with the task of housing these courts in dignified and appropriate buildings, in extending the area of the jurisdiction, and particularly in supplementing the work of the judges with the service of a competent and sufficient staff of probation officers.

Prior to July 1, 1910, there was no probation officer paid out of public funds in the service of the Brooklyn court. Three probation officers representing the Catholic, Jewish and Protestant faiths were supported entirely by private resources. In Manhattan the situation was practically the same.

The court has recently been subjected to much painful but not altogether unjust criticism. Attention has been called to the short terms of judicial service, generally not more than one month, to the lack of specialists on the bench who might give their entire time to children's cases, to the identification of the court with a criminal tribunal for the trial of adult offenders, and to the lack of a sufficient force of probation officers.

Within the past two years marked progress has been made in response to this criticism. Specially trained experts, giving their entire attention to the adjudication of children's cases, are now appointed for substantially long periods of judicial service. In fact, at each of the four children's courts in the city some one judge, under the present plan of judicial assignments, sits for more than half the time and is relieved only for necessary vacations. An effort has been made to direct attention to the equity powers of the court, in pronouncing judgment of improper guardianship and in making suitable commitments for institutional treatment. The letter as well as the spirit of the law calls upon the court to consider the child at the bar in need of the care and protection of the state. The forms and phrases of criminal court procedure have been abandoned as far as possible. Even the papers on file and process of the court studiously obscure the character of the court as a criminal tribunal.

Procedure in the various counties has been standardized, the salaries of judges in different counties have been equalized, new tribunals have been organized in Queens and Richmond Counties, the erection of a noble building, commensurate with the dignity and wealth of the city, has been commenced on the old site of the City College in Lexington Avenue, the sittings of the court in Queens County have been doubled to meet the increasing demand of the population, and plans for the new county of the Bronx are being carefully considered.

But the one conspicuous element of progress is to be seen in the provision during the year 1912 for forty new probation officers, mainly for service in the children's courts. These are to be taken, under a recent decision of the Court of Appeals, from civil service lists.

Headquarters for the probation work have been selected in the Ashland Building, far away from the frowning fortress of the Tombs and the gloomy atmosphere of the Criminal Courts Building.

For some years past the interest of penologists in psychopathic and psychiatric analysis and experimentation has been great and growing. All now recognize that what is sometimes called crime or delinquency, and what at best is an unfortunate happening, may be treated pathologically instead of morally, and may be conceived as the necessary result of irresistible physical forces rather than the deliberately chosen end of voluntary moral action. Definitely known drugs stimulate sleep, thirst and various animal appetites; other drugs suppress these energies. Music and visions, rest, quiet and summer skies sooth and calm the mind and nervous system, disordered and weakened by the stress and strain of prolonged labor and excitement. Tonsils, appendices and adenoids are often sacrificed with beneficial results. In this way medicine and surgery contribute to solve the problems of the criminologist.

Abnormal man frequently appears at the bar of criminal tribunals; and common justice demands that we make a scientific estimate of his capacity for what we have been in the habit of calling free moral action. Does he know the nature and quality of the act which he has committed and for which he has been arraigned? This is the crucial question. It can only be answered by the trained scientific observer, and, in many instances, only after prolonged and patient investigations. This demands laboratories with expensive apparatus and equipment and a staff of specially trained experts. Progress in such a field must necessarily be slow. Theorists and faddists, actuated by an honest but misguided enthusiasm, can only delay and embarrass the work of reform. Not all the defendants who appear in the children's courts need the

services of these trained experts. The impulses that prompt a boy to take an apple and eat it, to leave school for the playground, and to seek the companionship of spirits kindred to his own, are pretty well known and accurately estimated by the judges of juvenile courts who have been called upon to adjudicate thousands of cases.

But the exceptional case does appear, perhaps daily in this city, when the last word and the best word of the skilled psychiatrist must be spoken. Appropriations of public money are needed for this purpose and can hardly be gotten till public sentiment is cultivated and aroused. Meanwhile private philanthropy is supplying about all the means we have to use in this direction. At the State Reformatory for Women at Bedford<sup>1</sup> a noble start has been made through the munificent endowment made by Mr. Rockefeller, and at the Post Graduate Hospital Dr. Max G. Schlapp is continuing, without the aid of the public purse, to meet the more urgent calls of the justices of our children's courts. No greater need than this now confronts us in our treatment of juvenile delinquency.

## THE COURT OF APPEALS AND THE LOAN SHARK

ARTHUR H. HAM

The year just ended, which has been a notable one in the campaign for the improvement of small loaning conditions, had a fitting close when on December 31 the New York Court of Appeals rendered its decision in the cases of Thompson against Gimbel Brothers and Thompson against Erie Railroad. As a result of satisfactory laws enacted in several states and of court decisions which erected obstacle after obstacle in the paths of the usury-mongers the past twelve-month a considerable number of these craftsmen are now repenting their sins in the quiet retreats provided by government for the reformation of law-breakers. These last decisions of the Court of Appeals cut the string which lenders, operating from Portland, Me., and other points, have been able to tie upon victims in New York.

The cases have been in the courts for more than two years.<sup>2</sup> They arose from an attempt by the loan shark to evade the usury laws of New York by requiring the prospective borrower to sign a power of attorney which authorized the lender to execute and sign for the borrower such notes and contracts as he saw fit. The power of attorney was sent to Portland, Me., where the loan broker's agent executed the notes and pretended to sell them to a resident of that state. Naturally the notes called for the payment of a much larger amount than the borrower

<sup>1</sup>See THE SURVEY, December 7, 1912.

<sup>2</sup>See THE SURVEY, June 10, 1911, and January 13, 1912.

received, for no stringent usury laws are in force in Maine. When the borrower became delinquent in his payments the power of attorney was utilized for the execution of an assignment of wages, a copy of which was then filed with the employer in an attempt to collect the notes, protest fees and collection charges through his agency. The New York personal property law provides that a copy of the assignment must be filed within three days of the making of such assignment and the making of the loan.

Gimbel Brothers, on receiving an assignment filed against the wages of an employee, refused to recognize its validity. The loan agent sued and the case, which was defended for Gimbel Brothers by Messrs. Gallert and Heilborn, was carried through the courts to the Appellate Division, first department. This court by a three to two decision held that the claim was invalid for the reason that the assignment was not filed until more than three days had elapsed after the making of the loan.

The Erie Railroad case which was based on similar facts was passed upon by the Appellate Division, second department. This court unanimously held that the purpose of the law was to give the employer notice of the assignment and even though such assignment be executed by virtue of a power of attorney many months after the loan which it secured was made, the employer must recognize the claim. Both cases were appealed and argued conjunctively.

In discussing these two decisions we expressed the opinion that the Court of Appeals would hold with the Appellate Division, first department, in its more enlightened construction of the law. This expectation was justified, for the state court of last resort has affirmed the opinion in the Gimbel Brothers case. The court held in effect that a person making a loan secured by an assignment of wages must notify the employer of the borrower within three days after the loan

*Rhodes in Milwaukee Leader.*

#### THE SHARK IN WISCONSIN

Following the conviction and imprisonment of a Milwaukee loan shark, District-Attorney Zabel, aided by the leading newspapers of that city, undertook recently to close up the loan shark offices and secure the conviction of all money-lenders who are violating the law of Wisconsin.

is made. Unless such notice is given the employer has no legal right to deduct the amount claimed from the wages of the employee.

The way is now prepared for employers who have been harassed by the assignment of wage evil to protect their employees against the payment of unreasonable interest charges. The first step is to follow the example of the members of the Retail Dry Goods Association and rescind the rule of discharge which is the sole weapon left in the salary loan shark's hands. Borrowers who are not living in constant fear of discovery and loss of position will not submit to outrageous interest demands. The second step, which should be concomitant with the first, is to provide an opportunity for deserving employees to borrow at reasonable rates and to encourage habits of thrift and saving by organizing employees' savings and loan associations.

# THE HOLIDAY CONVENTIONS

BOSTON, DECEMBER 27-31, 1912

AMERICAN ECONOMIC ASSOCIATION

ECONOMICS

STATISTICS

POLITICAL SCIENCE

LABOR LEGISLATION

SOCIOLOGY

EFFICIENCY

THE meetings of the American Economic Association were productive not only of good discussion upon present day topics but were valuable in showing the progressive attitude taken by the economic professor on these vital problems. It is true that contentions were set forth which many of the economists felt could never be practically realized. But on the whole no time was wasted on theoretic discussion which did not have a bearing on some practical problem.

The discussion on the minimum wage attracted a good deal of interest because of the attack upon its practicability urged by men who have been engaged in enforcing various forms of labor legislation. Prof. Henry R. Seager, of Columbia University, presented the main paper which treated the subject from the economist's standpoint. He maintained that the wages paid for some forms of labor, particularly that of women and children, were lower than sufficient to maintain a livelihood. By way of example he chose tenement house workers and department store girls. Wages among such classes are constantly low because there is an overabundant supply of the laborers, because the workers usually do not have to depend wholly upon their own wages for maintenance and because the nature of the work precludes unionism. The speaker said that the conditions controlling the lives of these workers showed no signs of improvement. Hence it was necessary for the state to fix a minimum wage. Such action would put an end to the exploitation of such labor by unscrupulous employers. Professor Seager welcomed the likelihood that it would be necessary for the state to take some definite action to lessen the number of unemployables.

Prof. John R. Commons, of the University of Wisconsin, said that he was in perfect agreement with Professor Seager on the principle of the minimum wage but as a member of a state commission whose duty it was to enforce such legislation, he saw many grave objections. The difficulty of fixing such a wage and of really enforcing it were too important to be overlooked.

E. F. McSweeney declared that the Massachusetts law which goes into effect next year "is a monument to the timidity of the legislature which allowed itself, because of a situation created by the Lawrence strike, to be bullied into

passing a bill because of the general belief that failure to approve it might cost votes at the coming election." He said that Massachusetts is not to have a minimum wage board but "a sort of a denatured arbitration board, lacking in power and authority."

The discussion of the rising cost of living turned chiefly upon rise in prices. As a remedy Prof. Irving Fisher, of Yale University, proposed his scheme of basing the value of our money unit upon index numbers of a large variety of commodities in place of the one commodity—gold. He felt that if such a scheme were adopted by several leading nations, its success would be assured, for after seeing its advantages other nations would come to adopt it as they have the gold standard. There was general approval of Professor Fisher's plan though it was felt that it would be a most difficult subject to present to the people and for this reason its progress with law making bodies would be slow. Charles P. Neill, commissioner of labor, said that the rise of general prices was a subject about which we knew but little. He spoke of the work of the Bureau of Labor in collecting price statistics but he felt that a great deal more must be done in this line before we can hope to establish an adequate set of index numbers.

It was the general feeling of those attending the meeting on banking reform, that some form of central bank is needed to meet our banking difficulty. In the main paper read by Prof. E. W. Kemmerer, of Princeton University, the Aldrich plan was supported but it was held that a change should be made in the choosing of the directorate of the central bank. Professor Kemmerer holds that the proposed board of directors should be reduced in number and that each bank which is a member of the association should have one vote regardless of its capitalization. This would remove any fear of domination by the large New York banks and would make the scheme more acceptable to the farmer. Professor Hollander, of Johns Hopkins University, urged the need of a great campaign of publicity in regard to the banking plan. He feels that the Aldrich plan is generally misunderstood.

A great many practical ideas on farm management were presented at the meeting on Agricultural Economics. The need of accurate farm

cost-accounting in determining the cost of each crop and in determining what crops do not pay was treated by Prof. H. C. Taylor, of the University of Wisconsin, and Prof. C. K. Graham, of Hampton Institute. Prof. T. N. Carver, of Harvard University, maintained that American farming is not less scientific than European farming simply because we raise a smaller number of bushels of grain to the acre. The greatest profit is to be had in combining labor and land in the right proportion.

Since land in the United States is of lower value than that in England it is not profitable to work it so intensively and though we raise a smaller crop per acre the return of each unit of labor is greater. Hence our farming is fully as scientific as the European.

Prof. Simon N. Patten's round table on the Reconstruction of Economic Theory was well attended, and was enlivened by a number of diverting dialogues.

The meeting on Governmental Price Regulation was productive of much good discussion. Prof. J. M. Clark, of Amherst College, supported the thesis that the regulation of the prices of the products of industry was altogether too complicated to be attempted by the government. He pointed out the difference between such regulation and that of public service corporations. There is greater need for regulation of the latter and it is less difficult because there are usually but few prices to fix. By assuring fair competition he feels that prices will not become monopolistic.

While in practical agreement, Prof. C. W. Wright, of Chicago University, held that it was possible for the government to regulate some prices by fixing a maximum price. In this manner the consumer would be protected from monopoly but still competition would be left to set the real price.

Many of the speakers felt that price regulation could not be brought about except by complete governmental control or ownership, as was pointed out by Eliot Jones in connection with the difficulty of the government in regulating the sale of so simple a product as anthracite coal, should control of price here be deemed necessary.

The need of some immediate restriction upon immigration if we are going to maintain our present standard of living in this country, was presented by Prof. Frank A. Fetter in his address as president. He called attention to the operation of the law of Malthus at the present time and showed how the pressure for subsistence in this country was becoming more severe each year. If we are more interested in the quality of our people than our numbers, he believes that there must be some important restrictions placed on immigration.

The officers for 1913 are: President, David I. Kinley, University of Illinois; vice-presidents,

John H. Gray, University of Minnesota; Dr. C. W. Macfarlane, Philadelphia; Prof. W. E. Hotchkiss, Northwestern University; secretary and treasurer, T. N. Carver, Harvard University.

R. C. LINE,

[Mount Holyoke College.]

## THE AMERICAN POLITICAL SCIENCE ASSOCIATION

THE annual meeting of the American Political Science Association was in every way a successful one. This nine year old society now numbers over 1,700 members, and in addition to its annual volume of proceedings containing the papers read at its annual meetings, it publishes a quarterly *Review* which has now completed its sixth volume. The issuance of the *Review*, which is sent to all members of the association, was begun at a time when the membership was small. This led, for a time, to an annual deficit in the treasury. The association is now, however, out of debt and has a satisfactory excess of receipts above current expenses.

The presidential address of Prof. Albert Bushnell Hart, entitled *A Government of Men*, dealt in a most interesting manner with the necessity, in a democracy, of providing the means whereby the popular will may not be defeated or oppressed by the formalism of laws. The escape from this thralldom, Professor Hart argued, is by furnishing opportunity to intelligent and liberal-minded men to exert a decisive influence not only upon the enactment of laws, but upon the spirit in which they are interpreted and enforced.

The problems of democratic government furnished the theme for a number of the papers read. Prof. J. F. Stimson, in a paper entitled *Old Fashioned Reforms*, dwelt upon the fact that many of the political reforms recently introduced, or urged for introduction in our states—the referendum, the initiative and the recall—have their close analogues in the institutions of the early Germans. Whether or not this fact furnishes an argument in their favor, Professor Stimson left to the judgment of his hearers. Walter E. Weyl discussed *The Democratization of Party Finances* and urged the desirability of providing the necessary sinews of war for political parties by the assessment and collection of small dues from the rank and file of their members, in this respect imitating the Socialist Party in this country and the German Social Democratic Party which, he declared, is, through this method, rapidly devolving into "the most powerful as well as the best organized political party in the world." H. A. Garfield, president of Williams College, spoke on *Good Government and the Suffrage*, and dwelt especially upon their relation to the immediate future. He declared it both futile and foolish to attempt to prevent the ultimate extension of the suffrage to all adult

citizens, which, when realized, will open the way to the constructive stage of democratic government upon which we are now entering. President Garfield emphasized, however, the fact that good government is not necessarily dependent upon the exercise of the suffrage, and made a strong plea for the greater use of technically trained men in the administrative service. Professor Schapiro in a valuable paper explained the present position of political parties in Belgium; H. B. Learned discussed Some Aspects of the Vice-Presidency, and showed how necessary this office is to the American constitutional system; and Adam Shortt of the Civil Service Commission of Canada explained the historical development and present day working of the relations between the legislative and executive branches of the government of his country.

One of the most interesting of the sessions was that given over to budgetary methods in their relation to economy and efficiency in government. The principal papers were by Frederick A. Cleveland, head of President Taft's Commission on Efficiency and Economy in the federal government, and Profs. F. J. Goodnow and W. F. Willoughby, both of whom have served upon the same commission.

In a special session devoted to jurisprudence and political theory, Prof. Roscoe Pound dwelt upon the Political and Economic Interpretations of Jurisprudence; Professor Walter J. Shepard discussed The Theory of the Subjective Right to Vote; and Professor C. H. McIlwain considered historically The Tenure of English Judges. The topic for the last session of the meeting was Journalism and Public Opinion, the principal addresses being by Arthur Brisbane of the *New York Evening Journal*, and Rollo Ogden of the *New York Evening Post*. As may be imagined the views of these two speakers were not wholly identical. All of the papers read will appear in full in the February issue and supplement of the *American Political Science Review*.

The following officers of the association for the year 1913 were elected: President, W. W. Willoughby; Vice-Presidents, Adam Shortt, F. A. Cleveland, and C. E. Merriam; Secretary and Treasurer, W. F. Dodd; members of the Executive Council, J. I. Wyer, Jr., R. H. Whitten, J. A. C. Chandler, J. W. Garner, and C. A. Dunniway.

It was voted that the next annual meeting of the association be held in Washington, D. C., beginning December 30.

W. W. WILLOUGHBY,

[Johns Hopkins University.]

## AMERICAN STATISTICAL ASSOCIATION

THE American Statistical Association is much the oldest association devoted to study and research in the field of the social sciences of the group which met in Boston. This was its seventy-fourth annual meeting. After nearly three-quarters of a century devoted to the fur-

ther extension of statistical method in the field of population, vital and social statistics, the association has recently been active also in the industrial field—a study of which can be aided by application of the statistical method. This association for many years had no part in these annual gatherings, which are so valuable to the members of the several associations in the extension of acquaintanceship and enlargement of outlook. Four years ago this exclusive policy was abandoned and since that time the association has grown rapidly in numbers and, it is felt, in influence.

Statistics has always been distinctively a utilitarian science, or perhaps an art. It was not necessary, therefore, for it to have a new birth in order that it might become an instrument in the field of social improvement. It has been gratifying to statisticians to note the increasing use of their method and results by the followers of the other social sciences in recent years, and to observe the almost complete abandonment of the spirit of aloofness which was at one time so characteristic of their discussions.

The keynote of the recent meetings was struck in the opening session at which Prof. Albion W. Small, president of the American Sociological Society, and Prof. Walter F. Willcox, president of the American Statistical Association, delivered their presidential addresses on Modern Tendencies in Social Science and The Need of Social Statistics as an Aid to the Court respectively. In the estimation of these speakers the chief question before the sociologists and statisticians is not: What is the world doing, or whither is it moving, but: How can we aid in shaping the course of social progress and in accelerating its speed along right lines? Students of social problems have long been in close touch with actual conditions, but never before have they shown the amount of missionary zeal in promoting better conditions of living and labor than in the series of meetings which has just come to a close.

President Willcox emphasized strongly the need of better social statistics as an aid to the courts. He cited cases in which decisions had hinged on the determination of the facts of the cases, but in which even the most fundamental facts could not be determined, and any scientific gauge of probable results on the communities concerned was impossible, because of lack of statistical data. Going further, he showed what would have been the course of action, and the probable results, in Great Britain and Germany

where adequate statistics are to be had, emphasizing the superior advantages of such definite knowledge over the uncertainties which

at present obtain in this country.

Space is lacking to set forth adequately the scope of the other papers, including a round table discussion at the South End House of the Compilation of Urban Population Statistics by Small Local Areas, by Walter F. Willcox, Robert

A. Woods, E. Dana Durand, Lawrence Veiller, and others.

At the annual business meeting it was decided to hold a special anniversary session in Boston on the seventy-fifth anniversary of the formation of the association.

Officers elected for the year 1913, are: President, John Koren; Vice-Presidents, Henry W. Farnam, E. Dana Durand, Charles P. Neill, Henry B. Gardner, Henry R. Seager; Editor, William B. Bailey; Treasurer, S. B. Pearmain; Secretary, Carroll W. Doten.

JOHN H. SHERMAN.

## ASSOCIATION FOR LABOR LEGISLATION

THE thing which sets off the American Association for Labor Legislation from the learned bodies which are its holiday bed-fellows is the fact that it is out for propaganda. It is not primarily a meeting organization, nor a proceedings-publishing organization, nor a quarterly-publishing organization, though it does all three, but an all-the-year-round going concern with a practical job to perform. The Efficiency Society is, of course, another exception, but that is a newcomer in this group of holiday meetings.

So it was that perhaps the most interesting session of the American Association at Boston was its annual business meeting. And perhaps the most interesting feature of that meeting was the series of impromptu reports from chairmen of committees that have been working on various labor topics within the last year. The principal subjects thus discussed were Industrial Hygiene, by Frederick L. Hoffmann; Workmen's Compensation and Insurance, by Henry R. Seager; One Day of Rest in Seven, by John A. Fitch; Women's Work, by Irene Osgood Andrews; and the international aspect of these subjects, by Ernst Freund, Mary C. Wiggin and Charles M. Cabot, who were among the eleven delegates representing the association at the Zurich Congress on Labor Legislation last September. During the two years of the presidency of Prof. Henry R. Seager, of Columbia University, the association has developed markedly in scientific content and in practical activity. He is succeeded by Prof. W. F. Willoughby, of Princeton University, at different times an expert of the United States Bureau of Labor, an assistant director of the census, treasurer of Porto Rico, and more recently called to the chair at Princeton formerly held by Woodrow Wilson. Professor Willoughby wrote the first American book on workmen's compensation, and his election marks his re-entry into active work in a field in which he was a pioneer.

The association has grown from 1790 members, at \$1, in 1910, to 2,549 members with a minimum annual fee of \$3, in 1912. One of the distinctive events of the past year, reviewed by Secretary John B. Andrews in his annual statement, was the national conference on industrial

diseases at Atlantic City last June, at which an industrial hygiene exhibit was displayed and through it, together with joint sessions of the American Medical Association, that powerful organization, for the first time in the sixty-six years of its existence "was definitely pledged to official recognition of the industrial disease problem and to giving a place to this question on its annual program." A joint committee of the two associations will continue the work among physicians.

This campaign against "phossy jaw" was initiated and directed step by step by the association. Its larger importance lies in calling attention to the industrial disease problem generally—it was picturesque and made people see—and to the use of taxing power as an implement for social control.

But it is not to be supposed that the association's Boston program was weak from the conference standpoint. There were three major sessions; the first, on factory inspection and law enforcement, at which Prof. John R. Commons outlined the work of the Wisconsin Industrial Commission along the lines of his article in *THE SURVEY* last week. Henry Sterling, of the Boston Typographical Union, and Charles Sumner Bird, the East Walpole manufacturer who was the Progressive candidate for governor last fall, spoke from the points of view of laborer and employer. Edward F. Brown, special investigator of the National Child Labor Committee, presented an incisive criticism of present factory inspection machinery. The practical importance of getting the activity of manufacturers and workmen on safety committees, the need for greater money, greater staff, and longer tenure in the factory departments were discussed.

The immediate legislative program of the association was the subject of the second session, the principal speakers being Charles Earl, solicitor for the Department of Commerce and Labor, John A. Fitch, and Robert Emmet Chaddock of Columbia University.

It was the third session on the minimum wage which was perhaps most exciting. The range of points of view was illustrated fairly well by two Massachusetts men, both members of the first minimum wage commission. E. F. McSweeney held that "the living wage" is based on the family as a unit and is Christian; the minimum wage, he said, is based on the individual and is pagan. George W. Anderson stated that the responsible heads of many industrial establishments had been found by the Massachusetts commission to be ignorant of the actual wages paid in the lower grades; that it was only a small minority of employers who, knowing the facts, continued to be responsible for what he called "wage slavery," and that many employers, driven by competition from this minority, welcomed co-operative efforts such as the minimum wage boards afforded, to put their industries "on a self-supporting basis."

Various points were raised against minimum wage legislation—its legality, the impracticability of getting through compulsory legislation, its social consequences, etc., yet among the audience, and among the speakers there was a very obvious trend in favor of the principle and of its application. The principal paper was that of Prof. Henry R. Seager, who said in conclusion:

"The economic interests of society requires the payment of living wages to all workers, except children learning trades, and defectives, who must be treated as wards of the state.

"In the United States the great majority of industries pay such wages to the great majority of their employes. Starvation wages are only found under exceptional circumstances. Typical of these are home workers under the sweating system, and the employment of girls in department stores. For both of these employments the requirement of minimum wages, covering necessary living expenses, would be a distinct social gain. It would increase the health and efficiency of those employed at such wages. It would put a stop to exploitation by grasping employers and hasten a better distribution of the labor force of the country. Finally it would compel society to face the problem of caring for the unemployable through insurance or pensions for those who should not be expected to be self-supporting and through the better distribution and industrial training of those who might be self-supporting if given some assistance. The objections to the plan are mainly practical, and the most convincing answer to these objections is the fact that other countries are actually making minimum wage regulations effective."

PAUL U. KELLOGG.

## THE EFFICIENCY SOCIETY

A MODERN complaint concerns the bad social effects of over-subdivision of labor and over-specialization of task. At its meeting on education the Efficiency Society advocated a still further subdivision of labor and a further specialization of task. Carver, advocated a redistribution of human talent so that although specialization be intensified, only those will undertake special tasks who are especially fitted to do them. Samuel McCune Lindsay, speaking in favor of vocational guidance, favored a gradual steering of talents of children into special fields from very early years. S. A. Cortez, inspector of tests of Detroit, speaking of the measurement of efficiency in education, explained a new and more scientific method of rating the abilities of students in various elementary branches as an assistance in guiding them into special fields. John Martin, of the Board of Education of New York, pointed out that vocational guidance and vocational training standing alone are not sufficient to steer talent into the work for which it is fitted because the social and financial rewards of given tasks oper-

ate to take young people out of the work for which they are especially fitted. Much social legislation and readjustment of the social status is needed to steer human talent into the right activities.

These views, mainly grouped under the head of vocational guidance, were brought out at the afternoon meeting in Emerson Hall at Harvard University. Meyer Bloomfield, of the Boston Vocation Bureau, presided.

Vocational training with special reference to training for business was the chief topic at the evening session at the Boston City Club, over which Prof. Joseph French Johnson, dean of the New York University School of Commerce, Accounts and Finance, presided. Professor Carver had said in the afternoon that the talent for business management was the scarcest and the most difficult to train. James P. Munroe, secretary of the Massachusetts Institute of Technology, took up this point and showed what huge responsibilities are wielded by the modern business manager of large plants. His duties are diplomatic and social and the modern business manager needs to be trained almost as if for the responsibilities of public office. The so-called captains of industry are not business executives and frequently lack the technical knowledge demanded of departmental managers. They are mainly manipulators of colossal enterprises. J. B. Geijsbeek, of the University of Denver, joined with Mr. Munroe and Assistant Superintendent Frank B. Thompson, of the Boston schools, in attacking the present methods of training for business as being far and remote from the actual demands of the time. Business schools, in their judgment, have simply elaborated shorthand and bookkeeping instead of recognizing the new organization

of business which demands as much social as technical knowledge.

The secretary of the Efficiency Society, H. F. J. Porter, took occasion at the evening meeting to indicate the policy of his organization in regard to education. He said that more efficient industry was absolutely dependent upon a more efficient education of business managers and upon a redistribution of human talent. It was the province of the society, he said, to co-ordinate the activities of those engaged in vocational training and vocational guidance and with those urging social legislation because, as Mr. Martin and others had pointed out, work had to be made attractive and dignified in order to hold those perfectly fitted and scientifically guided into it. Behind vocational guidance, he said, are housing reform, industrial reform and eugenics. Co-ordinate with it is a public responsibility for recreation and artistic life. Mr. Bloomfield and other vocational guides, he thought, will find their work nullified unless their social agencies co-operate with them in the effort to redistribute human talent.

BOYD FISHER.

## THE AMERICAN SOCIOLOGICAL SOCIETY

THE intimate correlation, amounting almost to organic unity, of all the social sciences was the keynote of the Boston meeting of the American Sociological Society. Albion W. Small, of the University of Chicago, in his presidential address, emphasized the fact that sociology, psychology, religion, education, philanthropy, politics and law are all so interdependent that what has heretofore been an impersonal treatment of institutions, of a philosophy of wealth as an end in itself, has passed into a philosophy of human obligation, a task of promoting human well-being. He spoke of the enormous aggregate of public service performed by American social scientists in excess of the requirements of their positions as a most powerful indication of the present tendency. He declared that the task of the American people would not be finished without the co-operation of all our social sciences from the historical, functional, moral, and instrumental standpoints. The function of social science is to be the chief organ of social self-examination.

G. Stanley Hall, of Clark University, called attention to the intimate relation between psychology and sociology. He showed how the various psychological phenomena of voluntary juvenile organizations, primitive tribal relations, and kindred examples of institutional life were all extremely valuable to the sociologist as a commentary upon, or rather a guide to, a proper conception of modern social organization. He showed further how psychoanalysis of the abnormal—the criminal, the insane, the defective—showed that all psychic phenomena conformed to a uniform law, and that the normal and the abnormal were but different combinations of the same psychic elements. Some psychologists, he said, are already dreaming of the time when psychic tests will take the place of every kind of examination in schools or for vocational guidance to determine morbid processes in a stage so early that they can be rectified.

Prof. Paul Munroe, of Teachers' College, contrasted the principle that education is the means by which the normal members of society are prepared to perform their normal function in society with the older idea that education was intended for a few chosen because of wealth, birth or exceptional privilege.

Prof. Charles E. Merriam, of the University of Chicago, spoke on The Outlook for Social Politics in the United States, which he defined as the conscious systematic control exercised by the government over economic and social life. He contrasted it with the police system in which government contented itself with merely preventing violence and fraud and showed how in our own country progress in the direction of a comprehensive social policy had been particularly slow. Among the reasons for this, he cited the attitude of economists toward the structure and powers of government, the strict constitutional

limitations imposed upon the states and the narrow interpretation of these limitations by unfriendly courts, and

the organized system of political corruption.

Prof. Simon N. Patten, of the University of Pennsylvania, in formulating a basis for the reconstruction of economic theory, pointed out that the year 1912 marked a new epoch; that social thought had abandoned the earlier program and had entered a new field. He divided sociological thinkers into three classes: the reactionary class which seeks to justify the present class consciousness by an appeal to the historic doctrine of the economic man; the revolutionary thinker who hopes to accomplish the needed changes in sociological thought by epoch making revolutions; and lastly the evolutionary thinker who recognizes that social advance is the accumulation of small persistent effort in commonplace material things.

It was significant that the last session was given up to a discussion by representatives of two law schools of the contributions of legal theory to this new social unity. Professor James, of the University of Wisconsin Law School, showed that the present generation was witnessing a conscious effort to use sociological investigations in the preparation of laws and that legislation—not judicial action—has distinctly changed the character of a large portion of American statutory laws. He called attention to labor legislation, particularly employers' liability and mitigation of the fellow servant and assumption of risk doctrines and the fact that many of the terms of employment which under the common law employer and employe were left to settle are now regulated by the state, and contracts contrary to the terms of the statutes are void. He insisted that the realization of the social ideal backed by American legislation will ultimately find expression in juristic philosophy very different from that of the old school. Professor Pound, of Harvard Law School, classified the four stages of legal development into: first, primitive law, or the beginning of law; second, the strict law; third, equity or natural law; and fourth, maturity of law. To these he added a fifth stage which he called the socialization of law. The beginnings of the fifth stage he sees in the emphasis which is now being gradually transferred from individual to social interests. The watchword of this movement, he said, is the satisfaction of human needs.

Prof. Francis Peabody, of Harvard Divinity School, presented socialized religion as the ideal which should be present in the mind of every sociologist—closet or practical.

Social Ideals Implied in Modern Programs of American Philanthropy were presented by Edward T. Devine.

The society elected officers as follows: President, Albion W. Small; first vice-president, Edward A. Ross; second vice-president, George E. Vincent; secretary-treasurer, S. E. W. Bedford.  
W. K. FOSTER.

## BOOKS

IMMIGRATION AND LABOR, THE ECONOMIC ASPECTS OF EUROPEAN IMMIGRATION TO THE UNITED STATES  
By ISAAC A. HOURWICH, PH.D. G. P. Putnam's Sons.  
544 pp. Price \$2.50; by mail of THE SURVEY \$2.78.

Does our present immigration lower wages, increase unemployment, depress the standard of living, displace native workers and the older immigrants, and thus do harm?

Most people unhesitatingly answer, "yes," without bothering about evidence, either thinking it a waste of time to prove the obvious, or perhaps finding the proof, after all, somewhat difficult to secure. Even our recently disbanded Immigration Commission, after four years of research, have permitted themselves more than one generalization on these points for which we are unable to find authority in their statistics.

Dr. Hourwich, however, in his new book, *Immigration and Labor*, just as unhesitatingly answers "no," and with such a wealth of historical illustration and statistical proof, such keenness of economic analysis, as to jolt the reader at once out of the usual easy acceptance of things as they seem.

In general, the line of argument is that immigration is a force set in motion by more fundamental economic forces, which would work out much the same order of things as we now have, irrespective of the specific human material involved. Immigration does not overstock the labor market, because it merely follows demand for labor. For the same reason, immigration does not increase unemployment, but varies inversely with unemployment, because the business expansion which calls in the immigrant reduces unemployment and *vice versa*.

The introduction of labor-saving machinery during the last thirty years has reduced the proportion of skilled and unskilled workers required in our principal industries. But the general expansion of industry, calling in the great unskilled labor force afforded by the newer immigration, has prevented this change in ratio from becoming actual displacement of the skilled. So that the newer immigrant, instead of pushing aside the American workingman and the older immigrant, is really pushing them up, and maintaining them on the higher economic levels. And Dr. Hourwich offers statistics to show that a racial stratification of occupations of this nature has actually taken place.

But has the newer immigrant, while doing this, lowered the wages of unskilled labor to a "single-man" standard, to the detriment of wholesome family and social life in what has become a relatively large part of our population?

All available data on wages seem to show that unskilled labor has never been at any time or in any place, entirely or appreciably above this standard. In the period of the older immigration, the wages of unskilled labor and even of some of the skilled mechanics, did not fully provide for the family support. The shortage had to be made up by the labor of the wife and chil-

dren. And even on our American farms, in the earlier period, women and children were worked and overworked to bring the family out even at the end of the year.

On the other hand, actual advance in wages in many industries, reduction of hours of labor, increase in union membership and strength have gone on with increase in immigration. So that on the whole, good and not harm is the accompaniment of this new foreign invasion.

These are certainly propositions sufficiently debatable and interesting in themselves to attract the reader from this bare and inadequate outline to the book itself, to see how the author works them out. The reviewer earnestly hopes that this will be the result, and can promise that anyone who wants to come out of the fog of emotion about immigration, and really think the matter through, in its relation to general economic development, will be greatly assisted in doing so by a careful study, chapter by close-packed chapter, of Dr. Hourwich's scholarly and stimulating book, whether he ends by agreeing with the author or not.

KATE HOLLIDAY CLAGHORN.

THE MAN FARTHEST DOWN, "THE STRUGGLE OF EUROPEAN TOILERS"

By BOOKER T. WASHINGTON. Doubleday, Page & Co.  
300 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

Booker T. Washington, in the summer of 1911, was given two months' leave of absence from Tuskegee on condition that he spend it in recreation and rest. Accordingly, he sailed for Europe, and in the six weeks that he had at his disposal visited England, Germany, Hungary, Italy, Sicily, Poland and Denmark, studying the people living in poverty and making notes for a book. Assuredly this is a Twentieth Century American's conception of recreation and rest!

We, however, are the richer for Dr. Washington's vacation. His *Man Farthest Down* contains, in simple, accessible form, much important matter regarding European laboring people. The pictures that he draws of city poverty are somewhat hackneyed, but in the country he is at his best. We go with him through the orange groves of Sicily, and then to the dirty, tiny homes in which the orange pickers live. We travel to the sulphur mines and see the man at the bottom, a homeless, ill-treated, cruelly-worked boy. In Poland we see the Jew, in mediaeval garb, heavily taxed, impoverished. In Austria we meet Magyar and Slovak, and learn of a race hatred and contempt as deep as any between white and black. And last, in Denmark, we find the man farthest down a thrifty, intelligent farmer, saved from severe economic oppression by his co-operative societies which manufacture and sell farm products. In fact, we have here a guide book which will serve us when we are weary of the past and want to study the workers of today in Europe.

Dr. Washington does not attempt to generalize in his book. He, however, likes frequently to draw a parallel between the American Negro, the man at the bottom in the United States, and the man at the bottom in Europe; and this parallel is always to the Negro's advantage. The colored man does not starve to death as does the man lowest down in London; he can easily acquire land, unlike the agricultural laborer in Great Britain; he and his children have greater educational opportunities than the children of the Sicilian. This cheerful optimism must increase the book's attractiveness to the American who is weary of being muckraked, but he must remember that he fails to hear the answering retorts of the English and Sicilian and Scotch!

In discussing the Poles and their political status, Dr. Washington reveals, as he has often before revealed, his distrust of political action as a means of permanent improvement of economic conditions. In this he stands for the moment with the syndicalists of France and the United States, with Sorel and Haywood. He parts company with them at once, however, on remedial methods as he has no revolutionary tactics, but believes in education as the cure for degrading poverty. Without the franchise this education, of course, would come from the people in power and he believes should be along those industrial lines that are familiar to all readers of Dr. Washington's works.

The book ends with the suggestion that we should look at things from the point of view of the people who are looking up, rather than from that of the people who are looking down, "and, strange as it may seem, it is still true that the world looks, on the whole, more interesting, more hopeful, and more filled with God's providence, when you are at the bottom looking up than when you are at the top looking down. The man who is down, looking up, may catch a glimpse now and then of heaven, but the man who is so situated that he can only look down is pretty likely to see another and quite different place."

MARY WHITE OVINGTON.

#### THE MILK QUESTION

By M. J. ROSENAU, Professor of Preventive Medicine and Hygiene, Harvard Medical School, Houghton, Mifflin Co. The Riverside Press, Cambridge, 1912. 309 pp. Price \$2.00; by mail of THE SURVEY \$2.15.

#### DUSTY AIR AND ILL-HEALTH

By ROBERT HESSLER, A.M., M.D. Printed privately. 352 pages. Price \$2.00; by mail of THE SURVEY \$2.10.

#### HYGIENE FOR THE WORKER

By WILLIAM H. TOLMAN, Ph.D., and ADELAIDE WOOD GUTHRIE. Edited by C. WARD CRAMPTON, M.D. American Book Company. 255 pp. Price \$5.50; by mail of THE SURVEY \$5.75.

The milk question is one that interests profoundly laymen as well as sanitarians, pediatricists and bacteriologists, but the person with unscientific training has had to suffer great bewilderment because of the disagreements of the scientists. It is a relief to have a book appear which is written for laymen primarily and which gives in readable form the latest pronouncements of science on the vexed question of what is good

milk and why it is good, what is bad milk and why it is bad. Dr. M. J. Rosenau, formerly of the United States Public Health and Marine Hospital Service, now of Harvard University, has given us such a book in the one recently issued under the title of *The Milk Question*.

This book takes up every phase of the subject and the searcher after truth can find here the actual facts which underlie the mass of more or less loose statements we are all accustomed to hear made concerning such matters as milk-borne infections, the infection of human beings with bovine tuberculosis, the comparative value of milk as a food, the dangers of dirty milk, the real bearing of the milk question on infant mortality and the much disputed subject of pasteurization. It is interesting to read the section on the bacteriology of milk and to learn that it is character (or rather bad character) that counts and not mere numbers of bacteria, for milk may contain actually more bacteria than the same amount of city sewage and yet be harmless, at least for adults. It is also interesting to read that the great danger in milk comes not from the cow, but from the milker and handler, epidemics of milk-borne disease usually being caused by a typhoid or diphtheria carrier or by some one with scarlet fever or septic sore throat. Tuberculosis is probably the only serious cow-borne infection. The whole chapter on dirty milk is very enlightening. Perhaps the most valuable part practically is that dealing with pasteurization, of which Dr. Rosenau is an outspoken advocate, since it is the "simplest, cheapest, most effective and least objectionable method" of destroying germs in milk. However, it has its limitations and objections, which must be considered. Consideration of these cannot be taken up in a review. To any one who wishes a clear understanding of this important question and wishes to be kept from making extravagant, or obsolete, or inaccurate statements this book is recommended.

\* \* \*

The pleasant discursiveness of Dr. Hessler's book takes us back to the literature of an earlier generation; a generation of ampler leisure, and perhaps wider interests, or less specialization. It sets down in rather rambling sequence the observations of a family physician of many years' experience in city and country practice, who has formed a strong belief that dust is the greatest single cause of disease. The reader must not, however, be misled by the apparent carelessness of style into thinking that the book is essentially loose and unscientific, for it is not. Dr. Hessler is familiar with modern medical science and if his book be pronounced one-sided by physicians it will not be rejected as unsound. The lay reader will find it an interesting and novel exposition of what is certainly an increasingly important source of disease in civilized communities.

\* \* \*

*Hygiene for the Worker* is a book of practical instruction adapted especially to the needs of the wage worker. The usual instruction in the care of the body is modified to

meet the different requirements of working people in sedentary occupations, in occupations involving physical strain, involving excessive changes of temperature, etc., and each chapter closes with an excellent short summary of the instructions contained in it. The really novel feature of the book is the part devoted to industrial hygiene. The worker is told what should be the standard of a work shop, what dangers should be guarded against, and how. Descriptions are given of machinery properly safeguarded and without guards, of good and bad ventilating systems, of proper measures for fire prevention, and so on. In other words, the book seeks to show the worker what he has a right to demand, and to give him a standard by which he can judge of the conditions in his place of work. One chapter is devoted to a brief review of the labor laws of New York state, and the reader is urged to find out what are the laws in his own state. This book is a very valuable addition to the literature on hygiene, which so far has had nothing of a popular nature devoted to the hygiene of occupation.

ALICE HAMILTON, M. D.

#### COURTS, CRIMINALS AND THE CAMORRA

By ARTHUR TRAIN. Charles Scribner's Sons. 253 pp. Price \$1.75; by mail of THE SURVEY \$1.87.

Arthur Train is always worth reading. If one wants good stories about criminals, accurate descriptions of the domain of courts and prosecutors, attorneys and "bad men," let him read *The Prisoner at the Bar*, and its sequel with the above title. Train fills a place that needs filling in our sociological literature. He popularizes a field that generally gets known to the public either through the out-of-focus daily press or through the annual reports of dry statistics from district attorney's office or from the chief clerks of criminal courts. What the public wants to know, and should know, is how the district attorney's office thinks and acts, and for what it stands, and what its difficulties are. At present, Mr. Whitman and his assistants have shown that in New York County the office can be an important, and at present almost inexorable, lever in prying off the lid of the witches' cauldron that has brewed the most subtle and noxious forms of graft and crime in New York City.

But Becker cases and gunman convictions are exceptional. The daily work of the office, the routine processes of the courts, the intense human interest features of the lowly cases, the methods of the real detectives and not those of the old sleuth variety, the limitations of intelligence and system, all are told instructively by Mr. Train. His book divides itself into three parts, relating to the three heads of the title. He shows how the criminal case is prepared for trial, what the jury system amounts to, and then turning to the criminal, tries to analyze the motives leading men to kill each other. A considerable space is given to the personnel and methods of detectives. Then, journeying to Italy, he gives us the clearest description of the Camorra

trial that I have happened to read. Perhaps the most valuable part of the book is the direct and indirect comparison of American and Italian methods of court procedure, and the outlining of certain features of continental procedure that should give us food for thought. One will not find Mr. Train's book a comprehensive and systematic study. It is far more a collection of articles, some of which have appeared in well-known periodicals.

O. F. LEWIS.

#### CHARACTER BUILDING IN SCHOOL

By JANE BROWNLEE. Houghton Mifflin Company. 268 pp. Price \$1; by mail of THE SURVEY \$1.07.

This little book may be read with profit and interest by all who feel with the author that "The purpose of moral training is the building of character." It should be distinctly helpful to the social and settlement worker who sees in character building the fundamental remedy for much existing social mal-adjustment, and whose work affords many a chance to put in a heartening word. It is a handbook of practical value to the teacher who sees in the classroom the daily opportunity for opening up channels of thought which will have enduring and constructive influence on the child mind; who realizes, vaguely, that her attitude toward her work and her pupils affects her success with them; but who does not know how to set about "putting her house in order."

Miss Brownlee's book is, she says, "the outgrowth of eight years' experience in the definite moral training of children through instruction in the right use of their power to think." Some of the chapter headings—*The Personality of the Teacher, The Mind a Servant, The Body a Servant, Constructive and Destructive Thinking, The Real Child or the Soul*—suggest ideas that are used in the day's work by many who would not acknowledge conscious allegiance to the many "mind-over-matter-isms"; but while the author claims, indeed, that thought power and mental control are all-powerful factors in character building, her conclusions are drawn from such wise, sane and logical observations of child life that the effect of such instruction should be welcomed by the most "orthodox" of mothers.

Although Miss Brownlee in the preface refers to the subject matter as "suggestive only," it is practical and interesting, and will undoubtedly be helpful to the many who heartily subscribe to the author's views that "It is possible to present great truths so simply that little children may comprehend them. They may be taught the meaning of character; that the purpose of life is character building; that this great work goes on slowly day by day; that the materials used are the daily happenings in home and in school; that the tools they use are the power to think, to reason and to will; that if good use is made of materials and tools, the life of the individual cannot fail to be strong and useful, and so lead to happiness for himself and for all with whom he is associated."

C. C. M.

## COMMUNICATIONS

### THE UNITED STATES ARMY

TO THE EDITOR:

As a subscriber to *THE SURVEY* I beg to inquire whether the extract from the *American Magazine* which *THE SURVEY* prints in its issue of November 30<sup>1</sup> in regard to the army of the United States carries, as it appears to do, your approval of the sentiments expressed and the position taken therein.

The statements made are in my judgment, and largely to my knowledge, both false and purposely misleading, where partly true. They are furthermore so unpatriotic as to come very near being treasonable. The government is charged with the duty of enlisting and maintaining an army not only for defense against public enemies, but for the preservation of domestic peace, and it has never failed in its duty. I venture to say that the rank and file of the army whom your publication describes as having universally acquired the vices of the camp, which so far as they exist are largely due to the fanatical W. C. T. U. opposition to the canteen, are, in character and capacity to take care of themselves after a term of enlistment has expired, well up to the average young men in colleges. Furthermore, they have a discipline and a respect for law and authority which those young men not infrequently conspicuously lack. The whole unmistakable purpose of the extract is to discourage enlistments in the army, and if there is no law to punish it there ought to be. If the Socialistic teachings toward which you appear to lean were—as they surely will—to cause riots which get beyond the control of the local authorities—as they often have—and "Observer's" precious skin or sacred property were to be in danger, he would probably be the first to shriek for the debased, vicious United States troops, to save him. If *THE SURVEY* considers it proper to slander the United States army, and to join in an attempt to deprive citizens of the protection to which they are entitled, I for one am done with it.

ARCHIBALD HOPKINS.

Washington, D. C.

[*THE SURVEY* goes out of its way to get different points of view in "The Trend." That is the purpose of *The Trend*—a department of quotation from other periodicals, in the same way that "Communications" is a forum for *SURVEY* readers. The publication of the above letter, or any other letter, does not necessarily carry with it editorial approval or disapproval.

These points are illustrated clearly by the following "communications," pro and con. They refer to some illustrated verses republished in *The Trend* from *Life and Labor*, the organ of the National Women's Trade Union League.

In so far as these two departments enable *SURVEY* readers to know what one another is thinking about, and to know what people in widely different walks of life are thinking and talking about with respect to the things that fall within the field of *THE SURVEY*, they serve a journalistic purpose. They also serve an educa-

<sup>1</sup>See *The Trend*, page 259.

tional purpose in going a little way toward breaking through those water-tight compartments of public thought which grow out of professional, racial, sectional and economic groupings in the community.

Other generations may have given up trying to reconcile soldier and Quaker on questions of national defense; but ours can at least think it a good thing for army men and working class anti-militarists to have a glimpse of how each other looks at things, under earlier, less tense circumstances than the street engagements which the above writer forebodes. That the subject is one which need not be given up bodily to the extremists on either hand is illustrated by the colonel of a regiment in one of our important industrial districts. He has set about making clear what the function of the militia is in the scheme of national permanence, recognizing that the workmen of the region have conceived of it hitherto merely as a weapon for suppressing strikes, ready to the hand of their opponents. It took a decade following the last big strike in the region before the militia companies won back any popularity in the district. Today there are scores of union men in the ranks.—Ed.]

### A WORD OF PROTEST AND A REPLY

[See Editorial note above]

I.

TO THE EDITOR:

As a subscriber, as an employer and as one seeking to diminish friction between employer and employe—rich and poor—I want to enter a protest against the publication of such matter as appears on page 201 of the November 16 issue of *THE SURVEY* under the heading *A Song of Fines*.

While I shall be glad to see the shorter day and the better pay, neither will ever be helped to realization by such doggerel. Teach the girls to fit themselves for better pay and provide the way for them to obtain vocational training. These verses teach that a contract to give a certain amount of time for a certain amount of money may be broken so far as the time is concerned but must remain intact so far as the money is concerned; that a twelve-hour day is in vogue (I'd like to know where); and that if they will strike "we'll see you through"—who?

It seems to me highly improper to print any such matter—antagonistic to the very thing you are striving to do. I am aware of the crying need of the submerged, but they will never be bettered in condition by unfair means—and I consider these verses, to say the least, unfair.

Doubtless there are abused and overworked women as there are abused and overworked men of whom we hear less. But they are not helped by such talk or writing. On one side let *Life and Labor* talk plain and emphatic prose to the employer—in the courts if necessary—who demands a more than twelve-hour day in violation of the law. On the other side let *Life and Labor* talk in the same plain way to employes about keeping their agreements and other ways of being fair and true. A very nice adjustment is necessary to synchronize the two sides. It never can be done by making one side sorry for itself and the other side resentful by unfair criticism.

Action and direction are needed—not hysterics and heroics.

## II.

## TO THE EDITOR:

In answer to Mr. Simmons' letter regarding "A Song of Fines," quoted from *Life and Labor*, I do not quite understand how he reaches his interpretation of those verses. The Song of Fines is simply a statement of facts—and the unfairness against which Mr. Simmons protests lies in the facts and not in the verses.

The great strikes of the garment trades called the attention of the public to fines for thread, needles, and running power, and in her statement of grievances of the 50,000 garment strikers in Chicago, Katharine Coman of Wellesley College, referred to the unjust fines as one of the important factors of the strike.

The girl in the unorganized trades is many times docked half a day's pay for five or ten minutes' tardiness, having to work without pay for that time; while the girl in the union is docked merely for the loss of time, or an hour's pay for five or ten minutes' tardiness, without having to work for the time so lost. A common grievance among piece workers in the sewing trades is that during the slack season frequently they have to wait for work from four to seven hours a day without any recompense whatever for the time thus spent.

As to Mr. Simmons' inquiry, where a twelve hour day is still in vogue, it hardly seems credible that this question can be put by a subscriber to *THE SURVEY*. The legislation for the ten and eight hour days is of very recent date. The twelve hour day was legal in New York before the recent enactment of the fifty-four hour week, provided it was fitted into a sixty hour week. Yet the laundry workers' strike last January in New York showed at the hearing of the Board of Mediation and Arbitration, New York State Department of Labor, sixty-seven hour, seventy-five to eighty, and ninety-hour weeks for the laundry workers. Before the ten hour day for all women workers was secured in Illinois and declared constitutional only in June, 1912, the ticket agents at the elevated stations worked from 7 A. M. to 7 P. M.—a twelve hour day—whereas it was a notorious fact that the day's work ran to seventeen and eighteen hours in the laundries, and in all sewing and seasonable trades to twelve and sixteen hours a day.

Of course I do not know if Mr. Simmons refers only to the sewing trades or to all industries where women work, but does he not know that the twelve hour day is still legal in Pennsylvania; that there is no regulation of the hours of work for women in Alabama, Arkansas, Delaware, District of Columbia, Florida, Iowa, Idaho, Indiana, Kansas, Mississippi, Nevada, New Mexico, Texas, Vermont, West Virginia or Wyoming, while Arizona's limitation refers only to laundries, and Montana's only to telephone operators. There are no day limitations, though a sixty hour week in North Dakota and Tennessee.

Besides the legal twelve hour days and days

of still longer work in twenty odd states, it is a fact that hardly a state in the Union limiting the hours of work for women is equipped to enforce such law. Testifying before the Factory Investigating Commission (pp. 551-2), P. Tecumseh Sherman, formerly commissioner of labor of the state of New York declared:

"The law limiting the hours of labor of women is not enforced here very strictly. It is not enforced in any state in the United States. . . . When I say that a hundred factory inspectors are necessary, or proper, or adequate, I exclude that, because one thousand inspectors would not be able to watch and detect all violations of the law. I think that the question would have to be left to the labor unions pretty largely to work out for themselves. They can enforce the hours of labor law, and if they cannot, there is nobody that can."

It is sometimes thought that the so-called over-time is a matter of no moment, but when over-time runs, as Miss Goldmark testifies (Vol. 111. p. 1607 Report of Factory Investigating Commission) in binderies, canneries and clothing manufactories to seventeen weeks in the year, that is, to over four months, it can no longer be regarded as over-time in the technical term. So shocking have been the facts reported regarding the long hours in the canneries that the New York Factory Investigating Commission has made a special investigation of those hours upon which it will doubtless report to the New York legislature.

We agree with Mr. Simmons in the need of vocational training (see Report of Committee on Industrial Education of the American Federation of Labor, Senate Document 936), but does Mr. Simmons really think that wages are always in proportion to skill? Above all other trades this is not a fact in the sewing trades where many of the most skilled workers, doing beautiful embroidering on waists and dresses and monograms on linen, are the least paid of the workers. And in those trades where machinery is almost entirely eliminating skill, how can skill be the only determining factor for the wage?

As to doggerels themselves, I am sorry Mr. Simmons does not enjoy them. Surely the whole history of nursery rhymes teaches us the wisdom of putting thoughts that must be universal into rhymes and jingles. Somehow in such form these thoughts become imbedded in the minds of the people. It would seem as if even Mr. Simmons had his attention called through a doggerel to the possible existence of a twelve hour day.

And last, there is but one way and only one way to "diminish friction between employer and employe" and that is to help establish industrial democracy and social justice.

MARGARET DREIER ROBINS.

[President National Women's Trade Union League.]  
Chicago.

## JOTTINGS

### CRANBERRY BOGS UNDER LABOR LAW

The National Child Labor Committee has just received a written opinion from Nelson B. Gaskill, assistant attorney general of New Jersey, in which it is stated that cranberry bogs are included in the mercantile law which applies "to any employment of labor other than a factory, workshop, mill, or other place where the manufacture of goods of any kind is carried on."

It is of interest to the people of New Jersey, as well as to those of other states, to know that according to the definition of this act the employment of children under fourteen years of age in the cranberry bogs is illegal, and the power to enforce obedience to this law is in the hands of the state Department of Labor.

### CHURCH AND SOCIETY TO BE DISCUSSED

On the third Tuesday of each month, from January to April (inclusive) monthly conferences will be held under the auspices of the New York Charity Organization Society. The general topic for consideration will be the evils of pauperism, and the possibilities of religious and charitable organizations to overcome them.

The first conference will be held January 21, at 11 A. M., in the Assembly Hall of the United Charities Building, 105 East 22 street. The church and the organization of society will be discussed from the following angles: The Newer View of the Social Mission of the Christian Church, by Rev. Charles S. Macfarland; Organized Co-operation in the Gramercy Neighborhood Plan, by S. Boyd Darling; City Neighbors of a Block, by Rev. Theodore Sedgwick. The committee in charge of the meetings is composed of: Kate Bond, chairman; Mrs. F. S. Sellew, secretary; Mrs. Talbot Olyphant, Mrs. Francis Barlow, Mrs. John Erving, Mrs. W. Alexander Ewing, Mrs. Benjamin Nicoll, Mrs. James A. Scrymser, Mrs. L. J. Wyeth, Jr.

### FEDERATION FOR CHILD STUDY

The Federation for Child Study will give a course of three lectures on eugenics at 2 West Sixty-fourth Street on January 16, 23 and 30, at 8:15. The first lecture will be by Scott Nearing of the University of Pennsylvania, and will consider the social worth of human beings, the relation of education and environment to social worth, race characteristics, immigration, the birth rates, etc. In the second lecture Henry E. Crampton of Barnard College will give an account of recent experimental work that establishes the so-called "Mendelian" laws of heredity, and show how these laws are applied practically in the breeding of plants and animals; the evidence of their applicability to human beings will be brought out. In the final lecture Lester F. Ward, the veteran sociologist of Brown University, will survey the social field with a view to applying the known laws of biology to the problems of social life.

October, November and December made up the first quarter of the first fiscal year under the new organization of THE SURVEY.

The response to our appeal as an adventure in co-operative journalism has been fairly stirring.

173 readers of THE SURVEY have renewed their \$10 co-operating subscriptions to our educational work. 139 readers, who had hitherto been just regular \$2 subscribers, have enlisted as \$10 co-operating subscribers:—312 in all toward the total of 800 which we have set for the year's goal.

40 others have given or promised larger amounts ranging from \$15 to \$1,000. These contributions make a total of \$6,535. This \$6,535 and the \$3,120 from co-operating subscriptions together make \$9,655—well toward half the \$20,000 needed above circulation and business receipts to shoulder the general budget of the Survey Associates for the twelve months.

\* \* \*

In acknowledging these contributions, the Survey Associates extend a further invitation to every reader of THE SURVEY to join this roster of contributors. Without their support the work of magazine and National Council would be cramped at a hundred points.

\* \* \*

Under the terms of the constitution of the Survey Associates, co-operating subscribers (those who contribute \$10 or more annually) may be elected annual members. Contributors of \$100 or more in any one year, so elected, become continuous members. Annual and continuous members will hereafter elect the board of directors. Neither form of membership carries with it financial obligation.

At recent meetings of the board of directors, the following contributors to the educational fund in sums of \$100 or more, between October 1 and December 31, were elected continuous members:

McCormick, Mrs. Cyrus H., Chicago  
Borg, Miss Edith D., New York City  
Dodge, Miss Grace H., New York City  
Lewisohn, Miss Alice, New York City

Lewisohn, Miss Irene, New York City  
Mason, Miss Ida M., Boston  
Sommerich, Edwin, New York City.

The following contributors of sums above \$10 but under \$100 were elected annual members:

McGregor, Tracy W., Detroit  
Pratt, Frederic B., Brooklyn  
Twombly, John Fogg, Boston  
Eidlitz, Otto M., New York  
Evans, Mrs. Glendower, Boston  
Herter, Mrs. Christian A., New York  
Hazard, Miss Caroline, Pasadena, Cal.

Seager, Henry R., New York  
Speyer, James, New York  
Weyl, Mrs. Walter E., New York  
Danenhowser, Mrs. John W., New York  
Jenks, John Story, Philadelphia  
Hill, Fred B., Northfield, Minn.

The following co-operating subscribers, whose contributions for the new fiscal year were received on or before Dec. 31, were elected annual members:

Ach, Lee Edward, Cincinnati, Ohio  
Adler, Dr. Isaac, New York City  
Adler, Isaac, Rochester, N. Y.  
Allaben, Marshall C., New York City

Alling, Mrs. Joseph T., Rochester  
Anderson, F. F., Merriam Park, Minn.

## THE PITH OF IT

**J**USTICE Blackmar, in the Supreme Court, Brooklyn, last week, upheld the New York fifty-four-hour law for women. The case will be appealed. Said Justice Blackmar: "Laws which may be meddlesome interferences with the liberty of the individual in a primitive state may, in a highly organized society, become essential to public welfare, or even to the continuance of civil liberties themselves."

**A**LEXANDER Johnson has resigned the general secretaryship of the National Conference of Charities and Correction to become head of the new extension department at the Vineland (N. J.) training school for the feeble-minded. P. 487.

**G**OVERNOR Sulzer, it is declared, has set out to make New York the healthiest state in the Union. Pointing out the large number of deaths due to preventable diseases and the annual toll of epidemics, he appointed a commission last week to investigate various matters of public health from both a remedial and administrative standpoint. Dr. Herman M. Biggs, general medical officer of the New York City Health Department, was made chairman; Homer Folks, secretary of the State Charities Aid Association, was made secretary and John A. Kingsbury, general agent of the Association for Improving the Condition of the Poor, assistant secretary.

## THE COMMON WELFARE

### A NEW FORCE IN THE WAR ON FEEBLE-MINDEDNESS

Alexander Johnson has resigned the general secretaryship of the National Conference of Charities and Correction to become the head of the new Extension Department of the Training School for Feeble-minded at Vineland, N. J. His resignation will take effect as soon as the executive committee of the conference fills his place, or at latest immediately after the close of the fortieth conference in Seattle. The department at Vineland of which he is to take charge constitutes a new method and weapon of attack upon the racial and social evils of degeneracy. So far as is known it is the first organized scheme for spreading far and wide the facts as to the prevalence and effects of feeble-mindedness, and for carrying on a persistent propaganda in behalf of preventive measures.

The Training School at Vineland is primarily an institution for the care and education of feeble-minded youth. Under the superintendency of E. R. Johnstone, extensive researches have been made into the causes and hereditary nature of mental abnormality. By tracing back, through personal visits to the homes by field workers, hundreds of genealogies; by comparing like and unlike matings and charting their succession of offspring; and by intensive study of individuals, the department of research, under the direction of Henry H. Goddard, has brought together a mass of data from which it is now felt reliable deductions can be made and on which preventive measures can be safely based.

To supplement this laboratory of research the

new extension department comes as a publicity and propagandist agency. The hypotheses and proposals which enter into its program are somewhat as follows: There have been three stages in our modern thinking about feeble-mindedness. In the early days it was held to be entirely possible, by careful training, to fit the feeble-minded boy or girl to take a normal place in the work of the world. After that hope was dashed it was believed that society had discharged its full obligation to its defectives and itself when it had segregated all the obviously feeble-minded in institutions and appropriated sufficient money for their comfort during life. Presently it was discovered, however, that the ordinary processes of commitment reached only a few of the pronounced cases, and that there were in addition great numbers of border-line people, whose abnormality could be detected only by elaborate tests and who yet constituted a real menace to the purity of the human stock. In addition, it was learned that the increase among the feeble-minded is much more rapid than that of the whole population. English figures place the birth rate in normal families at 4 and that among the feeble-minded at 7.3. Mere custodial care of flagrant instances was therefore seen to offer no hope of even keeping up with the evil. Then it was that the vital need of stopping feeble-mindedness in its sources became manifest. Bad strains, it was concluded, must be prevented from continuing themselves.

So far the scientist and investigator went, and for this much they were sufficient. But now comes the need for telling the world what is

known about this menace to it. The very classes among whom the evil exists are perhaps most in need of the information and, in some respects, hardest to reach. Here is a task, then, of constantly dinning unpleasant subjects into the public ears—ears often closed to that which needs technical explanation. It will not do simply to convince the intelligent members of society that their feeble-minded fellows must be shut up where they can have no offspring. By that method you leave all the normal people with defectiveness in their ancestry quite free to transmit to the next generation a new body of imbeciles to be in their turn detected and closeted away. It is a problem, therefore, of putting a new law in the moral code, of saying to men and women: "Just as none of you would now marry a brother or sister, so you must come to think of it as a crime and a sin—a sin against your race—to marry into a strain that shows feeble-mindedness in its past."

In so far as this is a task of publicity and education, it will fall to the scope of the new extension department. In giving the widest possible circulation to the facts of mental degeneracy, in originating practical measures of prevention, and in securing their adoption, the department is expected to do its most distinctive work.

#### SOME PLANS FOR PRESENT ACTION

The new department has been made possible by the contributions of individuals interested in the work of the Vineland School, particularly in the problems of eugenics. It will try to co-operate effectively with all agencies now engaged in related activity, such as the eugenics department of the American Breeders' Association. It is declared that care will be taken to avoid duplication of work being done by other organizations and that in its publications and tracts credit will be given to original sources and investigations.

Those connected with the department have been slow to prophesy large things for it. Some details of the immediate work to be undertaken have been determined, however. On the educative side it will maintain a lecture bureau through which addresses on matters relating to feeble-mindedness will be given wherever local interest is sufficient to provide halls, audiences and traveling expenses. A tour throughout many southern states made this winter by Mr. Johnson in the interests of the National Conference revealed a marked demand for just this sort of service. As a further educative measure, it is expected that moving picture films will be prepared, illustrating present ways of

caring for and studying the feeble-minded, such as methods of making tests, feeble-minded children at play and at work, dances, school gardens, etc. In addition to the publication of *The Training School*, a pamphlet which the Vineland institution now issues monthly, a news bureau will be conducted. This will furnish newspapers and magazines with timely copy on all the subjects included in the scope of the department. A third bureau, one of information, will be maintained and will be free to all who wish to make inquiries of it.

In order to conduct these bureaus, information will be drawn from every available and reliable source. A systematic correspondence is to be carried on with graduates of the teachers' department of the school, as well as with all other institutions for the feeble-minded, here and abroad. In this and other ways it is hoped to collect and analyze a large number of individual cases, including photographs, life histories, pedigrees, Binet tests, etc. These will be secured from the widest possible radius and will be studied with a view to the discovery of unknown facts about the nature of mental defectiveness. It is expected also to conduct tests of children in various cities, the work to be done by experts sent out from the department. These experts will also instruct school principals and others in the method of making tests.

Active propaganda will be carried on in states which now make no provision for their feeble-minded residents. Among these are Alabama, Arizona, Arkansas, District of Columbia, Florida, Georgia, Idaho, Louisiana, Mississippi, New Mexico, Oklahoma, South Carolina, Utah, Vermont, Wyoming, Montana, Nevada, Oregon, Tennessee, and Texas.

The laws of the different states dealing with the feeble-minded, epileptic, insane and other defectives will be collected and compared. Especial attention will be paid to laws on marriage and sterilization.

One of the most interesting of the experiments which the department will make will be its attempt to demonstrate scientifically the economic value of the labor of the trained imbecile. This will be based on work now being done at Rome, New York; Templeton, Massachusetts; Fort Wayne, Indiana, and other places. It will be completely separated from the educational and custodial work for the feeble-minded and most of the labor will probably be utilized in clearing, grubbing and draining rough land, planting trees, and in growing, canning and drying fruit. It is not the intention of the department ever to employ a large number of persons in this way, but simply to demonstrate what can be done with a small group, probably seventy-five or a hundred.

## THE MAN AT THE HEAD AND WHY HE WAS CHOSEN

Mr. Johnson, who has for many years been a contributing editor of *THE SURVEY* and is one of the best known men in the field of social work today, was chosen to direct the new activity at Vineland partly because of his ability as a lecturer of great dynamic power and partly because of his successful administration of the Indiana School for Feeble-minded Youth at Fort Wayne. During the ten years of his superintendency there, which ended in 1903, he pioneered in utilizing the labor power of the able-bodied feeble-minded adults. Particularly notable was his demonstration at that time of the extent to which the higher grades of imbecile could be trained to useful work, such as building, farming, brick-making, etc., under proper supervision with such efficiency that many were able to support themselves entirely so long as they remained within the custody of the school. His experience there enabled him also to enter the lists as a champion of remedial legislation. In those days people were just waking up to the crucial importance of the feeble-minded woman of child-bearing age in any program of prevention. Many of the old school shook their heads, therefore, when Mr. Johnson drafted and aided in putting through the legislature a measure that opened the doors of his school to women not over forty-five. The previous age limit was eighteen.

It was largely at Fort Wayne that Mr. Johnson learned also the statesmanship of institution management. It was this training which the Russell Sage Foundation called on when it recently turned to him to write its book on the significance and administration of the almshouse. Mr. Johnson has many times conducted the courses in institution management at the New York and Chicago schools of philanthropy. Of the former he was associate director from 1904 to 1906.

Between 1884 and 1886 he was general secretary of the Associated Charities of Cincinnati, and for the next three years held a similar position with the Chicago Charity Organization Society. During those years he acquired that experience and acquaintance with modern philanthropic theory which fitted him to become in 1889 the first secretary of the state board of charities of Indiana. It was largely due to Mr. Johnson's conception of the relationship which a board with advisory powers should bear to the institutions under it, and to his ability to make such a body a real and sympathetic force in their administration, that Indiana became a leader in the movement to secure effective and intelligent classification and treatment of society's defective wards. There, too, Mr. John-

ALEXANDER JOHNSON

Who is to head a forward movement in the prevention of feeble-mindedness

son first saw the possibilities of systematic publicity, of that systematic co-operation with the censors of the people's information which is essential to the highest efficiency of any public business. Ernest P. Bicknell, national director of the American Red Cross, was then one of a group of newspaper reporters in the state capital who worked closely with Mr. Johnson in letting the folks throughout the state know what was going on in their own institutions.

But it is as general secretary of the National Conference, and through his lectures and writing, that Mr. Johnson has become most widely known in the social field. When he entered on the work of the conference eight years ago he took hold of a membership of 1373. He will leave it with a membership of 3500. At that time it was just beginning to widen its horizon beyond the fields of organized charity and institution management to take in the newer forces that were gradually being brought to bear on social conditions. Today it is perhaps the most virile and far reaching of the national non-propagandist humanitarian bodies. Its awakening effect on the people of state and city where its annual session is held is such that a dozen places often vie with each other in the effort to secure its next meeting.

For the past few years Mr. Johnson has lived on the shore of an Indiana lake, where he owns a small farm which he named Yggdrasil. His office was situated in Angola. His new work will require his removal to Vineland.

#### FEDERAL MONEY FOR VOCATIONAL SCHOOLS

It is likely that the fate of the Page-Wilson bill, which grants federal aid to the states to promote vocational education, will be settled some time between January 20 and February 1. During the past three weeks mayors, school principals and superintendents, agricultural bodies, and national, state and local commercial and industrial associations have rallied strongly to its support, as had been previously done by most of those engaged in furthering vocational education for boys and girls over fourteen years. The bill is on the calendar of the United States Senate for early action and the hopes of its friends have risen high. It has met with the opposition of those who do not like to see a further expansion of federal activity as well as of those who are against its specific proposals.

This measure, which has the endorsement of the National Society for the Promotion of Industrial Education, grants such specified sums of money for successive years, beginning in 1913, that by 1921 the total annual expenditure under it will be, for the federal government, about fourteen and three-quarters millions. For every dollar which the national government thus appropriates, the states themselves or the local governments are required to spend another dollar of their own.

The bill provides both for the instruction of children and the training of teachers, as follows:

1. For training teachers to give instruction in agriculture, industries and home economics it gives \$480,000 a year to state colleges of agriculture and mechanical arts and \$1,000,000 a year to normal and other training schools. It is the intention that most of this money shall go to schools now in existence. This grant takes effect in 1913.

2. For the operation of schools which shall give instruction in agriculture, industries and the household arts the bill gives \$9,000,000 a year. These may be all day, part time or evening schools. This grant takes effect in 1916. It thus becomes available three years after the sum for training teachers, the purpose being to provide a period of grace in which to prepare teachers for the job.

3. A million dollars is granted yearly to branch stations which shall provide demonstration work in agriculture. This sum becomes available in 1916.

4. For the purpose of extension teaching the

bill grants to state colleges of agriculture and mechanical arts a half million dollars in 1913. By the provisions of the measure, this sum would increase to \$3,000,000 in 1921.

#### THE QUESTION OF THE DUAL SYSTEM

The most discussed administrative question in the establishment of vocational education today is the question whether this education ought to be carried on as a separate and distinct system of public instruction, or whether it ought to be engrafted on the present public school system and incorporated in its curriculum. This is the mooted question of the "dual system." Wisconsin stands for the dual plan but the trend among those states which have lately made provision for vocational instruction seems to be toward incorporating the work in the existing system. In a few days we shall know what attitude is taken towards this most important question by the board of managers of the National Society for the Promotion of Industrial Education. At the recent annual meeting of this society<sup>1</sup> a committee of manufacturers, teachers, social workers and vocational guides drew up a tentative statement of principles and policies and urged its adoption upon the board of managers. This statement declared that the work in vocational education, whether administered by regular public school authorities or a separate board of control, and whether conducted in a separate building or under the same roof as the regular school, should be carried on separately and independently from that of general education, so that it may be left free to realize the dominant aim of fitting for useful employment. This, the statement continues, requires a separate organization, under a separate head or a distinctive management, and separate equipment, courses of study, pupils and teachers who shall have had extended experience in the industries they are employed to teach.

The Page-Wilson bill allows each state to solve this problem for itself. Under its provisions each state is required to have a state board for vocational education to administer the act. But the state can decide whether a new board shall bear this name or whether the name can be given to the old board. The bill then requires this board to formulate its own plan for using the funds made available by the act. This plan is to be submitted to the secretary of the interior. It will probably be passed upon by the commissioner of education under him. If the secretary approve the plan, the state board then becomes the highest power in putting it into effect. Only if changes are later made in

<sup>1</sup>See THE SURVEY for Dec. 14, p. 321.

this fundamental working scheme can the secretary of the interior again interfere in the autonomy of the state board. He can, however, check up the use of funds by this board and if he finds them misapplied can withhold the misused sum from the next year's appropriation.

#### TRAINING FOR THE WORKER OF TOMORROW

The supporters of the bill believe that it has thus struck the necessary balance between that freedom which the state must have to meet its own needs and the right of the federal government to see that money appropriated by it is wisely spent. They hope that the commissioner of education will insist that well recognized principles in the establishment of vocational education be applied by each state. His office it is thought would naturally become a clearing house of information as to what all of the states are doing in this field.

The friends of the act say that it is in a sense merely the logical extension, demanded by present industrial conditions, of the old Morrill Act. That measure, passed during President Lincoln's administration, granted money to the states to establish colleges in agriculture and the mechanical arts. Under its provisions every state has set up such a school, and sixteen southern states have established two such colleges each. It is to these schools that the Page-Wilson bill grants money for training teachers and for extension work. The training given in these schools must be of college grade. Until lately few of their graduates actually went back to the farm, most of them entering research work instead although the colleges are now showing a tendency to broaden out and to do extension work among farmers. The Page-Wilson bill thus, in effect, extends the scope of the Morrill Act to include the training of the youth of the country, the farmers, home makers and industrial workers of tomorrow.

Another measure before the Senate is the one known as the Lever bill. This also grants federal money to the states for vocational instruction. It does not require the states to meet these sums with like amounts of their own. It is pointed out that while the Lever bill gives money only for extension teaching among mature farmers the Page-Wilson measure is interested chiefly in training the young; and friends of the latter say, further, that in providing extension teaching for farmers only, the Lever bill neglects the towns and cities. It is the view of these people that something must be done to meet the problems of practical education of the great mass of industrial workers in the centers of population. A dozen different inquiries have shown recently that the fourteen

year old child who leaves school to find a job in the city is ill trained, ignorant of his own aptitudes and totally unfamiliar with the needs of industry. The result is that many children spend the next three or four years of their lives shifting from one profitless occupation to another, without advancement and without educational benefit. To set going a nation-wide movement to face and solve this half economic, half educational problem is the proposal of the Page-Wilson bill; its ultimate aim, to fit boys and girls to pursue profitable occupations with advantage both to themselves and to society. The method it suggests, namely, using federal funds to stimulate state activity by offering them to only those states which would spend equal amounts and meet certain tests of performance, is very similar to the method by which some of the states carved out of the Northwest territory have used their school land funds to induce towns and counties to build public schools and keep them up to standard.

#### THE NEEDLE TRADE STRIKES IN NEW YORK

The long unrest in the needle trades of Greater New York which showed itself in the dramatic strikes of shirtwaist makers and cloakmakers in 1910 has come to a head again this year. A general strike was declared on December 30 by practically all the unions in the different processes of men's tailoring and after mass meetings on January 5 and 6, the ladies' waist, dress, kimono, wrapper and underwear workers followed suit by voting to quit work on January 9, 10 and 15. The strike movement involves over a hundred thousand persons, most of them members of the unions in the United Garment Workers of America (men's clothing workers) or of one or another of the unions affiliated with the International Ladies' Garment Workers.

One union in the latter affiliation is not involved in the strike. This is the Cloak, Skirt and Suit Makers' Union. Their strike in 1910 was settled under the so-called protocol<sup>1</sup> which provided for permanent collective bargaining between a thoroughly organized body of employers and a strong union, which created a joint board of sanitary control and an arbitration board, and which put representatives of the public on both. The plan also provided the novel feature of the "preferential shop," which makes it to the advantage of a worker to belong to the union, but which does not in principle exclude the non-union man from employment. Under this regime the union has grown until it practically includes all the workers in the trade to the number of 70,000. The manufacturers' organization includes the greater share of the 1,200 shops in the

<sup>1</sup>See THE SURVEY, September 11, 1910.

city. For here, as in all these garment trades in New York, the separate establishments run into as large numbers as do the work-people making up a union, in one of the smaller cities.

While in this one branch of the garment trades a peaceable entente has been grounded for two years on strong organizations both of employers and men, the other branches present practically the same situation as was true in all up to two years ago.

In the shirtwaist industry the history of the past two years affords a marked contrast to that of the cloak trade. A waist makers' union of 40,000 members sprang out of the strike of 1910. But this strike was settled on no such permanent basis for collective bargaining between employer and worker, with the result that only 5,000 members remained on the rolls at the outset of the present strike movement.

### THE MEN'S TAILORS AND THEIR DEMANDS

The present strike is the first general strike of the men's tailors in New York since the complete defeat in 1904 of the United Garment Workers of America, when 30,000 struck against the open shop policy adopted at that time by the National Association of Clothiers. A two weeks' agitation preceded the present strike, which was called by an overwhelming referendum vote in favor. Both before and since the strike began, the union membership has increased by leaps and bounds from the original 20,000 on the rolls at the beginning of December.

Of the number of tailors already on strike it is possible only to conjecture. The New York Clothiers' Association, representing 35 per cent of the manufacturers, estimates the number out 50 per cent lower than the union officials, possibly because this organization represents the best shops where the response to the strike call has been slowest. The many empty shops and the two score crowded strike headquarters, each day more densely crowded, show no small body on strike, and the body has so far shown steady increase day by day. There have been skirmishes between police, strikebreakers and strikers, and intimidation is claimed by some of the employers as the reason for the emptying of their shops.

Conditions in regard to subcontracting and pay for piece work are, according to the statements of both sides, much the same as those made familiar by the strikes of 1910 among the cloak and shirtwaist makers. Of home work there is said to be considerably more than in the two other trades. The union demands

"The abolition of the subcontracting system.

"The abolition of foot power.

"That no work be given out to be done in tenement houses.

"Overtime to be paid for at the rate of time and one-half, double time for holidays.

"A forty-eight-hour work week.

"A general wage increase of 20 per cent for all the workers in the garment industry.

"The following scale of wages:

"Operators—First class, sewing around coats, sewing in sleeves, and pocket makers, \$25 per week; second class, lining makers, closers, and coat stitchers, \$22; third class, sleeve makers and all other machine workers, \$16.

"Tailors—First class, shapers, underbasters and fitters, \$24; second class, edge basters, canvas basters, collar makers, lining basters and bushelers, \$21; third class, arm-hole basters, sleeve makers, and all other tailoring, \$17.

"Pressers—Bushel pressers, \$24; regular pressers, second class, \$24; underpressers and edge pressers, \$18.

"Women and Child Workers—Button sewers and bushel hands, \$12; hand buttonhole makers, first class, 3½ cents; second class, sack coats, 2½ cents; feller hands, not less than \$10 a week."

Recognition of the union is implied by the presentation of union demands. There is, however, no demand for the closed shop. Whether this will come as the strike progresses or whether its omission will leave a loophole for a protocol, as in the cloakmaking industry, remains to be seen. As yet efforts at mediation in any form have been unsuccessful, though the State Board of Mediation and Arbitration, the Chamber of Commerce and the International Peace Forum have all offered their services. So far neither the union or the employers' association expresses any strong leaning toward the protocol agreement, but it is freely said that some individual employers favor it, and there is a small but growing agitation for the protocol throughout the needle trades.

### WILL THERE BE MORE PROTOCOLS

The question of adapting the protocol agreement of 1910 to men's wear and other branches of the garment industry has been raised pointedly by the present strike. Though it is too early in the strike to predict such protocol agreement, it is a significant fact that Meyer London, attorney for the Cloak Makers' Union, and one of the framers of their protocol, is also attorney for the United Garment Workers, and that the independent manufacturers, who do not belong to the New York Clothiers' Association, have recently organized and chosen Julius Henry Cohen, attorney for the cloak manufacturers, and like Mr. London, a father of the protocol, as their attorney.

The New York Clothiers' Association, which is made up of the larger and stronger establishments in the tailoring trade, is opposed to the

preferential shop as being nothing but in practice a closed shop, and is opposed to recognizing the union. Eugene S. Benjamin, president of the association, is quoted as follows in the *New York Times*:

"We wish to let it be known that while all members of the associations allied with us will meet and discuss higher wages and shorter hours with their employes as individuals, none will recognize the union. So far as we are concerned there has been no step toward a settlement. Even if a few manufacturers undertook to grant an immediate increase in pay of 5 per cent they couldn't keep it up more than a week under the present conditions of competition unless all the operators fell into line."

His position has been challenged by Mr. Cohen, representing the new association, who claims that the latter, the United Manufacturers, will have all the business of the rival association in two years if it persists in rejecting the proposal submitted to the union.

Mr. Cohen said:

"It is ridiculous to say that a 'protocol' will not work in the clothing industry. The Century Dictionary definition of 'protocol' is: 'A diplomatic document or minute of proceedings signed by friendly powers, in order to secure certain diplomatic ends by peaceful means.' Will such a document carry injury? What the Clothing Trades Association professes to stand for is: 'No peace, no attempt to obtain adjustment of difficult situations by diplomatic means, but steady warfare—smash the union, and everything will be all right.' If the public agrees with this policy, let it say so. If the public agrees with the policy of arbitration, let it say so. We are willing to abide by the consequences."

"The line-up is very clear. On one side is a group of manufacturers who are willing to arbitrate and who are willing without surrender of principle to obtain permanent peace. On the other a group of manufacturers who frankly are anti-union and refuse to arbitrate. Where does the third party—the public—come in?"

The walkout of the waist-makers and white goods workers was not at once accompanied with a general formulation of demands. Here, also, the movement for a protocol is gathering head, complicated, though it is by the fact that unlike the cloak makers, a majority of the workers are young girls, difficult to hold in a dependable organization.

These unions in the International Ladies' Garment Workers have appointed Gertrude Barnum special protocol agent, and she is conducting a systematic lecture and leaflet educational campaign. At the mass meeting of January 5, the general organizer of the International, John Dyche, hinted at the obtaining of a protocol as one of the objects of the strike agitation, and on the employers' side in these trades the waist manufacturers have recently engaged Julius Henry Cohen as their attorney.

## THE SOCIAL WELFARE AMONG LEGISLATORS

"Mr. Speaker, I move that this bill be referred to the Committee on the Social Welfare."

This is likely to be a much used expression in the Massachusetts House of Representatives during the session just begun, for a new legislative committee bearing this name has been created. It came in response to a recommendation made in his opening address by Speaker Grafton D. Cushing, who wants to see "continuous and carefully planned improvement in social conditions" in his state. To the Committee on the Social Welfare will be referred "bills and petitions dealing with the welfare of the individual in his relation to the state and to society." Such matters now are scattered among diverse committees of the legislature and do not receive, thinks the new speaker, the thorough and connected consideration to which their importance entitles them. Similar recommendations were made to the Senate upon its organization, and the House and Senate both acquiesced in the suggestion and created the joint committee which was appointed as follows:

William A. L. Bazeley, of Uxbridge; Samuel Ross, of New Bedford; Charles F. McCarthy, of Marlborough, on the part of the Senate; William M. Armstrong, of Somerville; George D. Chamberlain, of Springfield, Allison G. Catheron, of Beverly; George H. Ellis, of Newton; Windsor H. Wyman, of Abington; Michael J. McEttrick, of Boston; John J. Conway, of Boston, and Edward F. McLaughlin, of Boston, on the part of the House.

So important in the mind of the "great and general court" is this committee that the speaker of the House and the president of the Senate will often meet with it—an almost unheard of procedure. In giving the basis for his advocacy of the new committee, Speaker Cushing emphasized the unmistakable indications given by the election of 1912 that the people are vitally interested in legislation for the social welfare. He regarded this as an opportune time, he said, to crystallize this public sentiment into concrete action, and to organize such proposed legislation into a definite program. Massachusetts, he said, already occupied an advanced position in her treatment of such subjects and he hoped that her rank would be maintained.

In its membership, the Committee on Social Welfare is representative not only of the legislature but of the state at large. Its chairman, Mr. Bazeley, declares that he has brought to the winter's work an open mind. Mr. McCarthy has the experience of his four years' membership in the house. In the appointment of Mr. Ross, President Greenwood of the Senate emphasized one of the underlying ideas concerning the new committee—that it should rigidly corre-

late the work of the traditional standing committees; Mr. Ross is chairman from the Senate of the joint standing committees on labor and education. In public life since 1892, he has been a pioneer in pushing labor legislation. He is now president of the National Spinners' Association and active in the management of the craft unions of New Bedford. Mr. Armstrong, "house chairman," also illustrates this policy of correlation for he is a member of the joint committee on education. This is his fourth year in the house. At home in Somerville he is active in the Y. M. C. A. and kindred organizations.

To the readers of *THE SURVEY*, Mr. Chamberlain of Springfield, is known as the chairman of the Council of Federated Boys' Clubs. In addition to his work with the national society, he has been for twenty-five years the leading spirit in the Springfield Boys' Club. He was president of the Playground Association of Springfield and later, as chairman of the playground committee of the Springfield City Council, was instrumental in the adoption by the city of that work as one of the city's activities. He is one of the trustees of the International College of the Y. M. C. A. and chairman of the Public Improvement Committee, which represents the social-mindedness of the Springfield Board of Trade. Mr. Catheron, a young lawyer of Beverly, is president of the Beverly Society for Prevention of Cruelty to Children. "As foe of the 'three decker,'" he has been effectively interested in housing. In Swampscott and Beverly he is active in the work of such organizations as the Good Government Club, Y. M. C. A., and boys' clubs. Mr. Ellis was the author of the milk bill which passed the legislature in 1910 and 1911 to be vetoed each time by Governor Foss. He has been president of the United Typothetae for many years. His interest in educational affairs is evidenced by his trusteeship of the Massachusetts Agricultural College and Simmons College. After a legislative service of many years, he is now chairman of the committee on railroads, and a member of the committee on labor. The opportunity of the Progressive Party to stand for their social program is represented in the appointment of Mr. Wyman. He is a member of national organizations concerned with peace and child labor and of the Y. M. C. A.

Mr. McEttrick, who, as the member of the House oldest in point of service, this being his twelfth term, called it to order at this session, is the most picturesque figure on the committee. He has for many years been an outspoken champion of certain lines of humanitarian legislation, particularly public education and measures relating to women and children. He has seen Negroes sold in the New Orleans market, and witnessed the dragging of Anthony Burns through Boston streets, but he is quoted as de-

claring that there are present industrial conditions much worse than Negro slavery. After an adventurous life as a plainsman, and incidentally the winner of the long distance pedestrian championship of the United States, he was elected to Congress as an Independent. Now he is nominally a Democrat, but in his mind organization is of secondary importance to "legislation for the common welfare." Mr. Conway is a member of the Ways and Means Committee as well as of the Committee on Social Welfare.

As illustrations of the legislation which the committee will be called upon to consider the bills already introduced and referred to it can be cited:

To provide for an investigation of white slave traffic and like evils.

To provide for investigation of the employment of women workers in the commonwealth.

To provide for employment of prisoners in the improvement of waste land and in other outdoor labor.

Relative to appointment of agents by the board of prison commissioners.

To provide for a minimum wage for state laborers.

Three bills providing for old age pensions.

To provide for a maximum nine-hour day for women, in industries other than those covered by the present law.

To limit to five hours the labor of children between fourteen and sixteen years of age.

To investigate health, safety and general conditions in all industries.

#### STATE LABOR LEADERS AND SOCIAL LEGISLATION

A further illustration of the social legislation that will come before the new committee is afforded by the legislative program of the Massachusetts branch of the American Federation of Labor. Not only will its legislative committee present and back bills in the field which is often considered the only one that interests organized labor, but it will urge a great variety of social legislation. Among the measures is a bill to provide for city and town planning. Especial attention will be paid to the elimination of congested areas and to promoting healthful homes for wage-earners. Firm, also, is the hope that the legislature will take the first steps toward constitutional amendments providing for the initiative and referendum and for home rule for cities and towns.

In the domain of statutory law, the committee will seek to have the present eight hour law strengthened. The present measure, passed in 1898, is declared to be far from clear; it provides for referendum by which certain specified cities and towns can adopt the provisions of the act and if the act is so adopted the provisions of the law become obligatory upon them, but not

otherwise. This act was modified in essential particulars in 1908 and again in 1911. By a codification of the state law in 1902 and 1909, some of the features embodied in these respective acts were so rearranged that the eight hour law itself became ambiguous in its terms. They were left still more uncertain by rulings of the attorney-general. The present legislature will be asked to enact a bill which will remove these uncertainties and which will do away with the necessity for a referendum, and will make an eight-hour day standard for all laborers in the employ of the state or any county, city or town, or for any contractor executing contracts with the state or any county, city or town.

The present legislature will also be asked to extend the present fifty-four hour law to *all* women laborers employed in *all* industries. The legislative committee of the federation is divided in opinion as to whether or not its instruction relative to this bill definitely embraces women engaged in domestic service, although some healthful homes for wage-earners. Firm, also, of the labor leaders say that they would carry the provisions of the proposed law that far.

The committee further intends to urge limiting the labor of children between fourteen and sixteen years of age to five hours per day—a bill has already been introduced to that effect—and also proposes to make attendance in schools for the balance of the day compulsory upon such children. While the federation is not committed to additional action concerning this part time employment for such children, the vision of some of the labor leaders extends so far that unquestionably their next request will be to enlarge the functions of the present bureaus for vocational guidance, and to increase their powers. Moreover, they will propose that every employer of children between fourteen and sixteen be compelled to apply for his labor to vocational bureaus or to the constituted school authorities. They are advocates that the vocational bureaus should pay especial attention to the question of agricultural training and should try to divert new laborers from industries already crowded into agriculture, where they are so sorely needed.

The federation will seek to make the present child labor law uniform in all its provisions. It favors a pension for widowed mothers. In legislation more specifically relating to labor, it will seek to have enacted an anti-injunction bill; a peaceful persuasion bill, "to establish the right of a man, even if he is on a strike, to speak to other men"; the picketing bill, "to allow the strikers to state their case to men taking their places"; and the bill to facilitate the settlement of trade disputes and to decrease the number of strikes. It also hopes to have created a commission to make an exhaustive inquiry as to conditions of health and safety in all industries.

## REFORMS WANTED BY THE SPEAKER

In the course of his address Mr. Cushing took up in detail many of the civic and social improvements which he hopes to see made during the session. The existence at large of so many feeble-minded persons calls, he holds, for these steps:

"1. Provision must be made for the segregation of the defective delinquents discharged from our penal institutions. Chapter 595 of the acts of 1911 established departments for defective delinquents at the Reformatory for Women, at the Massachusetts Reformatory, and at the state farm. These departments have never been built.

"2. Additional accommodation must be provided at Wrentham, where the present buildings are now inadequate to care for the feeble-minded who are committed there.

"3. Plans must be made for a third institution for the feeble-minded in the central or western portion of the state."

Among other things the speaker said further:

"A reorganization of the prison commission is urgent, and an improved plan for the parole of prisoners, the classification of prisoners, and the development of prison industries.

"The success of the probation system is dependent on the intelligence and devotion of the probation officers. In all cities of 75,000 and over there should be juvenile probation officers. There should be women probation officers wherever conditions warrant, and authority should be given for the appointment of volunteer deputy women probation officers in all cases where suitable persons can be found to undertake the work.

"Hitherto the richness of our soil and the opportunities of an undeveloped continent have led us to look upon as remote many of the problems which have vexed older civilizations. The time however is fast approaching when the demand for certain forms of social insurance is becoming insistent. Piece-meal legislation is never satisfactory, and the far-sighted way of dealing with the subject is perhaps the authorization of an unpaid commission composed of able investigators who will study the results of the systems in operation in Germany, in England and in other countries, and report upon the advisability of a plan of social insurance against sickness, accident, death and unemployment. Such a report, if intelligently made, will be of incalculable benefit in shaping future legislation."

## LIMITING THE HOURS OF VERMONT WOMEN

The Vermont legislature has passed and the governor has signed a bill limiting hours of labor of women to fifty-eight a week. The bill also provides that no woman shall be employed within two weeks before or four weeks after child birth.

## BRINGING ORDER OUT OF CHAOS IN PENNSYLVANIA

When it was shown recently in Pennsylvania that a single hospital under private management had received a larger subsidy from the legislature than the Eastern Penitentiary, with an average of 1,400 convicts; that of \$16,000,-000 which had been appropriated at the last session to charitable and correctional institutions nearly half had gone to 273 agencies under private management, and that 263 of these were local in sphere and yet received over \$6,-000,000; and that there was almost no co-ordination or articulation among the state, county, municipal and private agencies that have been multiplying of late, some of which were declared to be positively superfluous<sup>1</sup>; the need was felt for some strong standardizing influence that should bring order out of the chaos, put the state's care of its wards on a non-political and scientific basis and act as the originator of new and modern ways of fighting the causes of poverty, degeneracy and crime.

To this end the Public Charities Association has been created. Its functions will be similar to those now exercised in New York state by the State Charities Aid Association, in New Jersey by the State Charities Aid and Prison Reform Association, and in Massachusetts by the Massachusetts Civic League. It thus becomes the fourth organization of the kind in a movement which, in the opinion of Homer Folks, secretary of the New York State Charities Aid Association, ought to spread to every state in the union just as the charity organization movement is spreading throughout the cities and towns of the country. It is just forty years since the first state charities aid association, that in New York, was formed. Created originally to remedy the bad conditions found in almshouses and public hospitals, this organization has shown the power of development in such a body by pushing back from effects to their causes until now it is carrying on preventive work against insanity, tuberculosis, inebriety, feeble-mindedness and other evils, of the same radical nature.

The Pennsylvania Association has already been underwritten to the amount of twenty-five thousand dollars. Its support will, it is expected, come entirely from private sources. County committees of the association will be organized in the principal cities. Through the committee on legislation an effort will be immediately made to secure united support for important measures of state wide scope. It is pointed out by those backing the new organization that Pennsylvania has no women's reformatory, no separate institution for feeble-minded women, no provision for inebriates, and

that its state hospitals for the insane are overcrowded. The initial platform of the association contains the following planks:

The elimination of "politics" from the state's charities.

The adoption of a sound state policy in making charitable appropriations—based on scientific standards and classifications.

The development of an adequate system of state institutions before extending aid to private local charities.

The segregation of all feeble-minded persons by 1920.

The adoption of preventive measures against insanity as an auxiliary to state care.

The removal of all children from almshouses.

The providing of adequate state or county care for the tuberculous.

The establishment of a state reformatory for women and the modernizing of county jails and prisons.

The adoption of more modern and scientific methods in dealing with inebriety and vagrancy.

The strengthening of probation work and methods, particularly for adult offenders.

The association will also undertake to keep the public informed by correspondence, publications and public meetings of social conditions in the state and of the requirements of its charitable, penal and reformatory institutions.<sup>1</sup>

## A BOARD THAT WILL CONTROL, NOT ADVISE

Largely in response to the same needs which have brought into existence the Public Charities Association an effort is being made in Pennsylvania to create a State Department of Charities, in place of the present State Board of Charities, whose powers are purely advisory. With the assistance of a committee of Philadelphia social workers a law for this purpose has been drafted by the legislative committee appointed in the spring at the Republican State Convention to carry out the platform promises of the party.

While it is the opinion of many that advisory powers such as are lodged in the Indiana Board of State Charities are, if thoroughly exercised, sufficient to secure a satisfactory administration of a state's charities, the framers of the Pennsylvania bill have thought that a peculiar situation exists in that state which renders powers of greater control necessary. One element in this

<sup>1</sup>The committee on organization, which, it is expected, will become the first board of managers of the association, is composed of: Vance C. McCormick, Harrisburg; Martha P. Falconer, Darling; Walter G. Smith, William Draper Lewis, Charles H. Frazier, George W. Pepper, Mrs. Louis C. Madelra, Louis Wolf, Asa S. Wing, and George Vaux, Jr., Philadelphia; Mrs. Edward Biddle, Carlisle; Frank B. McClain, Lancaster; Mrs. Enoch Raub, R. L. Little, and Allen T. Burns, Pittsburgh; Robert K. Young, Wellsboro; Charles B. Staples, Stroudsburg; James A. Lilen, Jr., Scranton; Henry W. Fuller, Wilkes-Barre; A. B. Farquhar, York; and William B. Buck, Philadelphia, secretary.

<sup>2</sup>See THE SURVEY, Nov. 30, page 252.

situation is that the recommendations of the present board have for some time been quite disregarded by the legislature. The board's suggestions in regard to management have been overlooked by the institutions over which the board is supposed to have supervision. Another element is the time-honored subsidy system already described.

The Department of Charities under the new law would be composed of a commissioner with a salary of \$8,000 and an unsalaried advisory board consisting of the commissioner of health, the commissioner of education and six members appointed by the governor for six year terms so arranged that eventually the term of one member will expire each year. The commissioner is empowered to appoint deputies to head four bureaus into which his department is divided, that of charity, of insanity, of reformation and of fiscal affairs. The deputy commissioner in charge of the last bureau, together with the superintendents of the various state managed institutions, constitute a board of standardization for effecting economical and uniform standards.

Upon the initiative of the commissioner the members of the board have the power to make rules and regulations relating to methods of care and management, of construction of buildings erected at the expense of the state, and for the treatment of patients, even to the question of admission and discharge. The yearly licensing of all private institutions according to standards prepared by the board is made obligatory.

The commissioner has plenary powers of inspection. Penalties of fine and imprisonment, one or both, are established in case inspection is refused by the managers of any institution, or in case the regulations of the board are not observed. It is the duty of the commissioner to prepare a budget for the legislature showing the amount needed by each state or private institution. The auditor general may pay no money to any institution without the approval of the commissioner. Severe penalties are invoked against any lobbying, direct or indirect, by the managers or friends of any institution.

Pennsylvania social workers who have been fighting the system of subsidy to private charities regret the omission from the bill of a clause limiting appropriations to privately managed institutions to maintenance only and upon a per capita basis. In view of the present sentiment throughout the state and the fact that a number of public hearings are scheduled at which the matter will be discussed, it is possible that this may be inserted before the bill is finally passed.

The bill further gives the power of semi-annual inspection to the newly organized Public Charities Association.

### DEMOCRACY AND THE ILLITERACY TEST<sup>1</sup>

JOSEPH LEE

#### I.

I believe that the bills now before Congress to exclude aliens who cannot read, or who cannot read and write, are of great importance to the realization of true democracy in this country.

We shall never have true social and political democracy until the lower standard of living and of wages can be raised far above the present level. It is not a question of a bare living wage but of wages on which not only physical existence but real life can be carried on. I believe the thing can be done. I think we can attain a far higher standard than we have so far even learned to aim at. And I believe it is going to be done. But this end will not be attained by simple legislative fiat. We are not going to get high wages simply by decreeing that wages shall be high. That sort of legislation began, so far as English-speaking countries are concerned, with the Statute of Laborers, back in the time of Edward III of England. The object of that statute was not to keep wages up but to keep them down. But with all the prestige and power of the governing classes of those days behind it, it utterly failed because the French wars had so cut down the supply of labor that the economic laws worked against it. The same has been the history of laws fixing commodity prices. If the thing could be accomplished so easily it would have been done long ago; and we should not stop with a living wage but provide that everyone should have comfort and even luxury while we were about it.

But we can get the desired result by working in accordance with economic laws. One of these is the law of supply and demand. There are limits in any country, at any given time, to the demand for unskilled labor. The wages such workers command will depend largely on the supply of them. So long as every rise of wages in this country operates simply to draw in unskilled labor from the inexhaustible supply at starvation level in the Old World, we shall never raise wages in this country very high. It is like trying to bail out the boat without first plugging up the leak, or rather—when the leak is as big as the steamship companies now make it—it is like trying to dig a hole in the surface of the ocean itself. In fact, the argument most commonly used for unrestricted

<sup>1</sup>Argument against the literacy test was presented by Miss Addams in *THE SURVEY* of January 4, p. 419, under the title *Pen and Book as Tests of Character*.

immigration is that it is necessary for the development of our industries, that is, to keep wages down and to encourage enterprises dependent on low-priced labor.

Secondly, restriction is necessary because it is impossible to assimilate foreign populations in unlimited quantities, and is becoming increasingly so, as each new layer of immigration comes in contact with American ideals at a constantly greater remove from the original. The net immigration in the past dozen years has probably been about six million or nearly twice as large as the number of people in this country at the time of the Revolution.

Restriction of immigration is necessary to the establishing of a democratic standard of wages and of living and to the permeation of the mass by American ideals.

## II.

The illiteracy test is the best method of restriction that has been suggested. A head tax has the disadvantage of partly impoverishing the immigrant. To wholly exclude any European race would be a poor method because there is no European race of which the best are not desirable. The critics of the illiteracy test have never suggested or attempted to suggest an efficient substitute.

A very curious argument, perhaps the commonest against the illiteracy test, is that it lets in some undesirables—that some bad men can read and write. This argument overlooks the fact that the adoption of this test does not exclude the retention or adoption of other tests. We restrictionists have succeeded in having certain of the least desirable classes excluded, such as the insane, the feeble-minded, convicted criminals, white slaves, the physically unfit to a limited extent, and persons likely to become a public charge. The present Senate bill contains clauses to make these exclusions more effective by stopping some of the holes that our liberal immigration friends have found, or made, in present laws. We shall be glad to help in any further practicable exclusion of the least desirable. Meantime it seems clear that if the illiteracy test is in other respects a good thing, it is not an argument against it that there are some evils which it does not prevent. It might similarly be argued against the prevention of tuberculosis that it is not also a cure for cancer. Indeed, the same argument might be used against the enactment of any law on any other subject.

Secondly it is argued that the illiteracy test will keep out some good people. So undoubtedly would any test. That result is unavoidable unless we are to face the alternative evil of the surrender once for all of American standards and American ideals. So also the African slave

trade brought in some good people. Booker Washington is a product of it.

Upon the whole the illiteracy test does exclude the less desirable and admit the more desirable. It would be justified as a selective measure even if positive restriction were not necessary to the preservation and advance of American standards.

Illiteracy itself is an evil in a democracy. I suppose that is why we teach our own children to read and write. At all events we in Massachusetts have been made to feel by recent events that people who cannot read a newspaper, or be reached by ideas through any channel except by words spoken in their native language, are thereby rendered less amenable to public opinion and less easy of assimilation. And illiteracy among those over school age is a handicap which usually lasts for life.

The illiteracy test excludes, upon the whole, those elements of Old World society that are the more backward and the less favorable material for democracy. Education and democracy have always gone hand in hand. It is the more forward and more democratic communities in the Old World that have established education, the more backward and less democratic communities that have not done so. It may not be the fault of the individual in the latter kind of community that he has never learned to read; but it is the fault of the community itself and an indication of the amount of progress its people have made through all the centuries in democratic government.

Italy affords an instance of the sort of selection that will be made. The illiteracy test will exclude only some 5.6 per cent. of the north Italians, the race that produced Columbus, Dante, Michael Angelo, Garibaldi, Mazzini and Cavour. It will, on the other hand, exclude about 42.8 per cent of the very different race of southern Italy, the race that, whatever its merits in other respects, has made, or submitted to, the successive governments of Sicily and Naples, and whose most notable political and social institution of the present day is the Camorra. The illiteracy test, again, will exclude only from 1 to 2 per cent of the Germans, the Scandinavians, and the inhabitants of the British Isles; while on the other hand it will exclude some 32 per cent of the people of southern and eastern Europe whose most stable and characteristic political achievement has been the Russian Empire. Which of these two classes would the reader choose if he were starting out to select material for a democracy—the people of Florence, Genoa and Lombardy, or those of Sicily and Naples; the German burgher or the Russian peasant?

And what will be the effect of the exclusion upon the American stock as it was transmitted to us? Longfellow wrote of the settlement of

New England that "God had sifted three kingdoms to find the wheat for this planting." The old stock, North and South, was largely of the cream of the English nation, drawn off at its greatest period. I cannot believe that the average unlettered citizen of Sicily or Naples is its equal in the matter of carrying on successful democracy.

## "I BEG YOUR PARDON"

C. L. STONAKER

General Secretary, State Charities Aid and Prison Reform Association of New Jersey

*[From a half dozen states recently have come rumblings of an aroused public interest in the constitutional right of the chief executive to pardon state prisoners. In some cases these have been attended by pronounced views on the advantages of pardon boards. Because of his seven years' experience as executive clerk to the Colorado pardon board THE SURVEY turned to Mr. Stonaker for a review of the present situation.—Ed.]*

The ethics of politeness requires us to say: "I beg your pardon" whether we really mean it or not. It implies that we are in the wrong, that we think we are wrong or that someone thinks that we are wrong. It implies forgiveness. It overlooks the automatic rule of cause and effect. It is an admission that we are not Spartan, but Christian. The thief on the cross was pardoned.

The dominant idea of a pardon is forgiveness rather than justice, mercy or extenuating circumstances. It is an admission that human nature is prone to error no matter how we may attempt to safeguard our courts. And courts do err. Not wilfully, not stupidly, not ignorantly, not carelessly, not by being imposed upon somewhere in the course of legal proceedings, but somehow and somewhere there has been a break in the chain. "Man is prone to error as the sparks fly upward."

Even a governor upon whom rests this burden to grant forgiveness may do wrong in his attempt to correct a wrong: He may forgive unwisely and against the peace and order of society. Any attempt to justify a pardon is liable to cause a governor trouble. The governor of Arkansas believed that his state was doing a great wrong by continuing its system of sentencing men to prison camps. He could not await the slow process of a development of public opinion to cause the overthrow of the system, and he decided to take advantage of the right granted him to pardon the men compelled to work in those camps under the system. If he and succeeding governors of that state continue to grant pardons as freely as he has done, the people of the state will the sooner decide to change the system.

The governor of South Carolina is threaten-

ing to exercise his right to grant pardons in order that he may obtain reforms in the conduct of the prison in his state. He threatens to depopulate the penitentiary in order to protect the prisoners from what he calls a "tuberculosis incubator." He also looks with a baleful eye upon the hosiery mill. He, too, cannot wait for the people of his state to catch up with him.

The recent governor of New York apparently had a more or less muggy idea that our criminal code and our criminal procedures in the courts were not measuring up to the standard of our times. He is a man of commercial affairs rather than one grounded in the niceties of jurisprudence. He thought a convict innocent of a crime for which the prisoner had already served a term of many years (during which time the convict had exhausted every legal means to secure a correction of a legal wrong as believed by that convict), and that the pardoning power was created for the explicit purpose of permitting him as governor to pardon such a man. No one questions his right as governor to pardon that particular man, but we have the privilege of expressing an opinion upon the reason he gave for so doing. By declaring his belief in Patrick's innocence, he attacks the courts and judicial procedure. Patrick may be innocent of the crime of murder, but no review of his case by any of the courts has intimated any weakness in the court proceedings which ended in a jury's vote for conviction.

We are willing to accept a reasonable amount of justification in explanation of the exercise of the pardoning power. There was a time in the far West when horse stealing was a more serious offense against society than murder. Few horse thieves were pardoned. They seldom lived long enough to ask for pardon. It is no crime in most states for a man to desert his wife and family, but let him abscond with the bank's cash, and we will go after him even to Timbuctoo. The other day an old woman appeared in court with blackened eyes, a bruised cheek and a cut lip and asked that her only son be put away because whenever he was drunk he abused her. The judge's sentence was thirty days. A saloon was held up and money to the amount of several hundred dollars was assessed by the highwayman. He went up for seven years. The inequality of sentences by different judges for practically like offenses; the circumstances of a wealthy or influential prominent citizen as complaining witness against an unknown defendant, often an alien and without friends; the final conviction of one burglar in a community where many previous burglaries went by without an arrest; these and many similar conditions all appear at length when the governor is appealed to for pardon. Common sense arguments take the place of rules of evidence. A beautiful girl sheds tears for her brother all over the governor's rosewood desk,

and what governor can resist tears! Among 5,000 prisoners there must be a small percentage deserving of clemency. Five per cent of 5,000 is 250. It may be that society is not yet ready to forgive 5 per cent.

Shall we use the expression: "I beg your pardon" as a cant phrase, meaningless, hollow and cold, or do we sincerely, honestly and sympathetically ask to be forgiven for our transgressions? Do we wish to grant pardons to those who have offended against society? Do we wish to forget the enormity of the offense or do we wish to measure out the extent of the offense before we decide to forgive?

One of the "divine rights" of kings was the privilege of granting pardons. It may be that this pardoning power of a king was principally exercised in restoring political offenders to civil rights. It was a personal grace without rule or reason. No king had to establish a rule nor give a reason.

When they were making constitutions in this country, the framers felt that there must be lodged somewhere this right to exercise clemency, and so they uniformly lodged this right in the office of the chief executive of the state. It was as near as they could get to a king. If they had desired to have this power of granting pardons hedged about and safeguarded by rules of law and court practices, they would have lodged it somewhere in the judiciary. The fact that this has never been done by our constitution makers implies that they wanted to eliminate legal forms and orderly procedures so that quick action might be had.

However, setting all other things aside, the simple fact remains that our state constitutions place in the hands of our governors the unqualified right to grant pardons. Each governor may exercise this right in his own way and no one by any legal procedure can question a governor in the exercise of this right. It would require a constitutional amendment to change this situation. No state has yet done it, and so long as we continue to believe in the frailties of human nature, we will not abolish the pardoning power. Neither will we take it out of the hands of the chief executive of the state. By restricting the arbitrariness of the governor's right to grant pardons, we merely create a new court for a re-hearing and a re-trial of a cause.

The only thing we may hope to do is to help the governor in his duty, right and privilege. But in so doing, if we attempt to hedge it about by legal rules and restrictions, just so soon we create an artificial court of review, and thus make matters worse.

A number of states have attempted to assist the governor, to protect him from the clamors of prisoners who feel themselves aggrieved, to protect him from the wiles of paid attorneys or

scheming politicians, to shield him from vulnerable attacks upon his human weaknesses, by creating a council or board or court sitting with him to consider all appeals for clemency. No matter how this body is composed, the final decision must rest alone with the governor. In some states the position of a member of such a pardoning court carries with it a salary. In other states no salary is attached. In still other states subordinate state officials comprise this court. Meetings are held at stated intervals, monthly, quarterly or semi-annually. If meetings are held frequently, more time can be given to each individual case. At the last meeting of the New Jersey Court of Pardons 218 applications were on file for consideration. This represented the work of an executive clerk for something like six months, delving into the history of each case in an effort to present cogent facts in an orderly and somewhat systematic manner. If this clerk in his work should endeavor to confine his review of the facts simply to the story of the crime and the history of the trial proceedings, he would be taking upon himself the power of a court of review. But if he should gather facts regarding the past life of the applicant, facts of heredity, of social relations, facts relating to the conduct of the applicant while in prison, facts indicating the present mental poise of the prisoner, and finally any indications of penitence, remorse or hopefulness or promise for the future, he would then be able to submit to the Court of Pardons a brief summary that would enable them the better to advise with the governor and thus assist the governor to determine whether he shall grant a pardon or not.

When we in this country shall improve in our criminal court procedures, and when we shall have adopted in full spirit the real indeterminate sentence law and not, as in most instances, the present makeshift of a so-called indeterminate law, and shall properly and fully provide for wholesome parole, there will be little need for the governor of any state to exercise the right of pardon. What few cases finally would come to him could be duly considered by his board of advisors in a careful and thorough way; and probably to the general commendation of the public. Until we have the full indeterminate sentence, and a well equipped parole supervision, the governor of a state must handle as best he may the great number of appeals that come before him. So hedge the governor about by some form of advisory board, that he may not become too forgiving and thus upset the entire legal machinery of a commonwealth. The probabilities are that the average governor errs more often in withholding a pardon than in granting one. "To err is human, to forgive divine."

# INFORMATION

**CHILD LABOR**—National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

**CHILD HELPING**—Department of Child-Helping, Russell Sage Foundation, 105 East 22d St., New York. Correspondence and printed matter relative to institutions for children, child placing, infant mortality, care of crippled children, Juvenile Courts, etc.

**CONSERVATION OF INFANT LIFE**—American Association for Study and Prevention of Infant Mortality, 1211 Cathedral Street, Baltimore. Gertrude B. Knipp, Exec. Sec'y. Literature on request. Studies preventable causes of death and illness; urges birth registration, maternal nursing, parental instruction.

**SCHOOL HYGIENE**—American School Hygiene Association. Pres., David L. Edsall, M.D., Harvard University Medical School; Sec'y., Thomas A. Storey, M.D., College of the City of New York, New York. Yearly congresses and proceedings.

**MENTAL HYGIENE**—National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of the insane, social service in mental hygiene, State Societies for Mental Hygiene.

**MENTAL DEFICIENCY**—The American Association for the Study of the Feeble-minded publishes the proceedings and papers of its annual meetings in the Journal of Psycho-Asthenics. Address Dr. A. C. Rogers, secretary, at Faribault, Minnesota.

**EUGENICS**—Eugenics Record Office, Cold Spring Harbor, L. I., N. Y. (American Breeders Assoc., Eugenics Sect., Charles B. Davenport, Sec.). Membership \$2. a year. National repository of data on hereditary family traits. Schedules for family records furnished free. Advice as to suitable matings. Publications at cost. H. H. Laughlin, Supt.

**NATIONAL HEALTH**—Committee of One Hundred on National Health. E. F. Robbins, Executive Secretary, Room 51, 105 East 22d St., New York. To unite all the government health agencies into a National Department of Health to inform the people how to prevent disease.

**TUBERCULOSIS**—National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M.D., Exec. Sec'y. Reports, pamphlets, etc., will be sent upon request. Annual transactions and other publications free to members.

**SEX HYGIENE**—Society of Sanitary and Moral Prophylaxis, Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y. 22 affiliated societies. Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

**WOMEN IN INDUSTRY**—National Consumers League, 106 East 19th St., New York. Mrs. Florence Kelley, Gen'l Sec'y. 87 branch leagues. Reports, pamphlets sent on request. Minimum membership fee \$1.00 includes current pamphlets. Minimum wages boards, protection of women workers, pure food, sweatshops, etc.

**WORKING WOMEN**—National Women's Trade Union League, to better industrial conditions through organization and legislation. Information given. "Life and Labor," events in industrial world. Three months for 25c. Mrs. Raymond Robins, Pres., 127 N. Dearborn St., Chicago.

**EVENING CLUBS FOR GIRLS**—National League of Women Workers, Hotel Savoy, New York. Organizing Sec'y, Jean Hamilton. Recreation and instruction in self-governing and self-supporting groups for girls over working age. Monthly magazine—"The Club Worker," Twenty-five cents 1 year.

**YOUNG WOMEN**—National Board, Y. W. C. A., 600 Lexington Ave., N. Y. C. Official magazine: The Association Monthly. Pres., Miss Grace H. Dodge, Gen. Sec'y., Miss Mabel Cratty. The advancement of Christian Social Service. Free literature (all departments).

**HOME AND INSTITUTIONAL ECONOMICS**—American Home Economics Association, for Home, Institution, and School. Publishes *Journal of Home Economics*, 600 pp. per vol. \$2.00 per year. Conducts Graduate School of Home Economics. Meeting: Boston, December 31, 1912—Address, Roland Park, Baltimore, Md.

**SOCIAL CENTERS**—Division of Recreation of the Russell Sage Foundation, 400 Metropolitan Tower, New York City. A Survey of the School Centers of 1911-12, containing the latest information regarding their extent, the new civic developments, and the recent state enactments affecting them. Price 5 cents.

**RECREATION**—Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y. Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

**BOY SCOUTS**—National Headquarters of the Boy Scouts of America, 200 Fifth Ave., New York City. James E. West, Chief Scout Executive. Local Councils organized in principal cities, towns and counties. Literature on request. Monthly magazine, "Boys' Life" \$1 a year. Memberships: Associate \$3. Sustaining \$10.

**MUNICIPAL PROBLEMS**—National Municipal League 703 North American Bldg., Philadelphia. William Dudley Foulke, Pres.; Clinton Rogers Woodruff, Sec'y. Charters, commission government, taxation, police, liquor, electoral reform, finances, accounting, efficiency, civic education, franchises, school extension.

**CITY PLANNING**—National City Planning Conference, 19 Congress St., Boston, Mass. Frederick Law Olmsted, President. Flavel Shurtleff, Secretary. A Seminar for the Discussion of City Planning Problems. Publishes Annual Proceedings. Membership at \$5 a year Includes All Literature.

**THE SMOKE NUISANCE**—Send 25 cents, stamps or coin, for American Civic Association Bulletin on "Smoke Abatement: How to Organize for Pure Air; Model Ordinances, etc." Address American Civic Association, 914 Union Trust Bldg., Washington, D. C.

**SHORT BALLOT and COMMISSION GOVERNMENT**—The Short Ballot Organization, 383 Fourth Ave., New York City. Woodrow Wilson, President; Richard S. Childs, Sec'y. National clearing house for information on these subjects. Pamphlets free. Publishers of *Beard's Loose-Leaf Digest of Short Ballot Charters*.

**CHARITY ORGANIZATION**—Charity Organization Department of the Russell Sage Foundation, 105 E. 22d St., New York City. To study, teach and publish in the charity organization field. Pamphlets on family treatment, community study, relief, transportation, etc. sent free.

# DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but memberships not required of those seeking information. Correspondence is invited. Always enclose postage for reply.

**CHARITIES AND CORRECTION**—The Proceedings of the National Conference of Charities and Correction sent free to each member. **BUREAU OF INFORMATION** on any topic of philanthropy, penology and kindred subjects free to members. Alexander Johnson, Sec., Angola, Ind. Next meeting, Seattle, July 5, 1913.

**ORGANIZED CHARITY**—American Association of Societies for Organizing Charity. Francis H. McLean, gen'l sec'y., 105 East 22d St., New York City. To promote the extension and development of organized charity and of community co-operation in social programs in the United States.

**THE CHURCH AND SOCIAL SERVICE**—The Federal Council of the Churches of Christ in America operates through its Commission on the Church and Social Service. For literature and service address the Secretary, Rev. Charles S. Macfarland, 215 Fourth Ave. (at 18th St.), New York.

**STUDIES IN SOCIAL CHRISTIANITY**—*Jan'y.*: Poverty. *Feb'y.*: Wealth. *March*: Socialism. See the lessons for classes and individuals in *The Gospel of the Kingdom*, published monthly by the American Institute of Social Service, 82 Bible House, New York City. Price 50c. per year.

**EPISCOPAL SOCIAL SERVICE**—The Joint Commission on Social Service of the Protestant Episcopal Church. For literature and other information address the Field Secretary, Rev. F. M. Crouch, Church Missions House, 281 Fourth Avenue, New York City.

**UNITARIAN SOCIAL ADVANCE**—The American Unitarian Association through its Department of Social and Public Service. Reports and Bulletins free. Lecture Bureau. Social Service Committees. Rev. Elmer S. Forbes, Secretary of the Department, 25 Beacon St., Boston.

**METHODIST SOCIAL SERVICE**—Methodist Federation for Social Service; Literature: Bureau of Information. Speakers' Bureau; Reading and study courses; Invites all Methodists to extend its usefulness and use its facilities. Rev. Harry F. Ward, Sec'y., 2512 Park Place, Evanston, Ill.

**BAPTIST SOCIAL SERVICE**—Baptist Department of Social Service and Brotherhood. To study social questions, publish findings, suggest ways whereby Christian men may become socially effective, and co-operate with similar bodies. S. Z. Batten, Secretary, 1701 Chestnut Street, Philadelphia.

**CONGREGATIONAL SOCIAL SERVICE AGENCY**—The Congregational Brotherhood of America, Henry A. Atkinson, Secretary, 19 S. La Salle Street, Chicago, Ills. Programs and information furnished. Study Course: Speakers' Bureau; Publications. Service available for Institutes, Conferences and Addresses. Correspondence and inquiries invited.

**PRESBYTERIAN SOCIAL SERVICE**—Bureau of Social Service, The Presbyterian Board of Home Missions; Rev. Charles Steitzle, Supt., 156 Fifth Ave., New York. Sociological surveys made, Clearing house for city problems of the Church. Correspondence Course in Applied Christianity. Methods for Church Publicity.

**THE AMERICAN SEAMAN'S FRIEND SOCIETY**—Rev. J. B. Calvert, D.D., pres. George McPherson Hunter, Sec'y. The national seamen's society has stations in the United States and abroad, relieves shipwrecked and destitute seamen. Annual membership includes all literature, \$5.00 a year. C. C. Pinneo, Treas., 76 Wall Street.

**REMEDIAL LOANS**—National Federation of Remedial Loan Associations, 31 Union Square, N. Y. Arthur H. Ham. Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

**SOCIAL BETTERMENT FOR NEGROES**—National League on Urban Conditions Among Negroes, 281 Fourth Avenue, E. R. A. Seligman, Chairman; G. E. Haynes, Director. Develops welfare agencies. Trains social workers. Aids travelers. Supports probation officers. Seeks industrial opportunities. Correspondence invited.

**NEGRO AND RACE PROBLEMS**—National Association for the Advancement of Colored People, 26 Vesey Street, New York. O. G. Villard, Chairman. Board of Directors: M. C. Nerney, Secretary; W. E. B. Du Bois, Director Publicity. Publishes Crisis Magazine. Investigation, Legal Redress, Literature, Lectures, Lantern Slides.

**IMMIGRATION**—National Conference of Immigration: Land and Labor Officials, 22 East 30th Street; F. A. Kellor, Sec. Information affecting aliens after admission, especially in reference to labor, land, education, protection and distribution. No matters of admission or restriction dealt with.

**IMMIGRATION**—North American Civic League for Immigrants, New York-New Jersey Committee, 95 Madison Ave., N. Y. C. Protection, Education, Distribution and Assimilation of Immigrants. Printed material furnished upon request. Grace E. J. Parker, General Secretary.

**IMMIGRANT GIRLS**—Council of Jewish Women (National) Department Immigrant Aid meets girls at docks; visits, advises, guides; has international system safeguarding. Work in Religion, Philanthropy, Education, Civics. Invites Membership. Address Sadie American, Exec. Sec., 448 Central Park West, New York.

**AID FOR TRAVELERS**—The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex. For literature address Orin C. Baker, Gen. Sec'y., 238 East 48th Street, New York City.

**SURVEYS AND EXHIBITS**—Department of Surveys and Exhibits, Russell Sage Foundation, 31 Union Square, New York City. A national clearing house for advice and information on social surveys and exhibits and for field assistance in organizing surveys and exhibits.

**PROBATION**—National Probation Association, The Capitol, Albany, N. Y. Arthur W. Towne, Sec'y. Advice and information; literature; directory of probation officers; annual conference. Membership, One Dollar a year.

**LABOR LEGISLATION**—Workmen's Compensation; Industrial Hygiene; Labor Laws. Official Publication: *American Labor Legislation Review*, sent free to members. American Association for Labor Legislation, 131 East 23d St., New York City. John B. Andrews, Secretary.

**PRISON LABOR**—National Committee on Prison Labor, 27 E. 22d St., N. Y. City. Thomas R. Slicer, Chn.; E. Stagg Whitin, Ph.D., Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

**SETTLEMENTS**—National Federation of Settlements. Develops broad forms of comparative study and concerted action in city, state, and nation, for meeting the fundamental problems disclosed by settlement work; seeks the higher and more democratic organization of neighborhood life. Robert A. Woods, Sec., 20 Union Park, Boston, Mass.

# The New York School of Philanthropy

Edward T. Devine, Director.

A limited number of students may be admitted to the following courses which begin on February 6:

¶ **Executive and Financial Management.** Samuel McCune Lindsay. Thursday and Friday at 9:10.

Financial support of charitable enterprises, methods of appeal, reports, publicity, propaganda, reciprocal relations of directors and managers to executive officers and workers.

¶ **Amusements and Recreation.** Francis D. Tyson. Monday at 9:10.

Economic and social background of recreation, social cost of lack of wholesome facilities; play as a social factor in city life; playground movement; athletics and the dance; the theatre.

¶ **The Church and the Community.** Gaylord S. White. Thursday and Friday at 9:10.

What is the relation of the Church to the present social and industrial situation? How can the Church best serve the community? What can the social worker expect from the Church and what can the Church expect from the social worker?

¶ **Training for Settlement Work.** Mary K. Simkhovitch. Tuesday at 9:10 and Thursday at 12:10.

Personal qualifications required; studies in club work; class work (manual and academic); music, drama, dancing, balls, picnics, pageants, social, athletic meets; personal relationship with families; neighborhood work—civic, educational, social; outline of what the settlement worker should learn about his district and city; administration.

¶ **Medical Sociology and Hospital Social Service.** Dr. James Alexander Miller. Wednesday evening, 8-10.

Relation of disease to poverty and dependence; organization of hospitals and dispensaries; personal requirements and training for hospital social service; practical details; problems of public and private hygiene; social factors in disease; tuberculosis, infant mortality, child hygiene, alcoholism, nervous diseases, insanity, venereal diseases, occupational diseases.

¶ **Delinquents.** O. F. Lewis. Tuesday at 9:10.

An outline of the purpose of imprisonment, development of prison systems, indeterminate sentence, parole, probation, juvenile court. Prisons, reformatories, and jails are discussed as to administration, architecture, and efficiency. Vagrancy, inebriety, the social evil, feeble-mindedness, and other special subjects relating to the classification of delinquents. The courts, penal law and criminal procedure are briefly considered.

¶ **Immigration.** Kate H. Claghorn. Tuesday at 12:10.

A study of racial characteristics as a basis for intelligent social work among our foreign populations; present methods of care for immigrants; legislation, and other means for securing the welfare of the immigrant and the community. Many of the lectures will be given by representative Italians, Slavs and Hebrews.

The fee for each two-hour course is \$15, for a one-hour course \$7.50.

New York School of Philanthropy  
105 East 22d St., New York

## PAMPHLETS

To the Editor of The Survey:

As chairman of the Social Service Committee of the — Baptist Church of this city, I am anxious to secure for distribution pamphlets covering various social subjects. Will you kindly advise me where to obtain them and the prices in quantity?

The writer of this letter, who is a lawyer, was referred to all of the organizations listed in the Information Desk on the other side of this page, and to others which, because they are not national organizations in the social field, are not eligible to the Information Desk. There are many such.

These and other similar bodies can bring their pamphlet publications directly to the attention of The Survey's 21,000 subscribers by advertising them on this page at 20 cents per agate line per insertion (minimum accepted, five lines). Where several titles are given, the name of the advertiser need be used only once.

National organizations listed in the Information Desk may profitably use this column for additional announcements or for more titles than space in the Desk permits.

SELECTIVE LIST of pamphlets of various Russell Sage Foundation Departments free on request to Room 511, 105 East 22d St., New York.

JUVENILE COURT issue of The Survey, edited by Bernard Flexner. Articles by leading workers, reviewing first decade of Juvenile Court. First-class material in preparing club papers, debates. 25 cents. 10 copies, \$2. 25 copies, \$4.50. 50 copies, \$7.50. The Survey, 105 East 22d St., New York.

## A CHALLENGE TO THE CONTEMPORARY CHURCH

¶ A reprint of Jane Addams's article in THE SURVEY for May 4. Comprising her address on the protection of women and girls given before the Christian Conservation Congress of the Men and Religion Forward Movement. Single copy 5 cents. 25 copies for distribution, 60 cents; 100 or more copies 2 cents each (express extra).

THE SURVEY, 105 East 22d Street, NEW YORK

## CIVICS

### PHILADELPHIA NO LONGER CORRUPT AND UNASHAMED

KARL de SCHWEINITZ

EXECUTIVE SECRETARY, PENNSYLVANIA SOCIETY FOR THE PREVENTION OF TUBERCULOSIS

City Hall in Philadelphia has twenty elevators, five at each corner of the big square which the building occupies. Before December 4, 1911, riding in these elevators was something like investing in a lottery; sometimes you won, but more often you lost. It was not unusual on arriving at the southeast entrance to be referred to the northeast or to the southwest corner for a lift upstairs. Something seemed always to be the matter with the elevators. Now Philadelphians are beginning to wonder if that something was not politics, for since the Blankenburg administration has taken charge, the elevators in City Hall run as smoothly, and as often and as surely as those in any large office building. Let this be an illustration of the fact that the Blankenburg administration stands for efficiency.

When George D. Porter was appointed Director of Public Safety a year ago, he felt the need of an expert to systematize the business of his department. When lack of money prevented him from employing the man he desired, a number of public spirited citizens offered to help, and underwrote the salary of Captain Martin H. Ray, a West Point graduate, who was thereupon appointed aide to Director Porter. This marks another characteristic of the Blankenburg administration—co-operation between the people and their servants.

The new heads of the Department of Public Safety soon learned that the carrying out of their duties required a great quantity of printing. The necessity for advertising for bids and for sending work to job printers caused frequent delays. Accordingly a printing press with full equipment was purchased. This press, including the cost of labor, paid for itself within six weeks.

In order to put the press into immediate operation without going through the delay of waiting for a special appropriation from Councils, it was decided to try to find a printer from among the members of the police force. When this

became known, Director Porter's mail was enlivened with scores of the most entertaining kind of recommendations. Citizens living along the "beat" of Officer Jones wrote to say that he was always on duty and was so good to children. Officer Smith was urged as the right man for the job because he had never been known to be intoxicated. Strange to say, the man's ability as a printer was in no case mentioned.

Meantime Director Porter had ascertained that the force included twenty-seven printers. These were interviewed, and as a result a recent recruit was chosen. He was amazed at receiving a position which under the old regime would have cost him money. He was still more surprised when upon trying to thank his superiors he was told that he had earned the job upon merit and that merit alone would hold it. Merit as the basis for advancement is the third new feature of the administration.

There is much more which might be said in this connection to show that the chief work of Mayor Blankenburg during his first year of office has been to give Philadelphia a

business government. A review of the accomplishments of the first year of such an administration can be no more exciting and no more interesting than the story of the first year of any corporation which has taken charge of a worn-out, run-down, mismanaged factory and is starting to renovate and develop a modern, up-to-date business.

When Mayor Blankenburg took office, however, he had one handicap, with which the receiver of the average bankrupt company is not usually burdened. This was the contractor-boss system, which in Philadelphia had probably been developed to greater nicety than in any other city. Under machine politics it operated in this wise. For all city work specifications were drawn calling for the very best kind of materials and labor. All honest firms were therefore, compelled to make their bids accordingly. The political con-

RUDOLPH BLANKENBURG  
Mayor of Philadelphia.

GEORGE D. PORTER  
Director of Public Safety

tractor bid low; received the work; whereupon the city inspectors would shut their eyes to the kind of material that was furnished. Firms outside the organization rarely bid upon municipal projects. Lavish expenditures for inferior goods were one cause of an indebtedness of more than five million dollars incurred for running expenses.

Councils is antagonistic to Mayor Blankenburg. And Councils in Philadelphia means two unwieldy bodies, forty-seven men in one and eighty-seven in the other, which control all appropriations and through whom there is no such thing as speedy action. With the exception of the city solicitor, practically all of the county municipal officers are opposed to Mayor Blankenburg politically. The new mayor when inaugurated did not even have the endorsement of a majority of the voters. He had been elected not so much by a wave of reform, as by a split in the "gang," which in Philadelphia is called the "Organization."

As support Mayor Blankenburg had the backing of all of the best citizens. He also through appointments had control of practically all of the city's business.

The mayor of Philadelphia has greater powers perhaps, than the mayor of any other city in the United States, inasmuch as he appoints five directors who govern the city—the directors of Public Safety; Supplies; Wharves, Docks and Ferries; and Health and Charities.

Mayor Blankenburg's selections for these offices were well considered. George D. Porter, Director of Public Safety, had led the battle for reform in Councils almost single handed for

years. Morris L. Cooke was appointed Director of Public Works at the suggestion of Frederick W. Taylor, the widely known efficiency expert. Herman Loeb, Director of the Department of Supplies, was a successful manufacturer. Director George W. Norris of the Department of Wharves, Docks and Ferries, some time before Mayor Blankenburg was elected, had resigned his membership in one of the most important banking firms in the city in order to devote himself to the study of municipal problems. Dr. Joseph S. Neff, Director of the Department of Public Health and Charities, had held that office under the former administration, but upon practically the unanimous endorsement of the medical profession of the city, was retained to continue his work.

The mayor and his Cabinet first directed their efforts to the breaking up of the contractor boss system of low quality goods at first class prices with political favorites controlling the city inspectors. This was done by drawing reasonable specifications and inviting everybody to bid on an equal basis.

Director Loeb of the Department of Supplies, by observing this policy has everywhere reduced prices and increased quality. For instance, under the old regime the specifications for the meat, which was served to the residents of the alms-house at Blockley, called for whole carcasses of well fattened steers weighing at least six hundred pounds dressed. What were actually delivered were cows worn out as milkers and whose meat was too lean to be exposed for sale. The inspectors closed their eyes and the favored contractor made money by deliveries far below standard.

Director Loeb's new specifications call for bids upon so many hind and fore quarters of steers and of cows. In other words, he has asked for what the city really needs for its institutions, and by playing fair has obtained the kind of bids that a big business house would receive. In the same way Director Loeb, through specifications without jokers and honest inspection, was able to reduce the cost of lumber to the city by 41 per cent and the price of flour by nearly a dollar a barrel. In the past year he has saved 11,000 tons of coal, or \$44,000.

Director Cooke of the Department of Public Works, also has been able to effect economies. For 1912 he reduced the garbage contract from \$516,000, the amount paid by the city in the year previous, to \$278,000, and he has let the contract for 1913 at \$225,000. Under the former administration the garbage contract was so desirable that it was common talk in political circles that one garbage disposal company was paying 10 per cent on the stock of another firm in order to insure to itself the monopoly of garbage collecting.

The complete overthrow of the contractor boss system is again shown in the changes which Director Cooke has been able to make in the street cleaning specifications for 1913 for in Philadelphia this work is not done by the city.

The old system demanded that asphalt streets should be cleaned twice a week and all other

streets every day. The bid for this work was so low that no company could have lived up to the specifications without entering into bankruptcy proceedings. The new specifications are so drawn that the streets which have the heaviest traffic will be cleaned oftenest. By providing oil skins for the men, street cleaning will be done rain or shine. Previously wet weather stopped all work. In the Bureau of Highways Director Cooke found that out of forty inspectors not one was an engineer. All of the forty are now.

Director Norris of the Department of Wharves, Docks and Ferries, has conducted a publicity campaign throughout the State showing the advisability for investment by the state in the improvement of Philadelphia's water front. He expects to bring before the Legislature bills giving the city power to condemn property which it may need to improve its docking facilities and large appropriations to carry this into effect.

Dr. Neff—one of whose first moves, by the way, was the appointment to the office of assistant director, of an experienced social worker, Alexander M. Wilson—has aroused the public interest in the situation at Blockley, which is the name given to the largest conglomerate institution for the care of sick, indigent and insane in the world. He has begun the breaking up of this relic of nineteenth century charity. Through the passage of a municipal loan, \$250,000 has become available for the building of a tuberculosis hospital, which will take that department from Blockley. The male tuberculous insane have already been removed. The building of a sanatorium for the female tuberculous insane has been begun.

The city has a farm of 875 acres just within its northwestern border. Here Dr. Neff is developing a colony for the insane, utilizing the farm houses on the property. A home for the male indigent is half way towards completion. Work has also been begun upon quarters for feeble-minded women.

The Department of Public Safety with its problems of vice and crime-suppression and fire protection is the crux of every administration. For the first time in years this part of the city government is clean. No longer are the police obliged to pay a percentage of their wages into the campaign treasury of the "organization." At the recent Presidential election the police were not used to intimidate voters. Formerly anti-"organization" men were often taken from polling places where they had been stationed as watchers, and were jailed until the necessary ballot manipulating had been carried out. All of this has been stopped. At the last election there were fewer arrests than on an ordinary week day.

Shortly after the reform administration took charge, a Vice Commission was appointed. Pending the report of the investigation of this commission, Director Porter has made no announcement as to his policy, but in the meantime, he has closed disorderly houses in out-

JOSEPH S. NEFF, M.D.  
Director of Public Health and Charities.

lying districts and has put an end to all street solicitation.

Fifteen years ago a manual of instruction for policemen was issued. Since then there has been no new edition, and it is doubtful how many policemen there were on the force at the time the new administration took charge who knew what a manual was. Very shortly a most complete one will be issued.

A school has also been established for the instruction of recruits. Formerly a new man spent two days in the company of one older in the service and was then told to shift for himself.

In the old days before the patrolmen were sent out "upon the street," they were lined up at the various police stations. The lieutenant then read to them descriptions of whatever criminals happened to be wanted. After hearing the color of the eyes and hair of half a dozen different persons, the average patrolman was as ignorant of the appearance of the men desired as before. Now each policeman is provided with a notebook. Upon what is called an alarm sheet, a description of the criminals wanted is printed for insertion in this book. The very first day this system was inaugurated, two men who had long been searched for, were arrested. When such a capture is made, the name of the policeman making the arrest is circulated on the next alarm sheet, thus arousing emulation and encouraging an esprit de corps.

Reform has also reached the Fire Department. The firemen no longer tilt back lazily in arm chairs in front of the fire houses. They are now under a military discipline and are in better physical condition than ever before. There is a

and Ferries

MORRIS L. COOKE  
Director of Public Works

special fire school for the officers of the various fire companies where are taught the various methods and ways of attacking burning buildings, and training men.

Philadelphia has been enjoying a dollar tax rate for some years, whereas for 1913 after all the economies of Mayor Blankenburg, the rate should be between \$1.35 and \$1.40, unless of course, the assessments are raised. Mayor Blankenburg tried to solve the tax riddle by recommending the levying on occupations, automobiles, household possessions and upon businesses. Councils refused to adopt these suggestions. Mayor Blankenburg then pointed out that an increase in tax rate was necessary. Again Councils failed to act. This means that a temporary loan will have to be made again as has been the case for several years in order to pay current expenses. The usual amount of this loan has been \$1,200,000. During 1912 Mayor Blankenburg reduced this sum to \$600,000 by economical administration.

A low tax rate combined with low assessments has meant a low borrowing capacity which has brought with it scant funds for permanent improvements. Consequently there has been no further work upon the parkway, a boulevard running across million dollar lots from City Hall to Fairmount Park. This is one of the burdens which the "Organization" administration, with its ardent attention to the spectacular and its forgetfulness of the less showy institutions of honest government, bequeathed to Mayor Blankenburg. Since the parkway has been begun, it will have to be finished, but evidently Mayor Blankenburg, with a great many other citizens, feels that there are other far more important things which should come first.

Hitherto there had always been an amazing lack of system in the method of asking for appropriations. Mayor Blankenburg, with the co-operation of the Bureau of Municipal Research, has brought about the adoption of a businesslike system of requests for appropriations, so that hereafter if a proper amount of

publicity is observed, the budget will become a real community program from which citizens can tell what the administration is planning for the coming year.

Philadelphians have been waiting with a good deal of interest to see whether Mayor Blankenburg would make good his campaign pledge of an eighty cent gas rate. At present gas is served to the people of Philadelphia by a private corporation at a rate of \$1.00 per thousand cubic feet, twenty cents of which is returned to the city's treasury in the form of a rebate. In a message to Councils on January 2, Mayor Blankenburg pointed out that by reason of one and one-half million dollars worth of economies which had already been effected, and by the rearranging of the present system of taxation through the inclusion of taxes on automobiles, occupations, amusements and personal property, it would be possible to bring about an eighty cent gas rate. It is now for Councils to decide whether they will assist the mayor in redeeming his pledge.

Reform administration should largely be an administration of education. The present regime has not lived up as closely to this ideal as might be desired. When Tom Johnson was mayor of Cleveland, he conducted a series of public mass meetings in which he and his staff explained to the people the needs of the city and the reasons for the policies which had been inaugurated. 'Some such plan could well be carried out in Philadelphia. Newspaper publicity could be used to great effect. Some departments, to be sure, have spoken to the people through the press, but as a whole the administration has been too quiet about its accomplishments. The citizens of Philadelphia do not realize what is being done for them.

The Blankenburg administration has made a remarkable beginning of efficient, honest management of city affairs. Politics have been done away with; the business code has been established and the future promises a healthier, happier better Philadelphia than ever before.

NEW YORK

#### ON THE SUSQUEHANNA

"Play has never yet lessened the work product of a community."

*[At the picnic of the home and invited granges at Hickory Grove, Pa., last summer Dr. Brush delivered to his old neighbors an address of unusual feeling and suggestiveness in its treatment of grave rural problems. The recommendations he made for rebuilding community life in this Pennsylvania town are for the most part applicable to almost any farming district and are here presented. Personal references to acquaintances in the audience are omitted.—Ed.]*

My subject is all in the word HERE. I would have you consider with me today this place—not Washington or Binghamton, but Hickory Grove and a few miles around.

Let us at once come at the Main Things.

First, this is one of the best places on earth to spend life in. Second, this was, up to about 1880-85, a first-class rural community. Third, it is now a second-class rural community. Is it desirable to go back to first ranking, and how?

But I see you thinking at me, keenly and justly, the question: "If this is a best place, why is Fred Brush not living here, and why should he come with advice?" Second thought will, I am sure, tell you that I never left you. I have been back for long vacations each year. You are getting my modest investments and educating my children. "Home to Pennsylvania," my folks have come to say, and it sounds good to me.

Main thing No. 1—we are alive, more or less, in one of the world's best places, here in the loop of the beautiful Susquehanna. The Fixer of Things has given here air, pure through all winds and seasons, and surely helping to better health and age. Water, for drink and power and pleasure, unexcelled. Land, not the best, but good enough to have attracted here the best farmers of New England and Europe. Timber, second only to that of the Pacific slope. Mar-

kets and accessibility, with three great trunk lines of railroad converging through our gap in the ranges. Scenery, ranking it with the five other rare scenic sections of the country—and to be appreciated and paid for beyond our conjectures as time goes on.

It is a fair part of earth. But we are here for truth and would know its drawbacks. Are they not,—First, too few people within touch; Second, poor roads; Third, too long and hard winters, as at present lived at least?

Despite these many advantages things went wrong with our community during the past three decades. It will be profitable to know and name the main heads of this wrong, that we may move straighter and speedier toward bettering conditions. It may be stated at once that the main trouble has been the deterioration and partial loss of the communal life—the co-operative life. Not failure in farming or money-making, but degeneration of our society in its broadest sense. Around this idea we must rebuild. If you get to believe it, we may lift back to first rank.

The past is ever acting part of us; on it we of necessity rebuild. Come back with me then a little time into the story of our countryside. Careful investigation reveals that four to five houses were occupied where is now one. This little stream turned six mills. There were full

churches, schools of thirty to seventy, bees, debating societies, picnics, singing schools, parties, quiltings, military drills, big hunts and fishes, shooting matches, fife and drum corps, sugar-making, and two goose-feather beds for every bride, however poor.

Why review this past? Because it is part of today and us; because early in that past there developed here what was stated at the outset, a first-class rural community—measured up with the country's best.

Then came gradually the bad times, not to be dwelt upon here, known but too well by you. Leaders gone, young folks leaving, schools almost closed, various neighborhood organizations closing one after the other, the humus and plant foods gone from the soil and the farmers wondering and waiting—and scarce a game of dominos or quoits to be had. Widespread economic causes can be laid thereto. Not all life neighborhoods sank so far. Records are of many that braced, thought, took community action—saved a part of the old good and prepared for its grafting on the new.

In this our darkest period, from '85 to late in the '90's, there appear a body of remarkable women who quietly took leadership and did important things. It was as if, seeing clearly with hearts more than minds, they flung a banner: "We can live with less incomes, decorations, equipment, new clothes, travel but not with less hope or religion or laughter or love." And they patched and rebuilt and held on till they gave over from their falling hands most of the good things that leave us what we are, as a community, today.

Well, we are on the up-grade again. — But there's a long way to go—years long. But it is not yet assured that this our community will rise to another class. A little betterment is often half failure. Sober thoughts, these, before having looked at the past, we take up the problems of the present. Most of all, the communal life, the co-operative life needs upbuilding here. Individualistic effort served well its time and place. But the magic success-word is now "get together."

Rules of action help.

Rule I. Use existing organizations; their mere survival proves many fitnesses.

Rule II. Have few organizations and keep them large. Small ones are racked and wrecked by passing circumstances, and by individuals; attaining a certain size, self-repair and renewal take place almost automatically.

Rule III. Use leaders. When a man can do something well set him at it, for all your good, and then give him fair credit and honor.

Rule IV. Try for a guiding principle or two—rules of action. Here's one particularly for you. Face every proposition with the question, "Is this good for the community and the long pull; or is it for an individual, or a clique, or a day?" And slowly, through ever lessening disputes and enmities, the habit of communal thinking will form, and action for the most good to the most of you will inevitably follow.

Let us inspect our machinery. Here are grange, school, church and Ladies' Aid Society (with its library illustrating the advisability of placing lesser things under few main heads). Now add one other—an athletic organization—and there are tools enough.

We would fairly view our resources—social and material. Ladies' Aid Society—the story of its achievement is known to you all. One thing, follow the law; keep large. Have branches if you will, but rally about one organization. Then dare more; you have never failed. Church, school, amusements, roads, forestry, moral standards, politics—these and more are clearly in your field.

Grange—the same laws of organization will advance or punish you. Size alone gives power and stability; work for larger membership and the uniting of the small. Then attempt more. "These are words," you say, "and don't bulge pockets or stomachs." But there are really wide zones of home effort that you have not entered. For example, suppose the chestnut blight necessitates wholesale cutting. Appoint a committee to get, with government assistance, markets, specifications, prices, contracts, etc., for the duly estimated large cut; make money and time for each of you, and save money and time of the buyers. And stand by your representatives. Openly praise good work.

School—better education in this section you must have. The old district school did great work, but it is failing now, and more each year, mainly because attendance is so small. The solution is the central graded school. I know the unusual obstacles and difficulties here—no logical center, isolated valleys, poor roads and all; but you cannot retreat in the education of your children.

Church—the church will go on here, doing its beneficent work; but whether in its present places and ways, or drawn to centralize by the same quiet forces, will be determined later.

Play—more play is needed. Some of you smile (while your husbands look perturbed) and I know why. But the greatest peoples have been the greatest players. No surer proof of degeneration in a community than lack of sports. The wisest people in this country, studying to know how to do the rural sections most good, decide that more play, in groups, is a pressing need.

Our community should not again go without a baseball team. The interim of the past ten years has been unfortunate. The team organized under unpromising conditions in '87 perpetuated itself fifteen years, and was a large factor in carrying us through those lowest sagging times.

We have been canvassing the matter and find that by next year there will be enough small boys for a junior team and arrangements have been made. This day shall not end with talk. Support it as you do your grange or church; it is not trivial. And remember the rules of success; go widely into all the valleys for this team, and keep it large with branches and substitutes.

More play for all, then. I know you will think on this, and will say: "But there's too much to do," etc. Play has never yet in this country lessened the work product of a community—has rather always increased and bettered it. Business men are providing for it in their plants. Sitting, hesitating, "kicking," waiting—the fog and smother life. Activity of any kind has intrinsic value. More picnics then, and camping parties, coasting and skating, house games, boxing, croquet, sleigh rides, quoits, and little trips away for mothers.

Sanitation—the villages and the farms are now acknowledged to be behind in sanitation. Surely little can be accomplished in this line save through wide co-operative effort. Your neighbor, who refuses modern treatment of diphtheria and sends abroad a germ carrier, or who disobeys the strict rules in care of typhoid, kills your child or your young husband, miles away, almost like a murderer with a gun. In this matter you cannot longer sanction carelessness or excuse ignorance.

You note that we have ignored the material things—the land, roads, forests, etc. Are they not of basic importance? Yes; but are we not comparatively strong in these? The land is being restored to fertility.

Let us review and see if we are sane and fair. We are a second rate rural community—and may about as readily become third rate as first—depending not on politics or distant governments but on ourselves for the next two or three decades. The rest of rural America is advancing rapidly; it is not enough to advance a little here. Here is proven ability in the past ten years to rightly develop the lands and forests, to arrange the way for good roads and these various material things—to make livings and lay by something. But the message today is that these alone will not bring high success. These are but parts; and the harder task here is the patient years-long upbuilding of the social co-operative community; one that shall not only educate the children, but be so full of the best things in American life that many of them will stay, or come back, and taking our thinning hands say: "I've been around, and seen, and I'll live here alongside o' you." For after forty we live for the children and it is intrinsically wrong for the individual and the nation to be so much separated.

Here in these hills, despite our dreams, ambitions and occasional outbursts—*here* nearly all of us will stay out life. Here we opened baby eyes to the clear sky. Here we shall go on playing, working, loving, marrying.

If there is any place on earth worth while for us it is **HERE**.

"HERE WE SHALL GO ON"

### SOUTHERN BOYS IN CIVIC WORK

LeROY HODGES

Secretary, Winston-Salem Board of Trade

Although it is not the first commercial organization in this country to stand out boldly and announce that it believes real city building is possible only through conscious and intelligent civic effort, there are few that accentuate this phase of civic work as does the Winston-Salem, N. C., Board of Trade. This organization is one of the first in the South to conduct its work on such a basis. Maintaining that a commercial organization does not perform its full legitimate functions unless it makes an effort to advance the social conditions of the people, the Winston-Salem Board of Trade has sought to organize the boys of the city into a militant body for the improvement of general civic conditions.

This has been accomplished by the formation of a department known as the Juvenile Club of the Winston-Salem Board of Trade, in which membership is restricted to boys between the ages of fourteen and eighteen years. To become a member of this club each boy is required to memorize the Athenian oath, which is as follows:

"We will never bring disgrace to this, our city, by any act of dishonesty or cowardice, nor ever desert our suffering comrades in the ranks; we will fight for the ideals and sacred things of the city both alone and with many; we will revere and obey the city's laws and do our best to incite a like respect and reverence in those above us who are prone to annul or to set them at naught; we will strive unceasingly to quicken the public sense of civic duty. Thus, in all these ways we will transmit this city not less, but greater, better and more beautiful than it was transmitted to us."

After a boy has appeared before the secretary of the Board of Trade and recited this oath he is presented with a certificate of membership, which states that the holder, having memorized

☐ WINSTON-SALEM BOARD OF TRADE ☐

## Juvenile Club

### CERTIFICATE OF MEMBERSHIP

*This is to certify that* \_\_\_\_\_

having memorized and subscribed to the oath of the patriotic youth of ancient Athens, which is recited on the reverse side of this Certificate, has been duly enrolled as a member of the JUVENILE CLUB of the WINSTON-SALEM BOARD OF TRADE and is entitled to all the privileges of such membership so long as he shall prove true to his obligations

Number \_\_\_\_\_ Pres. \_\_\_\_\_

Date \_\_\_\_\_ Sec'y \_\_\_\_\_

### JUVENILE MEMBERSHIP CARD

and subscribed to the oath of the patriotic youth of ancient Athens, has been enrolled as a member of the Juvenile Club of the Winston-Salem Board of Trade and is entitled to all the privileges thereof so long as he shall prove true to his obligations.

Regular meetings for the boys are held under the direction of the secretary of the Board of Trade where city problems are explained and debated. Members of the Juvenile Club also have the privilege of attending all the regular meetings of the Board of Trade and see at first hand how the work of the organization is carried on. They are assigned special committee work, and are encouraged in every way possible to take an active and intelligent part in the affairs of the city.

The popularity of this new departure in commercial organization work which is being undertaken by the Winston-Salem Board of Trade is only another indication of the economic revolution going on in the southern states. It is significant as indicating along what lines the new South is developing.

### JOTTINGS

#### HOUSING ASSOCIATION FOR PENNSYLVANIA

As the result of correspondence among charity and philanthropic workers in various cities and towns throughout Pennsylvania in regard to housing and sanitary conditions existing in the commonwealth, a state housing conference was held in Philadelphia last month. There were 135 delegates in attendance, of whom eighty-three were from societies outside of Philadelphia. Before the program, which consisted of two sessions with speeches by Lawrence Veiller of the National Housing Association, W. D. C. Bliss, Mildred Chadsey of the Bureau of Sanitation in Cleveland, J. Horace McFarland of the American Civic Association, and George W. Norris of the Philadelphia Housing Commission, was finished, speakers rose from the floor to present resolutions. One of the first of these provided for the organization of the conference into a state housing association and the appointment of a committee with power to elect the board of directors and other officers.

In response to the protest of a member of the general assembly, who was in attendance, that he had not received a definite suggestion as to

what the assembly could do to improve conditions, a resolution was presented and adopted calling for the presentation of an act to the legislature giving wider power to boards of health, to establish original sanitary inspection services, to condemn insanitary houses and to prevent their occupancy, to fumigate all houses after the tenants have moved before they could be re-rented.

The organization committee appointed by J. Horace McFarland, chairman of the second session of the conference, has taken the first steps for the strengthening of the State Housing Association and the act called for by the conference has been drafted and will be presented by the state association to the General Assembly.

#### A CIVIC REVIVAL IN PORTSMOUTH, N. H.

An uprising engineered by a Citizen's Committee against the lax enforcement in Portsmouth, N. H., of the laws relating to disorderly houses has borne quick results. Three months ago the committee undertook to rid the city of eleven notorious resorts which were operated within the city without the interference of the police authorities. The Bureau of Municipal and Social Service of the People's Institute was at the same time engaged to make a survey of some of the social problems of the community. The mayor of the city, who was also a member of the survey committee, undertook to call to the attention of the local police commission the facts relating to the unenforcement of the laws. The mayor's offer was ignored by commissioners, and the agents of the Bureau of Municipal and Social Service were instructed to secure evidence that "would hold in court" and which would reveal the local conditions. This evidence under the direction of Carol Aronovici, the director of the bureau, was secured and submitted by the committee to the governor of the state and the attorney general. An inquiry into the administration of the police commission, which is appointed by the governor and council, was ordered while the attorney general took steps to close the resorts and prosecute their keepers. As a result eight of the keepers of disorderly houses have been indicted, three have left the city, the city marshal and one of the police commissioners have resigned, while the chairman held over so as to be able to act on the marshal's resignation. The mayor, who undertook to improve conditions, running solely on the moral issue, was re-elected by a substantial majority.

#### LECTURE TOUR OF EWART G. CULPIN

Arrangements are being made by Edward E. Pratt, 225 Fifth Avenue, New York, in co-operation with George B. Ford, lecturer on city planning at Columbia University, and Flavel Shurtleff, secretary of the National Conference on City Planning, for a lecture tour by Ewart G. Culpin, secretary of the Garden Cities and Town Planning Association of Great Britain. Mr. Culpin will be in the United States until March 1.

THE PUNCHBOWL DISPENSARY AT HONOLULU, HAWAII

A public welfare exhibit which was conducted by the Palama Settlement with the co-operation of the thirteen other social service agencies showed the need of remedying such insanitary conditions as dark living rooms below the street level. Some of these children come from such homes.

## HEALTH

EACH fresh statement that some scientist has discovered a specific cure for tuberculosis is hailed with enthusiasm by the daily press and the statements made about it are as naively optimistic as if such announcements had not been made almost every year since Koch's discovery of the tubercle bacillus.

The principle underlying these professed cures—we are speaking only of the genuine efforts of scientists, not of fake cures—is that the body has the power to form substances antagonistic to the germs of disease, and that it is stimulated to do this by the presence of these germs. Now if there is in a diseased person an insufficient production of such substances—anti-bodies they are called—it may be possible to increase their production by injecting the special germs, but these last must of course be rendered as harmless as possible. Thus we may use the powdered bodies of bacteria or more often germs killed by heat or by chemicals. Such "vaccines," as they are now called, have been used successfully in the case of chronic suppuration. Even more numerous have been the efforts to ensure protection against infection through the formation of these anti-bodies.

Endless attempts have been made to produce the right vaccine for tuberculosis, a tubercle bacillus so modified that it will stimulate the formation of anti-bodies and yet will not light up a tuberculous process in a healthy person, or add fuel to the flame in a consumptive pa-

tient. Koch's original tuberculin was expected to do this, and the disappointment following its use was widespread. Since then many tuberculins have been tried and several of them are in use at the present day, having proved to be of decided, but never of universal value.

\* \* \*

NOW comes the announcement of a new tuberculin discovered by Dr. Frederick Franz Friedman of Berlin. Eight years ago he reported that he was having great success with a tuberculin made of bacilli from cold-blooded animals (turtles) supposedly harmless for man. His new tuberculin is said to consist of living bacilli—their source is unrevealed—rendered harmless by a secret process. Friedman and other physicians claim to have used it on 1,182 cases, including 325 children.

The Berlin Medical Society, before which the paper was read, criticized Friedman for his secrecy on the ground that it savors of charlatanism, and makes it impossible to check up his results. The society also scored Friedman for his inoculation of living germs in healthy children, because it is impossible, the members believe, to control the virulence of germs. What was once a harmless strain may at any time change to a virulent one. They found that Friedman's cases had not been carefully followed up, and that he had not proved that his tuberculin was more efficient than other varieties of tuberculin.

SENATOR Gore of Oklahoma, has introduced into the Senate, a resolution which, if passed, will enable the United States Public Health Service to send a small committee of scientists to Berlin to investigate and report upon Dr. Friedman's tuberculosis serum. A preliminary official examination of this "cure" has been ordered by the State Department, through Consul General Thackara. Senator Gore has stated his purpose as follows:

"It is my idea that our most competent medical authorities could look into this matter at once with entirely unprejudiced minds. If it is actually true that a tuberculosis cure has been discovered, the discovery is of the utmost importance. In my judgment the matter should not be left to theorists or be permitted to become the property of high-priced specialists. If there is a consumption cure within the reach of the world, the people ought to have it quickly, and it should be brought within the reach of the poorest and most unfortunate."

\* \* \*

DULUTH has recently passed an ordinance to regulate the sale of narcotic drugs, which aims to embody the best features of the ordinances in force in other cities, and to correct their mistakes. The draft of this ordinance was passed upon by Dr. Harvey W. Wiley and Dr. George W. Goler. It is expected to serve as a model for cities or states which are contemplating legislation to control this evil.

Some years ago Hull House was drawn into a campaign against the illicit sale of cocaine because of the discovery of a number of youthful cocaine habitués, and was obliged to carry its cases into court under a faulty ordinance. It may be of interest to mention the admitted weaknesses in the Chicago act, which has since been replaced by a state law, so that the advantages of the Duluth ordinance may be better appreciated. In the first place the Chicago law did not make clear the responsibility of the druggist for his clerk's actions. For the druggist to be convicted he must have made the sale himself, which he very rarely did. The Duluth law forbids a pharmacist to make the sale through an agent. The Chicago law did not attempt to control in any way the writing of prescriptions for narcotics or the filling of such prescriptions. The Duluth law requires that the prescription be kept on file, filled only once and that no copy of it be furnished. This makes it expensive for a drug fiend to obtain cocaine or morphine through unscrupulous physicians. An attempt is made to exert some control over the doctor by a section forbidding him to give such prescriptions save as legitimate practice requires.

Hull House had endless trouble trying to convict runners and street peddlers, who would be arrested with dozens of boxes of cocaine on their persons, but who could not be convicted unless it could be proved that they had actually tried to sell it. Mere possession of any narcotic drug under the Duluth law is *prima facie* evidence of a violation of the ordinance, unless the person can prove that it was legitimately ob-

tained. Another feature of the law is that requiring a permit from the health commissioner, good for one year only, for hospitals, sanatoria and nurses, to keep narcotic drugs for medical purposes. This is not because such persons are likely to misuse the drugs but the issuing of a permit to them makes it easier to convict people who have no permit.

One great difficulty which Hull House experienced came from the fact that the Chicago law did not cover the more recently discovered narcotics, even by a blanket clause. This led the defendants to insist that the material found was alpha- or beta-eucain, and not cocaine, which of course necessitated the services of an expert in court. One particularly clever druggist used to testify that what he sold was a mixture of eucain with atropine and benzoate of soda, a compound calculated to make the experts' work much harder, for the benzoate of soda would account for the principal chemical reaction given by cocaine, and the atropine would account for the dilatation of the pupil. Eucain does not dilate the pupil, while cocaine does. All this meant that every specimen had to be carefully tested on the human eye, and a note made not only as to the anaesthetic effect, which might be caused by eucain, but also the blanching of the lining of the lids, not caused by eucain, and the rapidly disappearing dilatation of the pupil, in contrast to the more lasting effect of atropine. Such expert testing and testifying are quite unnecessary under the Duluth law, which includes the cocaine-like bodies, chloral hydrate, and the derivatives of opium, such as heroin, that new habit-forming narcotic.

Another effective provision is the inclusion of catarrh remedies marked for external use only, and containing cocaine, for it is well known that the cocaine habit has often had its beginning in the innocent use of catarrh remedies.

The only feature which physicians and social workers, who are anxious to see effective anti-narcotic ordinances passed, are at all inclined to criticise is the lack of a severe penalty for frequent offenders. A fine of \$100 they fear may be found to be a trifling matter to some of the druggists and they urge that while it is right to prescribe a light punishment for the first offense, which may have been inadvertent, the penalty for repeated offenses should be not only a fine, but a jail sentence.

\* \* \*

IN a recent 'number of THE SURVEY' an account was given of two cases of wood alcohol poisoning in workmen who had been engaged in varnishing the inside of beer vats. One man died, the other became totally blind, and this after only three days' exposure.

In 1903 Dr. Casey A. Wood of Chicago and the late Dr. Frank Buller of Montreal, published the history of the cases of alcohol poisoning which had occurred up to that date. There were in all 275 instances of death or blindness or both directly traceable to drinking wood alcohol or inhaling its fumes. In an article for the *Journal of*

<sup>1</sup>See THE SURVEY, November 23, 1912, p. 211.

the American Medical Association for November 30, Dr. Wood reviews the subject afresh and favors legislation forbidding the use of "purified," that is deodorized, wood alcohol, "because it serves no purpose that denatured grain alcohol will not serve and because its existence is everywhere and at all times a menace to public health. It looks, tastes and smells so much like grain alcohol that its very existence must ever be a challenge to life and sight."

Thirty years ago poisoning from wood alcohol was almost unknown because the taste and odor was so repugnant that no one thought of drinking it, but in 1890 the deodorized product was put on the market under the names "Columbian Spirits," "Colonial Spirits," "Purified Wood Alcohol," "Eagle Spirits" and others. Various claims were made for it. It was declared to be a cheap and harmless substitute for grain alcohol, absolutely non-poisonous. The first cases of poisoning that appeared in medical literature were of men who had drunk wood alcohol in cheap whiskey for which it was used as an adulterant. Such cases are still reported from time to time.

We all remember the instance of wholesale poisoning from adulterated "Schnapps" which occurred in Berlin last Christmas in a municipal shelter involving 161 inmates, seventy-one of whom died from the effects. So unfamiliar were the German physicians with this poison that they attributed the trouble to decomposed sausage and the cases were so reported at first.

Later on instances of industrial poisoning began to be reported in which blindness had resulted from inhaling the fumes of wood alcohol. The dealers in "Columbian Spirits" and other forms of the deodorized product receded from their first position as to its harmless nature when taken internally, but they and the makers of varnishes in which this is the solvent still deny that poisoning can come from the inhalation of fumes. However, the evidence of physicians on this point is unanimous.

\* \* \*

**I**N addition to the cases already reported in THE SURVEY Dr. Wood gives the following four instances:

"Gustav K., twenty-one years old, went to work for a contracting varnisher in New York the week before Thanksgiving, 1911. He worked Thursday, Friday and Saturday, November 23, 24 and 25. He was then laid off until Monday, December 4.

"An older brother of Gustav was also hired, beginning Monday. Two other men and these two brothers were the only men working on the job. They had to crawl through a small opening into the vats, which were twelve or fifteen feet high, closed, dark and airless, except for slight ventilation through the small openings. The former employer of the two brothers had used a small machine run by a dynamo for blowing out bad and sending good air into the vats. Such an engine costs about \$65 and, in the opinion of Gustav K., he became blind because the employer would not spend anything on ventilators.

"Gustav K. worked Monday and Tuesday, December 4 and 5. On Monday, after coming out of the vat, he felt dizzy. On Tuesday, after arriving home, his mother remarked that he walked as if he were intoxicated. Wednesday morning he tried to go to work but had to come back before getting on the car. A physician was consulted twice but because he could not afford to pay the fee, the patient went to the Ophthalmic and Aural Institute on Tuesday, the 12th. When he entered the hospital he could not see at all. On Friday, the 15th, he could see just enough to get about the room in the hospital.

"The older son worked through Wednesday, the 6th (one day longer), and then showed some of the symptoms of poisoning, reeling, headache, etc., but no more serious effects.

"The two men who had worked with the brothers continued through Wednesday. Both were poisoned; one died on Thursday and the other on Saturday."

Dr. Wood insists that our deodorized wood alcohol possesses no advantage over the British "methylated spirits" or our own denatured grain alcohol, which is as cheap or cheaper. Methylated spirits is a combination of grain alcohol with 10 per cent. of wood alcohol. It is extensively used in Great Britain, and not a single case of acute poisoning or blindness is recorded from its use. The German *Brennsprit* is a grain alcohol made undrinkable by the addition of disagreeable substances whose fumes are harmless.

\* \* \*

**I**T is very difficult to give a novel, dramatic, interest-awakening tone to an appeal for proper birth registration. In spite of cartoons and moving pictures, it seems impossible to get rid of the slight mustiness and dryness which clings to this subject and makes people turn from it to the more varied and obviously fascinating branches of child study. Dr. Cressy L. Wilbur put the matter picturesquely before the American Statistical Association.<sup>1</sup> "Vital statistics is the Cinderella of modern public hygiene. She sits in the chimney corner and sifts the ashes of dusty figures while her proud sisters, Bacteriology and Preventive Medicine, go to the ball and talk about the wonderful things they have done. But the prince's slipper fits no other foot and when we descend to facts, and not mere empty bombast about the results of administrative work, vital statistics and accurate vital statistics are our sole dependence. What do we know about infant mortality which we are all so anxious to prevent, when not a single state or city in the United States has the data for a correct statement?"

A recent report on vital statistics and health reports of New York City by the Public Health, Hospital and Budget Committee of the New York Academy of Medicine gives a depressing picture of birth registration in one of our few registration cities. Not only is it criticized as incomplete as to numbers but the system is declared to be altogether imperfect. "The demographic

<sup>1</sup>See quarterly publications of the American Statistical Association, Vol. 10, p. 419.

tables of this city present the minimum of information necessary for general administrative purposes. They are utterly inadequate as a guide for social or legislative action and are of little use for scientific purposes.

"The unique opportunity scientific men have for medicosociological studies in this city with its large variety of racial elements, diversity of occupations, and habits of life, has never been exploited. In spite of the much discussed question of so-called 'race suicide,' no numerical studies of this phenomenon have been made in this city. The fecundity of marriage among the various racial and economic elements of the population; the distribution of stillbirths among the various social classes; the effect of illegitimacy on infant mortality; the influence of

the age of the parents upon the vitality of their children; the effect of consanguinity upon the fertility of marriage; infantile diseases in relation to the age and occupation of parents; births in relation to occupation of mothers; the relation of mortality to the density of population; the proportion of males and females at birth in relation to the ages of parents, their race and economic status; all these and many other matters of vital interest have never been studied nor current beliefs regarding them put to a statistical test."

These are questions we should all like to hear authoritatively answered, but this is impossible without that fundamental necessity, a proper system of birth registration. Dr. Urie's paper on the subject on this page is timely.

## BIRTH REGISTRATION

JOHN F. URIE, M. D.

HULL HOUSE, CHICAGO

We are living at a time of unusual endeavor for the rebuilding of our social structures. Everywhere there is evidence of a slow but general awakening to the fact that the old edifices no longer shelter all men with equal protection. Philanthropy, politics, and business are all tinkering with the remodeling. But unfortunately, though humanly, we more often than not direct our efforts to the parts of our structure most in evidence, without investigating all the adjacent supports upon which its stability depends.

The effort to safeguard child life is a conspicuous example in point. We are justly proud of our public school system. As a part of this system we have compulsory education laws, and every law, as a fundamental provision, establishes a minimum age under which a child may not enter school and a maximum which fixes the period at which he may cease going to school. But unfortunately for the operation of the law, there is no way throughout our broad land of authentically establishing the age of the child. Practically no law exists in any state whose provisions are adequate to bring about a registration of all its births. Of what use then is it to fix the limits of age for compulsory education unless we first build a foundation of effective birth registration?

Co-ordinate with educational laws are the laws regulating child labor. Again, of what avail is the best planned law possible, if there be no previous legal provision for establishing the age of the child. An effective birth registration law is the foundation upon which all regulation of child labor must rest. Only a few days ago, a little lad came before me for physical examination. He gave his age as eighteen years, but his appearance was that of a boy of twelve. There was nothing in his physique to suggest a retarded development. Three years ago when he had been put to work, the word of his mother established his age. He was then probably not much over ten, and was taken from school and

made to work in defiance of two laws. Think of the struggle it has taken to place the child labor laws we have on the statute books and how easily that effort may be nullified for want of a little forethought about birth registration.

The International Congress of Hygiene and Demography met a few weeks ago in Washington and its proceedings were given unusual notice by both the newspaper and magazine press of the country. How many readers caught the significance of the title of the society? We are all familiar with the word hygiene and what it stands for, but demography is quite an unusual term. Jane Addams, in an address to some of the foreign delegates of the congress who were visiting Chicago, said that the word made her feel that something would be accomplished under such a title—it sounded as if it stood for big things. And so it does, for demography is the science of vital statistics, and is the base on which we must build much of our structural work for social betterment. The first and most important division of this science of demography is birth registration.

The federal government has lately added a Children's Bureau to the Department of Commerce and Labor to safeguard child life and welfare in the United States. The very initial activity of this bureau must necessarily be retarded for want of efficient birth registration throughout the states, for all effort to guard the rights and welfare of the child must have behind it authoritative evidence of the child's age and a record of the number of children born. Almost nowhere in this country is this evidence and record available. Some few cities, such as Boston and New York, obtain through the administration of their health departments an enforcement of their state laws which brings in a fairly large percentage of births to the registrar's office. But no state or municipality can boast of a complete registration of its births. The map shown on page 517 illustrates the practical absence of real birth registration in our country. Even

#### REGISTRATION AREA FOR BIRTHS

In 1911 the states shown in black on this map had registration acceptable to the federal Census Bureau but they possessed no machinery for collecting the records of all their births. The almost unbroken expanse of white stretching from the Atlantic to the Pacific shows the practical absence of real birth registration in this country.

the states depicted as having registration that is acceptable to the federal Census Bureau have not the machinery to collect the records of all their births.

In the administration of many of the laws and provisions devised to safeguard the individual in the affairs of life, mere statement is accepted where official documentary evidence should be required. If this evidence were required—and by such action only is efficient administration possible—an individual in the process of physical and social development would need a birth certificate at the following important milestones of his career: the christening, entrance into school, leaving school, beginning work, becoming of age, voting, getting married, possibly holding public office, death and burial. Questions of inheritance and identity, the proof of citizenship, the establishment of the age of consent are incidents of life in which birth registration would have a practical value, and to meet the requirements of travel, education and residence in a foreign country a birth certificate, if not always necessary, is frequently a valuable aid.

It would be interesting to know why we, as a people, should be so indifferent to a subject that is of such vital importance to our offspring. In most of the older countries of the world, and in some younger than ours, birth registration has been so long an established institution of government that their people cannot realize a condition without it. With us, a want of understanding of the value of registration and a belief that it is peculiarly an affair of the medical profession is probably at the bottom of our apathy. To arouse public interest in the subject and to teach that it is purely a social and not a medical one should be in the program of every movement for public welfare. We owe that much, at least, to the success of our efforts as a nation for child welfare as expressed in the establishment of the Children's Bureau of the Department of Commerce and Labor.

#### AMERICAN RED CROSS RURAL NURSING

FANNIE F. CLEMENT  
Superintendent Red Cross Rural Nurses

The Red Cross has recently entered a new field of work by undertaking to establish a nursing service for rural districts in the United States. Hitherto there has been in this country no adequately organized service of nursing to cover fields such as are reached by the Queen's Jubilee Institute in Great Britain, and the Victorian Order of Nurses in Canada, and in only a few instances have the advantages of city nursing associations been extended to farming communities.

The organization of the Rural Nursing Service is made possible by a generous gift of \$5,000 annually from Jacob H. Schiff, and another of \$1,000 from Mrs. Whitelaw Reid. These sums are to meet central administrative expenses. The plan of the service outlined is tentative and the extent and ultimate policies of the work will be determined by future developments.

The following have been appointed a Committee on Rural Nursing: Mabel T. Boardman, chairman; Jane A. Delano, vice-chairman; Lillian D. Wald, head worker Henry Street Settlement, New York; Mrs. William K. Draper, New York; Mrs. Whitelaw Reid; Annie W. Goodrich, inspector of training schools for nurses in New York state; Wickliffe Rose, administrative secretary Rockefeller Sanitary Commission; John M. Glenn, director Russell Sage Foundation; Dr. Winford Smith, superintendent Johns Hopkins Hospital.

The service aims to provide nurses for the sick in rural communities, to carry instruction along sanitary and humanitarian lines into the homes and to deal with environment in a way to improve living conditions. It stands ready to furnish all possible assistance to communities which are looking for qualified rural nurses, to those which realize the advantages of a nurse but need

advice as to ways and means for her support, and to those regions where it will doubtless appear necessary to demonstrate more fully the need of a nurse. It hopes to co-operate with all organizations relating to questions of individual and public health.

The unlimited opportunities for humanitarian and educational work to be found in rural communities will appeal to nurses who understand and enjoy country life and people, and who are interested in public health movements and social service. It is hoped that a response to a call for this work will come from visiting nurses throughout the country, from enrolled Red Cross nurses, from private duty nurses who look for a broader field of activity, and from undergraduates whose choice has not yet been made.

Red Cross rural nurses must in general meet the requirements of the Red Cross for enrollment, and must also have had training or experience in a visiting nursing association or some other form of social service. As preparation for the work, arrangements have been made for a short course of training with certain visiting nursing associations, and a loan fund is provided by the Red Cross in connection with this course, available to a limited number of nurses.

In order to establish and maintain a high standard of nursing, the Red Cross will retain general direction and supervision of its rural nurses, but this will not interfere with their responsibility to the local committee or organization representing the Red Cross in the community, under which the local work will be conducted.

#### SEWAGE POLLUTION IN NEW YORK HARBOR

After a thorough canvass of the question of the permissible limits of sewage pollution in New York harbor, the Metropolitan Sewerage Commission has adopted recommendations, which allow for a limited amount of sewage in the upper harbor, provided such discharge is not offensive to the senses, nor dangerous to navigation or health.

In the current number of the *American Journal of Public Health*, Dr. George A. Soper gives the results of the findings of a symposium of experts and the recommendations of the commission.

Practically all of the eight experts agreed that so far as sickness was concerned the present condition of the harbor was not a serious menace to health. The epidemiologist stated, however, that in his opinion strong reasons existed for keeping the harbor clean. He considered that the amount of disease and death directly produced would not be a proper measure of the objectionable state of the harbor's waters but conditions which offended the senses, of the existence of which he saw abundant evidence, should also be taken carefully into account, for such conditions indirectly lead to disease. The civil engineer pointed out that while many lives probably could be saved and much ill health alleviated by reducing the pollution, it was possibly still more important to consider the question

of a clean harbor from the standpoint of what was suitable and appropriate on the score of cleanliness. It was a case where civilization demanded a remedy on the score of what was necessary for the comfort, happiness and welfare of the public.

There was a preponderance of opinion among the experts that it would not be practicable to keep the waters of the inner harbor clean enough to make bathing entirely safe, but it was held to be both feasible and desirable to maintain bathing places near the sea, and within easy reach by the public, in satisfactory condition. Because some bathing was likely to occur in the populous parts of the harbor in spite of any restrictions which might be made, and because the shores were certain to be crowded with human beings engaged in gainful occupations or seeking the water-front for relaxation and fresh air, the hygienists and others thought the water along the shores ought to be kept as clean as practicable.

On the strength of these various opinions, the commission has officially recommended the following specific requirements:

"Garbage, offal or solid matter recognizable as of sewage origin shall not be visible in any of the harbor waters.

"Marked discoloration or turbidity, due to sewage or trade wastes, effervescence, oily sleek, odor or deposits shall not occur except perhaps in the immediate vicinity of sewer outfalls, and then only to such an extent and in such places as may be permitted by the authority having jurisdiction over the sanitary condition of the harbor.

"The discharge of sewage shall not materially contribute to the formation of deposits injurious to navigation.

"The quality of the water at points suitable for bathing and oyster culture should conform substantially as to bacterial purity to a drinking water standard. It is not practicable to maintain so high a standard in any part of the harbor north of the Narrows, or in the Arthur Kill. In the lower bay and elsewhere, bathing and the taking of shell-fish cannot be considered free from danger of disease within a mile of a sewer outfall."

#### JOTTINGS

##### FOREST CAMPS FOR TUBERCULOSIS PATIENTS

Forest camps in the heart of the public reserve for persons convalescing from tuberculosis or threatened with that disease, were suggested recently by E. M. Griffith, the state forester, in an address before the Wisconsin Anti-Tuberculosis Association. Mr. Griffith proposed that the state board of forestry should set aside several thousand acres of dry, pine clad land bordering on one or more lakes where patients might spend the greater part of the year and be provided with light work which would make them at least partially self-supporting.

The forestry board, Mr. Griffith said, might employ the patients in its nurseries and in planting trees. This work could be graduated to suit the strength of convalescents in accordance

(Continued on page 536.)

# CHURCH AND COMMUNITY

Edited by GRAHAM TAYLOR

## SEEING CLEVELAND

E. S. CLAFLIN

The old Greek proverb, "Know Thyself," so long applied intensively, is getting a wider application in our modern social awakening. If it is important for the individual to know himself, it is also important for the city to know itself. A city is not a big, inert lump of humanity, but a living organism with a will and a purpose. Such self-conscious direction can only come through a knowledge of itself. First of all, the facts must be scientifically dug out of the general blur and massed before the people. Getting these facts into the heads of the citizens is the first step toward intelligent community action.

### 200 SALOONS INVESTIGATED

63.5 per cent had family entrances.

93 per cent had small tables about which men could sit and read.

89 per cent offered some social features, and 11 per cent were merely drinking places.

12 per cent of saloon keepers act as bankers for the people of the community.

Women and girls found in 37 per cent of the saloons.

THE SALOON AS A SOCIAL AGENCY IN CLEVELAND  
January 18, 1913.

## "Seeing Cleveland"

—at, the—

**Presbyterian Exhibit**

—in the—

**Chamber of Commerce  
Auditorium**

**ADMISSION FREE**

Experts have been studying the forces at work for human betterment in our city. Their findings, in an amazing array of photographs, diagrams, charts and statistics, will be on free Exhibition Today and Tomorrow in the Chamber of Commerce Auditorium. Every alert citizen, regardless of religious affiliations, should see this informing and interesting display.

THE FACTS about the foreigners.

THE FACTS, good and bad, about living conditions.

THE FACTS about the children.

THE FACTS about Churches, Schools, Theaters, Saloons, etc.

THE FACTS about Cleveland as compared with Seventy other American cities.

Popular, yet scientific; interesting, yet accurate.

ALSO THE FACTS—in the large and in detail—concerning the Presbyterian Church in Cleveland.

**500 Men at a  
Supper Tonight**

**500 Women at a  
Luncheon Tomorrow.**

Exhibit open Wednesday from 9:00 to 3:00. Thursday, 9:00 to 11:00—3:00 to 6:00.

**Chamber of Commerce Auditorium**

A NEWSPAPER AD.—HOW CLEVELAND WAS TOLD:  
"KNOW THYSELF"

The first large scale work of this sort to be done in Cleveland has been accomplished by the Federated Churches, a federation of the Protestant forces in Cleveland organized two years ago. Charts and maps were prepared by experts showing the constant drift of foreign populations from one district to another, the living conditions in the congested sections of the city, the religious and social organizations at work, and the numbers and ages of the criminal and delinquent classes. These charts and maps were studied and discussed by ministers, laymen and social workers.

Another exhibit on a larger scale was prepared as a feature of church and city week by the Extension Committee of the Presbyterian Church in Cleveland. This exhibit presented a great array of facts, not only concerning the social conditions, but also statistics presented in an attractive way showing the history and status of every Presbyterian church in the city, with photographs of buildings, pastors, and officers.

The exhibit was given in the Chamber of Commerce Building situated in the heart of the city. Six by ten inch advertisements were run in the newspapers for two days with the headline "Seeing Cleveland," the largest advertising space ever taken by a church in that city.

It is evident that at least one denomination is beginning to find itself, like the ship in Kipling's story. Cleveland has turned foreign, to the extent of 76 per cent. The Associated Charities last year aided families from no less than seventeen foreign countries. The Public Library circulated 142,206 books printed in foreign languages. Foreign mission work is right here in Cleveland at our very doors. The changing population has affected the church so that 30 per cent of the Presbyterian churches report less members now than at some time in the past. The reason given is the "influx of foreigners." The city is growing rapidly; there was an increase of 52 per cent in the last decade, and the population is now about 700,000. It is evident that the church must change its methods to meet these new conditions.

One of the interesting features of the exhibit was a large number of photographs of children of the streets, tenements, back yards, etc., which are not to be found on picture postal cards.

As to results, this exhibit has certainly done something to help the church to know the city and to help the city to know the church. They should know each other in order to co-operate. The church cannot retire to some sheltered suburb and save its own soul. Its main business is to redeem the city, foreigners and all, from everything that makes living hard and goodness difficult. The church must cease the idolatry of the accession column, think less about building up itself and more about building up the community.

Among the results of the survey so far attained are a campaign of education now being conducted in different churches with the help of the exhibit charts; the raising of \$20,000 for church extension and work among foreigners, for the support of which an equal amount is to be secured annually. Other denominations profiting by the example of the Presbyterians have begun to hold similar exhibits, the Methodists being the first to follow.

#### RE-POSSESSING AN OLD CITY PARISH I

It is refreshing to have a halt called in the flight of parish churches away from their original parishes, by such a high hearted summons as the Rev. Henry Mottet issues to the Church of the Holy Communion to re-possess its old down-town field in New York. Of that changed field he thus frankly speaks:

"Our immediate vicinage supports lavishly three distinctly immoral theaters, a score of nickel and dime shows—all of them bad, dancing academies so-called, pool rooms, family entrance saloons and 'Raines Law Hotels.' It is the comforting and pious fashion among some religious people to sit in

judgment on all who give any kind of support to these dens of iniquity. For one I refuse to be reckoned among these critics. All these condemned people crave change. Probably they need change a thousand fold more than do their condemners. I am satisfied that the Master would not stand aloof and ignore such conditions, and that he would not, as a *preliminary*, demand of the municipal authorities to withdraw the licenses from each of these places. He would study that social craving—that heaven-instilled instinct—and he would satisfy it with meat for the people.

"I realize sometimes with humiliation, that many of the untoward conditions of my neighborhood might at least be modified, if not even very greatly improved upon, provided the church under my care were in such relationship to the people as would be the Father's were he now among us. As the result of a house to house canvassing comes the revelation of the fact that the church is, in deplorably many instances, a negligible quantity. On the other hand, I am convinced of the fact that if these self-same people came in direct contact with the personality of the Master, he would command the best of their interest and their attention. They are not bad, they are only waiting for the quickening touch of a divine hand. If a certain type of man comes among them—one who unconsciously convinces that he is disinterested—who can read, and interpret the yearnings and aspirations of the people—who impresses them as being one with them—who inspires and wins their confidence and affection and reverence—all the people involuntarily flock to him—heed him and follow him."

Like Dr. Chalmers, when looking down upon the district which needed him most in all Glasgow, Mr. Mottet seems to regard this situation as "a glorious prospect." Instead of lamenting its location as a mistake in the past or at the present, he asserts that

"had its great founder, Dr. Muhlenberg, been endowed with a divine vision, he could not have chosen the site of the church with greater wisdom. Excepting perhaps Trinity and Grace Churches, there is none today on Manhattan Island so favorably situated to get hold of the greatest number of people every day and every night throughout the whole year."

To assure "the permanency of the church for all time in its present location," is the foremost step in the four-fold plan of the rector. And he is grateful for "the privilege granted to this generation to determine the permanency of the church." Instead of substituting a mission for a church, in order by the sale of its site, to build a fine new edifice elsewhere, the second feature of this plan for permanency is to make the present church site finer in order to meet the greater needs of the changed population. He says:

#### A BIT OF RELIGIOUS ADVERTISING

How the Home Mission Campaign, culminating in Home Mission week last November, bore striking testimony to the public function of religion, was described in this department at the time. Here are a few of the clippings from the campaign. Six hundred thousand posters 22 x 28 inches were sent to Protestant ministers. A weekly bulletin was furnished to leaders in every city. The central office corresponded with 2,500 cities of 2,500 or over.

"The undertaking now nearly completed the church in its appeal to the sense of the beautiful and in its interpretation of the majesty of God, the very noblest and most uplifting that can be devised by the heart and the art of the most skilled, backed up by a commensurate generosity. The men of this generation will pass on to the people of our part of the city a church edifice that should stand forever as the best they could devise."

It is also planned to have the church thrown open every week night throughout the year, in order that the people may hear the most beautiful music. As a pledge of faith in this project, which will be consummated as soon as there is sufficient endowment to maintain it, a new organ has recently been placed in the church. It is the rector's belief, based upon some tests already made, that the church can be filled every night, "provided the organist is one of God's prophets, who speaks God through the organ."

A social service house is another feature of this plan. The great auditorium is to offer nightly counter attractions to the immoral theater and moving picture show; its educational and recreational facilities, crowned by a roof garden, enclosed with glass and heated for winter use, are "to interpret the church to the people in such a manner that the church will command a respectful, kindly, and reverent hearing." Mr. Mottet goes on:

"Adding all this to the Sunday ministrations of the church—with its frequent services—none of them as a rule exceeding one hour in length—maintaining a high standard of efficiency in a staff of consecrated, devoted clergy and sisters—all of them con-

stantly in and among the people—utilizing, as the case may demand, the hospital, the asylum and the orphanage, the house for the aged and the fresh air work—helpful whenever and wherever the Master would prove helpful among the self-same people, it is my profound conviction that the church will advance toward the attitude that must win back the respect and reverence and affection of all those whom Jesus loved and for whom he died."

Although in good part realized already, Mr. Mottet calls the plan in its entirety a dream, yet he reminds himself and his people that sixty-five years ago St. Luke's Hospital was nothing more. For then it was that Dr. Muhlenberg outlined his dream plan for it to his parish and in response got a collection of only \$30. And yet there stands "the first and greatest church hospital." So may this new vision for an old parish soon stand realized as "the bond between God our Father and all his children."

#### ONE CHURCH FOR SEVERAL CONGREGATIONS

The multiplication of denominational "houses" and church buildings at or near universities is arousing new fears and new hopes. Some are beginning to fear that the community of religious interests so long and so well established by the college departments of the Young Men's and the Young Women's Christian Associations may thus be divided within university circles as badly as are outside communities. Offsetting this, it is said, that unless the student's attachment to his or her own religious fellowship is maintained while in college, it will not be re-asserted after graduation. At most of the large educational

centers the several denominational college pastors co-operate so well with each other and with the Christian association workers that the unity of spirit is still unbroken.

New hopes are also arising out of this situation. One of them, as recently outlined by a far-sighted student, is that several denominations may yet unite to build one large church edifice, each of them with an assistant pastor to have the care of students within his own fellowship and to conduct week-day services, the main preaching at the Sunday services to be done by the most capable representatives of each denomination in turn.

This plan has the merit of providing a better building at less expense for erection and maintenance than each of three or four denominations could possibly build and equip for its own exclusive use. It would make possible such enrichment of worship by the better music and preaching thus obtained that the combined religious resources and attendances could not fail to impress the whole body of students more effectively than the best that could be done by the same personal and financial resources if divided. While each denominational fellowship could maintain its distinctive features among its own adherents, all of them together would impressively exemplify the unity of the spirit and the bond of peace.

And why would not such a single civic church building in other than university towns, or in distinct districts in larger cities, obviate the waste of resource in the needless multiplication of church edifices, and yet provide cathedral-like structures for the use of each in turn, which could be supplemented by parish houses, or even by chapels, for the family use of each fellowship? Would not this co-operative unity concentrated at one civic or social center serve the interests of each denomination as well, and yet serve the religious interests of the whole town far better? If such centers began to be established by the voluntary efforts of the churches, it might not be long before towns would erect such civic sanctuaries, for the common use of each and all, just as some cities now build opera houses, or assembly halls for other purposes. By the gown at the university the town may thus be helped, but as never before. What have you to say, reader, *pro* or *con*? Let us hear.

#### CHINESE STUDENTS AND AMERICAN EDUCATION

One of the American leaders of the Chinese Y. M. C. A. at Shanghai reports that notwithstanding the disturbances due to revolution and financial depression, all concerned are surprised at the heavy gains the work has scored. The membership has risen to nearly 2000 and the number of young men in the day and evening classes to over 800. The educational success is due to the broad view of the evangelistic purpose with which these courses of lectures and teaching are conducted—"to combat the tendency towards materialism which seems to have spread

over the entire country and give the thinking man the correct scientific attitude towards religion, especially towards Christianity, and then to follow up these lectures with addresses of a purely religious nature." To this end such far-reaching and timely subjects were treated as The British Constitution by a judge of the British Consular Court; The French Constitution by the Principal of the *l'Ecole Francaise*; The Constitution of the United States by Dr. S. Hornbeck; A System of National Education by President-Emeritus Eliot of Harvard University; The Revolution by Bishop Bashford, and Aviation by Z. Y. Lee, the first Chinese aviator to fly in China. A series of lectures on constitutional government was also given by a number of law students recently returned from abroad. Nearly 100 men took a course in first aid to the injured, a large proportion of them successfully passing the examination for the diploma of the St. John Ambulance Association of Great Britain.

Formerly Christians were supposed to be unpatriotic. That charge is never made against them now, while patriotism is receiving its first birth in the hearts of millions. The self-sacrificing patriotism and great ability shown by Christians who have been in office have given the cause a great impetus. Toward the \$27,000 to buy the land for a new boys' building such leading Chinese men of affairs contributed as the governor-general of Shanghai, the admiral of the Chinese navy, the commissioner of foreign affairs, General Hsu, the hero of Nanking, and Dr. Wu Ting Fang.

Michigan University is contributing its share to the same educational religious influences among the Chinese students enrolled there. There are sixty of them, the largest number in attendance at any American university. Many of them have won government scholarships in competition with thousands of other students in their native provinces. Some come on their own private means, but practically all are from the most brilliant and progressive of the young men in China. About half of them are either professed Christians or openly sympathetic toward Christianity. All, however, are eager for western ideas, which they are said to adopt with astonishing facility and therefore are sensitive to influences wisely given to inspire religious interest. The non-Christian Chinese are puzzled mostly by the inconsistencies they observe in our failure to apply Christianity to life. With a reticence due to their inborn courtesy they hesitate to come directly to their American friends with these perplexities, which they bring to the Christian Chinese for discussion. To get help in meeting these problems the Chinese Students' Christian Association holds weekly conferences for all their fellow Chinese students, with distinguished men to discuss the essential content of Christianity, its historical, theological and philosophical problems, and such practical problems for the Chinese as What constitutes a Christian life? Does Modern Civilization Need Christianity? Of What Importance is the Christian Life to a Man Who is to Help Build a Country Like China?

### THE FAMILY AND SOCIAL WORK

The intersphering of religious and social thought and work is freshly demonstrated by the preparation of Edward T. Devine's little hand-book<sup>1</sup> bearing the above title, written at the request and for the use of the college department of the International Y. M. C. A. It is, however, not more indicative of the extension of religion into the social sphere, than of the intensive tendency of the social movement to find its rootage and source of power in religion.

The directors of the Y. M. C. A. college work are farsighted in choosing the family as the common ground on which to bring these two tendencies together. For, there is no better test of the true and the false in religious and social theory or practice than the effect of either upon the family. Moreover, there is no social theme, which is in such vital contact with so many things that the college student is studying about, as the family. Biology, psychology, economics, political science and administration, sanitation, physical culture, philosophy and religion, one and all, and many more branches of knowledge, are readily shown by Dr. Devine to be involved in any study or observation of family conditions and life. Skillfully all these academic interests are interwoven with the social ideal, the religious motive, and the practical purpose in a way to appeal to the college student's mind.

Squarely is the author's aim—"to make clear the essentially religious character of social work"—brought to bear at just those two closest points of contact with the student's intellectual inquiry—the biological and economic interpretations of life. Degeneration and progress as involving either the elimination of the unfit by the struggle for existence, or the redemption of the lower to the higher life by social and religious forces, are the negative and positive poles of thought to which the whole discussion is keyed. Together they state the fundamental religious and social problem of our time. In its solution "social workers and economists have come to terms; with biologists, on the other hand, social workers have hardly yet reached such an understanding." But beyond these adjustments, "the fact is that social work, while welcoming support and criticism from both economic and biologic science, is something more and better than applied biology or applied economics. It is fundamentally applied religion."

From this basis the study of the family proceeds with a method as scientific as its aim and application are practical.

Although in the brief space at command, the actual conditions and tendencies of family life could only be lightly touched, they are practically all included either in the broad discussion or in the incisive questions following each chapter. Reaching after an insight to be gotten only through wider reading and independent thought, these questions lead the student out into the field to see facts for himself, and into the practical work to co-operate with manifold movements and agencies to improve existing conditions. But

<sup>1</sup>The Family and Social Work. By Edward T. Devine. The Survey Associates. Price 60 cents; by mail of THE SURVEY 68 cents.

the original and strongest motive for all this interest and endeavor is steadily held "to come from our religion, from our inherited and trained instincts of love and compassion, from our instinct for justice, our inbred passion for fair play and decency." And this is shown to be not more the religious motive than it is the attitude of social work.

### CATHOLIC CO-OPERATION IN KANSAS CITY

The Catholic churches of Kansas City joined heartily with the Protestant and Jewish congregations in taking a religious census of the city. The fellowship that grew up among the representatives of these different faiths while engaged in this common work led to further results. The Rev. Father Scanlon, pastor of St. Stephen's Church, responded to a circular letter sent out by the district superintendents of the Board of Public Welfare, asking for an opportunity to present various lectures in church buildings. These addresses on social topics were given for three months every Sunday evening in the hall connected with his church. The same building was equipped with a gymnasium, shower baths and game rooms for the use of boys' clubs and a young men's club. The Rev. Charles Delbecchi, pastor of the Holy Rosary Church, in response to the same official appeal, arranged numerous lectures and social entertainments and personally co-operated with the district superintendent in social work for the whole population. In a recent address at the City Club he charged the city with neglecting his district and made a forcible plea for the improvement of the housing conditions and for the erection in his community of a large new public schoolhouse fully equipped for social center meetings. At such neighborhood centers in other districts he frequently speaks. His translation into Italian of a little manual of legal suggestions for the ordinary man was printed with the English original by the free legal aid bureau of the Board of Public Welfare for the use of the Italian population. His assistant conducts a class in Italian for about a dozen of the social workers in Kansas City. He attends a normal class in recreation, conducted by the superintendent of the recreation department, in order the better to initiate Italian boys' clubs in some of the public social centers.

Some Catholic ladies have recently started a girls' hotel for the working girls of their faith. One of them serves on the board of directors of the Florence Crittenton Mission. A prominent Catholic layman is a member of the Board of Public Welfare and another is attorney for the board. Several others are active in the anti-Tuberculosis Society and in the board of directors of the Provident Association.

This city-wide co-operation of the churches and other voluntary agencies with public officials is very effectively promoted by L. A. Halbert, general superintendent of the Board of Public Welfare. Inviting such co-operation are such departments of practical work as cannot fail to be directly tributary to the work of the

## INDUSTRY

### THE INDUSTRIAL OUTREACH OF THE Y. M. C. A.

CHARLES R. TOWSON

INTERNATIONAL SECRETARY, INDUSTRIAL DEPARTMENT, Y. M. C. A.

"The Y. M. C. A. is going too far," said the president of a coke company. "I believe in it and think it has its place, but when it comes to working among these people who can't speak English that is going too far."

But this is just what makes the organization move in its ever-widening circles—the *all-men-our-field* policy. It has limitations of means surely, imperfect methods, of course; its leadership has decidedly human limitations—but there is one respect in which there is no limit—men and boys of all colors, creeds and conditions are its field.

#### *Extension of Work*

This has not always seemed to be so. Organized by a group of London dry goods clerks, its first buildings located in commercial centers, its privileges appealing especially to men and boys of the clerk type, its natural growth was toward the commercial group. But with this growth came also an instinctive outreach toward other groups. This growth has been of an opportunist rather than of a studied nature. A conversation between a New York business man, William E. Dodge, some Princeton students and an association secretary led to the organization of the Student Department. A railroad official's request to the Cleveland association for service to his men made way for the railroad work. The tent work with the National Guards carried on

by the various state committees developed into the present army and navy work, and the colored department resulted from the plea of a southern white man who caught up a gleam of prophecy and focused it until it became the vision of an international convention. His wildest imagination could never have pictured what is history today.<sup>1</sup>

At every outreach there have been those who thought "that is going too far," but the progressive spirit has led.

#### *Entering Industry's Realm*

The time came when the association saw a new field in the world of industry where the workers were massing and the industrial work was begun. Night classes for artisans were started, shop meetings were held, physical and social activities were inaugurated. Now there are 30,000 industrial workers in night classes; last year 1,500,000 attended shop meetings, while first aid and prevention of disease are themes in shops and factories throughout the country. This carrying the association outside of the building and without regard to membership has been accompanied by the same question "Is this not going too far?" Five years ago many ques-

<sup>1</sup>Julius Rosenwald, president of Sears, Roebuck & Co., Chicago, has agreed to give \$25,000 to any city erecting a \$100,000 Y. M. C. A. building for colored men within the next five years. Six cities have already accepted this challenge.

tioned the wisdom of attempting work for immigrants, yet 150,000 were personally served last year at the ports and in English and citizenship classes.

A secretary helping in the annual outings and field sports of an organization of working men was cautioned by a director of the conservative type: "You had better not spend too much time with that kind of work. They are a lot of booze histers." But now outings, field days, athletic meets and playgrounds are a part of the regular program. The circle of service has continued to widen, until only a few associations are confining their service to their buildings and to their members, and in the isolated industrial places not only the men and boys but the entire community are the modern association's field.

#### *International and State Promotion*

This industrial movement which had begun in the local associations demanded special promotion, and the International Committee was asked to give it special attention. The industrial department was organized. Its field is North America and the emigration zone of Europe. Its commission is to help relate the association to industrial workers. It is composed of five laymen with twenty-five others on special committees and a staff of ten secretaries—all of whom are specialists. One studies new methods of industrial work in city associations, two promote

the scheme of immigration work which is in operation at European ports, on ships, at ports of entry, at railway stations and at destination. One conducts a school of training in southern industry and agriculture; four specialize in the mining, textile and lumber fields and construction camps respectively and another promotes the association in miscellaneous industries. One enlists students in engineering schools to engage in forms of service that bring them into relation to industrial workers, learning to know and understand them and their needs, so that when these students become engineers they will have more intelligent regard for the welfare of the workers.

As the work progresses the various state committees employ specialists for full or part time promotion of various phases of industrial work, and the international secretaries co-operate with them.

#### *Progress*

Including railroad men, 35 per cent of all the members of the North American associations are from the ranks of the industrial workers. Besides the industrial work of the city and railroad associations there are in miscellaneous industries 70 association buildings costing a million and a half dollars erected at the cost of the employers and maintained by the joint efforts of employers and employees: 12 in cotton mill villages, 6 in coal mining communities, 12 in lumber

NOON-HOUR EDUCATIONAL SHOP MEETING, EASTERN DISTRICT, BROOKLYN

A common type of association extension work—talks on health, travel, civics, industry, self-improvement, religion, etc., given by secretaries, business and professional men at any point in an industrial plant where a group of working men can be conveniently brought together.

TEACHING WORKERS HOW TO MEET INDUSTRIAL ACCIDENTS

First aid teams among miners and railroad men developed on an extensive scale.

towns and camps, 12 in construction camps, 11 in metal mines and nearly a score in manufacturing centers. There are 153 secretaries at work in industrial fields.

#### *Welcomed by Employers and Employees*

The employees always share in the support and control. For example, one company employing 4,500 men and boys has provided a building and gives \$10,000 annually and the men give as much more. The association has 2,200 members and its management is in their hands. All of the apprentices of that company are taught in the educational class rooms of the association. The playgrounds of the community are operated as an association feature; the building is the social center for the community, and a special branch with a building and secretary is provided for foreign employees. The police authorities say the association is one of their best allies, and the company say it is one of their best assets.

Contrasting in size with this, another is doing successful service in a lumber center where there are less than 100 white employees. It pays the company to provide the building and to contribute an amount equal to the salary of the secretary. Here, also, the employees do their part and the work is a success notwithstanding the prediction that it would fail because of the small number and the differences in race and religion. In both places the association deals successfully with the non-English speaking population.

Where its work is clearly understood, neither racial nor religious differences are a bar to success. Men of all creeds and no creeds are enrolled in the nearly 600,000 members in the 2,100 associations in North America. For example, there are many Hebrews in the membership and there are more Roman Catholics in many associations than from any other denomination, and in some cases, more than from all the others combined. The proselyting spirit is absolutely out of place in the association.

Employers and employees both approve its co-operative basis. It works in the zone of their agreements. While it is not blind to issues between employers and employees, it does not assume the responsibility for adjusting them; but

it does help to develop that spirit which is calculated to prevent disputes. It helps to allay irritation; creates the right state of mind and begets that good will which finds the basis for the friendly adjustment of differences. In the midst of a strike in a coal field where the feeling ran high, the striking miners and guards were seen swimming in the same Y. M. C. A. pool. In another place the strikers and strike breakers occupied beds on different floors in the same Y. M. C. A. building. These incidents may be unusual, but they illustrate the association

spirit and attitude.

The association enjoys an increasing measure of confidence and co-operation from both organized labor and organizations of employers. There is little ground for the fear sometimes expressed that "the good may be the enemy of the best," that the association may interfere with the betterment of industrial conditions by serving as a salve to the conscience of employers on the one hand, or, on the other hand, as an anaesthetic to the workers. It is not installed by employers as an industrial lightning rod to avert strikes, nor is it regarded by workers as a sop to induce silence.

The employers who approve the association as a welfare agency are in the forefront of both thought and action concerning industrial betterment; no wage scale is lower and no worker less free because the Y. M. C. A. exists in industry. It does, however, help to draw the line between the progressive and the reactionary employer. For example, an employer connected with a western plant said to another: "Here is a plan for betterment of foreign employees—it looks good to me." The other answered: "Oh, the first thing they will do is to teach those foreigners English and then they will get together and raise Hell." Evidence is not wanting to show that if this super-heated condition is to be raised, it might better be in English. The association is proving that such work raises not "Hell," but happiness, efficiency and production and that at the same time it lowers the accident, disease and death rate.

#### *Meeting Individual and Community Need*

The association stands not only for character based upon religious convictions but for an environment in which character may develop. One association induced a great railroad company to change the method of paying off so that the men got cash for their checks in the pay car. This was a blow to the saloons where the checks were formerly cashed. Another association submitted facts upon which a great industry increased the wages of the boys. Scores of companies have been induced to co-operate in giving better educational advantage to their employees, young and old. Other associations have pioneered the

health movements of the community. One mill president says that his machines were idle less during the past summer because of the association leadership in cleaning up the village, draining swamps and teaching hygiene. At the suggestion of the association secretary that company spent thousands of dollars to screen windows and closets, carry away garbage, employ visiting nurses, etc.

Many associations lead in clean-up days. One cotton mill village gave up 250 cart loads of trash in a single day; one iron manufacturing center furnished 95,000 empty tin cans in a day; playgrounds and physical examinations are promoted as religiously as shop meetings and Bible classes. The association secretary in charge of the welfare work in sixteen mill villages reports that the school teachers in calling the roll not only have the pupils answer "present," but also whether they have used the tooth brush.

One of the latest advances is the instruction in English and citizenship for non-English-speaking workers. Seventeen thousand were in English classes last year and many more attended lectures on citizenship. In the beginning this was done on the men's time only and at the cost of the association. Some thought this was going too far, but the initiative had to be taken; today some of the largest industries pay the cost of this work for their employes and in some cases they are willing to give company time for it.

The service rendered at European and North American ports helps to make the work done at the immigrants' destination more effective. For example, two Hungarians who had been met by the emigration secretary at Liverpool and again at Ellis Island, and then at their destination, were so much pleased by the help received and by their reception at a quarry men's association in Vermont that they went out among their fellow countrymen and brought in twenty new members.

A weaver in South Carolina said: "I gave up a job paying the same money to come where I could find a Y. M. C. A.," and a logger in the Mississippi woods said: "This place means home to me." Both these men appreciate the outreach of the association into industry. The same is true of the citizens in a community in West Virginia, where, "the express liquor business has been cut in half," and in the far West where in construction camps secretaries are driving away lonesomeness and vice with friendship that will do anything from teaching English or a Bible class to putting a drunk to bed; or from writing a letter for an illiterate to becoming a deputy sheriff and closing up the dives of a whole district. Such service expresses religious motives in sane terms and is finding a constantly widening field.

TRAVELING SHOP LIBRARY, EASTERN DISTRICT, BROOKLYN

Encouraging working men to read good books by taking the books to them at noon hour in the shop. Books are loaned by the local public library.

# THE EFFICIENCY OF PRESENT FACTORY INSPECTION MACHINERY IN THE UNITED STATES

EDWARD F. BROWN

NATIONAL CHILD LABOR COMMITTEE, NEW YORK

The phrase "factory inspection" is a misnomer. The inspection of factories is merely incidental to the duty of enforcing a body of labor laws, and inspection takes place simply that labor laws may be better enforced.

Broadly speaking, two of the most glaring defects in the present machinery for administering labor laws are:

1. The inadequacy of legislative appropriations, and
2. Antiquated customs, chiefly political, and inefficient organization in many states for the carrying out of the legislative intent insofar as the meager appropriations permit.

On the first point consider that in 1911 thirty-nine states appropriated for the use of labor departments approximately \$1,544,073, the largest single grant being \$324,384, made by Pennsylvania, and the smallest being \$2,400 in Tennessee.

The aggregate appropriation of a little more than one and a half million dollars for the whole country was intended to serve the health, comfort, safety and welfare of twenty million toilers in the land.

Edson Lott estimates from the federal census that the average wealth created by each wage-earner in the United States (exclusive of the material he uses, supervision of his work, and his own wages) is about \$630. In return for stocking this store-house of national wealth, society doled out by way of labor department grants for the conservation of its wealth producers .013 of one per cent of the wealth so created. In other words an average of 8.1 cents per annum is spent on each factory wage-earner in this country for the prevention of accidents, sanitation, preventing the illegal employment of children, providing for out-of-works, studying occupational diseases, etc.

Clearly, from this presentation, it is obvious that our legislatures provide very deficient machinery when they expect that we shall conserve the human resource of the land on eight cents a year or seven mills per month, for each factory wage-earner.

The federal government spent in one year in the Bureau of Animal Industry \$1,654,750, or \$110,677 more than thirty-nine states spent for the health, safety and comfort of their workers.

The Bureau of Plant Industry spent in one year \$2,061,626, or \$517,613 more than thirty-nine states invested in the welfare of their toilers.

While the federal government was spending in one year these vast sums of money on animal and plant life Nebraska, with 24,000 workers to be protected, spent \$56,000 for the conservation of

its cattle, and \$4,840 for the conservation of its workers.

The legislature of North Dakota in 1909 realized the necessity of establishing a stallion registration board, but not the need for a department of factory inspection.

Of the following fifteen states Texas alone employs a factory inspector—one inspector to 73,000 employes. The others have no machinery for the protection of workers.

Arkansas	with more than	45,000	workers
Georgia	" "	105,000	"
Florida	" "	58,000	"
Mississippi	" "	50,000	"
North Carolina	" "	121,000	"
Vermont	" "	33,000	"
Texas	" "	73,000	"
Nebraska	" "	24,000	"
Montana	" "	11,500	"
Idaho	" "	8,000	"
Arizona	" "	6,400	"
New Mexico	" "	4,000	"
South Dakota	" "	3,500	"
North Dakota	" "	2,500	"
Wyoming	" "	2,500	"
In all	" "	547,400	"

More than half a million wage-earners practically without legal protection. In these states unscrupulous business may, unmolested, maim the body and mar the mind while the sovereign state stands by in apathy looking upon the ruin it might have minimized, if not averted, by the exercise of its constitutional authority.

Yet in a few of these states it is a high crime to molest the young oyster or lobster. Business demands that they be permitted to prosper until with maturity comes a higher selling price. But men, women and children are, through lack of proper legislation and improper enforcement of existing laws, crippled and incapacitated and stunted. The men and women are taken in the prime of life—the children before they are strong—and after spending their energies they are roughly cast in the scrap heap of an exacting and inexorable industrialism. The question then arises, is it the part of wisdom to continue spending more money on bugs, bees and beasts than in an endeavor to prevent the accidents and diseases of industry?

The bare fact that we have approximately 425 factory inspectors in the whole country to care for nearly seven million factory workers, spread over an area of three and a half million square miles, establishes, I believe, my first premise, that the efficiency of present-day factory inspection machinery is impaired, first, through the inadequacy of legislation appropriations.

Let us consider now what, in spite of the niggardly grants, we may expect from our labor agencies. At the outset we are struck with the fact that except for two or three states, the most undesirable brand of politics permeates the administration of labor departments.

In twenty states the head of the labor depart-

ment is designated by the governor, and his term of office depends usually on the political fortunes of his chief. The absence of a permanent character in this important post makes it possible for politics to play no uncertain game, both in the choice and character of the man who is sworn to enforce the labor laws. The best type of man is not always attracted to the position. To my mind, no state, except possibly Massachusetts (under its plan of reorganization) and Wisconsin, have entirely freed their labor departments from a destructive political influence. And even in the two mentioned states, the system is still pregnant with possibilities if the chief magistrate of the state is not all that is desired in the man. It is, I think, the one cloud which hovers over the otherwise successful administration of labor laws by commissions. It is not politics that is objected to, as much as the kind of politics. Democracy demands that politics take a prominent place in our national life, but the word has become odious to those of us who have watched the kind of politics many of our communities tolerate.

Not alone is it necessary to have a capable and trained man at the head of the department, but the inspection staff should be made up of men equally trained and capable in their separate fields. In only five states in the United States (New York, Massachusetts, New Jersey, Wisconsin and Illinois) are inspectors required to qualify after a civil service test. And unfortunately, even in some of these elect five, the test does not appear to be the last word in the selection of able and honest assistants. In Kentucky, Minnesota, Ohio and Indiana some practical experience is required of inspectors. In not a single state, perhaps, is the standard as high as that apparently required in Prussia, Saxony, France, England, Russia, the Netherlands, Spain, Finland, Hungary or Norway. Inspectors, as well as the head of the department, should be required to devote all of their working time to the business of the state.

In Pennsylvania, where I recently made an investigation of the administration of the department, I found that many of the factory inspectors were conducting private business enterprise while holding commissions in the department. One is alleged to have sold fire insurance to the establishments he was sworn to inspect impartially. Another kept a saloon. Still another was in the coal business. Let us trace the effect of such a system. Last year Pennsylvania spent approximately \$105,000 for factory inspection. The staff of forty-one inspectors in 1911 is reported to have inspected 16,725 establishments. This, as will be seen, is an average of less than two establishments per day for each inspector during the year.

In the same state, from 1906 to 1911, Chief Delaney, who was dismissed recently by Governor Tener, reports 16,477 violations of the unguarded machinery law. During the same period there were reported 14,444 accidents of all kinds, nearly 1,200 of which were fatal. With all this gruesome record growing on him, Delaney instituted only two prosecutions on this provision of

the factory act. Since 1908 there were no prosecutions at all, although between 1908 and 1911 the reported accidents more than doubled in number.

In another state where the chief factory inspector divides his time between conducting a livery stable he owns, and the business of caring for some 30,000 factory wage-earners, I found him contributing a remarkably concise annual report consisting of exactly fourteen words. It reads, under date of July 1, 1911, as follows: "I have visited the same factories as last year and find conditions the same."

The foregoing sidelights tend to emphasize the second premise with which I started out—that antiquated methods, chiefly political, and inefficient organization in many states render many of our labor laws ineffective.

Finally, the most dangerously unguarded machinery I have known is the machinery of factory inspection in the United States, exposed to a most pernicious political influence, and the parsimony of legislators, rendering possible the industrial diseases and accidents which a provident nation would promptly make impossible.

## ANNOYANCES

PAUL U. KELLOGG

At the meeting last month of the American Association for Labor Legislation in Boston, Prof. Robert E. Chaddock of Columbia University discussed needed legislative changes with respect to the registration and reporting of trade accidents and diseases. Few states have anything like complete reporting; few have blanks that contain all the significant facts. He raised the question whether the point had not been reached where general labor reports should not be required quarterly of all employers.

This suggestion, advanced by a statistician in a matter-of-fact way, took on a fine edge when it was heard in connection with the protestations on the part of two members of the Massachusetts Industrial Accident Board. At the previous session, James B. Carroll, chairman of the board, spoke of the annoyance of the manufacturers of Massachusetts at multifarious reporting. At a later session, E. F. McSweeney, member of the same board, made the same point as to the annoyance of the manufacturers of Massachusetts. This annoyance of the manufacturers of Massachusetts seemed to be the most vivid impression these two gentlemen gathered from their official work. There was no intimation in their remarks that possibly there were other people in Massachusetts who might be provoked or annoyed. It is annoying, after a workman has had a leg fractured in a certain way, or in a certain process, or has had an eye pierced, to have another workman suffer a similar injury in a similar process in another part of the state; and another workman, and another workman—merely because there has been failure to report accidents precisely and quickly so that all managers in all parts of the states may know where the danger lies, and so that the ways of prevention can be spread equally broadcast. Such a re-

currence is annoying all his life to a man with a wooden leg or a withered eye. It is annoying to the decent self-respect of a state. The Massachusetts system of reporting accidents may be faulty; there may be need for simplification and co-ordination of reports. But it would seem that the Industrial Accident Board has a larger job before it than to act as a society for the prevention of unnecessary annoyance to manufacturers.

That the spirit shown in these two addresses is not fairly representative of the manufacturers of Massachusetts, is illustrated by the work of the mutual insurance organization which some of the leading manufacturers of the state have organized under the new compensation law. One of the most experienced safety experts in the country has been employed, every accident of every member is at once studied, the experience pooled, and methods of safeguarding elevators, electric wiring, gears—each of the danger zones—are distributed to the constituent members. These manufacturers are definitely enlisted in a campaign to cut down accident risks, in the same way that the Massachusetts mutuals have cut down fire risks. They are getting rid of the annoyance of reporting accidents by getting rid of accidents.

#### STILL ROOM FOR A FEW HUSKY REFORMERS

The other day a well-known educator, in the course of an address delivered before a body of teachers in New York, stated that less attention than formerly need be paid by good citizens to the subject of the prevention of industrial accidents and industrial diseases because these things have now become objects of vigorous state activity! This, in spite of the fact that there are only eight states in the Union where the reporting of industrial diseases is required by law. And now comes the Bulletin of the New York State Department of Labor with some accident figures that may justify even the average citizen in doing some thinking. There were reported to the department in the second quarter of 1912, just three months, 19,567 accidents in factories, mines and quarries, and building operations; that is, 136 more than were reported for the entire year of 1907, which at that time was the high-water mark in the history of the department. Only two years out of the four since then have exceeded the record of 1907, but these have shown a tremendous swelling of the figures. In 1910, 25,390 were reported, and in 1911, 44,551. There were 15,371 reported for the first quarter of 1912, making a total of 34,938 for the first half of the year. If the same rate was maintained in the second half, the year's record will be nearly 70,000.

But this does not mean at all that more men are being hurt than formerly. On the contrary, the bulletin points out that "this increase should be interpreted only as an evidence of more nearly complete reporting, and no inference can be taken from it as to the increase or decrease of the actual number of accidents in the state." The proportion of fatal accidents appears to be

very much higher in building operations than in factories, for although less than half as many accidents were reported, there were seventy fatal cases in the building industry as against forty in factories in the second quarter. It is further pointed out that since accidents have been reported in the building industry for only two years, while for upwards of twenty years there has been a law requiring the reporting of factory accidents, it is likely that the proportion of fatal accidents occurring in the building industry and unreported is very much greater than the proportion of unreported accidents for factories.

It may fairly be assumed that the public may still concern itself with the problem of industrial safety.

#### A NEW STEEL TOWN

In the 1912 report of the Crucible Steel Company of America, it is announced that, owing to an expansion in operations at the works of the Pittsburgh Crucible Company, a subsidiary, at Midland, Pa., the working force will have to be largely increased and that there are not enough houses in the town to provide for the expected increase in population. Consequently, the company has purchased 500 acres of land adjacent to the town and will divide it into lots, some of which will be sold to employees while houses will be built upon others.

The company recognizes that since the new town is a consequence of its own activities, it has a responsibility concerning the sort of town that it is to be, and it has definite plans for discharging that responsibility. It has employed an architect to work out a plan with a view to combining beauty and utility, which should rank with two other steel towns in America where similar forethought is manifest—Vandergrift, Pa., built some fifteen years ago by the American Sheet and Tin Plate Company; and Corey, Ala., the new town of the Tennessee Coal and Iron Company.

The plans for this new development in the Pittsburgh district are described in the report as follows: "To modernize the improvement, it was decided that a large portion of this new purchase should be laid out as a model town for the company's employees, following in a general way the development of some of the workmen's settlements in England and Germany, where the streets are laid out in curves, with parks and recreation grounds at intervals, planned to make the most attractive place for the establishment of workmen's homes and for the rearing of their families. Here a filtration plant is already in course of construction for the purpose of supplying pure water. The location for these improvements is one of the most beautiful natural sites in the Ohio Valley, high above the highest water, and where an old growth of large trees will add much to the beauty of the surroundings. The company has, since the property was purchased, made contracts for an initial construction of thirty houses, and as the plan develops the number will be largely increased. All houses the company builds will be most modern in construction, having the best improvements, keeping in

mind the desire to uplift the whole moral tone of the wage-earner."

Herbert Du Puy and C. C. Ramsay, respectively chairman of the board of directors and president of the Crucible Steel Company of America, and J. W. Dougherty, president of the Pittsburgh Crucible Steel Company, are actively directing the work.

#### BUREAU OF MINES REPORT

The second annual report of the Bureau of Mines for the fiscal year ending June 30, 1912, which has just issued from the government printing office, contains a large amount of very interesting material.

The bureau has through its investigations proven the danger attendant upon the use of black powder and has at the same time demonstrated that other explosives may be used having a short and "relatively cool flame." In spite of the fact that there is no power to compel the use of those so-called permissible explosives, nevertheless the use of them "has increased from a small beginning a few years ago to more than 13,000,000 pounds during 1911."

At the same time the bureau has been studying and promoting safety. Six mine rescue stations are maintained and seven rescue cars are scattered over the country in those districts where mine accidents are most likely to occur. More than 200,000 miners in different parts of the country attended the safety lectures and demonstrations conducted by officers of the bureau and certificates were granted to 2,000 miners who had received training in mine rescue and first aid work.

The report states that the appropriation acts which have given the bureau power to make investigations into coal mine accidents have strangely limited such investigations to "inquiries concerning the causes and prevention of mine explosions" although the investigations carried on by the bureau, handicapped as it is, have demonstrated that "more than one-half of the fatalities in coal mines result from falls of roof, slate, or coal, and injuries from mine cars and locomotives." The brief review of miners' circular No. 9, published elsewhere in this issue, shows to what an extent the general public has been misled as to the causes of mine accidents on account of the spectacular character of mine explosions.

It is pointed out also that the bureau has no power at the present time to make investigations as to health conditions in and about mines. A third defect is that the work of the bureau is at the present time confined to coal mines. The report urges that "mine investigations should be extended to include the collection of complete and reliable data concerning the character and number of accidents as well as the methods of prevention in all branches of the mining industry, metal mining as well as coal mining and in metallurgical and miscellaneous mineral industries." Attention is called to the fact that mine fires and other accidents have occurred during the past few years in metal mines to such an

## Legislative Program for 1913

¶ The American Association for Labor Legislation opens the New Year with a **definite program** of eight parts for the 42 states having legislative sessions.

¶ For the first four parts of the program it is initiating legislation and **supplying standard bills**.

¶ For the second four parts it **supplies the essential facts** for securing effective legislation and co-operates with other organizations.

The program is:

1. Provide for one day of rest in seven, no matter how continuous the industry.
2. Secure sanitary regulations for the protection of workers exposed to the dangers of lead poisoning.
3. Extend the uniform reporting of industrial accidents and occupational diseases and urge the adoption of the standard schedules for such reports.
4. Secure a revision of the federal employees' compensation act, including extension of the compensation principle to embrace occupational diseases as well as industrial accidents.
5. Aid in the enactment of additional state laws providing just systems of compensation or insurance against industrial injuries.
6. Encourage the investigation of industrial accidents and occupational diseases by state and national authorities, and urge upon the federal government proper provision for the study and advancement of industrial hygiene and safety.
7. Co-operate in securing effective legal safeguards for working women.
8. Prepare for the supreme test of law enforcement by helping to develop machinery for more efficient factory inspection and better enforcement of labor laws.

Each of the eight parts in this program forms the subject of a chapter in the December issue of the **American Labor Legislation Review**. Each represents months of work by an expert. The whole forms a **legislative handbook** for the year 1913, illustrated with colored maps and charts, tables and bibliography. Invaluable to those wishing to write their representatives in Congress and State Legislatures—gives the concrete information to make such letters effective.

This December issue of the **Review** sent postpaid for \$1.

Annual membership, including this and four following issues of **The Review** (quarterly) for only \$3.

**American Association for Labor Legislation**  
131 East 23d Street, New York City

## Laws to Protect Women Who Work

Will be proposed in most of the **42 states** whose Legislatures meet this year. Do you want to help? Keep track of the movement? Learn what other states have done? Know where **your state stands?**

The simple way, to have all necessary information conveniently at your fingers ends, is to send for the new edition of **Fatigue and Efficiency**, by Josephine Goldmark, one of the latest and most useful of the **Russell Sage Foundation Publications**.

Miss Goldmark, as publication secretary of the National Consumers' League, spent several years in preparing this book which gives a complete compilation of all American legislation regulating women's hours of labor. It gives not only extracts from the **statutes of all the states**, but also comparative schedules in tabular form, showing at a glance the **standing of each state** in regard to the extent of protection afforded. A separate schedule is given for each important **place of employment** covered by the laws—manufacturing establishments, mercantile establishments, laundries, telephone service, etc. A final schedule summarizes the whole.

Most important of all—the scientific basis for protecting women in industry—is Miss Goldmark's remarkably lucid interpretation for laymen of the findings of physiologists in regard to the **toxin of fatigue**—the poison of overwork—how long hours, speed, overstrain affect women and their children.

Jane Addams says: "A most masterly assemblage of the very material we all need."

extent as to show the necessity of first aid and mine rescue work in this field.

Among the other activities of the bureau investigations into the quality and efficient use of fuels has resulted in the saving of a considerable sum of money to the government in the purchase of fuel. The government purchased \$8,000,000 worth of fuel during the year, based upon the analyses and examinations made by the Bureau of Mines. Beside its importance to the government, "the benefits to the general public resulting from this work may be indicated by the fact that more than fifty of the larger cities, a number of states and a large number of private corporations and business concerns in different parts of the country have adopted the general plan followed by the government in the purchase of its coal."

Another field of activity in which the bureau might be able to render great service is, it is pointed out, in the conduct of investigations with a view to the prevention of mineral waste. It would be difficult for any body other than a bureau of the federal government to carry on investigations that would have the required scope and authority, to the end that proper legislation may be enacted.

The report, which covers 87 pages, is crowded with information that is of utmost importance and interest not only to the mining expert or to the investor in mining properties but to the workers and to every public spirited citizen.

### AN IMMEDIATE LABOR PROGRAM

The American Association for Labor Legislation, in the December issue of its quarterly publication, announces what it calls its "immediate legislative program." This program consists of eight propositions which are as follows:

1. One day of rest in seven.
2. Protection from lead poisoning.
3. Uniform reporting of accidents and diseases.
4. Revision of the federal employees' compensation act.
5. State workmen's compensation legislation.
6. Investigation into industrial hygiene and safety.
7. Effective legal safeguards for working women.
8. Factory inspection and labor law enforcement.

The association has brought together under each one of these eight heads in a compact and summarized form most of the best arguments in favor of the propositions. Under the one day of rest in seven proposition is to be found conveniently summarized all of the available information that has been gathered to date with regard to the amount of seven day labor in the United States. A table is presented showing the half dozen rest day laws that have been enacted so far in this country and, as in the case of each one of the other propositions presented, a bibliography is appended giving some of the most readily available and useful books and articles that have been written in support of the proposition.

Under the plank calling for the uniform reporting of accidents and diseases, the accident schedules of nineteen states are tabulated in order to show how many states ask each specified question in a list of fifty-eight which in one or another of these states the employer is required to answer. Illustrating perfectly the need of greater uniformity, this tabulation shows that one question only, the name of the injured person, is asked by all of the nineteen states. The date of the injury is desired by eighteen states. From these the list tapers down until at the end there are twelve distinct questions, each one of which is asked by only one state out of the nineteen.

None of the sections of this review is presented more strikingly or more effectively than the one dealing with the efficient enforcement of labor laws. It is shown that there are four different general schemes of organization which are themselves again subdivided to a considerable extent in the states—which have departments of labor, that there are at least nine different ways of selecting the chief officer of such departments, that there are no two states which agree in the proportion between wage-earners and inspectors while none of them have an adequate force, and that in a majority of the states no training whatever is required of inspectors.

### JOTTINGS

#### THE NEW LABOR LAW OF NEW YORK

This is to be a memorable year in the annals of labor legislation in New York. After two years of work the Factory Investigating Commission is prepared to recommend legislation going far toward that protection to industrial workers which the public is at last demanding. Protection against fire was the first and particular concern of this commission called into being as a result of the Asch Building fire, and the commission's last year's bills were the subject of much adverse criticism. Their tentative proposals this year have been subjected to long and careful scrutiny and their final bill is awaited with interest. The problems of home work, the better regulation of canneries, the organization of a bureau of industrial hygiene and the practical reorganization of the Labor Department so as to make it an efficient organization for the enforcement of the labor law, are some of the other subjects upon which the Wagner-Smith Commission have been taking testimony and upon which they are now about to make final report.

To secure such support for this commission's final bills as they promise to deserve and to furnish opportunity for public discussion of what has been done—and perhaps left undone—the New York Association for Labor Legislation has arranged to devote its annual meeting to the one subject—the New Labor Law and Its Enforcement. President pro tem Wagner, Speaker Smith and Abram I. Elkus of the commission with Samuel McCune Lindsay and I. M. Rubinow will deliver short addresses and then promises to follow, what is rare in annual meetings, real

discussion of the principal papers. Among those who will lead in the discussion will be Dr. George M. Price, Dr. W. Gilman Thompson, Prof. Henry R. Seager, Josephine Goldmark, Edward T. Devine, Frances Perkins, Mornay Williams, Thomas I. Parkinson and Owen R. Lovejoy.

The meeting which will be open to the public will be held in the Assembly Hall of the United Charities Building at 3 o'clock Saturday afternoon, January 25.

#### THE DANGER POINT IN MINES

The United States Bureau of Mines in its vigorous campaign for safety, is appealing directly to the miner himself. Miners' Circular 9 by George S. Rice, issued recently, dispels some current impressions as to the greatest source of danger. It is not explosions of gas or dust.

"Great mine explosions shock the public," says the report, "but in 1911 falls of roof and of coal in the coal mines of this country killed over three times as many miners as were killed by explosions, and as many as were killed by all other accidents underground. Very few recover from the injuries they receive in an explosion; usually it is a matter of either life or death. On the other hand, each year thousands of coal miners are caught by falls of roof and coal, and hundreds are killed or are crippled for life."

In the period of 1907 to 1911 inclusive 13,874 men were killed and although this period includes some of the worst mining disasters of modern times—such as the Cherry mine in Illinois, the disasters at Monongah, W. Va.; Primero and Starkville, Col.; Banner and Palos mines, in Alabama, and Briceville, Tenn.—yet nearly half of all fatalities, 6,024, were due to falls of roof and coal. The circular is designed to promote methods that will reduce this danger.

#### BAY STATE A BOYCOTTER?

"Massachusetts Protects the Boycotter" is the caption over a gleeful editorial that is going the rounds of the labor press. The reference is to the Minimum Wage Commission law which gives no authority to the commission to enforce its findings but in order to bring public opinion to bear, provides that "the names of employers who refuse to accept the recommendation of the commission shall be published in at least four newspapers in each county of the commonwealth in type not smaller than that in which ordinary news is printed." This, says the labor editorial, sounds a good deal like an unfair list, the logical use of which has brought down upon the heads of the hatters' union a fine of \$240,000 and has brought the president and two other executive officials of the American Federation of Labor in dangerous proximity to the inside of jail cells. Rather pertinently the editorial further asks the question why the state of Massachusetts can do this when labor men trying to establish a minimum wage for themselves cannot do it.

#### ARBITRATION IN SWITZERLAND

A law of Basel passed this year established a permanent board of three non-partisan members for the settlement of labor disputes and con-

tained a clause, making appearance in court compulsory. Zurich has a similar board, which settled about 75 per cent of the disputes with which the court was besieged. As the appearance of litigants could not be forced, however, the more important cases never came up for conciliation or arbitration. A new code has recently been brought before the assembly by representatives of employers and employed, including a clause like that in the Basel law, making trial or arbitration compulsory before strikes or lockouts can be declared. The board consists of a president and one employer and one employe, and an award only goes into effect if both parties are willing to accept it.

Surety may be required from both sides for its executing.

SOME PROPOSED LABOR MEASURES IN MICHIGAN

Last month a group of union labor men, college professors, women and lawyers gathered in the Michigan state senate chamber at Lansing to discuss measures of various sorts which it was thought important to press upon the attention of the public. The meeting was called by Perry F. Powers, whose friends describe him as a labor commissioner "with a large view of the functions of his office. A resolution was adopted asking the governor-elect to appoint a minimum wage commission and asking the legislature to make an appropriation sufficient for its investigation.

It was voted that no exceptions should be made to the industries which come under the law limiting the work of women to fifty-four hours a week. At present this law excludes hospitals, telephone exchanges and canneries. Several of the union labor men wanted amendments to the law which would prohibit women from working in particular occupations, such as core rooms in foundries. The commissioner of labor was asked to appoint a committee to draw up a bill which would provide means for finding out what occupations are dangerous to the health of women and for prohibiting them from working therein. The conference favored a pension for mothers and an eight-hour day for both men and women, especially for those in the continuous industries where the 12-hour day now obtains.

At present Michigan has no law restraining children from street trades. The bill which this body proposed prohibits boys under twelve from selling papers and those between twelve and fourteen from doing so except when they have a permit from the school authorities. It is also designed to regulate other street trades. No one is to be allowed in night messenger service until twenty-one.

CHARGE 199 VIOLATIONS OF CHILD LABOR LAW

The Diamond Match Company is the defendant in a suit brought by the state of Wisconsin to recover \$19,900 fines for 199 violations of the Wisconsin Child Labor Law. The so-called "match trust" is alleged to employ a large number of children between fourteen and sixteen years of age and to keep them at work beyond the hours permitted by the Wisconsin law.

## CHURCH AND COMMUNITY

churches. In addition to its municipal farm, women's reformatory, parole department, factory inspection and labor statistics, the Board of Public Welfare conducts a legal aid bureau, a welfare loan agency, a social service department for family rehabilitation and hospital social service, a department for the homeless and unemployed, with employment bureau, meals and lodgings and a municipal quarry; a recreation department covering inspection of dance halls, investigation of commercial recreation and social center work; a research bureau for housing and special investigations; charities endorsement and registration and vacant lot gardening.

### JOTTINGS

#### CO-OPERATION FOR PUBLIC HEALTH

The present administration of the Michigan State Board of Health went to work believing that it could do more for health conservation through awakening public interest and co-operation than in any other way. It is succeeding by varied and persistent efforts in enlisting the county commissioners of schools, school teachers, the rural folk, commercial travelers, insurance companies, the newspapers, the railway managers and the ministers and churches. The railway men promptly co-operated. Although slower to respond the ministers are gradually coming into line with this enlightened public policy. Foremost among them is the Rev. M. L. Fox, district superintendent of the Niles Methodist Episcopal Conference, who has organized sanitary, civic Christian leagues for practical lines of work in every community in his district.

His response to the board's public appeal for co-operation is noteworthy. It reads:

"I like the tone of your letter. I am quite anxious to experiment a little along the line of better working conditions in my rural charges. I shall want to plan some *Institutes of a Day* in country churches, giving a program of talks and lectures on farm life sanitation and allied topics of interest. My plan will be along the line of applied science and Christianity to make the churches lead. I would be glad for any suggestions you could and would proffer."

#### AUTHORSHIP OF TOLEDOAN'S CREED

That Toledoan's Creed published in the last number of this department failed to be accompanied by the statement which would have added interest in it to every reader that it was written by the Rev. Ernest Bourner Allen, pastor of the Washington Street Congregational Church of that city, for a competitive contest inaugurated by the Toledo Commerce Club.

#### DISCUSSIONS OF FEDERAL COUNCIL

with the instructions of physicians. The forestry board he suggested could also lease small tracts of land to patients who might raise garden truck and chickens for the neighboring public resorts. A number of physicians who have made a special study of tuberculosis have declared that they strongly favor Mr. Griffith's plan.

### THE HYGIENE OF SWIMMING-POOLS

The care of swimming-pools in educational institutions, athletic clubs and public playgrounds has of late years attracted considerable attention. Notable studies have been made, among which may be especially mentioned those at Brown University, and by Dr. William J. Lyster at the University of Pennsylvania. In New York, H. F. J. Porter, secretary of the Efficiency Society, has led in calling the attention of the health authorities on this subject. Dr. M. P. Ravenel, director of the State Hygiene Laboratory of Wisconsin, has recently investigated conditions in the bathing-pools in the University of Wisconsin, and in a recent issue of the *Journal of the American Medical Association* he reports his findings. It seems possible that a swimming-pool with a limited supply of water, when used by a large number of persons, may convey disease from one to the other.

The danger from typhoid fever is the one chiefly considered by Dr. Ravenel and he thinks that there is no doubt that contaminated water may produce this disease in swimmers as the water is not infrequently taken into the mouth. The men's gymnasium at the University of Wisconsin is much overcrowded. The swimming-pool has a capacity of 97,000 gallons. The tank is emptied, cleaned and filled with water from Lake Mendota once each week. Approximately 275 men use the tank each day until Saturday, when the number is much increased. All must take a shower-bath before entering the pool.

But in spite of this precaution examinations made during 1910, 1911 and 1912, have shown that the number of bacteria gradually increases, the maximum being reached about the middle of the week, followed by a decrease until Saturday, when a considerable increase is again apparent. The chemical examinations show the presence of considerable organic matter in the lake water.

Experiments were carried out on the action of hypochlorite of lime in purifying the water in the swimming-tank. When one part of chlorin to a million parts of water was used, the water became practically sterile. To obtain entirely satisfactory results under the conditions as they exist at Wisconsin, hypochlorite of lime must be added to the swimming-pool twice each week. Dr. Ravenel concludes that contagious diseases can be spread by means of artificial swimming-pools, and that if the water contains the germs of typhoid fever they can be taken into the system. With ordinary water and with a pool of good capacity, the change once a week keeps the water in fairly good condition. The addition of hypochlorite of lime, however, is a simple, cheap and safe procedure which insures absolute safety.

### THE SHADOW OVER NEW YORK'S STATE USE SYSTEM

The resignation of Frederick H. Mills, sales agent of the Prison Department of New York state, was tendered to Governor Sulzer last week. Mr. Mills' displacement would bring to an end a situation first made public by *THE SURVEY*.<sup>1</sup> Since the "state use" system of prison production was established in New York it has been under the shadow of Mr. Mills' dual allegiance. His private enterprises have been selling goods to the same institutions with which he has had to deal as a public official.

Mr. Mills' resignation came two days after the publication of the report by John D. McMahon which charged him with having "not been efficient in the discharge of his duties and loyal to the interests of the state." This report on the position of sales agent was filed with Governor Dix September 3, 1912, but was not then made public. Shortly after Governor Sulzer took office he received from the United Garment Workers of America a request for an examination of the case against Mr. Mills. Governor Sulzer instituted a search for the McMahon report but it could not be found. Mr. McMahon was then asked to produce another copy and this was given to the press.

The main points in the evidence against Mr. Mills were presented by *THE SURVEY* in the editorial referred to above. Chief among them is his organization of the Hamlin Supply Company early in 1911. As sales agent it is Mr.

Mills' duty to provide a market for articles manufactured in New York prisons. This market is limited to the state and its political divisions. The chief purpose of the Hamlin Supply Company, says Mr. McMahon, was that of

"supplying articles to the charitable institutions of the state, particularly its state hospitals. He himself was the Hamlin Supply Co. \* \* \* For a year following the organization of this company Mr. Mills did a large business with state institutions, principally state hospitals. His bills which passed through the lunacy commission amounted to several thousand dollars each month. He testified that he made money by these sales; that the object of establishing the business was to make money."

Vouchers in the comptroller's office, Mr. McMahon charges, show that Mr. Mills violated the law by selling to these institutions even articles which were advertised by him in the prison catalogues as goods manufactured in the prison.

Mr. Mills' friends have claimed that he brought singular abilities to the administration of an office which could only command a fraction of his time; his critics, that under such confusion of public and private interests the prison industries could not develop to their fullest extent. It is further claimed that the state use system which, its advocates hold, represents "the most broadly conceived plan to conserve trade education and self-sustaining labor as elements in a system of prison industry" could not demonstrate its highest usefulness in the state of its birth.

<sup>1</sup>See *THE SURVEY*, April 13, 1912, p. 94.

## PUBLIC AND PRIVATE CHARITY CO-OPERATING

A step has been taken in Cook County, Illinois, to bring about a more effective co-operation between the county commissioners, who administer public charity, and the private philanthropic agencies of the city.

The county government involves an annual expenditure of about fourteen million dollars, which is nearly equal to that of the state government of Illinois. The public charity service of the community is almost wholly under the county board. Every year the work grows in volume and in social importance. The election of last November gave Cook county a president and board of commissioners which promises an efficient, business-like and constructive administration of these important affairs. It is in striking contrast to the inefficient, chaotic, demoralizing regime of the past two years.

The office of county agent, which is one of the divisions, has a budget of over \$3,000 and deals with something like 20,000 families a year. The Cook County Hospital, another branch, is the great charity service for the poor of the city and county. Over 30,000 patients pass through this hospital in one year. Oak Forest, the infirmary, has a population at all times of upwards of 3,000. Dunning, another branch, has a population of about 3,000.

The compensation for truant officers, the expense of the detention home, and the conduct of the Juvenile Court, comes through the county commissioners.

There are many other important phases of this work. These activities interlock at almost every turn with the work of the various private charitable and civic organizations. Indeed, the work of the county commissioners outside of making the budgets and collecting the taxes is a large charity organization in itself, with the welfare of the unfortunates of the city and county depending upon the honesty and efficiency of the commissioners.

In order that these relationships may be better understood, the president and commissioners have been in consultation with the representatives of the charitable and civic interests of the city. A committee has been formed for the purpose of studying and bringing about a more complete and satisfactory understanding and working arrangement between these forces, which are, after all, seeking to accomplish the same end.<sup>1</sup> This committee will meet from time to time with the commissioners. Sub-committees, with a representative of the central committee as chairman, will furnish the means of studying and effecting better understanding and co-operation.

<sup>1</sup>This committee consists of Sherman C. Kingsley, chairman, Mrs. James F. Kennedy, Mrs. James A. Britton, Minnie Low, Edna Foley, Eugene T. Lles, and Joseph Meyer.

A co-operative working agreement, with possibilities of suggestion and constructive criticism, is needed as much by the private agency as by the public, and the committees aim to represent both forces.

It is believed that this move augurs well for a thoughtful study of the many problems which are quite free from political considerations.

## STATE SUPERVISION VS. STATE INSURANCE

Last year William H. Hotchkiss, then New York state superintendent of insurance, urged before the Association of Life Insurance Presidents at their annual meeting, government supervision of premium rates as the only means of staying the tide that is setting toward state insurance. At this year's meeting, a few months after the Wisconsin State Insurance Law had gone into effect, the present New York state superintendent of insurance, William T. Emmet, speaking on the need of more progressive supervision of private insurance companies, said:

"In the background of this whole subject of insurance supervision stands the larger problem of governmental or state insurance. We are living in a time of intellectual and political upheaval, and in the forefront of every progressive program throughout the world today we find, in crystallized form, this demand that the state shall take over the business of insurance and conduct it. We find, indeed, that in several of the European nations elaborate systems of state insurance are now in force, and that similar projects, differing from each other in details but not in principle, are being inaugurated in some of our own states. There has as yet been no prohibition against private capital going into the insurance business in competition with the government, although this may well follow if the experiments which have already been started in the direction of state insurance prove in the least successful.

"Splendid as have been the results of private enterprise in building up this great business to its present state of efficiency, I am not one of those who believe that the movement in the direction of governmental absorption of the insurance business is likely to die out very quickly. The undercurrent is setting the other way. The people in their organized capacity feel surer of themselves than they ever felt before—surer of their right to invade the realm of private business to its uttermost limits, and surer of their ability to produce better results through governmental agencies than have ever been produced through private enterprise. The growing demand for state insurance is based, of course, on the fundamental proposition that insurance is a universal need, an absolute public necessity. All the campaigns which the companies have themselves waged to establish that view of insurance in the mind of the average man are now bearing their inevitable fruit in this grow-

ing tendency to regard the business of insurance a proper adjunct to government. . . .

"I am bound to say that if the present drift toward Socialism continues, it is not likely that even the upbuilding of great supervisory departments such as we are now trying to maintain in New York will have more than a temporary effect in quieting the demand for state insurance. In the end it may even be advanced as the final argument in favor of it, just as the companies' contention that insurance is a universal commodity has been used to the same end. Once a department of insurance supervision reaches a point of efficiency where it has attracted to itself talent and capacity equal perhaps to that which is found in the service of the insurance companies, the question is certain to be asked why all this elaborate and efficient machinery should not be utilized by the people in the direct transaction of the insurance business. There are answers which can be made to that question, of course, from the companies' standpoint, but when a revolution is on those answers sometimes do not carry very far. So that, while I may exaggerate the situation somewhat, it seems to me that at the present time those who are interested in keeping the business of insurance in private hands face rather a critical condition. If, in addition to opposing state insurance, they also seek to avoid strict and efficient supervision, they are entirely lost, because there is nothing plainer to me than that for the moment strict supervision is the one thing which stands in the way of state insurance. On the other hand, if conservative insurance men should now co-operate strongly in the creation of a system of strict state supervision—hoping that this will quiet the demand for state insurance,—they are apt to find that the structure of supervision which they have helped to build up will, by reason of its very efficiency, serve perhaps as the final strong argument for the taking-over of the business of insurance by the state.

"The truth is, the situation is completely and entirely beyond the power of any group of men to materially control. It is in the lap of the gods, and none can say now what the final answer will be. I am enough of an optimist to believe that, whatever the outcome, no disaster will ensue. If the drift toward Socialism continues,—involving necessarily the ultimate taking over of insurance by the government,—it will at least be a gradual process, and, by the time it has been completed, the world will doubtless be ready for it. In that event, other generations will have much to be grateful for to the men of this generation who have educated the world to the value of insurance as an institution and who have established for all time the basic principles upon which the business must be managed. If, on the other hand, the drift toward governmental ownership stops before it sweeps the business of insurance away from its present moorings, into the control of the people in their organized capacity, that result will be largely due to a recognition of the fact that the insurance which people are now able to get from the

great companies is amply sufficient for all their needs—that it is as safe as the Bank of England and administered with just as much fiduciary responsibility now as it would be by any public officer.

"Here and there, in some of the nooks and crannies of the insurance world which I have to look into, I find that that condition is still far from existing. Here and there, even among great companies, I find sporadic departures from the ideals and standards which should prevail. But, broadly speaking, I can say with absolute truth—and it gives me the greatest possible pleasure to say it—that the strongest impression which my work so far in the field of insurance supervision has left upon my mind is one of unqualified admiration for the courage, the capacity, the integrity, and the breadth of vision of the men who are leaders today in the insurance business in the United States. No men have been more responsive to the progressive thought of the time. None have labored more effectively and faithfully for the public good."

#### VENEREAL DISEASES IN AMERICAN ARMY

There is some plain speaking in the annual report of Henry L. Stimson, secretary of war, about venereal diseases in the army—a subject not mentioned in the gaudy advertisements which lure unemployed men to the ranks. "Shameful beyond that of the army of any other civilized nation" is the way in which Mr. Stimson characterizes the record of the American troops, and this record he believes to be due to "our own shortcomings as a nation in dealing with this matter."

He continues:

"So long as in our civil communities, and particularly in our larger cities, we continue to close our eyes to the magnitude and extent of the evil and refrain from attacking it with all of the weapons which modern scientific knowledge places in our hands, it can not but be expected that the younger men in our army, leading the abnormal life of the soldier, will show the effect of the evil to a marked degree. In this respect I believe that the so-called anti-canteen legislation has been responsible for much vice."

It appears that the percentage of venereal disease continues to be higher than that of any other disease. The medical corps has introduced careful methods of inspection and diagnosis during the past year, and one result has been that there has been a larger percentage of hospital admissions for syphilis than in former years. This is owing, it is stated, to the detection of cases heretofore latent and unsuspected. Lectures and instruction are now given throughout the service to the men, and Congress has lent a hand by enacting legislation which stops the pay of officers and men "during periods of disability caused by such misconduct." The pocket nerve responds quickly to discipline.

## EUROPE AND THE JUVENILE COURT

Almost every week one or two foreign experts sit next to an American juvenile court judge so that they may learn by observation how the court works. It would seem as if everyone familiar with the children's court would know that the idea of punishment has given way to the conception of reformation by educational measures. But, as was recently shown at the second congress of juvenile court judges and workers in Munich, punishment for the commitment of crimes is still advocated by a large majority.

America's example and the efforts of German workers induced the German government lately to publish a draft code for the procedure against juvenile offenders which, it is expected, will bring order out of the existing chaos. According to this code juveniles are people under eighteen years of age. In each judicial district there is to be established a juvenile court consisting of a learned judge and two laymen, chosen from educators and teachers. The principle of prosecution is to be abandoned, if educational measures are preferable to punishment. The public attorney decides this question. In such cases the court of guardianship places the children under probation or in institutions. The accused juvenile may be defended by a lawyer or by some other person interested in the case. While awaiting trial, the juvenile is not to be imprisoned, but may be temporarily confined in a reformatory. At trial and in prison, juveniles must be separated from adults.

The court must consider the mental and physical development of the juveniles over fourteen years before passing sentence. Germany has been obliged to adopt the system of paid probation officers, assisted by volunteers. The cities, in a few instances, private societies in most, pay their salaries.

It was brought out at the conference that even Russia has made some progress and lately has adopted the suspension of sentence in cases of minors. Minors are placed under the care of probation officers (*Kurators*) but with little success. A story was told of 667 minors who were placed under probation in St. Petersburg. Seventy-seven disappeared, forty-six had to be placed in reformatories and of the rest fifty-four stole again and were held to the criminal courts.

France and Italy, it was declared, have not made much headway in the treatment of delinquent children, though the criminality of minors increases in both countries at an alarming rate. Private societies there care for accused minors, defend their cases in court and take charge of them if they are released on parole. The work

of such societies, found in nearly all large cities, is especially successful if good judges co-operate with them.

## THE PLEAS OF 10,000 EPILEPTICS IN ILLINOIS

A singularly human document is a little pamphlet entitled *How the Uncared-for Epileptic Fares in Illinois*. It is issued by the volunteer committee of fifty, which includes some of the most representative and influential men and women of the state. Through pictures and descriptions of personal experience, epileptics tell their own pathetic needs for public care. The titles under which these stories are told tempt one to read further. Here is one of them.

### UNITS FROM AN ARMY OF TEN THOUSAND

"Doctor, I can't get work. No one will have me when they find out. My friends avoid me. I am less of a man than I was six months ago. I can feel myself going. This can't go on. I know that there is no place in Illinois for any one with epilepsy. But, doctor, I've got to do something. For God's sake, can't you help me? Can't I be arrested and sent to the bridewell?"

The doctor, a citizen of the seventh senatorial district, saw the young fellow walk out of the door and into the street without a shadow of a promise of help which he hoped to get. The interview was one of those tragic human contacts, a great need revealing itself to a big heart and an able, sympathetic mind, but nevertheless, as helpless as it was big and able. It left one man with a little less courage to hold himself from slipping, the other sick at heart to sit impotent in front of an appeal like that.

Many such stories are arranged in the pamphlet under senatorial districts, whose citizens and representatives in the legislature are thereby made to feel responsibility for the existence and continuance of such conditions. A map shows the population of each district and is accompanied by a table giving the number of epileptics in each—10,000 in all.

When such concrete personal facts have driven home their appeal the contrast is drawn between what Illinois fails to do and what nine other states are succeeding in doing for these afflicted people. Over against the Illinois almshouses, insane asylums, station houses, jails and distracted homes which house many of these wretched people, the epileptic colonies of those other states are effectively pictured and their results and costs tabulated. In planning a colony for Illinois, it is estimated that provision should be made at once for 2,500 epileptics, with an acre for each patient. A program for the campaign tells what each one can do and how to do it. Enough public sentiment has been aroused to secure the passage of bills for the establishment of a colony, but never enough to secure an appropriation to carry the act into effect.

## CHILD LABOR IN PENNSYLVANIA

CHARLES L. CHUTE

Executive Secretary, Pennsylvania  
Child Labor Association

There are unmistakable signs that Pennsylvania is thoroughly aroused to the fact that among the states of the North today it occupies a backward position in the protection afforded to its toilers in factory, store and mine, especially its women and children. The Pennsylvania Child Labor Association has met with powerful foes—"machine" legislatures and administrations unresponsive to the will of the people. Truly significant, therefore, was the summary dismissal by Governor Tener on January 5 of Captain John C. Delaney, chief of the Department of Factory Inspection. For years Mr. Delaney and his department have been the target of criticism and attack by civic organizations and organized labor throughout the state. These have hitherto failed to result in action on the part of Governor Tener or any of his predecessors. The chief factory inspector has had the backing of the glass manufacturers and other powerful industrial interests. Towards the close of 1912, the child labor association, following a searching investigation into the history and personnel of the department, sent written charges to the governor. These had to do not only with bad factory inspection, but also with letters calling on subordinates to contribute to campaign funds. In presenting charges and asking that the governor take action the association was joined to this end by the Consumers' League and the Central Labor Union of Philadelphia.

Governor Tener said he would take the matter under consideration. Just as the association was growing impatient at the governor's delay and was considering the advisability of going before the courts with its charges, an alleged interview with Delaney was published in a number of Pennsylvania papers. The gist of this interview was that Delaney had in his possession the confession of John H. Sanderson, the contractor who furnished the state capitol some years ago, and was convicted in the famous graft cases. By means of this confession, so the interview ran, Delaney could involve in serious misconduct men high in the state's administration and party politics in Pennsylvania.

This was on Friday. On Sunday Governor Tener summarily dismissed Delaney. The governor's explanatory statement to the press contained this sentence:

"If he [Delaney] has any information which should be made public and which he withholds because of his position, I want to relieve him of that embarrassment."

Later Governor Tener wrote a letter to the Child Labor Association in which he said that he would look for the best man in the state to take Delaney's place. This followed the appointment of the Rev. C. V. Hartzell, chief clerk in the Department of Factory Inspection since 1903. A number of the organizations which opposed Delaney would probably be just as much opposed to Mr. Hartzell, were it not for an explanation from the governor that his appointment was temporary and would continue only until the legislature took action on the proposed re-organization of the enforcement of labor laws in the state. This proposal was made by Governor Tener in a message sent to the legislature a few days after Delaney's removal. The governor urged the creation of a Department of Labor and Industry, which should include the Department of Factory Inspection and the Bureau of Industrial Statistics. The duty of such a department, said Governor Tener, would be "to enforce fearlessly and honestly the laws of the state protecting labor and to collect statistics which would result in wiser and more efficient labor laws."

All who have worked for social reform through legislation are counting on the next legislature. Independent in its make-up and progressive in its personnel, it is confidently expected to enact a series of advanced laws. Throughout the political campaign the demand for better child labor laws was prominent. Every party, even the so-called organization leaders, declared for them. Both the Republican and Democratic parties, reorganized and controlled by the so-called Progressives, are for them. Throughout the state the press has voiced the demand for better laws and also for reorganized and efficient factory inspection.

Furthermore, the child labor association has been reorganized, with a strong fighting body in both the eastern and western ends of the state co-operating in a state-wide campaign. Early last summer the association prepared a comprehensive child labor bill or code. The "uniform child labor law" was adapted to the peculiar conditions in the state. The act was submitted to the Republican Legislative Committee and, with some improvements, was adopted as the committee's bill. Since then it has undergone other changes, all, it is believed, for the better. It has been printed in several editions and circulated through the state. Public hearings have been held by the legislative committee in Philadelphia, Williamsport and Pittsburgh.

Its principal provisions are:

1. A fourteen year age limit for all employment or work excepting "work on a farm, in a

private home and in street trades." The present law leaves many loopholes even in this elementary restriction.

2. A sixteen year age limit in all dangerous and injurious work. Lists of such occupations were compiled from all other state laws. Here the signal advance for Pennsylvania would be the exclusion of more than 5,000 boys from the dangerous and injurious work of the coal breaker and about mines.

3. An eighteen year limit in extra hazardous employments.

4. The Factory Inspection Department is given the right to add to these lists of dangerous occupations from which minors should be excluded after a public hearing.

5. The eight-hour day, forty-eight hour week and no work after 6 p. m. for all children employed under sixteen. A ten-hour day, fifty-eight hour week is now allowed and night work except in "continuous industries" forbidden after 9 p. m. The new provision will do away with the notorious "glass exception" which now allows more than 2,000 boys under sixteen to work nine hours on night shifts in glass factories.

6. A nine-hour day, fifty-hour week (after September 1, 1914) for all boys under eighteen and girls under twenty-one. If a companion bill advocated by the Consumers' League regulating the employment of women passes, this provision together with no work in factories after 10 p. m. will apply to all women and after 9 p. m. to all girls under twenty-one in all industries.

7. All minor boys to be excluded from the night messenger service with its moral hazards throughout the state. Pennsylvania allows boys of fourteen and fifteen in this work today.

8. A twelve-year age limit is fixed for news-boys throughout the state, and work on the streets after eight at night forbidden under sixteen. A system of badges is introduced. Regulation of street trades is entirely new to Pennsylvania.

9. A greatly improved system of employment certificates is proposed. It provides:

(a) One issuing office in each school district. (b) Compulsory medical examination. (c) Completion of at least the fifth grade in school. (d) Reliable evidence of age. The parent's affidavit will no longer be accepted. (e) Statement of the intention of employer to give work and the return of the certificate upon the child's leaving his job. This is known as the Ohio plan. It has proven successful in Wisconsin also. The present law imposes no physical test and only the reading and writing requirement educationally.

10. Improved enforcement and penalty sections are included.

Besides being actively supported by the Pennsylvania Child Labor Association and the Republican Legislative Committee, the bill has been favorably received by leading Democrats in the state. It has received the endorsement of the State Federation of Labor, the State Educational Association, the Federation of Pennsylvania Women, the Interchurch Federation of Philadelphia and other organizations. It is believed that every organization in the state seeking better child labor laws will be back of this bill upon its introduction in the legislature this month. If the bill passes it will bring about a very great reform in a state which today numbers in its industrial army more than 40,000 child workers.

## THE ZEITGEIST AND THE JUDICIARY

FELIX FRANKFURTER

Law Officer of the Bureau of Insular Affairs,  
United States War Department

The American Bar Association, at its recent meeting, adopted a vigorous report condemning the recall of judges. Giving full weight to the force of this report and the public spirit that conceived it, one is yet compelled to the conviction that the American Bar Association fell short of its responsibility in not going beyond negative criticism and suggesting much needed procedural reforms to an inquiry concerning the causes of the deep social ferment that partly expresses itself in the proposal of the judicial recall.

The tremendous economic and social changes of the last fifty years have inevitably reacted upon the functions of the state. More and more, government is conceived as the biggest organized social effort for dealing with social problems. Our whole evolutionary thinking leads to the conclusion that economic independence lies at the very foundation of social and moral well-being. Growing democratic sympathies, justified by the social message of modern scientists, demand to be translated into legislation for economic betterment, based upon the conviction that laws *can* make men better by affecting the conditions of living. We are persuaded that evils are not inevitable, and that it is the business of statesmanship to tackle them step by step, tentatively, experimentally, not demanding perfection from social reforms any more than from any other human efforts.

This hopeful experiment is world-wide, but in this country it encounters a unique factor, for in the United States, social legislation must pass challenge in the courts, it must have the *visé* of our judiciary.

The exercise of this power by our judges is so elementary a feature of our constitutional system that until recently we little considered the true nature of the problems involved in it. Social legislation concerns itself with economic and social conditions, and aims at their conscious readjustments. For social legislation deals with the stuff of life. And, in so far as they have the last word on this legislation, our courts are concerned with economic and social questions, which can be rightfully solved only by a due regard to the facts which induced the legislation. For instance, in passing upon the constitutionality of an eight-hour law for bakers, just what principles of jurisprudence are to be resorted to for guidance? Questions of hygiene, of health, of the present conditions of the industry, the occasion for protecting this particular class against its employers, and the public against both employer and employee—these are the considerations, it would seem, which ought to be vitally in the minds of the judges. Is it really to be doubted that in passing upon the validity of a workman's compensation act, a court cannot get at the heart of the question without concerning itself, whether avowedly or implicitly, with economic and social questions? It involves a consideration of the vital changes produced by modern industrialism, the bearing of such legislation to the fair adjustments of the inevitable risks of modern industry, the promotion of harmonious relations between capital and labor and the resulting peace to the community—in a word, its promotion of the social welfare.

When the Supreme Court sustained the validity of legislation restricting the hours of work for women, it may have invoked legal principles and resorted to law books, but predominantly it considered the facts of life, marshaled with overwhelming force by Louis D. Brandeis, drawn from medical data, industrial reports, and the experience of the world. And so, as the minimum wage bills, the first of which has already been passed by the Massachusetts legislature, come up for judicial determination, the decisive considerations that will inevitably confront the courts will be the facts of the particular industries, and the right of the community to insist upon a social wage as the first condition of human welfare over against the claim of the individual's unrestricted industrial enterprise. Facts, not general principles or well-worn phrases, must of necessity be the determinants.

The viewpoint here urged has, fortunately, during the last few years, received increasing application from the Supreme Court of the United States. Far in advance of any state court, our Supreme Court recently has come to realize time's change of emphasis, that new conditions bring new problems and press for new solu-

tions. Social legislation, under our constitutional system, must rest upon the exercise of the police power. Only the other day the Supreme Court said that "in a sense the police power is but another name for the power of government," and "that it extends to so dealing with the conditions which exist in the state as to bring out of them the greatest welfare of the people." But "the power of government" is a living power, constantly changing and developing to meet new conditions and to accomplish new purposes. And the conception of the people's welfare varies, according to the dominant opinion, with time and place. Necessarily, therefore, the police power as the power of government is no more stable than the conditions which induce its exercise. If facts are changing, law cannot be static. So-called immutable principles must accommodate themselves to facts of life, for facts are stubborn and will not yield. In a word, may not one venture the suggestion that constitutional law, in its relation to social legislation, is not at all a science, but applied politics, using the word in its noble sense?

It is important to recognize this not only abstractly, as an intellectual proposition, but to make it a dynamic part of the professional equipment of the legal habits of thought.

"The felt necessities of the time, the prevalent moral and political theories, intuitions of public policy, avowed or unconscious, even the prejudices which judges share with their fellowmen, have had a good deal more to do than the syllogism in determining the rules by which men should be governed."

Thus wrote Mr. Holmes more than thirty years ago. And because he has so vitally felt this, Mr. Holmes has been a powerful influence in the changed attitude of the Supreme Court. Speaking of the English bench, Professor Dicey, himself a distinguished conservative, says, while the judges

"are swayed by the prevailing belief of a particular time, they are also guided by professional opinions and ways of thinking which are, to a certain extent, independent of, and possibly opposed to, the general tone of public opinion. The judges are the heads of the legal profession. They have acquired the intellectual and moral tone of English lawyers. They are men advanced in life. They are for the most part persons of a conservative disposition."

It is because of this natural tendency of the legal profession, and because of the far-reaching power enjoyed by the bench in this country, that it is essential that a correct appreciation of the problems raised by social legislation should become a vital part of professional thinking. It is not only a delicate but an infinitely difficult human function which our

courts discharge in passing upon the limits of their own power. In so far as these questions are, necessarily, questions of fact, dealing with actual conditions of life and current dominant public opinion, it is essential that the stream of the *Zeitgeist* must be allowed to flood the sympathies and the intelligence of our judges. With a just and sympathetic appreciation of the social issues before them, it is safe to say that courts generally will reach the conclusion which one may gather from the recent Supreme Court decisions, namely: that which is reasonably defensible on economic or social grounds, whether or not it accords with our individual notions of economics, cannot be offensive on constitutional grounds. Otherwise, it necessarily follows that the constitution definitely incorporated an economic theory prevalent over a hundred years ago that may well be inadequate and unsuited to modern conditions, whereas, in truth, "a constitution is not intended to embody a particular economic theory . . . it is made for people of fundamentally differing views."

A distinguished statesman, seeking for a deeper explanation for the present widespread unrest than one generally hears, attributes it to our failure to make, through our legislation and constitutions, the readjustments demanded by the new conditions incident to the extraordinary industrial development of the last half century. One ventures the suggestions that it is demonstrable, as Prof. Roscoe Pound has shown, that one of the prime factors contributing to the current dissatisfaction is the fact that judges have thwarted legislative efforts at just such readjustment, not because of any coercion of the constitution, but by reason of their constitutional conservatism. Therefore, as to legislation of this character, the suggestion of constitutional amendments does not meet the situation, for back of the constitutional amendment is the construing power of the courts. Unless the profession, from whose ranks the courts are recruited, has the right attitude of approach to these questions, human ingenuity cannot frame language specific enough, even if desirable, to meet the situation. Mere words cannot induce insight and right sympathies or appreciative interpretation. On the other hand if our courts generally will have the attitude that the Supreme Court now has, it is safe to say that all social legislation which has the commanding facts of life behind it will be allowed to justify itself by experience.

The standards here suggested in dealing with the constitutionality of this class of legislation are broad, but not indefinite. The limits of the life of a people cannot be charted by easy rules of thumb. We are dealing with considerations as flexible and complex as the public welfare. The constitutional limitation upon the

law-making power is as definite, but not more so, as a reasonably possible view of the public welfare. This leaves us still unimpaired the benefits of the reviewing power of the judiciary in our governmental system, for the reflex action of the *existence* of this power on the part of the courts to set aside legislation restrains unwise legislative action and induces the scientific attitude of basing legislation only upon adequately ascertained facts. On the other hand, it does not make of the constitution a mere charter of negation upon the power of the state. The courts should be a restraining, but not a hampering force. Doubtless, grave mistakes in legislation will thus go unchallenged through the courts, but legislation is essentially empirical, experimental, and the constitution was not intended to limit this field of experimentation. Think of the gain of having experience demonstrate the fallacy of a law after the supreme court had sustained its constitutionality! For, as a wise man has truly said, to fail and learn by failure is one of the sacred rights of a democracy.

## THE POLICEMAN

SAMUEL S. FELS

Some time ago on a rainy day, I met a policeman in a factory office situated in a fair neighborhood, and on inquiry found that he was there simply to keep out of the wet. This led to a talk as to what he did on clear days, and his frank answer left a strong impression on my mind. He said in effect: "If your duty was to walk a beat all day, with nothing to do, with nothing to think about, you would spend as much time as I do in saloons and other places where you could keep warm and have somebody to talk to. The life is a fearfully dull and stupid one, and in this neighborhood there are few criminals and few drunks, and I think under the circumstances you would go wrong as often as I do, if you had my job."

The fact is, that the average policeman of today needs more work—work which will make him think—and the major part of the trouble with him is not having it. By filling this need, I believe some of the problems that beset every police force would be overcome.

Our American idea of the city policeman is largely tainted with the military spirit because the policeman is an evolution from the soldier—a civic soldier, it is true, but still a soldier—and he has not gotten very far away from his model. We still think of the policeman largely as a fighting man who ought to inspire fear.

Every body of soldiers that the world has ever known, unless it was kept in constant drill and action of some kind, deteriorated and became a menace in time of peace, and the same thing happens to a body of policemen. Graft, dis-

loyalty and laziness creep in and ruin the force.

Our ideas of the policeman's duties largely are that he shall walk his beat most of his time, see that law-abiding citizens are protected and criminals captured and punished. These ideas are the same as when the first policeman was put on a beat. We have never broken away from them. They came from the past, when the number of criminals in proportion to population was far greater than now.

It has been said that at the beginning of the nineteenth century, one in every twenty-two inhabitants was of the criminal class. Times and men have changed, but the idea of a policeman's work has not, though the American city of today has a much more law-abiding population than ever before.

Those of us who have lived in a large city for many years can remember the time when it was not safe for a man to go alone in many districts at night, and in some of the worst districts even in the day time. Now there are very few spots where even a woman would be molested.

The spread of intelligence, better street lighting, the work of the policeman, etc., have evolved a different and better community. The old gangs which brutalized so many neighborhoods have largely disappeared. Notwithstanding this change, the policeman is still the same class of man, set to do the same work, though this work has partially been wiped off the slate.

A policeman is selected now as in the past because of his size and build. He is supposed to have good character, but the requirements are largely physical. We are, therefore, in 1912 just as in the years gone by policing our cities with a lot of big, fine-looking men, untrained, except in a half-hearted military way, though the job that they are engaged to do has changed materially.

The force in large cities is composed of:

Day policemen and night policemen, who have regular beats to cover.

Special policemen, or detectives, who work at large on any case that comes to the department.

The traffic squad, which handles traffic in crowded centers. This is the only real development that has come to the force, and its existence is due to the increasing numbers of persons and vehicles in certain sections.

It would be interesting to make a list of the work done by other city employes within the limits of every policeman's beat, such as looking after truant and other children for the schools and for the compulsory education department; getting information of different kinds for the bureau of health and charities, serving notices, etc.; serving writs and notices for the law department of the city and for the courts; inspecting street cleaning, seeing that garbage and ashes are properly removed; inspecting street repairs and the condition of the pavements and streets

which may need repairs; collecting delinquent taxes, etc.

None of this work requires a high degree of skill and any fairly intelligent man can, in a short time, be trained to do it. The amount of it all in any policeman's beat is not great on any one day, and if it was added to the policeman's task would not in any way overwork him.

It seems to me that all such city work as this should be done by the day policeman. It would bring to the force a better class of men who would be brought in close contact with the people on their beats. Many of the men now on the force could be trained to do it, and such men would become practically social workers, knowing every family and house in their district, and would be of great aid in many directions—for instance, to those societies seeking out the poverty stricken and separating them from the frauds.

If the policeman was doing these things, it would make him no less a brave man when his bravery was needed. In some of the worst districts, he might require a smaller beat than now. By having this work done by the policemen, the city would be enabled to drop a considerable number of constables, inspectors, and similar officials who now do little work and get salaries far out of proportion to the services rendered.

The scheme is perfectly practicable and could be easily handled. Each afternoon the different departments of the city would send to the police or district headquarters the work for the policemen in these districts for the next day. Each night the policemen would make a report of the work performed, and these reports would be forwarded the next morning to the different departments. An officer would keep in touch with his central office by telephone, and arrangements could be made by which he could be reached very quickly by telephone in case he were needed at any time. At present a policeman can usually be had more quickly by telephoning to one of the stations than by going on street and hunting one.

The result of this scheme would be better work done for the city than now, a steady development of the policeman himself, making him an extremely valuable public servant, rather than as now offering every opportunity for deterioration.

The policeman would practically be the neighborhood representative of the government; he would have responsibility on his shoulders. He would have work to do, standing in the something to think about, and his position in the community would be infinitely high, because he would be looked on as a public official with important duties, rather than as a brutal man who loafs most of the time. The change would be a great advantage both to the city and the man.

## BOOKS

### HEREDITY AND EUGENICS

By CASTLE, COULTER, DAVENPORT, EAST and TOWER. The University of Chicago Press. 315 pp. Price \$2.50; by mail of THE SURVEY \$2.70.

This book puts in permanent form a course of nine lectures summarizing recent advances in knowledge in variation, heredity and evolution and its relation to plant, animal and human improvement and welfare, delivered during the summer of 1911 at the University of Chicago. As the lectures were not intended for those trained in biology their form is intended to be popular and they contain little new material. The lectures were given by five lecturers. This has naturally led to some overlapping of material. What little overlapping there is, however, more than compensated for by the printing of each lecture complete in itself as delivered.

John Merle Coulter, professor and head of the Department of Botany, the University of Chicago, delivered the opening two lectures discussing Recent Developments in Heredity and Evolution, and The Physical Basis of Heredity and Evolution from the Cytological Standpoint. The first lecture serves as a general introduction to the course, providing an historical background as a setting for the succeeding lectures, which are devoted to the work of today. In his second lecture the author raises the question whether there is any physical basis for the transmission of like and unlike characters; whether there is any substance or structure by means of which the phenomena of heredity manifest themselves.

Next follow two lectures by William Ernest Castle, professor of zoology, Harvard University, on The Method of Evolution and Heredity and Sex respectively. There are two schools of thinkers on the method of evolution: the one with Darwin believes that new species usually arise as the result of "a slow and gradual modification of the race, constantly in one direction"; the other school, the Mutationists, believe in a "Minerva-like method of evolution, the birth of new races in a day." The position of the lecturer is clearly stated in his own words: "Now I am inclined to think that Darwin was on the whole nearer the truth than the Mutationists. They have perceived a half-truth and perceived it more clearly than did Darwin, but in scrutinizing this they have lost sight of the larger picture which he saw. Darwin saw that new races arise in two ways." The remainder of the lecture is devoted to a justification of the author's position.

Two lectures by Edward Murray East, assistant professor of experimental plant morphology, Harvard University, follow—one on Inheritance in the Higher Plants and the other on The Application of Biological Principles to Plant Breeding. The lecturer makes clear the fact that the general acceptance of the theory of organic evolution made necessary a new botany as well as a new zoology.

The seventh lecture, delivered by William Lawrence Tower, associate professor of zoo-

logy, the University of Chicago, presents the Recent Advances and the Present State of Knowledge Concerning the Modification of the Germinal Constitution of Organisms by Experimental Processes. The lecture reviews at length the two schools of thought explaining the nature of variation: the one believing that personal peculiarities developed in life are transmitted to the progeny, through being in some manner incorporated into the germinal constitution of the race; the other school upholding the hypothesis that changes in the race arise primarily in the germinal substance itself and appear later in the soma or body cells. As between these two schools the author's position is clearly seen in his statement that "as far as experience warrants a conclusion, there is at present no escape from the general proposition that all variations that are productive of permanent germinal changes, arise primarily in the germ and appear secondarily in the soma" (body).

The two closing lectures of the course, on The Inheritance of Physical and Mental Traits of Man and Their Application to Eugenics, and Geography of Man in Relation to Eugenics, were delivered by Charles Benedict Davenport, Station of Experimental Evolution, Carnegie Institution of Washington. Dr. Davenport's studies lead him to believe not only in the inheritance of feeble-mindedness, deaf-mutism, etc., but in the inheritance of marked gradations of ability of many types. It is the lecturer's contention that one must look closely to the life stream of a nation, to its germ plasm, to secure progress and prevent decay. His lectures stress the importance of considering all marriage from an eugenical point of view.

In view of the high standing of the lecturers, each well qualified to speak on his subject, it would be difficult to take exception to the data presented. If one, however, is in the habit of approaching some of the cases cited in the last lecture, from the point of view of the environmentalist, he has a feeling that the author in his enthusiasm for eugenics, has claimed too much for heredity in the cases that he cites to prove the inheritance of mental ability. The author seems on much surer ground when discussing the inheritance of mental defect, such as feeble-mindedness. One is tempted to wish that since the lectures were intended primarily for a general university audience, and the book for a still more popular audience, that the methods of presentation had in some places been more popular. Nevertheless, the course of lectures is stimulating and will doubtless have its influence in popularizing a field of science rapidly assuming great social significance.

FRANK D. WATSON.

### YOUTH AND THE RACE

By EDGAR JAMES SWIFT. Charles Scribner's Sons. 342 pp. Price \$1.50; by mail of THE SURVEY \$1.60.

Scourging the public schools has become a popular pastime. Some critics wield the lash wisely; many do not. To this latter class ap-

parently belong Edgar James Swift, professor of psychology and education in Washington University, St. Louis, a man whose keen mind and years of experience should save the making of unjust statements for which slight foundation exists.

Dr. Swift's latest book, *Youth and the Race*, is a study of the racial instincts of children, to determine how the school may utilize those primitive impulses to instill knowledge and to develop social consciousness. He deals with the spirit of romance—the desire to wander, to live in camps, secure booty, investigate, and fight. He says "A boy *will* be active, he insists upon adventures, and he is bound to show off." He tells of the growth of "gangs," the desire to be consulted, the tendency to exercise control. He makes a plea for the utilization and direction of these forces, and declares "If allowed to mature without control, these (racial) instincts retain all their primitive non-social or anti-social characteristics."

As an analysis of boy nature *Youth and the Race* is interesting if not new. The word "children" evidently means "boys" to Dr. Swift, for with one or two exceptions, and those slight ones, his illustrations and deductions ignore girls altogether.

The chief error of the book—and it is a very grave one—is that except in a few specific cases the author adopts an attitude of scornful condemnation for all schoolmen (especially superintendents) other than himself. He makes a strong plea for social centers, pupil government, individual teaching, but insists that progress along these lines is systematically blocked by the reactionary prejudice of school authorities. He says, for example, "Nearly every important duty beyond instruction which the schools have assumed has been undertaken only after long agitation by laymen. Not until the demands of the community have become irresistible have the authorities yielded. This was the case with medical inspection of pupils and with school nurses. The establishment of special schools for backward children was delayed until the popular demand became a menace. . . . When the public will no longer brook refusal, reforms are instituted and the next decade is spent in extolling the progress."

Anyone familiar with the history of education in this country knows that each of the reforms cited above was put in operation by schoolmen, who recognized an existing evil and insisted upon a remedy in the face of popular opposition. Let anyone who wishes light on this subject study, for example, the history of medical inspection legislation in America. Dr. Swift has only to search the educational records of his own city—the famous "St. Louis reports"—to learn how educational authorities are continually pleading with the people for the privilege of giving to the people better schools. In education at least, enlightened public opinion is the result of, not the cause of, educational reform. Reforms are instituted by individuals, not communities. The people are now receiving and always will

receive just as good schools as they are willing to stand for and to pay for.

This fact is so evident, so clear to anyone who takes the pains to study the field of education in America, that it is surprising to find a book written upon the assumption that school teachers are incompetent, principals cowardly, and superintendents time servers to their superiors and bullies to their subordinates.

Dr. Swift is not consciously unfair. He has made a mistake which is becoming increasingly common. What he seems to have done is to visit not the ordinary but the extraordinary schools of the country—the educational experiments; recognize their good work; and then, without taking the pains to find out what the rest of the schools are really doing, he compares what he has seen in the exceptional schools with what he assumes about the others. The grammar school of to-day is not the same as the grammar school of twenty years ago. There is room for improvement in the future; but there is already improvement over the past.

No matter how interesting a book may be, no matter how well written (and this book of Dr. Swift's is both interesting and well written) if it fails to recognize the keen interest, the enthusiasm, and the underlying sincerity of purpose among the school men and women of to-day, it cannot fail to place another stumbling block in the way of educational reform.

MAY AYRES.

#### PRESENT FORCES IN NEGRO PROGRESS

By W. D. WEATHERFORD, PH.D. Association Press. 191 pp. Price \$5.50; by mail of THE SURVEY \$5.57.

#### THE NEGRO IN PENNSYLVANIA

By R. R. WRIGHT, JR. A. M. E. Book Concern.

#### THE NEGRO AT WORK IN NEW YORK CITY: A STUDY IN ECONOMIC PROGRESS

By GEORGE EDMUND HAYNES, PH.D. Longmans, Green and Co. 158 pp. Price \$1.25; by mail of THE SURVEY \$1.32.

When an author, and particularly a southern author, starts to write upon the Negro, we expect to find a considerable portion of his book devoted to his theories on the race problem. Dr. Weatherford's volume, however, wholly departs from this practice. He gives us not theory but facts; facts regarding Negro population, the Negro in agriculture, the rural schools, and the work of the southern white church and Young Men's Christian Association for the Negro. Some part of this information is compiled from the latest census publications, but another part is secured from state and county reports and from the writer's own careful observations. The book is scarce two hundred pages in length, but it is full of important matter written in a simple and interesting style.

Dr. Weatherford shows clearly some of the disadvantages under which the Negro labors in the South. He describes the crop mortgage system, still common, by which the tenant mortgages his crop in advance, and starts encumbered with debt. The manager's store, with its high prices and ready credit eats up that part of the crop that the worker was to have called his own, and the tenant finds himself at the year's end as poor as when he started.

The author is evidently a prohibitionist, and he cannot at first understand why many planters who condemn the Negro as worthless, unambitious and thriftless, and swear at him for getting drunk, yet give him whiskey. "I at length," he says, "found the real reason. The planter of this type prefers to get, as rent, one-fourth of what a Negro can make working four days in the week, and then get for whiskey nine-tenths of the remaining three-fourths." This method keeps a tenant continually in debt so that he must stick to the land.

Dr. Weatherford speaks with frankness regarding the backward condition of the colored rural public schools. The Negroes, he says, have adequate school buildings, the teachers are poorly paid, and the county superintendent often fails properly to supervise. The school term is short and the curriculum unsuitable. He scouts at the idea, advanced by some southerners, that the Negroes should receive for education only such funds as they pay in direct taxation. "The purpose of public education is to help those who cannot pay. The state has absolutely no business in educational work save to make better citizens of all."

While he is not afraid to show the dark side of Negro life in the South, the author devotes an equal amount of space to the hopeful aspect; the progress of the Negro farmer, the interest and support the Negroes themselves give to their schools, and the improvement in conditions in the Negro home. He dwells also on the awakened interest in Negro education on the part of the white man. He tells of a new type of county superintendent in Virginia, the young, highly educated gentleman, who devotes his entire time to supervision of Negro schools. And lastly, he describes the college man who studies Negro conditions with an open mind. This study is bringing its results in service.

He ends with a call for service, for sympathetic workers among the Negroes.

\* \* \*

Mr. Wright's book is an economic study which deals chiefly with the Negro in Philadelphia, though Pittsburgh and some other industrial centers receive mention. We hear nothing of the agricultural Negro whose numbers are too small to make a study of his condition seem important.

We learn that slavery began with the founding of Pennsylvania, but that it was early criticized, the German Quakers of Germantown in 1688 making the first recorded protest against slavery in the United States. We follow the colored man in Pennsylvania through the period of emancipation to the days of the abolitionist and the underground railroad, and see the important part the Pennsylvania Negro took in aiding the southern runaway and his acumen in at once denouncing the colonization society, a society that was only interested in ridding the land of free and intelligent Negroes like himself.

The Negro in Pennsylvania today suffers still from the desire of the white man to be rid of him. Even this Quaker colony gives him scant

welcome, but this volume tells us that despite his handicaps he is improving in industry and morality and means to remain and to increase.

Dr. Wright's story is familiar today to students and careful observers of the city Negro. It has, however, many interesting side lights. Some of the figures regarding property holding are important. For instance, the assessed valuation of Negro property throughout Pennsylvania may be estimated at between twenty and twenty-five millions, and the property of the Negro church at three millions. Where else in the country would we find proportionally such immense church holdings, and holdings that are free gifts! The growth within one generation of a professional class in Philadelphia is elaborated.

Dr. Wright for years has studied the Negro skilled worker, not only in Pennsylvania, but in Illinois and in the South, and he discusses carefully the position of the Negro and the trades union. In Philadelphia, few Negroes attempt to enter unions; they feel confident of refusal and work is possible without a union card. But among the iron and steel workers in such a center as Pittsburgh, the situation is different. There unionism, at various times, has been strong, and unions have been organized among the Negroes by white men, to prevent their acting as strike breakers. "The whole history of the situation, however, has been an attempt of white workmen to use Negroes to their advantage without giving corresponding advantages." It is small wonder, then, that the Negro doubts the doctrine of brotherhood when it is preached only on the eve of a strike.

The ostracism of the Negro from the best in the white world and his free admission to the worst Dr. Wright, who has been a social worker in both Chicago and Philadelphia, well understands. His chapter on crime shows that added to poverty and long hours the Negro child has the handicap of immoral surroundings. The white world very occasionally shows any sense of responsibility for the temptation it sets before him. Indeed, the book leaves us with a profound sense of the neglect of this great race problem by the people of the North.

And yet, after all, the one thing the Negro asks is that he cease to be a problem and be given a man's chance: "The greatest need of the Negro is economic freedom, economic justice; a state of public opinion that will give a fair field to struggling individuals identified with a submerged minority." And if he obtains this, will he not then see that he is still with the great mass of individuals struggling for "economic justice?" But at least it will be better and braver to struggle with the many than to repine with the few.

\* \* \*

Dr. Haynes is the director of the National League on Urban Conditions Among Negroes, and is thoroughly at home in his subject of the New York Negro as a wage-earner and in business.

The material for the chapters on the Negro as a wage-earner is derived from the national census of 1900 and the state census of 1905. The investigation of the Negro in business was done by Dr. Haynes personally and is minute in its details. The writer finds the Negro wage-earner in New York moving slowly away from domestic service into other positions; in some cases falling to the rank of unskilled labor, in other cases obtaining important tasks. His figures show, for instance, a large increase in the number of stationary firemen, and of such skilled mechanics as masons, plasterers and carpenters. He believes that "slowly the walls of inefficiency on the one side and prejudice on the other which confined Negroes to the more menial and lower paid employments are being broken down."

The chapters on the Negro in business are the best in the book. We learn, among other matter, that 20 per cent of New York's colored business enterprises are conducted by West Indians while the city's West Indian colored population is but 10 per cent. Dr. Haynes believes this high percentage is due to the excellent general education of the West Indian Negro and to the large freedom which he enjoys in his home and which gives him independence and initiative when he reaches a new land.

The businesses conducted by the Negroes of Manhattan are chiefly outgrowths of domestic service. They comprise barbers' shops, restaurants, dressmaking establishments, tailor shops, grocery stores, hair dressing and manicure parlors, and employment agencies. Oddly enough, we learn little regarding real estate firms, the one Negro business which subway advertising has forced upon the attention of the average New Yorker. Perhaps this has become so important as to leave the classification of "Negro" and become simple New York business. Dr. Haynes's study is of the small shop catering to the Negro customer and we are given such minute information as the number of square feet the store occupies, the valuation of tools and fixtures and the number and character of the account books kept. The book contains a mass of well arranged material of interest to the student of small economic beginnings within a segregated race.

MARY WHITE OVINGTON.

#### ECONOMIC BEGINNINGS OF THE FAR WEST

By KATHARINE COMAN. The Macmillan Co. 418 pp. Price \$4.00; by mail of THE SURVEY \$4.30.

Four years of travel and research have gone into the making of Professor Coman's study, which fills two volumes of more than 400 pages each and traces the gradual transformation of the land beyond the Mississippi from a theater of adventure and conquest into a land of plenty. In the long struggle for possession Miss Coman sees the gradual working out of conflicting economic systems and the final triumph of "the American ideals of free land, free labor, and equal opportunity." The retreat of the Spanish grandee and the clerical despots of early California before the homestead farmer was the inevitable outcome of the economic contest. By

the law which decrees that the fittest shall survive, the American occupier was bound to win from the beginning.

Starting with the Spanish explorers of the early sixteenth century, the author gives an account of the unsuccessful Spanish occupation; the growth and decline of the fur trade under the *laissez faire* system; the transcontinental migration; and the stormy events which culminated in the passage of the Homestead Act in 1862. The actual economic awakening of the Far West, as Professor Coman sees it, was destined to await the arrival of the farmer from beyond the Mississippi. "The long struggle between forced and free labor," she says, "between land monopoly and the self-employed land owner, had ended in the triumph of the ideal American type—the homestead farmer."

Throughout the work Professor Coman maintains an extremely open-minded attitude in preferring local to distant authorities and contemporary to historical commentators. She quotes liberally from the letters and journals of the men who helped to make the West. Thus her book is singularly free from prejudice and is not likely to encounter the kind of sectional resentment which is so often aroused by historical studies of our country. Indeed, it is likely to be most appreciated in those quarters from which its material has been drawn.

KATHARINE ANTHONY.

#### MEDICAL BENEFIT: A STUDY OF THE EXPERIENCE OF GERMANY AND DENMARK

By I. C. GIBBON. P. S. King & Son, London. 290 pp. Price \$1.70 (including duty); by mail of THE SURVEY \$1.82.

This is a full, practical and well arranged study of one aspect of health insurance, as administered in the two countries which have had the longest experience, the one under a compulsory, the other under a voluntary, system. Each country is dealt with separately and conclusions are carefully summarized. The curative side of the medical benefit alone is treated, prevention being left for a later volume of a thorough study by the same author of the whole subject of national health insurance,—a study to which this volume is preliminary.

In view of the strained relations between the doctors and the government in England at the present time, the chapters of detailed conclusions on medical service and remuneration drawn from the experience of two countries which have profited by long experience are especially valuable.

M. B. S.

#### MAN OR MACHINE—WHICH?

By AL FRIDY. The Pilgrim Press. 111 pp. 75 cents; by mail of THE SURVEY 83 cents.

Man or Machine—Which? is in no way unusual except in its confusion of ideas. It begins with an attack upon modern industrial methods as exemplified in the increased use of machinery, goes on to a discussion of the effect of the machine upon the workman and upon the employer, and ends with a dissertation on the manner in which society is to be saved from the machine.

The effect of the machine upon the workman the author shows to be loss of skill, lessening of esthetic pleasure in work and a general lowering of self-respect. The effect upon the employer, he declares, is to stimulate his greed, to make him lose interest in his employes and so be willing to pay low wages and generally to make him incapable of altruistic thought or action. Although this scathing indictment contains a great deal that is undoubtedly true, yet, after such an arraignment, the reader would have difficulty in grasping from it the deeper meanings of present-day social unrest. And he would hardly be prepared to have the efforts of workmen to escape from this bondage by class action lumped as "anti-social," "anti-moral," an evidence of "anarchistic philosophy," of "irreligion and unsocial mind." What, then, are the author's proposals for a regenerated humanity? He sees three ways of escape.

The first he terms the practical method. The employer may invent a better machine.

The second is the economic, the more efficient handling of the machines. Here he praises the Taylor efficiency system as the means by which advancement, moral and economic, is to take place, and through which, while the employer gains from 100 to 400 per cent in profits, the employe is to get 50 to 100 per cent more in wages.

Finally, through efficient management is to come what the writer terms the moral mastery over the machine, which he declares, through a train of reasoning that cannot be taken very seriously, is to come inevitably with the increased use of machinery.

J. A. F.

#### PRISON MEMOIRS OF AN ANARCHIST

By ALEXANDER BERKMAN. Mother Earth Publishing Association. 512 pp. Price \$1.50; by mail of THE SURVEY \$1.65.

Alexander Berkman, the author of this book, is a Russian Jew who as a youth emigrated to the United States. A disciple of Bakunin, he was a fiery member of the Nihilistic group. A Russian revolutionist, he found in America fuel for his Anarchistic zeal. As a working man he came under the power of what seemed to him a despot industrial system controlling the political, social, intellectual and religious life of what he had supposed to be the land of freedom and equality. He was subject to a ruling class, even more irresponsible than the ruling class of Russia. To the intense Jewish nature of Berkman this state of things was horrible. It was the abomination of desolation in the holy place.

With his Anarchistic faith and revolutionary training Berkman was from the first, even as he is now, a rebel against the existing order. He consorted with the Anarchistic group in New York; his poverty compelled him to live in the poorest tenements and sometimes to sleep in the street. His devotion to his cause was absolute. He starved himself that he might give the more to his propaganda. He quarreled with his comrade, when that comrade spent twenty cents for a meal, when in the estimation of Berkman five cents was enough.

In the Homestead strike, Berkman thought he saw a way to show his faith by his works. Leaving his home in New York he went to Pittsburgh for the purpose of killing Henry Clay Frick, then head of the Carnegie Steel Company. Berkman made his way into Frick's office, shot at and slightly wounded him.

In the philosophy of the school of Berkman this was not murder; it was an act of war. He says: "In truth, murder and *attentat* [that is, political assassination] are to me opposite terms. To remove a tyrant is an act of liberation, the giving of life and opportunity to an oppressed people."

For this attempt on the life of Frick, Berkman was condemned and sentenced to a term of imprisonment of twenty-two years at hard labor. This book is a record of his prison experience. He commences his narrative with an account of the great Homestead strike and gives in detail an analysis of the thoughts and feelings which prompted him to commit the act of violence for which he was condemned. Berkman has the story-telling power of his race; his style, the vividness and intensity of the Bible narrative. He carries us through his jail experience while he is awaiting his trial. He portrays the rotting effect of that period of idleness. The description of the trial itself has all the qualities of the drama.

The incapacity of the Anarchist to judge of the effect of his words and actions upon the outside world is painfully evident in the bitter disappointment which came to Berkman when he found that the declaration which he had prepared with great care to make before the court fell flat, making no impression upon the court or the outside world.

His prison life is told in a manner to make us fairly see his version of what goes on within those gloomy walls. We know warden and deputy and "trusty," and a hundred other of the officers and convicts as he paints them, as well as we know our next-door neighbors. The narrative is terrifically realistic.

Berkman spent nearly two years in solitary confinement. His description of his mental condition during that time appals us. Only because he was a man of strong will and, apart from his Anarchistic philosophy, of a well-balanced mind, did he escape insanity. Again and again he charges that he was thrown into the "black hole," and put for days upon a diet of bread and water. He testifies to daily brutalities behind prison walls by wardens and keepers whom he depicts as degraded equally with those they themselves degrade. He describes the pathetic endeavors of the prisoners to communicate with one another. Naturally the book dwells in detail upon the beginning and the ending of the long fourteen years of prison life.

This book ought to be, but will not be, widely read. One would as soon court a nightmare as to voluntarily go through this chamber of horrors.

One lays down the book with the conviction that Berkman, so far as his Anarchism is con-

cerned, was insane; his judges stupid tools of a still more stupid tyranny; his jailors brutes, delighting in cruelty for the mere love of cruelty; his fellow prisoners, the victims of an absurd system the effect of which is to kill the body and the soul. The moral lesson derived from the reading of the book is that our whole criminal system must be reformed out of existence and a curative method be substituted for the present method of punishment.

ALGERNON SYDNEY CRAPSEY.

#### PENAL SERVITUDE

By E. STAGO WHITIN, Ph.D. National Committee on Prison Labor. 162 pp. Price \$1.50; by mail of THE SURVEY \$1.65.

Mr. Whitin's book is perhaps most interestingly read in connection with the reforms now urged or needed in the various states. In the author's own words, it is a "brief summary of the findings of the National Committee on Prison Labor," of which Mr. Whitin is secretary. It draws value, however, from the author's economic training and his personal acquaintance with actual conditions in many parts of the country.

For example, a dozen states or more will be struggling this year with some phase or another of prison production under private enterprise. In Connecticut, Delaware, Maryland, Virginia, Indiana, Wisconsin and Iowa, the issue of forever abolishing the contract system will be squarely joined. In Alabama the legislature will be petitioned to discard the lease system. In North Carolina many persons will seek to show why convicts should not be hired out to railroads at so much per convict. For all of these states there should be suggestion in Mr. Whitin's argument for the "state use" plan of production and distribution. Under the lease and contract systems of prison labor, the author shows, the prisoner becomes an economic slave; his body is owned; he is given no choice of occupation and is paid practically nothing.

Society will not much longer endure, thinks Mr. Whitin, the existence of such "slavery" or involuntary servitude, even as punishment for crime. Instead, the state will take over its prison industries, and will sell their products back to its own departments (a system already adopted by several states).

To this argument the practical objection will be raised that the "state use" plan of employing prisoners and distributing the product "does not pay." But it has never been proved that the "state use" system *can not* be made to pay, and even if that were proved, the answer would be: It is a greater financial failure to waste human life as private exploitation of prisoners wastes it; let society tax itself, if need be.

The ideal system of state controlled prison industry will allow each convict to pursue work suited to his own capacities or educational needs, and will pay him a just wage. Mr. Whitin urges that in assigning individual prisoners to this or that kind of labor, account should be taken of the character of the industries in the prisoner's home locality. He should be given training in some trade which he can profitably follow

after release. The requirements of education should be met also; the interest and hope of the prisoner should be enlisted and he should be enabled to work to some definite, attainable end.

Not only in the matter of system of production, however, does this book contain valuable hints to legislators and reformers. In Massachusetts, New York, Ohio, Wisconsin, Minnesota and Kansas the question of paying wages to prisoners has been or is likely to be definitely raised this year. More than any other single factor, Mr. Whitin thinks, the payment of wages tends to break down the condition of penal servitude. It is not only an incentive to greater labor; it is a restorer of self respect and makes easier the path of reformation.

In other states other changes are being considered. The question of control over penal institutions by the state is being debated in New Hampshire, Rhode Island, Pennsylvania, North Dakota and Maine. Mr. Whitin argues strongly for centralized authority, so definite in form that responsibility can be accurately located. There should be also, he thinks, some method of recall by which prison administrators can be made to respond to the highest standards of moral action of the community.

Owing partly to the nature of his subject and partly to method of treatment and peculiarities of diction, Mr. Whitin has not written a book that will attract the general reader. He has written one that undertakes to answer the question, What is the best punitive system now obtainable? The book is therefore a necessity wherever penal reform is in the air.

Maps by Christina C. Merriman

NIGHT WORK  
THE WORKING DAY  
THE WORKING WEEK  
IN  
FACTORIES  
AND  
STORES

## DO YOU LIVE IN A BLACK STATE?

The maps here reproduced<sup>1</sup> are designed to show at a glance the standing of each state in the protection afforded to working women from excessive hours of labor.

The desirability of these laws is taken for granted. No arguments are given to show that industrial overwork is dangerous to health and that a community must protect itself by providing in its statutes a reasonable working day.

What then is a reasonable day of work and what states provide it?

The goal of working people themselves throughout the world is the eight-hour day. Eight hours is the daily period which many communities—city, state and national—as model employers set for the labor of adult men in their employ.

The statutes shown in these maps may be found in *Fatigue and Efficiency* by Josephine Goldmark. The Survey Associates. Price \$2.00. They also appear in a *Handbook of Laws Regulating Women's Hours of Labor*, containing also a standard law and a summary of arguments in defense of such legislation, published by the National Consumers' League, 106 East 19th Street, New York. Price 15 cents for single copy; lower rates by 50 or 100 copies.

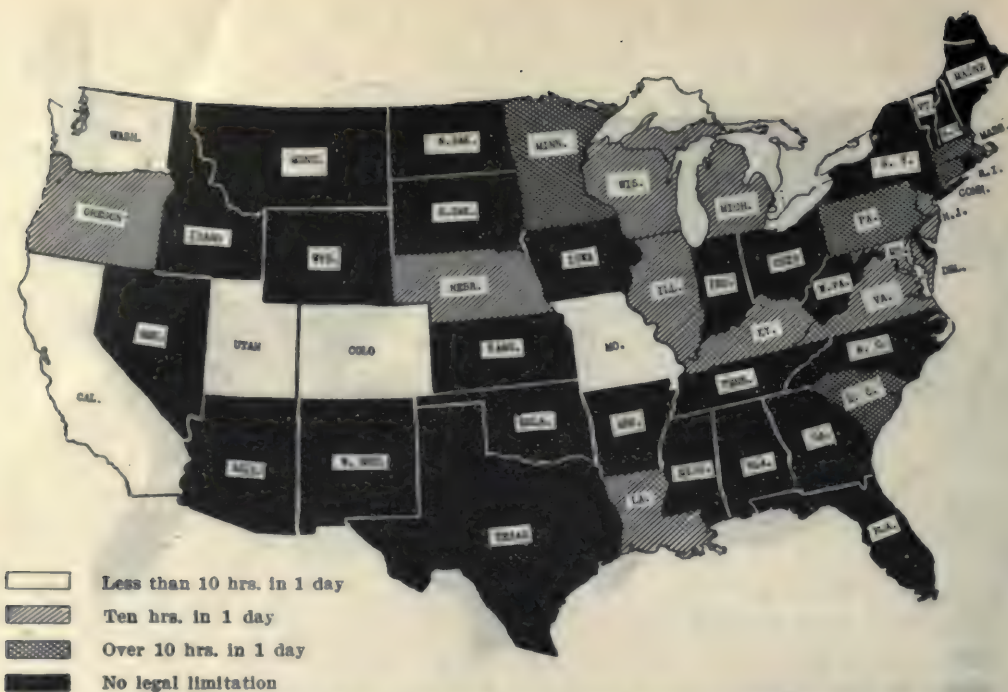

Granting that this limit cannot be set at once even for women in private employment in all the states, it should yet be the recognized goal for ordinary industrial occupations. Even the eight-hour day involves, with the noon hour and the journey to and from work, in most instances ten hours' absence from home. And at home there awaits the working woman, married or unmarried, in most cases unavoidable home work—washing, mending or cooking—which she performs in addition to wage work. From the standpoint of health, therefore, eight hours of employment leaves a small enough margin of time for rest and leisure.

For practical convenience, the states are divided into four grades in the maps, as shown by their captions. Map 1. makes plain the number of hours allowed in one *day* for women employed in factories. Six states are marked white or first grade because they lead the others: California, Colorado and Washington provid-

LEGAL HOURS OF LABOR FOR WOMEN IN MERCANTILE ESTABLISHMENTS: BY THE DAY

A second point is to be noted regarding the black states. It is only just to point out that many of them have not yet legislated to protect working women from excessive working hours because the need has not yet arisen. The census of 1910 reports that, excluding Colorado, less than 2,000 women were employed in manufacture in the whole Mountain Division, comprising eight states.<sup>1</sup> Naturally, then, the need of legislation has not been pressing. Yet bitter experience has shown the wisdom of obtaining such laws *before* industry is present to oppose them. If the Mountain Division of states will legislate now before the overwork of women assumes its appearance of "necessity," all manufacture will grow up under the same conditions and will be able to compete upon a higher level than in the older states.

Certain incongruities in the maps stand out sharply. Why, for instance, has Vermont alone in New England been content to wait until the year 1913 before granting any legal protection from excessive hours to the working women in her mills and factories? In 1910 there were over 4,600 so employed. Evidence brought out before the Vermont legislature this winter showed that women have been employed up to eighty-four hours in the week.<sup>2</sup>

Again, Pennsylvania—third only to New York and Massachusetts in number of female wage-earners—has been content to rank at the very

foot of the list, when measured by the number of hours of work allowed in one day; twelve hours are still provided in her law for women employed in factories and stores.

Maps 3 and 4 show the legal day's and week's work allowed in mercantile establishments. Here, too, the five states which lead in Map 1 are again white. Doubtless many readers will be surprised at the greater prevalence of black in these maps. Most of New England, New York and Ohio stand out in dark contrast to their appearance in the first maps. Even Massachusetts, the pioneer of legislation in America, still leaves the day's work unlimited, provided the week's work be not more than fifty-eight hours.

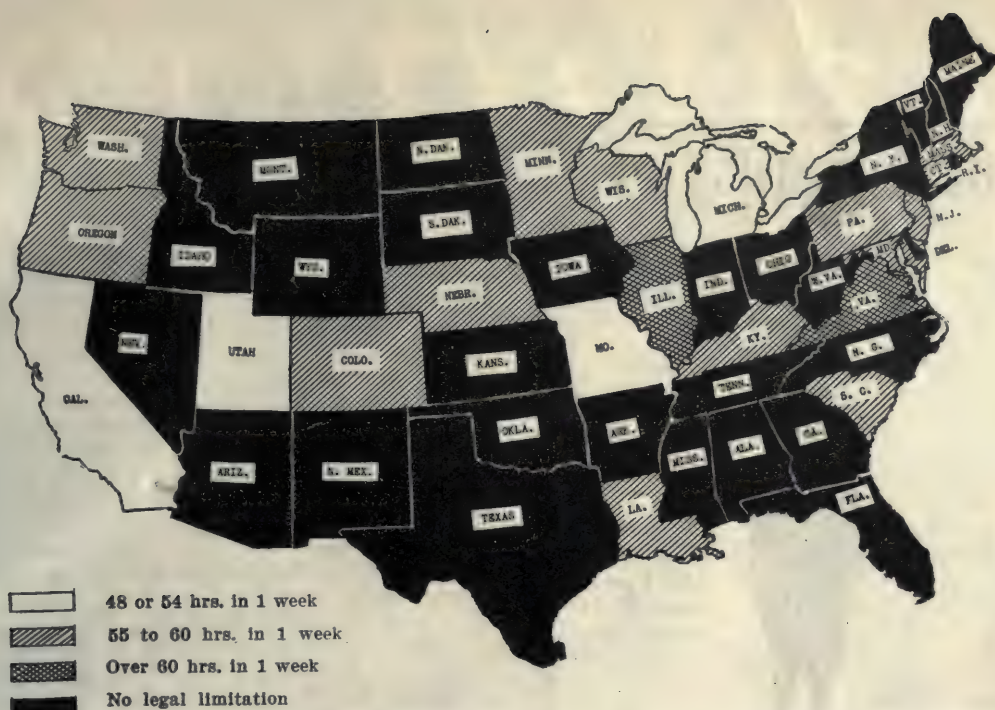

The discrimination against the women employed in stores is the more unreasonable because the strain of their work is being more and more clearly recognized. It is true that they are not subjected to the speed, the monotony, and complexity of machinery, but the girl behind the counter suffers greatly from the constant standing, continuing at any rush season or special sale literally throughout the day. Many girls complain of broken arches and varicose veins. There is also unmistakable nervous strain in being always on their good behavior, of an even temper, suiting the tastes and whims of customers of all sorts. Store employes need the protection of the law as urgently as factory workers.

Most striking is the Stygian blackness of the map reproduced on the cover of this issue of THE SURVEY. This shows that only three states

<sup>1</sup>Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah and Nevada.

<sup>2</sup>A fifty-eight hour law for women was passed this month, since the maps for this article were drawn.

LEGAL HOURS OF LABOR FOR WOMEN IN MERCANTILE ESTABLISHMENTS: BY THE WEEK

in the Union—Massachusetts, Indiana and Nebraska—prohibit work at night in factories, after a fixed closing hour. The Massachusetts law has existed for almost twenty-five years, affording to women employed in manufacture a period of rest at night between 10 p. m. and 6 a. m. Since 1907 the great textile industry of Massachusetts has prospered with an even stricter limitation of hours; the employment of women is prohibited therein between 6 p. m. and 6 a. m. This law follows the still more rigid European statutes, where the subject of adequate night rest for working women has been studied, reported on, and made the subject of the first important international treaty dealing with the hours of labor of wage-earners. The fact that fourteen European nations have through their specially appointed representatives signed a treaty to provide for women in industry at least eleven hours' rest at night brings out forcibly the inaction of our states upon this momentous issue.

Space does not allow us here even to enumerate the arguments in its favor: the benefit to health and morals, the assistance given to the factory inspectors in enforcing the daily limitation of hours.

In both Wisconsin and Maryland the working period after a fixed hour in the evening must be two hours less than by day. In both statutes the night shift is thus legalized during the time set apart as a period of rest by the International Convention on Night Work.

Some recent concrete instances of women's work at night show more clearly than all theories

how urgent the need is for the legal closing hour. Miss Van Kleeck's interesting volume, *Women in the Bookbinding Trades*,<sup>1</sup> gives for the first time detailed examples of the extraordinary duration of overtime in this trade. In one instance, a girl twenty-three years old was employed in a magazine bindery with short interruptions, from 8.30 in the morning until 5.30 on the morning of the next day. In the absence of a legal closing hour, she was almost continuously employed for nineteen hours. In other flagrant cases girls were employed from early morning until long after midnight, even until eight and nine o'clock in the morning of the next day! When work thus continues until any hour of the day or night, the difficulties of enforcing the eight or ten hours' limit are almost insuperable. Unless the inspectors remain bodily on the premises, they cannot tell when work stops. On the other hand, when employment after a specified hour at night is a violation, a single inspection suffices to prove it.

The legal closing hour is thus essential not only to protect health and morals, but to aid the enforcement without which the statutes are a mockery.

The adequacy or inadequacy of enforcement these maps do not attempt to show, except in so far as statutes clearly non-enforcible are ruled out. Only those statutes are included which affect all women, irrespective of age, employed in manufacturing and mercantile establishments.

## COMMUNICATION

### MR. CARSTENS' FINDINGS

TO THE EDITOR:

It has been brought to my attention that a  
statement is being circulated to the effect that  
the portions of my report on Public Pensions to  
Widows contained in *THE SURVEY* of January  
4, 1913, were not accurately given there. I wish  
to deny this emphatically.

It is true that an advance press notice, con-  
densing *THE SURVEY* article and not prepared by  
me, inadvertently substituted the word "immor-  
ality" for "low moral tone" and was to that  
extent inaccurate, but by every word of *THE  
SURVEY* article itself, I am prepared to stand  
and the advance notice was a good general sum-  
mary of my Chicago findings and of my general  
conclusions.

Very truly yours,

C. C. CARSTENS.

[Massachusetts Society for the Prevention of Cruelty  
to Children. Jan. 18, 1913.]

## JOTTINGS

### CHILD LABOR DAYS

The National Child Labor Committee has called  
upon the churches and schools of the country to  
observe Saturday, Sunday and Monday, January  
25-27, as Child Labor Days. To aid such ob-  
servance the committee has sent free to all cler-  
gymen and school principals who apply for it a  
pamphlet of facts about child labor. In this  
the committee prints, among other things,  
census figures on child labor for 1900, the latest  
figures available on the subject. It points out  
that the total number of workers ten to fifteen  
years of age, 1,752,157, does not include the  
thousands of newsboys and bootblacks who  
were attending school, nor the other thousands  
of children who were employed in tenement  
house manufacturing. It states also that the es-  
timate of 284,330 children classified as engaged  
in manufacturing and mechanical pursuits is mis-  
leading since cannery children were in many  
states reckoned as agricultural workers.

The Federal Council of the Churches of  
Christ in America and of the Social Service  
Commission of the Protestant Episcopal Diocese  
of New York endorses the committee's call.

### LECTURES ON TRADE UNIONISM

The Central Union Label Council of Greater  
New York announces a program of lectures on  
trade unionism designed to interest the general  
public in spreading the demand for the union  
label. The lectures, which are illustrated by  
lantern slides and pictures of the Triangle fire  
and the Lawrence strike, aim to bring out the  
contrast between union and nonunion conditions.

# THE COMMON WELFARE

## THE "WHITE" PROTOCOL

The garment strikes in New York are leading to more than a mere extension of the protocol plan of 1910. In the "white label" actually instituted in the shirt waist trade (such as is advocated by Mr. Cohen on p. 631), the effort is made to forge the link between country and city, and make the decent respect of the average citizen for the clothes on his back, and his decent respect for the back of the man who makes the clothes, count as a compelling factor in bringing all makers of clothing up to the standards which the organized manufacturers and workers set as their minimum.

Further, in the shirt waist trade, the principle of the minimum wage has been voluntarily adopted; an eight dollar standard set; and, more noteworthy, a revolutionary step has been taken in creating a joint wage scale board which will be for the permanent scientific study of piece rates and efficiency.

To understand these developments the general layout of the garment trades must be borne in mind. Clothes go back to the Garden of Eden, and "male and female created he them" is their first great law of division, as it is of the people who wear them.

The men's tailors are not necessarily men tailors. They are the makers of men's clothing, and they are in large part organized as the United Garment Workers. And the men's tailors are "out" in the present strike—sixty to one hundred thousand of them. In women's wear the central organization is the International Ladies' Garment Workers. These include the cloak, suit

and skirt makers, who were parties to the first protocol of 1910, and whose shops have continued serenely at work during the present crisis; the shirt waist makers, who signed a similar protocol last week; the kimono and wrapper makers, and the white goods makers. Movements towards arbitration and peace agreements in these last two trades are in process, and the independent manufacturers in the men's garment industry have announced their willingness to make similar settlements.

The strikes have not been without bitterness and big contrasts. The shirt waist makers were on strike less than a week when the agreement was signed, a turn fairly to take one's breath away when their long fruitless struggle of 1910 is remembered. But this year's strike was largely to bring coherence and group consciousness to the scattered forces of the workers, it gave support to their neighbors in the white goods trade, and brought to a head negotiations which had been going forward between the manufacturers and the unions for weeks past.

In contrast to these speedy and peaceful negotiations in the shirt waist trade, there has been an old-time belligerency in men's wear.

The so-called "white" protocol in the waist trade is modeled on that which has existed in the cloak, suit and skirt trade since September, 1910.

The closed-shop dilemma is met, as with the cloak makers, by the preferential union shop. The board of arbitration will be the court of appeal from a grievance board, to which disputes between individual employers and workers

MORRIS HILLAQUIT  
Member exec. com., Socialist Party

Members of the Board of Arbitration in the Cloak, Suit and Skirt Trade. These same men will make up the new arbitration board in the shirtwaist industry.

or between the unions and the manufacturers' association will be referred. As in the cloak industry, the lower or grievance board is made up of representatives of the two organizations, the upper of one representative each of the union, the manufacturers and the public. The decisions of the upper board are to be regarded as final, and recourse is to be had to the strike only in the event of one of the disputants refusing to abide by the decision of the board. The lower board will probably work out rules covering some of the commoner causes of dispute, and to it will be brought all problems and all plans for improvement of the industry—this latter provision giving it a scope much wider than that originally given to the cloak makers' lower board.

The Joint Sanitary Board is constituted, like

that of the cloak makers, and adopts, to begin with, the sanitary standards of that board. It also adopts as a means of securing the co-operation of the public in establishing decent working conditions, a white protocol label, to be attached to goods which have complied with the standards set by the board. For this the way has been paved by the recent agitation of the cloak makers' board, which has not as yet succeeded in introducing a label in that industry. The waist makers are promised, by the terms of their protocol, an advance of wages of about 10 per cent after this label has been in operation one year.

The cloak makers' agreement set a minimum week's wage schedule and established shop price committees for fixing piece prices; no machinery for permanent adjustment was provided.

MAX MEYER

**LILLIAN D. WALD**  
Nurses' Settlement.

**WILLIAM J. SCHIEFFELIN**  
Chairman Citizens' Union.

Representatives of the public on the Joint Board of Sanitary Control in the Cloak, Suit and Skirt Trade. They will serve in the same capacity in the shirtwaist industry.

The new protocol goes further. It sets a temporary week's pay scale and establishes shop piece price committees; it also establishes a wage scale board for the permanent scientific adjustment of wage scales on the basis of a living minimum, together with means of providing for the reward of increased efficiency. The first work of the board will be a six months' investigation of wages now existing in the trade. Pending the fixing of standards by this board the wage minimums now set provide that no week worker not an apprentice shall receive less than \$8, no piece worker less than 30 cents an hour. Sub-contracting—one great cause of low wages—is abolished. A maximum week of fifty hours is established, and except under special circumstances, overtime is cut down to four hours a week.

A special clause provides that all employers desiring to settle with the union be requested to apply for membership in the manufacturers' association, and that the union shall require of those employers who do not join the association the same standards of wages, hours and sanitary conditions.

### HENRY NEIL: PENSION AGENT

The widows' pension agitation has thrown to the surface a familiar type of charitable promoter in the person of Henry Neil of Chicago. Advocates and opponents alike of the principle of state aid to mothers with children should know the general working scheme of this indefatigable visitor to many states, who styles him-

**GEORGE M. PRICE**

self as the "father of the Mothers' Pension Law of Illinois."

To illustrate: on November 23, 1912, there appeared this advertisement in the *Evening Press* of Grand Rapids, Mich.:

**WANTED**—Woman to organize Mothers' Pension League to obtain pension law for Michigan, \$5 a day and permanent position for woman of ability. Henry Neil, father, Mothers' Pension Law. 443 S. Dearborn Street, Chicago, Ill.

In response to an application prompted by some such advertisement as this, a letter dated from the above address, and signed by Henry Neil, was received by an applicant in another state. It is long but its salient paragraphs follow:

DEAR MADAM:

We would like to get a woman of refinement and ability to organize in your city and adjoining towns a Mothers' Pension League, for the purpose of securing a Mothers' Pension Law in your state and to encourage the best possible administration of that law after it is enacted.

This work will need the constant attention of a capable organizer and the local league should volunteer its assistance to the court and other officers who administer the law to see that the deserving mothers get pensions. . . .

Pensions paid under the Illinois Mothers' Pension Law, in Chicago, Cook County, Illinois, for one month was \$11,713.88 to 508 mothers with 1700 children.

We mail you today copy of a membership certificate and a copy of the *Newer Justice Magazine*.

Each new member will receive a registered charter membership certificate and four consecutive numbers of the *Newer Justice Magazine* and other letters and printed information in reference to the mothers' pension work. . . .

If this plan meets with your approval, you can notify us at once and start getting new members, both men and women, collecting the membership fee of \$1 from each, and sending us the full name and address of each new member. All money received by us, is used in furthering the work of the league. . . .

We will pay \$5 a day to an efficient woman to do this work, providing that at least ten new members to the league are secured each day that the organizer works, and providing also that the membership fee of \$1 a year is collected in advance from each new member. You can send us a money order for the amount you collect less the amount of your pay for organizing.

Postal cards have been sold, in addition to the magazine, which preface the text of the Illinois Fund for Parents Act, with the following announcement:

The profit from the sale of this card goes to the promotion of Judge McKenzie Cle-

and's Probation Plan to protect Chicago homes and to prevent the breaking up of families. You can help a good cause by buying these cards at 5 cents each.

Copyright 1909 by National Probation League, 323 Dearborn St., Chicago.

Agents selling these cards and soliciting membership have operated in Chicago as well as in the states. A representative of a responsible Chicago association reports them going "around among the poorer people of the city with a pathetic story of the money being used to help keep children with their mothers, and consequently many poor people contribute."

Just what these methods of collection mean has been put crisply by no less keen an observer than the vice-president elect of the United States. In a public statement, January 10, Governor Marshall said:

"They are even now organizing mothers' pension leagues in Indiana. Each member is charged a dollar. My information is one-half of this goes to the solicitor, the other half to the parent organization. Does it not seem that these solicitors . . . are engaged in this cause for the money they can get out of it?"

Persons wholly unknown to the league's secretary are urged to engage in this inviting work, with the prospect of volunteering their assistance later on to the court and other officers who administer the law to see that the deserving mothers get the pension!

#### QUESTIONABLE STATEMENTS MADE BY MR. NEIL

With these questionable methods of collection in full swing the secretary of the Mothers' Pension League makes a ringing appeal for laws which will get the pensioned widow one hundred cents on the dollar!

In a statement printed October 11, 1912, in the *Wisconsin State Journal*, addressed to the editor and signed by Henry Neil, the following paragraphs appear:

There will be some opposition to a Mothers' Pension Law, when the Wisconsin legislature meets. But the big fight and the most serious opposition will be an attempt by the organized charities to put through a bill that will prevent any mother of dependent children getting one cent of pension money until all their own salaries and expenses are paid. On their plan they can push their salaries and expenses as high as they please.

The Organized Charities are highly unified. They have a central authority in New York City and paid agents in every large city in the United States. They will have expert lobbyists in the legislature of every state. They are already planning to put a

mothers' pension bill through in every state. . . .

What would the pensioned mothers get if such a law as that should prevail in your legislature? The average of every dollar contributed and collected by law would not exceed thirty cents. Under the Illinois Mothers' Pension Law, the pensioned mother gets one hundred cents out of every dollar, and that is the kind of a law I would like to have adopted by your state.

I intend to do all I can to prevent organized charities from putting through a law in any state that will capitalize poverty in their favor, or give them a vested interest in the needs of the poor. . . . My statement in reference to organized charities applies to societies that are dominated by the charity trust's central office in New York city.

Exactly the same statement, except the substitution of another state for Wisconsin, was published in the *St. Paul News* on December 11, 1912; in the *Philadelphia Telegraph* on November 15, 1912; and in the *Evansville (Ind.) Press* on November 12, 1912.

His claim that "under the Illinois Mothers' Pension Law the pensioned mother gets one hundred cents out of every dollar," should be read with this abatement: There are thirteen probation officers of the Juvenile Court who are devoting all their time to investigating and supervising pension cases, each officer receiving \$87.50 per month from the county, and the supervisor \$100 per month. To the expense account must also be charged so much of the salaries of clerks, stenographers, the chief probation officer, the assistant chief and the judge as is proportionate to this part of their much increased work. The county agent's officers who re-investigate the pension cases before they are heard by the judge are also paid \$100 per month.

He charges that the organized charities oppose or obstruct or seek to substitute themselves for the authority and officials of the court. The facts are exactly the contrary in Cook County under the operation of the Illinois law. The facts are that the judge himself sought the most experienced representatives of the very organizations which Mr. Neil denounces as part and parcel of the "charity trust," to aid the court and its officials by their investigations and counsel in the extremely delicate work of administering this "fund for parents." Perhaps the cost of the time which these experienced specialists expend in the public service, which is paid by the voluntary agencies they serve, should also be added to the other expenses of administering the act, of which Mr. Neil has failed to take account. In his address at the Cleveland session of the National Conference of

Charities and Correction, Judge Pinckney of the Juvenile Court publicly attested the value of the aid rendered by this advisory committee, and declared emphatically that the ordinary machinery of the court could not handle the situation alone.

With respect to the Illinois law itself, which Mr. Neil would "like to have adopted," in other states, the facts are that those who have to do with its operation, including Judge Pinckney, recognize the need of amending its broad provisions which are almost entirely without safeguards. The finance committee of the Board of County Commissioners of Cook County, in considering the request to appropriate \$250,000 this year to pay these pensions, demur on the grounds stated by its newly elected president, Alexander A. McCormick, himself an experienced volunteer social worker: "The major portion of the county's money this year might have to go to pay these pensions. The hazard is one that would easily bankrupt the county with a bad judge in office."

The county agent, Joseph Meyer, regarded in Chicago as one of the most capable men who has ever filled that office, has this to say as to the need of more thorough investigation and larger appropriations therefor:

There are now 523 persons receiving this charity and a large waiting list. Since Judge Pinckney established the rule that a person must live here for a year before a pension is available, some charitable organizations have supported persons for twelve months until the county funds would become available.

Persons have come to Chicago from other states and after asserting that they are *bona fide* residents of Illinois gained entrance to the hospitals. We know of instances where women have had their husbands confined in the insane asylums at Kankakee and Dunning that they might draw these pensions. One woman whose husband was released from Dunning because he was perfectly sane, begged that he be kept there, as she received more from the county than she did through his work. Some persons who receive pensions are married for three or four months before we discover the fact and get the pension stopped.

At the present time the finance committee of the county board, while considering Judge Pinckney's request for twenty-five additional investigators, are contemplating the recommendation to the judge to transfer the investigation of all applicants for pensions to the county agent's office.

Judge Ben B. Lindsey, whose name has hitherto appeared as vice-president of the league on its certificates of membership and letterheads, wrote Mr. Neil in December positively and explicitly resigning as such.

### THE REALITIES OF WORK

PAUL U. KELLOGG

Seldom has it been the good fortune of *THE SURVEY* to present two such sheaves of articles as those in this issue.

The emancipation series gathered by Miss Addams needs no foreword other than her challenge to a living faith in political democracy. Fifty years ago the feet of the young men of the country sprang to that call.

Those who re-read, in these anniversary years, Lincoln's first inaugural address cannot fail to mark the dependence he placed on self-employing, self-sufficient folk as the underpinnings of our civic life. Well may we consider whether in the economic field the present strife, and the resulting cleavage in men's minds, is but the fret of self-government adjusting itself to the industrial changes of half a century. The Indianapolis trials, the pitting of a Hillquit against a Haywood, the garment strikes in New York, are tremendous texts for a people's conscience-searching. They test our powers of social conception; of meeting new times, not bookishly in the letter of the founders, but buoyantly, with their old idealism and fire, their power for invention.

Mr. Taylor tells of a steel center where collective bargaining persists, and where the eight-hour day is being substituted for the twelve.

Mr. Fitch, from his studies of the major industry, where the twelve-hour day governs and where collective bargaining has been crushed out, turns to that branch of the trade where union officials, backed by a strong membership and secure in the eight-hour day—but threatened with destruction by those same masters in the twelve-hour field—blew up bridge and building until vengeance, thus taken into their own hands, recoiled upon them and at Los Angeles killed their fellow workers.

Miss Sumner tells of the new unionism which makes no bargains, sets going the gongs of revolution and preaches reprisals. Years hence we may come to compare sabotage with the thievery practiced by those gentle Quakers, who ran the stations on the underground railway. Or we may find that, all but unknown to the average citizen, the political Socialists who set their faces against it, have been the bulwark between civilization and a bottomless mire.

And finally, Mr. Cohen tells how, using protocols like caissons, a structure of order and health is being built up out of the sheer industrial anarchy of the garment trades. Here, un-

der the new regime, 1,200 employers and 70,000 employes have found new uses for some of the features of collective bargaining held by the erectors to be most irritating. At their hands, the closed shop has become a preferential shop, a means for holding together in the discipline of production as great a body of men as ever responded to the war cry of a strike. The label becomes an instrument for holding all establishments up to standards set by the progressives of the trade. The walking delegate becomes a clerk of the board, with more power for order and good government than the silly sheriff of New York county. The strike itself becomes a health measure and is applied with the backing of manufacturers as well as men against the shop that violates the self-imposed laws of safety and sanitation.

Significance may lie not only in the differences but in the analogies of these industrial currents. The I. W. W., for example, preaches an industry wide open at the bottom, an industry organized as a whole, an industry working out its common salvation. The protocol plan, apparently at the other extreme, claims the same program for its own. The one is on a war footing; the other organic peace. That these movements, starting so wide apart should both press toward self-government and social control within each industrial group, gives the optimist hope that democracy will yet prove a solvent for the forces that threaten to rend it.

The articles serve their informing purpose in setting facts and views before *SURVEY* readers. Mr. Franklin's criticism calls for a special word. When the public mind closed like a trap following the McNamara confessions, social workers and economists had the courage not to be stampeded either by old bogies or new jingoes, and came forward with a constructive proposal. Perhaps this was another case of Ducky Daddles and Chicken Little calling "The skies are falling," but the picture does not seem to fit Louis Brandeis, nor Henry Moskowitz, nor William Jay Schieffelin nor Miss Wald nor others of their kind, who signed the petition to the president urging a federal inquiry into industrial relations.

It was because they doubted the adequacy of a point of view which satisfies itself in preachment and punishment, that they held that the criminal court is "not a sufficient instrument through which the democracy can address itself to the economic struggle." The Indianapolis trial has sustained this contention. Had it wiped out the last vestige of labor violence in the United States, the problem before the Commission on Industrial Relations would remain—the need for deeper soundings into causes, for a greater broaching of the realities of work than any we have yet had.

## "UNKNOWN WORKMAN, AGAINST THE SKY"

GRAHAM TAYLOR

*By a passing spectator*

*Hail, unknown workman, against the sky!  
Who are you, up there on the tall building?  
I cannot see your face, or look into your eyes.  
I pass by on the street far below and wonder who you are.  
One of many, are you, too, like me, the very center of the  
Universe?*

*Does the sun shine and the breeze blow, especially for you?  
Until now, I thought it was all for me.*

*Are you thinking thoughts of your own up there, as you  
lay the bricks and flick away the mortar from the  
edges with ringing trowel?*

*Have you a home, wife, children, whom you love?*

*Have you books, flowers, hobbies, for the leisure hours?*

*Is your heart full only of your own affairs—what business  
have you with affairs of which I know nothing?*

*Can it be that I am no more to you than you are to me—  
not so much indeed?*

*Nay, you have built a great building in which one day I  
may be sheltered.*

*You yourself are this moment good for my soul—am I any  
good for yours?*

*What have I ever done for you?*

*Hail, brother, look down in God's name and forgive my  
debt—*

*Unknown workman, far up there against the sky.*

*You yourself so much now to me, while I am still nothing  
at all to you.*

—JOHN PALMER GAVIT in *The Commons*, April 30, 1900.

Is it not time for us all to challenge ourselves with the inquiries which John Palmer Gavit put to himself when he passed by? It was a bricklayer "up there" then. Now it is an iron worker who stands out "against the sky" as we pass by.

"Who are you?" we may still ask, for most of us know him not. The trial of his union officials at Indianapolis has informed us about him. The public accepts the verdict of the jury upon the conduct and character of these convicted leaders after what seems to have been a fair trial. The judge, though apparently convinced of their guilt, was considerate enough not only to tell some of them that they might have had a better defense, but also to ask each one of them for any facts that had not been brought out which might mitigate their penalties.

But that iron worker up against the sky is still unknown. Who he is does not yet appear. The counsel for the National Erectors' Association seems to think that the rank-and-file of him might have shown themselves unlike their leaders had the elections in their unions as hitherto been held in September. He charges that the leaders postponed it until January, because they were afraid of failing to be re-elected and so losing the benefit of the union's funds in their defense. The way in which that unknown iron worker came down with the cash to bail these imprisoned leaders out while their appeal was pending, shows somewhat of the man he is. It does not necessarily prove him to be a dynamiter himself, or that he justifies the use of dynamite in his behalf. But it does show him to be loyal to his officials while under fire.

It must be remembered also that these leaders, however desperately wrong they were, had everything to risk and little if anything to gain for themselves by going to this criminal length.

And one who has talked with them all since their conviction reports them as "really believing in dynamite as a means of grace." This certainly removes them from the category of ordinary criminals. Judge Anderson himself said from the bench before sentencing them: "This system of destruction was not carried on for revenge, or in obedience to any other human passion, but was for the deliberate purpose, by a veritable reign of terror, to enforce compliance with the demands of the iron workers upon the open and closed shop question."

That seems to put them in the category of fanatics, who resorted to criminal violence, not for personal ends but to serve what they would call their cause. This does not extenuate their guilt of a crime which involved utter indifference to the destruction of life as well as property. But it does raise these questions: Who are they? Why do they think so? How did they come to the conclusion that this terrorism is the best, or perhaps the only way of serving that fellow workman up there, unknown to us, but not to them? What does this conviction of thirty-eight American citizens, voters in fourteen states, living in twenty-three cities, mean? Does the prompt and successful effort of their fellow workers to raise nearly \$1,000,000 to cover their bail bonds imply that they are men like these leaders? If so, why? Why, unknown workman.

"You yourself so much now to me, while I am still nothing at all to you."

That "why," which must be answered by something more than any court verdict, can be answered only by such wide, patient, and impartial inquiry as only a truly national and expert industrial commission can make. Thus only will we find out how the seven years' war between the iron workers' and the erectors' association, or its constituents, has led to such desperate lengths. Thus only may we be informed of the working conditions in that hazardous trade. Perhaps we may learn what the effects of this very hazard may be upon the spirit and temper of these workers "against the sky." Thus too, we may be reminded of the steady nerve, the cool head, the perpetual courage and the never ending risks of these unknown workmen, who dare to work "against the sky." Perhaps when we think of the great buildings they build, which we could not build if we would, and would not if we could, even to shelter ourselves, we may ourselves say, with Mr. Gavit, "You yourself are this moment good for my soul—am I any good for yours? What have I ever done for you?"

Some of us, if not all; the nation, if not any of us in particular, may even be led to call up to these brave builders,—and the more when they seem most misguided—

"Hail, brother, look down in God's name and forgive my  
debt—  
Unknown workman, far up there against the sky."

LINCOLN'S DOWN-RIVER TRIP AND THE SLAVE AUCTION

## LINCOLN HALL FOR THE HUMANITIES

There could be no more fitting commemoration of the centenary of Abraham Lincoln's birth and the half-century anniversary of his Emancipation Proclamation than the appropriation for and the erection of Lincoln Hall by the legislature of Lincoln's state at the University of Illinois. He is justly claimed to be one of the founders not only of that university, but of our state university system, for in 1862 he signed the federal land grant act, which made both possible. Years before he had committed himself to the promotion of a system of state universities founded on federal land grants.

The University of Illinois is the largest of the institutions which grew out of this first grant. It was by its charter purposed to apply the natural sciences to agriculture and the mechanic arts—then a new educational project in America. It was known at first, therefore, as "the Illinois Industrial University." But it soon began to outgrow its name by recovering its cultural balance. Emphasis and resources were steadily added to the teaching of the liberal arts.

This more scientific policy now rounds itself out by the dedication of Lincoln Hall to the Humanities. Lecture halls and seminar rooms, libraries and museums will amply equip each branch of these studies, which are grouped in this new \$250,000 building. Everywhere its memorial design is carried out. Across the outer walls are graven in terra-cotta scenes in Lincoln's life, from his rail-splitting and rafting to his debates with Douglas and his inauguration as president. Flanking these are inscriptions of his most memorable words, beginning with his protests against

slavery in 1854, and ending with his Gettysburg address, which faces his monument in the impressive entrance hall.

But the memorial is to Lincoln's times and compatriots as well as to him. Scattered about are medallion portraits of his great cabinet ministers, the leaders in the army and navy, Congress and the press, together with the greatest sons of Illinois who staunchly stood with Lincoln for the Union, alike at the front and at home.

The teachers in training for Illinois' 500 high schools, for its many more public schools and its scores of colleges; the long front rank of engineers, farmers, miners; the economists, officials and professional people who pass from their homes to their places in the working world through Lincoln Hall or the other departments of the great university, cannot fail to take the impression of the Lincoln spirit—thus reincarnated in art and architecture not only, but in the Humanities taught therein. Perhaps even the state legislators are "building better than they knew" in raising a shrine for patriotism to mark the fall of the bribery and exploitation among them which have shamed the state and the very name of Lincoln.

The dedication on the twelfth of February promises to be memorable in the history of the state, with such men as Bliss Perry of Harvard to speak on language and literature, Prof. Frederick J. E. Woodbridge of Columbia on philosophy, Albert Shaw on the social sciences and their importance to the commonwealth. Perhaps it may ring out to realization the keynote struck by President James in his inaugural, that Illinois needs and shall have a great "civic service university."

THE FAMOUS LINCOLN-DOUGLAS DEBATE

"Is it possible for a nation to endure half slave and half free?"

LINCOLN, SAVIOR OF THE SLAVE

## HAS THE EMANCIPATION ACT BEEN NULLIFIED BY NATIONAL INDIFFERENCE

JANE ADDAMS

**I**N his remarkable book *Democracy and Reaction* Leonard T. Hobhouse points out a far-reaching reaction in the temper of the times which has, during the last sixty years, gradually penetrated every department of thought and life. He illustrates this by the changed attitude towards slavery, which he asserts is partly traceable to want of concrete acquaintance with the thing itself. Our fathers and grandfathers were nearer to it as they were nearer to many other political abuses; the principles of reform to which they appealed had a very real meaning to them in their struggles, just as today personal liberty means more to a Russian than to an Englishman who has never been without it, and he concludes that "Many principles which they established we have let slip merely for want of imagination enough to realize what the denial of such principles would mean in practice."

Although our very prosperity and political tranquillity were achieved through the efforts of the previous generation of reformers, it is our mood to accept their work with a nod of recognition for its sacrifices but with no sense of obligation to carry on the strenuous task. Does our mood repeat that world-wide yielding to race antagonism, or does it partake of the growing self-assertion of the so-called "superior" races who exact labor and taxes from black and yellow men with the easy explanation of "manifest destiny?"

Scrutiny of reactionary developments are, of course, valuable only as they indicate possible ways of escape, otherwise they were best left untouched. But is it not possible at this fiftieth anniversary of the issuance of the Emancipation Proclamation, that most compelling and far-reaching document of democracy, to seriously test our national trend, using as a touchstone our attitude towards those whose freedom was achieved with such an expenditure of moral energy and devotion?

What have we done to bring to the status of full citizenship the people Lincoln's proclamation raised from the conditions of slavery, who were there-

LINCOLN AS CIRCUIT RIDER

by enabled at once to legitimize family life and to make contracts, but who inevitably looked forward to the civil and political rights implied in the great document? How far are we responsible that their civil rights are often rendered futile, their political action curtailed, their equality before the law denied in fact, industrial opportunities withheld from them and, above all, that for twenty-five years they have been exposed to the black horrors of lynching? How far has the act of the great emancipator been nullified by our national indifference?

It would be difficult to state just when the tide of indifference set in but certainly we would all admit that the attitude both in the North and South towards colored men has been responsible for strange inhibitions and limitations operating on the spirits of the entire white population. If we would carefully study the souls of white folks to discover the cause of this spiritual bondage, it would not be difficult to find in the South a loyalty to a lost cause, to those who died in its behalf and to those who surviving suffered and dedicated all to it; the necessity for admitting that those who thus died or suffered might appear to be in the wrong, in itself tends to confuse the issue whenever the Negro demands political equality.

Memories of a caste relationship which permitted great intimacy but perpetuated differences in opportunity, blind whole communities to the inconsistencies practised in many parts of the South today. Whenever southern men thoughtlessly brand every black man as a menace to the virtue of white women, they forget the loyal protection given by black men to white women and children during the war while they, the white men, were striving to perpetuate a system involving the continuance of Negro slavery. Conditions of the shameful carpet-bagger and the corrupt political practices after the war are still used by the young South to justify a similar system of political corruption and oppression toward those whom the northerner so unwisely befriended. These, among other things, account for the treatment of the blacks by the white South when education, economic opportunity, civil rights, personal justice and political capacity are in practice often successfully, and apparently conscientiously, denied to the Negro.

But what of the white North, which ignoring the glory of its inheritance, careless of the principles for which the war was fought at such terrible cost, submits to the chains forged, not by the southerner as is often asserted, but by its own indifference. The consequence of such bondage upon the life of the nation can be formulated only when we have a wider and more exact knowledge. What has been and is being lost by the denial of opportunity and of free expression on the part of the Negro, it is now very difficult to estimate; only faint suggestions of the waste can be perceived. There is, without doubt, the sense of humor, unique and spontaneous, so different from the wit of the Yankee, or the inimitable story telling prized in the South; the Negro melodies which are the only American folk-songs; the persistent love of color expressing itself in the bright curtains and window boxes in the dullest and grayest parts of our cities; the executive and organizing capacity so often exhibited by the head waiter in a huge hotel or by the colored woman who administers a complicated household; the gift of eloquence, the mellowed voice, the use of rhythm and onomatopoeia which is now so often travestied in a grotesque use of long words.

Much more could be added to the list of positive losses suffered by the community which puts so many of its own members "behind the veil." It means an enormous loss of capacity to the nation when great ranges of human life are hedged about with antagonism. We forget that whatever is spontaneous in a people, in an individual, a class or a nation, is always a source of life, a well-spring of refreshment to a jaded civilization. To continually suspect, suppress and to fear any large group in a community must finally result in a loss of enthusiasm for that type of government which gives free play to the self-determination of a majority of its citizens. Must we admit that the old abolitionist arguments now seem flat and stale, that, because we are no longer stirred to remove fetters, to prevent cruelty, to lead the humblest to the banquet of civilization, therefore we are ready to eliminate the conception of right and wrong from political affairs and to substitute the base doctrine of "political necessity and reasons of state?"

# THE STATUS AND VOCATION OF OUR COLORED PEOPLE

GEORGE BURMAN FOSTER

PROFESSOR OF THE PHILOSOPHY OF RELIGION, UNIVERSITY OF CHICAGO

**G**O back a little. Time was when the ideal of man was the angel: fatherland-less, family-less, vocation-less, aye, body-less. The earth was evil, and man's true home was elsewhere. Verities and values were elsewhere. So the Mother Church of the olden days taught. But this view passed; for our purpose, it does not matter how or why.

Next, the ideal of man was not an angel from heaven, but the great man of classic Greece and Rome—the heaven of humanism. In the former case, to become an angel one must be subject to the church; in the latter, one must go to school—to the supermen of classic days. Those supermen were free, but only by subjecting others to themselves. As, in the former case, candidates for angelhood were an upper class by themselves, so humanism declared a breach between men: on the one side, the few and elect; on the other, the many, the second-class folk.

In the middle age faith made the difference between the saved and the damned; in humanism, culture, science, art, built the wall between man and man. The new, raw, wild Anglo-Saxon folk were to appropriate the strange foreign culture of far-off Hellas and Rome, of Homer, of Aristotle, Plato, Cicero, Seneca, instead of the Bible and the church fathers that were likewise alien to their genius. This is why the survivals of the humanists still among us think that you must know Greek and Latin before you have a right to express a judgment upon the decisive questions of human life, upon truth and beauty and goodness. But, for the most part, humanism has passed, too.

Then came the rationalistic eighteenth century, with its new ideal of humanity. This was not a learned but a practical affair. It was an effort to discern the human, no longer in the ancient Greek and Roman, and in the copies thereof alone, but in all men; no longer in noble, but in citizen; no longer in master, but in slave; yes, in black Negro slave, who, according to humanist proof, did not belong to man and had no soul; who, according to the candidates for angelic honors, were under the curse of Ham, and divinely destined to eternal slavery to the saints.

This age of humanity propounded the query once again: What is man? The best sons of

this age of enlightenment agreed that man was something noble and great and lofty; that his greatness did not depend upon the folk he belonged to, the faith he confessed; that in all nations and confessions he is to be found; that no color and no race can rob him of his human right; that no foredoom to slavery could deprive him of his right to be man. These new apostles of humanity had not simply the ancient classic folk, but the world, as their school; and precisely the world of their own day began to burst the bonds that bound it to the past, that it might live a life in the present; it eavesdropped the sound that floated over to it from strange lands and men, and found therein the basic tones of its own seeking, struggling human spirit.

But, for all that, there was something wrong with that eighteenth century ideal of humanity. It had its limitations. This man of "humanity" was something vague, indefinite, something universal. The living, concrete, real, specific man, member of a given people, speaker of a given language, dweller in a given land, this empirical man still suffered abbreviation. You have heard of the old monk who was so enamored with the universal, and not the concrete and particular or the actual, that he said he would no longer eat apples and peaches and pears, and the like, but just fruit! If the human quality in all men is the rational, as these rationalists declared, their reason must not be pitched too high, for there are so many men with reason so embryonic and undeveloped. Even the weak and scanty traces of the human in the feathered folk and wild, and in the black folk, are still human.

This was an epoch making confession. Instead of the angel like saint of the church, instead of the classic Greek and Roman of the humanist, instead of the abstract and lofty "humanity" of the rationalists, instead of any of these which were once idealized as models of the really human, we now have romanticism celebrating and glorifying the Negro and the Indian, nature-men and nature-people, as the true types of man. Therefore, the century of "humanity" was transcended and antiquated. And the new insight which is exhilarating all of us today was born.

That is, the next answer to the question, What is man? is the one which we now see that we

must give. Man is not until he becomes; we are not men; our vocation is to become men. Man is not angelic or classic; man is not the Great Concept, he is the Great Toiler. He is task, achievement.

This grave and stirring thought falls in line with creative evolution and creative democracy and creative personality. The angelic man was a gift, the classic man was a gift, the conceptual man was an easy, intellectual, and not an emotional and practical, product. Even nature-man is a gift; but culture-man is a task. This means the forming and ordering, the development of the inchoate into organic life, personal and social. This means the humanization of all animal impulses and passions, the ennoblement of all that is rude and vulgar, the culture of all that is crude and wild and raw. To be man is not to possess by donation the alien goods of thought, but to develop from within a function of thinking of one's own. So for beauty, for truth, for goodness, for faith; so for all values and verities, of every kind, social and personal. All this the human race has had to achieve by the sweat of its brow as it tilled life's thorny field, all this is no easy gift from without, but an evolution and creation from within. There is no gift that is not at the same time a task. Has the organism an eye? It grows it. Has it a conscience, an ideal—aye, a government, a law, an industry, a home, a school, a church, in a word, culture or civilization? It grows or creates or achieves that, too.

In these days we gratefully and hopefully speak of fifty years of the emancipation of the Negro. But we know that, while that first outer emancipation cost others blood and tears as slavery was shot to death by the million guns of the republic, it was mostly a gift to the Negro. The next emancipation is inner emancipation, and this he must achieve for himself. He must earn and create the true values for himself.

"There's no defeat in life save from within; Unless you're beaten there, you're bound to win."

But, right as the poet is, we know that the "within" needs a "without." And so we are glad for Booker T. Washington's point of view. Outer possessions, and the outer work and training and equipment for such work—that is a great desideratum, not simply as pre-condition, but as process and production of the inner world. While the moral ability to be poor is better than to be just rich, yet the merits of poverty have been much overestimated. Let the Negro among us keep on at the acquisition of material goods—it comes first in the order of time—and the virtues of industry and frugality and sound judgment and self-control will con-

stantly increase. And these are firm basis for the inner world.

What will that inner world of the Negro turn out to be? The Orient gave us religion; Greece, art and philosophy; Rome, law and equity; the Anglo-Saxon, science and democracy. What will be the distinctive contribution of the Negro race? Perhaps he is too new in the making for us to say. I think it will be a marvelous combination of realism and idealism, of verity and vision, of earth and sky. But especially will he soften and lighten our harsh and gloomy Anglo-Saxon nature and life, warm our cold intellectualism, water our emotional aridity with the poetry and art and song and oratory of his distinctive genius. His sensuousness, in the good sense of that word, will supplement and rectify our spirituality, which is not always a good condition. Flesh helps soul, not less than soul, flesh. We must not forget that the flesh can sin against the spirit as well as the spirit against the flesh. I believe that the Negro is going to contribute much to the solution of the difficult problem of the ideal relation between sensuousness and spirituality.

And our attitude toward him? In the spirit of human brotherhood, and by so much as we have arrived, it is our duty not to block or impede his arriving, but to co-operate with him in his self-achievement and self-consummation. Since he is human, too, we are members one of another; and no man liveth to himself and no man dieth to himself. In the long run and in the main we cannot be up if he is down, we cannot be cultured if he is barbarous, we cannot be healthy if he is diseased, nay, we cannot be good if he is bad. Besides, let our experience of how hard and long a task it is to achieve values, of how poor and cheap and tawdry much of our ideal goods are, of how frail and faulty we have ever been, make us patient and charitable with these new and inexperienced toilers at the ideal formation of our African humanity.

Above all, we should take pains to see that we closed no door of opportunity in any direction to them. How unbrotherly, how derogatory and paralyzing to the Negro's ability and possibility it is to restrict his opportunity to the drudgery and humdrum of the menial and the mediocre! Mopping floors, cleaning streets and sewers, washing dishes in restaurants, and the like—the arbitrary limitation of the Negro's opportunity to these tasks is unnecessary and unbrotherly on the part of our industrial and social life. Make it a point to give the Negro a chance at the vocations which require mental and moral ability and training, and our business men will see that the opposition of white laborers will not be serious and that the Negro will not be found wanting.

The life of the Negro is now in the making; he must make it himself; but not alone; we must work with him, he with us, and both with that God and Father of all men who is no respecter of persons. Like Him, we must have faith in man, in all men, in the black man; and faith is not absorption in the past, nor acquiescence in the present, nor cynicism toward the future which says we are such that the good thing can-

not be done, nor pessimism toward the future which says that the world is such that the good thing cannot be done. No, faith is the venturesomeness of moral knighthood, the response of the will to a vision, the identification of the will with an ideal. Faith is directed to the uncertain, indeed, but with the purpose of making the uncertain certain. It is ours to have this true faith in the future and fortune of our freedmen.

## THE BASIS OF RACE ADJUSTMENT

GEORGE EDMUND HAYNES

PROFESSOR OF SOCIAL SCIENCE, FISK UNIVERSITY; DIRECTOR NATIONAL LEAGUE ON URBAN CONDITIONS AMONG NEGROES

IT is an axiom that justice is the basis of social order. It follows that it must be at the foundation in the adjustment of relations between nationalities and races. This idea of justice is broader than political rights or than civic privileges, for it includes economic and social justice. It means that every individual should have an opportunity for physical, mental and moral development to the limit of his capacity. It waives the question of superiority and inferiority of individuals or races and vouchsafes to all the chance for self-realization. It means equal opportunity.

In the Negro's relation to the white people of America permanent progress can be made only by the increase of this type of justice. Equal chance for the Negro to get work, to hold work, to develop his capacity for work; equal protection of life and property; equal opportunity to educate his children to the limit of their varied capacity and to provide such a home for his family as his taste dictates and his purse allows; equal opportunity in sharing political responsibilities and of responding to the duties of citizenship, conditioned by character only, are fundamental conditions without which permanent adjustment cannot be made.

Another factor, which must grow stronger, is mutual confidence and sympathy between black and white citizens. Alfred H. Stone in his *Studies in the American Race Problem* points out the apprehension of white people about the Negro which grows out of "the association of ideas" of past experiences, especially during the reconstruction period. Although probably not arising from the same experience, there is apprehension in the Negro mind due to "association of ideas" which colors his view of the present attitude of white people toward him. To bring about amicable adjustment this apprehension of both races must be displaced by a mutual trust, which will expect only help the one from the other in their efforts for self-realization.

For centuries the Negro has been habitually sympathetic and unresentful. Prof. John W. Work of Fisk University, who for twenty years has gathered, set to score, studied and sung the Negro folk songs, says that in the nearly 500 he has collected not a rhythm or sentence of hatred, malice or revenge has been found. Probably every other passion of the human heart has been expressed in these songs. Most of these compositions are the sorrow songs of slavery. If this could come out of Egypt, nothing is improbable in the promised land of mutual sympathy between manly men.

Justice, confidence and sympathy must find community expression in co-operation. Competition, which tends to eliminate the weak, is not more fundamental than co-operation, which calls upon the strong to help the weak to attain strength. In fact, such just and sympathetic consideration is the purchase price exacted of the strength of the strong. But the Negro has valuable elements of strength to offer to American civilization. Music in the soul, meekness of spirit and wonder at the mysterious world are inner qualities of strength, though not reckoned by birth and banks and battleships.

In art, in literature, in music, in oratory, in education, in reform, in industry and in business, co-operation will bring rich rewards to both races.

But ideal principles must have practical application to foster adjustment between the two peoples in America. A long stride toward securing economic justice can be made by the labor unions extending a welcome to the Negro. Their interests are bound up with the industrial freedom of the Negro today as surely as the welfare of the free workingmen before the war was affected by slave labor. Civic justice will gain great headway when the Negro shares in its administration according to his capacity. A police force and judiciary in which he can have

no part, regardless of his attainments, produce lukewarm loyalty; and political life from which color alone excludes him ties a millstone about the neck of democracy.

Newspapers are probably the greatest single agency for dispelling apprehension and developing mutual confidence. The periodicals and magazines come in for their share of influence. If in some way both the white and Negro papers could be induced to present the good qualities, attitudes and actions, past and present, of the races toward each other, the wisest prophet could not predict the impulse to progress which would follow.

When the more thoughtful elements of the white people and the Negroes in each community begin to confer together about their common problems, substantial advancement will have been made in race adjustment. Each community with a Negro population needs a conscious plan and program. The two races must map them out together if success is to follow.

Justice, equal opportunity, mutual confidence, sympathy and co-operation in developing the weak by the aid of the strong should bring us nearer to complete race adjustment during the next half-century than that to which we have attained at this jubilee year of emancipation.

## SOCIAL EFFECTS OF EMANCIPATION

W. E. BURGHARDT Du BOIS

EDITOR THE CRISIS

**I**N endeavoring to sum up the results of emancipating the Negro slaves in the United States fifty years ago, it will be natural to note the material and educational advances the colored people have made; the evidences of group consciousness among them; their present legal and political status and the outlook for social reform.

In 1863 there were about 5,000,000 persons of Negro descent in the United States. Of these 4,000,000 and more were just being released from slavery. These slaves could be bought and sold, could move from place to place only with permission, were forbidden to learn to read or write, legally could never hold property or marry. Ninety per cent were totally illiterate and only one adult in six was a nominal Christian. Until 1863 the total slave population had been steadily increasing, and the South was passing laws to enslave free Negroes. The three-quarters of a million free Negroes had been equally divided between the North and the South. Those in the South were a wretched, broken-spirited lot for the most part and slaves in all but name. Here and there in cities there were a few among them who were prosperous mechanics and property holders to a small extent.

The 250,000 Negroes of the North were the leaven and had been making for nearly a century a struggle for survival. They aided in the anti-slavery movement, had a few newspapers, and had produced leaders like Frederick Douglass and Harriet Tubman. They had planned and carried through a systematic migration to Canada where several prosperous settlements sprang up. They started schools in a number of cities and founded the catering business in Philadelphia. They had held several general conventions ap-

pealing for justice. For the most part these appeals fell on deaf ears, although Garrison, Sumner, Phillips, Harriet Beecher Stowe and John Brown had come to their aid.

Nevertheless, up to the time of the opening of the war, the Negroes in the North were forced to live in the worst slums and alleys, were either excluded entirely from the public schools or furnished cheap and poor substitutes, and in 300 years only twenty colored men had received a college education. Except in parts of New England and partially in New York, the Negro was disfranchised and largely without civil rights. Indeed, the Fugitive Slave Law of 1850 made personal freedom difficult, and in 1857 the Supreme Court had declared that Negroes were not citizens, and that they had always been considered as having "no rights which the white man was bound to respect."

Then came the war, which was not started with the idea of liberating the slaves, but which soon showed the North that freedom for the Negro was not only a logical conclusion of the war, but the only possible physical conclusion. Two hundred thousand black men were drafted in the army and the whole slave support to the Confederacy was threatened with withdrawal. Insurrection was in the air and the emancipation of the slaves was needed to save the Union. Such, then, was the situation in 1863.

Fifty years later, in 1913, there are in the United States 10,250,000 persons of Negro descent, an increase of 105 per cent. Legal slavery has been abolished, leaving, however, vestiges in debt peonage and the convict lease system. The freedmen and their sons have

"Earned a living as free men; shared the responsibilities of government; developed the in-

ternal organization of their race, and aspired to spiritual self-expression."

### *Economic Progress*

The Negro was freed as a penniless, landless, naked, ignorant laborer. Very few Negroes owned property in the South; a larger number owned property in the North; but 90 per cent of the race in the South were field hands, servants of the lowest class. Today 50 per cent are farm laborers and servants, and over one-half of these are working as efficient modern workmen under wage contract. Above these, to use the figures of 1900, there are 750,000 farmers, 70,000 teamsters, 55,000 railway hands, 36,000 miners, 33,000 sawmill employes, 28,000 porters, 21,000 teachers, 21,000 carpenters, 20,000 barbers, 20,000 nurses, 15,000 clergymen, 14,000 masons, 13,000 dressmakers and seamstresses, 10,000 engineers, and firemen, 2,500 physicians, and, above all, 200,000 mistresses of independent homes, and 2,000,000 children in school.

Fifty years ago the overwhelming mass of these people were not only penniless, but were themselves assessed as real estate. By 1875 the Negroes probably had gotten hold of something between 2,000,000 and 4,000,000 acres of land through their bounties as soldiers and the low price of land on account of the war. By 1910 this had increased to about 18,000,000 acres.

In 1890 Negroes owned 120,738 farms; in 1900 they owned 187,799; in 1910 they owned about 220,000. Thus, over 25 per cent of the Negro farmers owned their own farms, and the increase of farm owners between 1890 and 1910 has been over 83 per cent. The value of land and buildings owned by Negroes in the South was in 1910 \$272,992,238. This is an increase of nearly 90 per cent in a single decade. This does not include land owned by Negro farmers but rented out. On a basis of the value of farm property in 1900, a committee of the American Economic Association estimated the value of Negro wealth in the United States at \$300,000,000. On the same basis we can estimate the total Negro wealth today at \$570,000,000.

### *The Negro and Organization*

Today the Negro is a recognized part of the American government; he holds 9,000 offices in the executive service of the nation, besides furnishing four regiments in the army and a large number of sailors. In the state and municipal civil service he holds at least 10,000 other offices, and he furnishes 500,000 of the votes which rule the Union.

In these same years the Negro has relearned the lost art of organization. Slavery was the absolute denial of initiative and responsibility. Today Negroes have 35,000 church edifices, worth

\$56,000,000, and controlling nearly 4,000,000 members. They raise themselves \$7,500,000 a year for these churches.

There are 200 private schools and colleges managed and almost entirely supported by Negroes, and other public and private Negro schools have received in forty years \$45,000,000 of Negro money in taxes and donations. Five millions a year are raised by Negro secret and beneficial societies, which hold at least \$6,000,000 in real estate.

Above and beyond this material growth has gone the spiritual uplift of a great human race. From contempt and amusement they have passed to the pity and perplexity of their neighbors, while within their own souls they have arisen from apathy and timid complaint to open protest and more and more manly self-assertion. Where nine-tenths of them could not read or write in 1859, today two-thirds can; they have 200 papers and periodicals, and their voice and expression are compelling attention.

Already the poems of Dunbar and Braithwaite, the essays of Miller and Grimke, the music of Rosamond Johnson and the painting of Tanner are the property of the nation and the world. Instead of being led and defended by others, as in the past, they are gaining their own leaders, their own voices, their own ideals. Self-realization is thus coming slowly but surely to another of the world's great races, and Negroes are today girding themselves to fight in the van of progress, not simply for their own rights as men, but for the ideals of the greater world in which they live—the emancipation of women, universal peace, democratic government, the socialization of wealth, and human brotherhood.

This, then, is the transformation of the Negro in America in fifty years; from slavery to freedom, from 5,000,000 to 10,250,000, from denial of citizenship to enfranchisement, from being owned chattels to ownership of \$570,000,000 in property, from unorganized irresponsibility to organized group life, from being spoken for to speaking, from contemptuous forgetfulness on the part of their neighbors to uneasy fear and dawning respect, and from inarticulate complaint to self-expression and dawning consciousness of manhood.

### *Legal Disabilities*

Notwithstanding this creditable showing the present situation has dark and threatening aspects: First, we have in the United States the distinct growth of a caste system. It has been adjudged in many states a misdemeanor to call a white man a Negro; it has been adjudged in many states that a person having the slightest degree of Negro blood is a "Negro"; inter-marriage of Negroes and whites is prohibited in

twenty-six states even if the persons are living as man and wife; travel is interfered with by separating whites and Negroes in the South and it has been decided that Negroes do not have to be given absolutely "equal" accommodations; colored and white people are separated in the South on street cars, in waiting rooms, on many elevators, on steamboats, etc. In practice Negroes are liable to discrimination in hotels, restaurants, saloons, soda fountains, theaters, cemeteries, insane asylums and in the militia. This is forbidden by many northern states, but the law is difficult to enforce. Church organizations either refuse Negro members entirely, as in the case of most white churches of the South, or put them in an allied organization or in separate congregations. Separate school systems are compulsory in the South and allowed in a few northern cities, as Indianapolis.

In the courts, Negroes are not legally discriminated against, but an extra-legal system has arisen in the South, to a less extent in the border states and to some extent in the North, which tries and punishes the Negro criminal on an entirely different basis from the white criminal. The result is that the number of long-term Negro convicts is extraordinary. In the South it is unusual to send a white man to the penitentiary or to capital punishment, or to punish a white woman under any circumstances. The penitentiaries, therefore, are filled with Negroes, and are among the worst penal institutions in the world. They are, most of them, run for profit under the convict lease system. There are very few reformatories for colored children, and their conviction, therefore, means the manufacture of confirmed criminals. There is a widespread tendency, which shows no decided reduction, to murder by mob violence Negroes accused of crime. Since 1885, 2,584 such murders have taken place. Only 25 per cent of those lynched have been even accused of crimes against women, and in most of these accusations the offense alleged was not criminal.

Since 1890 five and a half million Negroes, over half of whom can read and write and who own fully \$300,000,000 worth of property, have been practically deprived of all voice in their own government. The restrictions by which this has been accomplished are eight in number: 1. Illiteracy: the voter must be able to read and write. 2. Property: the voter must own a certain amount of property. 3. Poll tax: the voter must have paid his poll tax for the present year or for a series of years. 4. Employment: the voter must have regular employment. 5. Army service: soldiers in the Civil War and certain other wars, or their descendants, may vote. 6. Reputation: persons of good reputation who understand the duties of a citizen may vote. 7. "Grandfather" clause: persons who could vote before the

freedmen were enfranchised or descendants of such persons may vote. 8. Understanding clause: persons may vote who understand some selected clause of the constitution and can explain it to the satisfaction of the registration officials.

If these laws were impartially administered the result would be bad enough; but they are deliberately, openly and avowedly administered so as to admit any white man, however ignorant, to the polls and to exclude any colored man however intelligent.

To illustrate the immediate effect of these disfranchising laws, the following statistical tables are given:

#### LOUISIANA

		White	Negro
1900	Population .....	729,612	650,804
1900	Males 21 years or over.....	178,595	147,348
	Literate .....	146,219	57,086
	Illiterate .....	32,376	90,262
1908	Registered voters.....	152,135	1,743

#### LOWNDES COUNTY, ALABAMA

		White	Negro
1900	Males 21 years or over.....	1,138	6,455
	Illiterate .....	81	4,607
	Literate .....	1,057	1,788
1902	Registered voters.....	1,097	39
1906	" " .....	1,142	52

Under a strict educational qualification the literate Negroes of Lowndes county could outvote all the whites, literate and illiterate, yet only fifty-two are given the franchise!

#### *Social Reform and Educational Opportunities*

The result of all this has been to retard public education and social reform among colored people except that which can be carried on in private institutions or by voluntary taxation.

In the North they share somewhat in the general results of social reform work. There is, however, in this field a great deal of discrimination. Social settlements often exclude them—the "Lincoln" settlement, for instance, in Boston; fresh air funds sometimes make no provision for them; day nurseries discriminate; and even where they are not actually discriminated against, they are not made to feel welcome. On the other hand, they have their full share, heaped up and running over, of all the disabilities due to city congestion and municipal misrule. So too they are common sufferers with the rest of the South, in the general backwardness of the southern states in education, in public health regulation, in inadequate provision for the insane, the feeble-minded and the delinquent. They are sufferers without the power to vote for change.

The colored people through their women's clubs are bearing almost the whole burden of their own internal social reform. They have one hundred old folks' homes and orphanages, about 40 hospitals (some of which have partial public sup-

port), at least 500 private cemeteries, and a large number of charitable organizations of various kinds.

Not only has the general enrollment and attendance of Negro children in the rural schools of the lower South and to a large extent of the city schools been at a standstill in the last ten years and in many cases actually decreased but many of the school authorities have shown by their acts and in a few cases expressed declaration that it was their policy to eliminate the Negro schools as far as possible.

There is a distinct endeavor to curtail the facilities of education which the Negroes already possess. This can be seen in the persistent campaigns carried on in the North and directed toward the North which say in effect, that the Negroes' education as carried on by northern philanthropists has been a mistake, that it is an interference with the local conditions in the South, and that the stream of benevolence ought to be stopped. There is no doubt but that this argument has had tremendous influence upon the benevolent public.

Again, there has been a continual effort to curtail Negro education by reducing the number of grades in the Negro public schools. Macon and Augusta, Ga., and New Orleans, La., are typical in this connection. The lack of public high schools for Negroes is one of the greatest drawbacks of the southern school system.

At the same time the Negroes are helping to pay for the education of the whites, in the sense that public monies which Negroes pay in indirect taxation or which are endowments from past generations are diverted entirely to white schools. A southern city school superintendent gives this table:

	VIRGINIA 1907	N. CAROLINA 1908	GEORGIA 1907
Total cost of schools . . . .	\$3,308,086.00..	\$2,958,160.00..	\$2,850,211.00
Cost of Negro schools . . . . .	489,228.00....	402,658.00....	506,170.00
Per cent. of total cost going to Negro schools . . . . .	14.7.....	13.6.....	17.7
Per cent. of Negroes in population . . . . .	35.7.....	33.3.....	46.7
Negroes proportion of direct and indirect taxation and of endowments . . . .	\$507,305.00...	\$429,197.00...	\$647,852.54

On the whole, then, it may be said that the efforts of the Negroes since emancipation have been very promising and beyond what could be reasonably expected; that, on the other hand, the caste system which attempts to exclude Negroes from the benefit of the general social and political organization of a great modern state is strong and growing both North and South, and is not only a hindrance to Negro-Americans but a serious menace to American democracy.

OUR COUNTRY'S LYNCHING RECORD

IDA B. WELLS-BARNETT

CHICAGO ASSOCIATION FOR ADVANCEMENT OF COLORED PEOPLE;  
PRESIDENT NEGRO FELLOWSHIP LEAGUE

THE closing month of the year 1912 witnessed an incident which probably could not happen in any other civilized country. The governor of one of the oldest states of the Union in an address before the Conference of Governors defended the practice of lynching, and declared that he would willingly lead a mob to lynch a Negro who had assaulted a white woman. Twenty years ago, another governor of the same state not only made a similar statement, but while he was in office actually delivered to a mob a Negro who had merely been charged with this offense—it was unproven—and who had taken refuge with the governor for protection.

It is gratifying to know that the governors' meeting formally condemned these expressions, and that a leading Georgia citizen has undertaken to refute the sentiment expressed by Governor Blease. However, while no other official has thus officially encouraged this form of lawlessness, yet, because of the widespread ac-

quiescence in the practice, many governors have refused to deal sternly with the leaders of mobs or to enforce the law against lynchers.

To the civilized world, which has demanded an explanation as to why human beings have been put to death in this lawless fashion, the excuse given has been the same as that voiced by Governor Blease a short month ago. Yet statistics show that in none of the thirty years of lynching has more than one-fourth of the persons hung, shot and burned to death, been even charged with this crime. During 1912, sixty-five persons were lynched.

Up to November 15 the distribution among the states was as follows:

Alabama . . . . .	5	Oregon . . . . .	1
Arkansas . . . . .	3	Oklahoma . . . . .	1
Florida . . . . .	3	South Carolina . . . . .	5
Georgia . . . . .	11	Tennessee . . . . .	5
Louisiana . . . . .	4	Texas . . . . .	3
Mississippi . . . . .	5	Virginia . . . . .	1
Montana . . . . .	1	West Virginia . . . . .	1
North Carolina . . . . .	1	Wyoming . . . . .	1
North Dakota . . . . .	1		

Fifty of these were Negroes; three were Negro women. They were charged with these offenses:

Murder .....	26	Insults to white women .....	3
Rape .....	10	Attempted rape .....	2
Murderous assault .....	2	Assault and robbery .....	1
Complicity in murder .....	3	Race prejudice .....	1
Arson .....	3	No cause assigned .....	1

Because the Negro has so little chance to be heard in his own defense and because those who have participated in the lynching have written most of the stories about them, the civilized world has accepted almost without question the excuse offered.

From this table it appears that less than a sixth of these persons were lynched because the mob believed them to be guilty of assaulting white women. In some cases the causes have been trivial. And it appears that the northern states have permitted this lawless practice to develop and the lives of hapless victims to be taken with as much brutality, if not as frequently, as those of the South—witness, Springfield, Ill., a few years ago, and Coatesville, Pa., only last year.

The lynching mania, so far as it affects Negroes, began in the South immediately after the Emancipation Proclamation fifty years ago. It manifested itself through what was known as the Klu Klux Klan, armed bodies of masked men, who during the period between 1865 and 1875, killed Negroes who tried to exercise the political rights conferred on them by the United States until by such terrorism the South regained political control. The aftermath of such practices is displayed in the following table giving the number of Negroes lynched in each year since 1885:

1885 .....	184	1899 .....	107
1886 .....	138	1900 .....	115
1887 .....	122	1901 .....	135
1888 .....	142	1902 .....	98
1889 .....	176	1903 .....	104
1890 .....	127	1904 .....	87
1891 .....	192	1905 .....	86
1892 .....	235	1906 .....	60
1893 .....	200	1907 .....	63
1894 .....	190	1908 .....	100
1895 .....	171	1909 .....	87
1896 .....	131	1910 .....	74
1897 .....	106	1911 .....	71
1898 .....	127	1912 .....	64

With the South in control of its political machinery, the new excuse was made that lynchings were necessary to protect the honor of white womanhood. Although black men had taken such good care of the white women of the South during the four years their masters were fighting to keep them in slavery, this calumny was published broadcast. The world believed it was

necessary for white men in hundreds to lynch one defenseless Negro who had been accused of assaulting a white woman. In the thirty years in which lynching has been going on in the South, this falsehood has been universally accepted in all sections of our country, and has been offered by thousands as a reason why they do not speak out against these terrible outrages.

It is charged that a ceaseless propaganda has been going on in every northern state for years, with the result that not only is there no systematic denunciation of these horrible barbarisms, but northern cities and states have been known to follow the fashion of burning human beings alive. In no one thing is there more striking illustration of the North's surrender of its position on great moral ideas than in its lethargic attitude toward the lynching evil.

The belief is often expressed that if the North would stand as firmly for principle as the South does for prejudice, lynching and many other evils would be checked. It seems invariably true, however, that when principle and prejudice come into collision, principle retires and leaves prejudice the victor.

In the celebration of the fiftieth year of the Negro's freedom, does it seem too much to ask white civilization, Christianity and Democracy to be true to themselves on this as all other questions? They can not then be false to any man or race of men. Our democracy asserts that the people are fighting for the time when all men shall be brothers and the liberty of each shall be the concern of all. If this is true, the struggle is bound to take in the Negro. We cannot remain silent when the lives of men and women who are black are lawlessly taken, without imperiling the foundations of our government.

Civilization cannot burn human beings alive or justify others who do so; neither can it refuse a trial by jury for black men accused of crime, without making a mockery of the respect for law which is the safeguard of the liberties of white men. The nation cannot profess Christianity, which makes the golden rule its foundation stone, and continue to deny equal opportunity for life, liberty and the pursuit of happiness to the black race.

When our Christian and moral influences not only concede these principles theoretically but work for them practically, lynching will become a thing of the past, and no governor will again make a mockery of all the nation holds dear in the defense of lynching for any cause.

# THE COLOR LINE IN THE HOUSING PROBLEM

SOPHONISBA P. BRECKINRIDGE

DIRECTOR DEPARTMENT OF SOCIAL INVESTIGATION, CHICAGO SCHOOL OF CIVICS AND PHILANTHROPY  
ASSISTANT PROFESSOR OF SOCIAL ECONOMICS, UNIVERSITY OF CHICAGO

ONE of the many serious problems that now confront the Negro not only in southern communities but also in many a northern city is the difficulty he experiences in finding decent housing accommodations for his family. In the face of increasing manifestations of race prejudice, he has come to acquiesce silently, as various civil rights are withheld from him in the old "free North," which was once the Mecca of his race. He rarely protests, for example, at being excluded from restaurants and hotels or at being virtually refused entertainment at the theater or the opera. There are three points, however, which he cannot yield and in regard to which he should not be allowed to yield. He must claim a decent home for his family in a respectable neighborhood and at a reasonable rental, an equal chance of employment with the white man, and education for his children. We will consider here only the first of these three demands.

In a recent investigation of general housing conditions in Chicago,<sup>1</sup> the problem of the Negro was found to be quite different from that of immigrants. With the Negro, the housing dilemma was found to be an acute problem not only among the poor, as in the case of the Polish, the Jewish, or the Italian immigrant, but also among the well-to-do. The man who is poor as well as black must face the special evil of dilapidated insanitary dwellings and the lodger evil in its worst form. But for every man who is black, whether rich or poor, there is also the problem of extortionate rents and of dangerous proximity to segregated vice. The Negro is not only compelled to live in a segregated black district, but this region of Negro homes is almost invariably the one in which vice is tolerated by the police. That is, the segregation of the Negro quarter is only a segregation from respectable white people. The disreputable white element is forced upon him. It is probably not too much to say that no colored family can long escape the presence of disreputable or disorderly neighbors. Respectable and well-to-do Negroes may by subterfuge succeed in buying property in a decent neighborhood, but they are sure to be followed soon by those disreputable elements which are allowed to exist outside the so-called "levee" district.

In no other part of Chicago, not even in the Ghetto, was there found a whole neighborhood so conspicuously dilapidated as the black belt on

the South Side. No other group suffered so much from decaying buildings, leaking roofs, doors without hinges, broken windows, insanitary plumbing, rotting floors, and a general lack of repairs. In no other neighborhood were landlords so obdurate, so unwilling to make necessary improvements or to cancel leases so that tenants might seek better accommodations elsewhere. Of course, to go elsewhere was often impossible because nowhere is the prospective colored tenant or neighbor welcome. In the South Side black belt 74 per cent of the buildings were in a state of disrepair; in a more fortunate neighborhood, partly colored, only 65 per cent of the buildings were out of repair, but one-third were absolutely dilapidated.

Not only does the Negro suffer from this extreme dilapidation, but he pays a heavy cost in the form of high rent. A careful house-to-house canvass showed that in the most run down colored neighborhoods in the city, the rent for an ordinary four-room apartment was much higher than in any other section of the city. In crowded immigrant neighborhoods in different parts of the city, the median rental for the prevailing four-room apartment was between \$8 and \$8.50; in South Chicago near the steel mills it was between \$9 and \$9.50; and in the Jewish quarter, between \$10 and \$10.50 was charged. But in the great black belt of the South Side the sum exacted was between \$12 and \$12.50. That is, while half of the people in the Bohemian, Polish, and Lithuanian districts were paying less than \$8.50, for their four-room apartments; the steel-mill employes less than \$9.50, and the Jews in the Ghetto less than \$10.50, the Negro, in the midst of extreme dilapidation and crowded into the territory adjoining the segregated vice district, pays from \$12 to \$12.50. This is from \$2 to \$4 a month more than the immigrant is paying for an apartment of the same size in a better state of repair.

It seemed worth while to collect and to present the facts relating to housing conditions in the Negro districts of Chicago because one must hope that they would not be tolerated if the great mass of white people knew of their existence. Most people stand for fair play. The persecutions which the Negro endures because of race prejudice undoubtedly express the feeling of but a small minority of his fellow-citizens of the white race. Their continuance must be due to the fact that the great majority are completely ignorant of the heavy burden of injustice that the Negro carries. Ignorance is the bulwark of

<sup>1</sup>See *Housing Conditions in Chicago*, VI. *American Journal of Sociology*, Vol. XVIII, p. 241.

prejudice, and race prejudice is singularly dependent upon an ignorance which is, to be sure, sometimes willful but which more often is unintentional and accidental. It has come about, however, that the small minority who cherish their prejudices have had the power to make life increasingly hard for the black man. Today they not only refuse to sit in the same part of the theater with him and to let him enter a hotel which they patronize, but they also refuse to allow him to live on the same street with them or in the same neighborhood. Even in the North where the city administration does not recognize a black "ghetto" or "pale," the real estate agents who register and commercialize what they suppose to be a universal race prejudice are able to enforce one in practice. It is out of this minority persecution that the special Negro housing problem has developed.

But while it is true that the active persecution of the Negro is the work of a small minority, its dangerous results are rendered possible only by

the acquiescence of the great majority who want fair play. This prejudice can be made effective only because of the possible use of the city administration, and the knowledge that legal action intended to safeguard the rights of the Negro is both precarious and expensive. The police department, however, and the courts of justice are, in theory at least, the agents of the majority. It comes about therefore that while the great body of people desire justice, they not only become parties to gross injustice but must be held responsible for conditions demoralizing to the Negro and dangerous to the community as a whole.

Those friends of the Negro who have tried to understand the conditions of life as he faces them are very familiar with these facts. But it is hoped that those who have been ignorant of the heavy costs paid in decent family life for the ancient prejudice that persists among us, will refuse to acquiesce in its continuance when the facts are brought home to them.

## A CIVIC PROBLEM AND A SOCIAL DUTY

GEORGE PACKARD

MEMBER OF THE ILLINOIS BAR

**W**E are beyond the age when a subject of unpleasant but vital concern can be lightly dismissed. To satisfy the increasing demand for social justice, we must make a beginning, at least, of an attempt to solve it. That beginning should be made by discussing the problem freely and frankly.

The consideration of one subject that has been ignored by the intelligent far too long especially interests us at this time. The consequences of this neglect are a scandal to our civilization.

We have in our social system an evil born of iniquity, fattened upon base prejudice, and kept alive by a wilful disregard of the spirit of our constitution and fair play. Every day it is pressing more heavily upon the integrity of our national life. Its eradication is a task more overwhelming in its immensity than the mythical cleaning of the Augean stables.

"We hold these truths to be self-evident: that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty and the pursuit of happiness."

With these brave words written over the doorway of our republic, is it that we have failed to look up and read them with that "frequent recurrence to the fundamental principles of civil government," as so many state constitutions in-

struct us, or is it that we have, through familiarity, forgotten their significance?

Such a question must invariably arise in the mind of a European observer, when he sees our cities teeming with a race pathetically imitative of our social and political manners, but denied that vaunted liberty and pursuit of happiness we have blazoned above our doors. The searcher after truth is told that these people have black skins, and although they shade down to the almost white, mute witnesses of brutal sexual irregularity, the puzzled inquirer is informed that they are "niggers" with the tone with which one refers to outcast dogs. Our Declaration of Independence and our cherished Constitution preamble contain, of course, no color-test. With true universality these documents seem to extend their all-embracing arms to "all men."

Furthermore, the curious observer sees these black hands nursing our babies, cooking our food, bearing our burdens, tilling our soil, carrying our muskets, mingling in all the multiplex pursuits of our nation. But he also sees a respectable neighborhood thrown into a panic of lawless dread if a wealthy Negro either buys or rents a home to live in there. He sees the comforts of restaurants, hotels and sleeping cars barred to this class of citizens, although in every one, in all probability, people with black skins hold open the door to welcome the guests of

every race and color but their own, cook the food, serve the meals, make the beds, run the errands, and perform every kind of personal service.

The only reason for this strange state of affairs would seem to be that this black race was forcibly brought to this land of liberty, and held in slavery. It is the one element in our mongrel population that came here against its will. The condition of slavery, debasing alike the master and the servant, has left its trail of prejudice upon our social system. When the conscience of the nation was finally aroused and rid our country's vitals of this cancer, so far at least as the legal and political abolition of slavery could do it, there remained on this unfortunate race the social stigma. That persists from generation to generation.

It is to slavery, then, that we are to look for the source of the unreasoning race prejudice that reduces to the rankest absurdity our pretensions to the equality of man. As to the nation's state of mind before the war, let us look at the cool, unimpassioned pronouncements of the highest court of the nation, where at least the operations of logic and of law may be supposed to have chilled the fervor of the more intimate national feeling on the subject.

The Dred Scott decision (60 U. S., 475) marks one of the milestones of our national progress, as the revolt from the condition there announced and legally supported was swift and sure. This revolt was as colossal an example of recall of a judicial decision as the tablets of our history record. But even after this recall the festering sore remains unhealed and throbbing in our social life. By this decision, a slave from a slaveholding state, liberated and domiciled with his master in a free state, on return to the original state took on again the fetters of slavery. It is in the court's analysis of the institution of slavery that the interest and the import of the decision lie. Negroes of the African race, whether slave or free, were not to be regarded as members of the community within the meaning of the constitution. "They were not regarded as members of the community, were not numbered as people or citizens." Hence the special rights and immunities guaranteed did not apply to them. Therefore they could not sue in the courts of the United States. To make the African a citizen of a state could not make him a citizen of the United States.

At the time the constitution was adopted, which is the time at which to construe its import, says Chief Justice Taney, Negroes were considered "as a subordinate and inferior class of beings, who had been subjugated by the dominant race, and, whether emancipated or not, yet remained subject to their authority and had not rights or privileges but such as those who held the power and the government might choose to grant them."

The court then calls attention to the fact that

the English nation was far more extensively engaged in this commerce than any other nation of the world. The laws of the colonies show, as the court points out, "that a perpetual and impassible barrier was intended to be erected between the white race and the one which they had reduced to slavery and governed as subjects with absolute and despotic power, and which they then looked upon as so far below them in the scale of created beings that intermarriage between white persons and Negroes or mulattoes was regarded as unnatural and immoral and punished as crimes not only in the parties, but in the persons who joined them in marriage."

On p. 410 the chief justice then draws the conclusion:

"It is too clear for dispute that the enslaved African race were not intended to be included and formed no part of the people who framed and adopted this declaration; for if the language as understood in that day would embrace them, the conduct of the distinguished men who framed the Declaration of Independence would have been utterly and flagrantly inconsistent with the principles they asserted.

"The unhappy black race were separated from the white by indelible marks and laws long before established, and were never thought of or spoken of except as property, and when the claims of the owners or the profit of the trader were supposed to need protection.

"This state of public opinion had undergone no change when the constitution was adopted, as is equally evident from its provisions and language."

Chief Justice Taney then reviews many of the statutes of the original thirteen states, and says (p. 416):

"It is hardly consistent with the respect due to these states to suppose that they regarded at that time as fellow-citizens and members of the sovereignty a class of beings whom they had thus stigmatized; whom, as we are bound, out of respect to the state sovereignties, to assume they had deemed it just and necessary thus to stigmatize, and upon whom they had impressed such deep and enduring marks of inferiority and degradation; or that when they met in convention to form the constitution, they looked upon them as a portion of their constituents or designed to include them in the provisions so carefully inserted for the security and protection of the liberties and rights of their citizens."

It would be hard to find a more unintentionally scathing arraignment of our great national inconsistency than these words of our highest court in the Dred Scott case. Here was a nation bearing on its banners the motto of freedom and equality for all—yet at the same time it was buying and selling and working and criminalizing and beating something like four million men and women, degraded not by any act of their own, but by the arbitrary tyranny and brute

force of their masters. It would be futile to bewail, or regret or try to explain or justify the damnable existence of this blighting blot. *It was!* What we are vitally concerned with now is the hideous trail of injustice that even now scars our social life—as indelible and ineradicable as was slavery itself, apparently. *That* must be explained, *that* must be analyzed, *that* must be alleviated, unless we are to remain a pitiable laughing stock in our “lively experiment” in liberty.

Assuming that the fathers of liberty *did* ignore the Negro and exclude him both from the Declaration of Independence and the Constitution, yet the awakened conscience of the nation, once slavery was abolished, took such steps as it politically could to bring the unfortunate race back into the realm of human beings and make them a part of our national life. The thirteenth amendment prohibited slavery wherever the United States had jurisdiction, and gave Congress the power to enforce this sweeping mandate by appropriate legislation. The fourteenth amendment, “the greatest of all the amendments,” declared his citizenship in nation and state, prohibited the states from making and enforcing any law which shall abridge the privileges or immunities of United States citizens, or depriving any person of life, liberty or property, without due process of law, or denying to any person within their jurisdiction, the equal protection of the laws. And in 1870 the fifteenth amendment, recognizing the persistence of the slavery engendered prejudice against the race, directed that the right to vote should not be denied or abridged “on account of race, color or previous condition of servitude.”

The language of Justice Miller in the slaughter house cases (16 Wall, p. 71) is pertinent to these amendments in our political system:

“No one can fail to be impressed with the one pervading purpose found in them all, lying as the foundation of each, and without which none of them would have been even suggested; we mean the freedom of the slave race, the security and firm establishment of that freedom and the protection of the newly-made freeman and citizen from the oppressions of those who had formerly exercised unlimited dominion over him.”

Possibly—probably, I should say—the call for complete liberty was too strong. The prick of the aroused national conscience revealed only too plainly the glaring inconsistency between the fundamental constitutional principles and the flagrant practices for so many years; and nothing would do but a complete bestowal of complete political liberty to the victims of the nation’s shame. But unfortunately there was a complete oversight of the lasting effect of the awful social stigma that toleration of the iniquitous institution of slavery had engendered. That is the pith and marrow of the present intolerable condition.

Acting under the constitutional power of the thirteenth amendment, Congress with the, no

doubt, sincere purpose of ameliorating the social stigma, passed the Civil Rights Act. But the people, speaking later through the courts, again refused to consider this law in any other light than that of an announcement of political, and not of social, relief. In other words, it was permitted to mean nothing further or deeper than the thirteenth amendment meant. In *Robinson and wife vs. Memphis & Charleston Railroad Co.* (109 U. S. Reports, 3, at page 22), Justice Bradley sums up the situation in this way:

“The long existence of African slavery in this country gave us very distinct notions of what it was, and what were its necessary incidents. Compulsory service of the slave for the benefit of the master, restraint of his movements except by the master’s will, disability to hold property, to make contracts, to have a standing in court, to be a witness against a white person, and such like burdens and incapacities, were the inseparable incidents of the institution. . . . Congress, as we have seen, by the Civil Rights Bill of 1866, passed in view of the thirteenth amendment, before the fourteenth was adopted, undertook to wipe out these burdens and disabilities, the necessary incidents of slavery, constituting its substance and visible form. Whether this legislation was fully authorized by the thirteenth amendment alone, without the support which it afterward received from the fourteenth amendment, after the adoption of which it was re-enacted with some additions, it is not necessary to inquire. It is referred to for the purpose of showing that at that time (in 1866) Congress did not assume, under the authority given by the thirteenth amendment, to adjust what may be called the social rights of men and races in the community; but only to declare and vindicate those fundamental rights which appertain to the essence of citizenship, and the enjoyment or deprivation of which constitutes the essential distinction between freedom and slavery.”

But Justice Harlan dissented from the majority of the court and points out the great discrepancy between the law as it had been interpreted and the evil that it was supposed to meet. He says:

“The difficulty has been to compel a recognition of the legal right of the black race to take the rank of citizens and to secure the enjoyment of privileges belonging, under the law, to them as a competent part of the people for whose welfare and happiness government is ordained. At every step, in this direction, the nation has been confronted with class tyranny, which a contemporary English historian says is of all tyrannies the most intolerable, ‘for it is ubiquitous in its operation, and weighs, perhaps, most heavily on those whose obscurity or distance would withdraw them from the notice of a single despot.’ Today it is the colored race which is denied, by corporations and individuals wielding public authority, rights fundamental to their freedom and citizenship. At some future time it may be that some other race will fall under the

ban of race discrimination. If the constitutional amendments be enforced according to the intent with which, as I conceive, they were adopted, there cannot be in this republic any class of human beings in practical subjection to another class, with power in the latter to dole out to the former just such privileges as they may choose to grant."

None of the acts of Congress passed pursuant to the authority of the constitutional amendments has been held to confer this equality of social rights or privileges on the prescribed race or enforce social intercourse with it. If one race be inferior to the other socially, the Constitution of the United States, we are told, cannot put them upon the same plane.

When we bear in mind, however, the history and purpose of the amendments, and the language of the constitution before the amendments, as announced by Justice Miller in the slaughter house cases quoted above, it causes an instinctive revolt to read the opinion of the court which announces the postulates just set forth. I refer to the case of *Plessy vs. Ferguson* (163 U. S., 537), where a statute of Louisiana, seeking to evade the inhibition of the amendments and to preserve the unutterable slavery-born war of the races, required railroads to provide equal but separate accommodations for white and colored people, either by separate cars or by a partition in the same car, and providing punishment for invasion of this department by either race, is held to be a perfectly sound, just and constitutional measure. When we read the cold and unimpassioned words of Justice Brown, and while we wonder, as we grasp their import, we begin to see why the Negro problem continues to be the greatest problem confronting our national conscience. On page 543 we read:

"A statute which implies merely a legal distinction between the white and colored races—a distinction which is founded in the color of the two races, and which must always exist so long as white men are distinguished from the other race by color—has no tendency to destroy the legal equality of the two races, or re-establish a state of involuntary servitude. . . .

"So far, then, as a conflict with the fourteenth amendment is concerned, the case reduces itself to the question whether the statute of Louisiana is a reasonable regulation, and with respect to this there must necessarily be a large discretion on the part of the legislature. In determining the question of reasonableness it is at liberty to act with reference to established usages, customs and traditions of the people, and with a view to the promotion of their comfort, and the preservation of the public peace and good order. Gauged by this standard, we cannot say that a law which authorizes or even requires the separation of the two races in public conveyances is unreasonable, or more obnoxious to the fourteenth amendment than the acts of Congress requiring separate schools for colored children in the District of Columbia, the constitutionality of which does not seem to have been

questioned, or the corresponding acts of state legislatures.

The court then concludes:

"If the civil and political rights of both races be equal, one cannot be inferior to the other civilly or politically. If one race be inferior to the other socially, the constitution of the United States cannot put them upon the same plane."

Again, as always, when the plain intent and meaning of the constitution is being forced against this downtrodden race, Justice Harlan, with the fullest possible conception of the real situation, utters vigorous protest and dissent:

"In respect of civil rights, common to all citizens, the constitution of the United States does not, I think, permit any public authority to know the race by those entitled to be protected in the enjoyment of such rights. Every true man has pride of race, and under appropriate circumstances when the rights of others, his equals before the law, are not to be affected, it is his privilege to express such pride and to take such action based upon it as to him seems proper. But I deny that any legislative body or judicial tribunal may have regard to the race of citizens when the civil rights of those citizens are involved. Indeed, such legislation as that here in question is inconsistent not only with that equality of rights which pertains to citizenship, national and state, but with the personal liberty enjoyed by every one within the United States."

The justice then reviews the purport and effect of the three amendments abolishing slavery and protecting all civil rights that pertain to freedom and citizenship, and proceeds:

"It was said in argument that the statute of Louisiana does not discriminate against either race, but prescribes a rule applicable alike to white and colored citizens. But this argument does not meet the difficulty. Every one knows that the statute in question had its origin in the purpose not so much to exclude white persons from railroad cars occupied by blacks as to exclude colored people from coaches occupied by or assigned to white persons. Railroad corporations of Louisiana did not make discrimination among whites in the matter of accommodation for travelers. The thing to accomplish was, under the guise of giving equal accommodation for whites and blacks, to compel the latter to keep to themselves while traveling in railroad passenger coaches. No one would be so wanting in candor as to assert the contrary. The fundamental objection, therefore, to the statute is that it interferes with the personal freedom of citizens. 'Personal liberty,' it has been well said, 'consists in the power of locomotion, of changing situation, of removing one's person to whatsoever places one's own inclination may direct, without imprisonment or restraint, unless by due course of law.' (1 Bl. Com. 134.) If a white man and a black man choose to occupy the same conveyance on a public highway, it is their right to do so, and no government, proceeding alone on

grounds of race, can prevent it without infringing the personal liberty of each. . . .

"If a state can prescribe, as a rule of civil conduct, that whites and blacks shall not travel as passengers in the same railroad coach, why may it not so regulate the use of the streets of its cities and towns as to compel white citizens to keep on one side of a street and black citizens to keep on the other? Why may it not, upon like grounds, punish whites and blacks who ride together in street cars or in open vehicles on a public road or street? Why may it not require sheriffs to assign whites to one side of a court room and blacks to the other? And why may it not also prohibit the commingling of the two races in the galleries of legislative halls or in public assemblages convened for the consideration of the political questions of the day? Further, if this statute of Louisiana is consistent with the personal liberty of citizens, why may not the state require the separation in railroad coaches of native and naturalized citizens of the United States, or of Protestants and Roman Catholics? . . .

"If laws of like character should be enacted in the several states of the Union, the effect would be in the highest degree mischievous. Slavery, as an institution tolerated by law, would, it is true, have disappeared from our country, but there would remain a power in the states, by sinister legislation, to interfere with the full enjoyment of the blessings of freedom; to regulate civil rights, common to all citizens, upon the basis of race; and to place in a condition of legal inferiority a large body of American citizens, now constituting a part of the political community called the people of the United States, for whom and by whom, through representatives, our government is administered. Such a system is inconsistent with the guarantee given by the constitution to each state of a republican form of government, and may be stricken down by Congressional action, or by the courts in the discharge of their solemn duty to maintain the supreme law of the land, anything in the constitution or laws of any state to the contrary notwithstanding."

This scathing expression of dissent has been quoted because it reflects so logically the true situation, legally, politically and morally. Had this decision been the judgment of the court, we should be infinitely nearer a solution of our problem today. Now that the doors of the Supreme Court have closed on the only possible constitutional relief, there remains but the struggle of the individuals who are brave enough and high-minded enough and strong enough to repress and drive out by concerted and persistent action the poison of race prejudice that infects our social body, with the antitoxin of natural justice, based on the natural right of man to the pursuit of happiness.

Nor do the Civil Rights Acts of state legislatures constitute a vital benefit to the colored race. In the North, almost as much as in the South, because the influence of the social stigma is all-

pervading, their protection is seldom invoked. The Illinois act is a fair example. It was passed in 1885, and read:

"That all persons within the jurisdiction of said state shall be entitled to the full and equal enjoyment of the accommodations, advantages, facilities and privileges of inns, restaurants, eating-houses, barber shops, public conveyances on land and water, theaters and all other places of public accommodation and amusement, subject only to the conditions and limitations established by law and applicable alike to all citizens."

A penalty is provided in the alternative—either a forfeit of from \$25 to \$500 for each offense to be paid to the person aggrieved, or a fine as for a misdemeanor of \$500 or one year's imprisonment. But only one of these remedies may be applied.

Two cases only have ever gone to the Supreme Court under this statute. In *Baylies vs. Curry* (128 Ill., 287), the law was sustained and the right of a colored person to have access to a theater was recognized. And in *Cecil vs. Green* (161 Ill., 265), a drug store soda fountain was held *not* a place of public accommodation and amusement where Negroes must be accommodated. This latter case brought about an amendment in 1897, which included soda fountains, saloons, bath-rooms, skating rinks, concerts, cafes, bicycle rooms, railroads, omnibuses, stages, street-cars and boats.

On the question of discrimination by providing equal but separate facilities for school children, a majority of states, either by statute or by interpretation, both North and South, have permitted this subtle and child-impressing form of race prejudice to exist.

As to discrimination in public conveyances, there is a great variety of injustice and wrong to be found, largely due to the attitude of the United States courts. As a general theoretical rule, all discrimination against passengers on account of color, seems to be forbidden. But under that india-rubber wand of police power, a state may require carriers to provide separate, but equal, accommodations for both races. To the credit of the Illinois Supreme court again, it has been held that a woman could not be excluded from a ladies' car on account of her color. (*C. & N. W. Ry. vs. Williams*, 55 Ill., 185). This separation of races in the paths of public travel, remains one of the most obnoxious forms of discrimination. So far as interstate transportation is concerned, if the accommodation is not equal, the Interstate Commerce Act may be invoked. Otherwise the doctrine of separation is distinctly recognized, and the inequitable and iniquitous doctrine of separate accommodation has been frequently sustained with respect to theaters, hotels and schools, also. Its existence means the perpetuation of the slavery stigma, *ad infinitum*.

In regard to punishment for crime, while it has been held that a statute that attempted, as many did, to punish a black man more severely than a white man for the commission of

the same offense, was invalid because of the discrimination involved, yet statutes providing a different punishment for adultery or fornication between persons of different races than was prescribed when the offenders were of the same race, are not in violation of the constitution, because the discrimination is against the offense and not against the persons of any particular race. (*Pace vs. Alabama*, 106 U. S., 583.)

There is probably no point of contact between the races where greater injustice and wrong is brought to bear upon the Negro than at the polls in the southern states. In the face of the fifteenth amendment and the punishments prescribed in the Federal Civil Rights Act, it is amazing that evasions by individuals, as well on their own initiative as under state laws, artfully contrived to disenfranchise, have reached the point they have in many of the southern states. The United States Supreme Court has with reference to this amendment taken a strong position and interpreted the provision to mean that while it does not in terms confer upon the colored man the right to vote, it removed what had formerly been the obstacles in his path and hence was the equivalent of a provision declaratory of his right of suffrage. (*Ex parte Yarbrough*, 110 U. S., 651.)

It is easy to understand how, in many of the southern states, where the percentage of black population is large, extreme concern, bordering on panic has actuated the legislative course.

When you take into consideration the fact that it has been universally held that the right of suffrage is not a natural right, but a privilege which may be regulated and modified or withdrawn by the people by whom it was conferred,—that that power resides in the states, except as controlled by the fifteenth amendment,—it is not so startling, in view of the preponderance of the black race in many parts of the South, that the "circle of expedients" to obstruct the right of the Negro to vote has been thoroughly "swept." Nor is it at all to be wondered at, though infinitely to be regretted, and to be changed as soon as circumstances will permit, that the white heat of race prejudice sanctions such legal evasions whenever possible.

Another intricate device to restrict Negro suffrage is found in the constitution of Louisiana, and some other southern states, known as the "grandfather clause." Restrictions requiring an elector either to be able to read and write, or else own property to the extent of \$300, are followed, and apparently extended, by a provision that no male person who was on January 1, 1867, or prior thereto, entitled to vote, and no son or grandson of any such person, shall be denied the right to register and vote by reason of not possessing the educational or property qualifications prescribed by the constitution, provided he shall have resided in the state for five years next

preceding his application for registration, and that he shall have been registered, by separate registry, prior to September 1, 1898, and no person shall be entitled to register under this section *after* that date. If one recalls the small number of citizens able to vote January 1, 1867, and how few of these in turn possessed intelligence enough to avail themselves of the limited period for registration provided for them, he can realize what a masterpiece of intricacy and contradiction this constitutional attempt to avoid the charge of Negro discrimination really is.

It is this race madness that leads to the disgrace of lynching that continues to blacken the history of our time. It is like the perversion of Salem witchcraft—only a hundred times more brutal, because so widely spread. Sexual violence is not confined to the black race.

The Negro race as a whole, is capable of as fine and useful a place in our citizenship as that enjoyed by any other alien element. His sunny nature, his extraordinary imitative powers, that are as capable of a good direction as of a bad, his adaptability, his courage, his physical strength, are all characteristics that must be welded into our civilization. How, then, are we to go about the eradication of the prejudice? It is a matter primarily of individual effort, of the exercise of moral force. The logic of the situation must be brought home to each and all. We must give the Negro, whether we like him or not, a square deal. We must bring to bear the light of reason into the darkness of the self-stultification that engulfs our attitude.

I hold no brief for the Negro as an unworthy individual. Many of the race are diseased, degraded, lazy, ignorant, brutish; many are intelligent, able, refined and self-respecting people, who have adopted our ways and customs with far greater perfection and facility than many other races who are received by us with open arms. These individual differences are of course true of all races,—even our own.

For two hundred and fifty years the colored race has been systematically denied its rights as men and citizens. If we reform our social attitude towards them,—which is the only way on earth,—and eliminate the curse of race-prejudice, we can look to the Negro to take care of himself. Let us, then, as reasonable beings take this first step, by influence, example, common sense and ceaseless agitation, to rid our country of this social and political disgrace. The cause possesses a moral basis of transcendent import, and is bound on that account to triumph in the end. The integrity of our institutions, the welfare of our political state, the trampled rights of a wronged people, cry out for justice.

#### IV

### A ST. LOUIS "EAST SIDE" SUBURB<sup>1</sup>

HOW INDUSTRY IS JUMPING ACROSS THE MISSISSIPPI WHILE  
CIVIC AND SOCIAL PROGRESS FOLLOWS SLOWLY

HE "East Side" has come to be almost synonymous with social and civic problems. St. Louis applies the term to the string of towns sprawled along the opposite bank of the great river, and it is appropriate in its civic as well as its geographical connection. But while New York's East Side has problems of encrusted congestion, St. Louis' East Side consists of comparatively new satellites, their growth so much in process that its shaping is both possible and worth while.

These Illinois towns are linked to the larger city by four big coupling pins—the bridges across the broad, brown Mississippi. Directly facing St. Louis, and as close to the river bank as a network of railway terminals will permit, is a scattering mass of business buildings, dwellings, and tall chimneyed industrial plants. This is East St. Louis, and it is linked to the city proper by two bridges. On its northern edge between a sluggish, dirty-looking stream and some railroad tracks is an extensive stockyards. Beyond lies a low swampy stretch, criss-crossed with railways and dotted with occasional factories and houses. Still farther north, where the third bridge leads over from St. Louis, the settled area peters out into a cluster of houses and hovels. This is Venice, unkempt, half amphibious. The trolley cars from across the bridge spend little time on their way through Venice to another and larger

community set to the northeast a mile or two back from the river bank. Like a huge city wall, the big manufacturing plants are ranged along its western edge, while the stacks of a steel mill serve as sentinels to the east. The first section that the cars enter is made up of miscellaneous small houses with occasional ugly larger buildings. This is Madison. You go on into a better set-up section, Granite City, which is slow-creeping out into the prairie with skirmish lines of box-like dwellings. To one side is a forlorn neighborhood beyond the western bulwark of industries and railroads. This is "Hungary Hollow."

East St. Louis, Madison, and Granite City are not an overflow of St. Louis industry—for few factories have actually shifted their location from one side of the river to the other. But the modern tendency to utilize industrially the outskirts of large centers of population has here been based not alone on the factors which commonly operate. Special economic advantages, some of them arbitrary and artificial, are shared by all three Illinois towns over St. Louis. St. Louis has been reluctant to admit that such advantages existed. Until recently her principal commercial body would rather have thrown a new industry to Kansas City, nearly three hundred miles away, but in the same state, than to any one of the Illinois towns just across the river.

But the last couple of years has seen the beginnings of a new spirit; the old jealousies are

<sup>1</sup>Previous articles in the *Satellite Cities* series were: I. The Outer Rings of Industry (Introductory), October 5; II. Pullman, November 2; III. Norwood and Oakley, December 7.

being laid aside, and the real unity of the metropolitan industrial district is becoming recognized on both sides of the river. In seeking to bring in new industries, the Business Men's League of St. Louis, which is increasingly representative of the Illinois as well as the Missouri side, now seeks to explain fairly the relative advantages of locating in St. Louis proper, on its western outskirts, or in the towns of the East Side. Many plants find that St. Louis sites, with better sewerage and the cheap power which will be furnished from the dam across the Mississippi at Keokuk, are preferable to those with the advantages of the East Side.

Some of the advantages of the East Side over St. Louis are those which the periphery of any large center of population usually possesses:

1. **CHEAP LAND.** Large level tracts are available in East St. Louis within twenty-five minutes from the St. Louis business district. Al-

though the fare is ten cents it is expected to be reduced to five cents soon. The nearest similar tracts on the western outskirts of St. Louis are at least an hour away by street-car. East Side sites cost usually less than half as much as those in St. Louis.

2. **RAILROAD FACILITIES.** East St. Louis is a notable railway center.
3. **PROXIMITY TO LABOR SUPPLY.** St. Louis workingmen's districts are within street-car distance of East Side plants.

But the East Side's peculiar advantages over St. Louis are of a sort not usually possessed by the outskirts of big cities.

1. **CHEAP FUEL.** This, as important as cheap land, is due to an "arbitrary" whereby the Terminal Railroad Association charges on a ton of coal from the great Illinois bituminous mines from 10 to 100 miles away a uniform rate of fifty-two cents to St. Louis, and only

ST. LOUIS INDUSTRIAL DISTRICT

thirty-two cents to any point on the East Side.

2. **CHEAP WATER.** Large quantities for manufacturing purposes cost less than half as much as in St. Louis.
3. **DIFFERENCES IN LAWS.** The absence of smoke regulation such as that in St. Louis is said to be an advantage for the heavy coal-consuming industries of the East Side. But East Side manufacturers point to the fact that they are seeking fuel economy through the elimination of smoke. Labor conditions do not seem to be affected much by the differences in labor legislation. Missouri has a nine-hour day and fifty-four hour week for working women, while the Illinois law pro-

the railways composing it make excessive profits, public necessity demands relief for the whole city. The shippers were the first to organize a remedial effort. Under the leadership of David R. Francis they built the Merchants' Bridge in 1889. But in a few years this passed to the control of the Terminal Association.

The second development came a few years ago. The McKinley traction lines, with 580 miles of ramifications in Illinois, built a bridge. But it connects with no belt line facilities for distribution in St. Louis, and so has had little effect. Only a few months ago, the McKinley interests filed a forty-two cent rate and asked the St. Louis Municipal Assembly to give it a franchise to connect with the belt lines of the Terminal Asso-

ST. LOUIS' INCOMPLETED FREE BRIDGE

Although built to relieve the city from high freight rates, citizens have thus far refused to vote money for its completion, fearing the Illinois approach will be controlled by the railroads.

vides ten hours a day and sixty hours a week as a maximum. Illinois has a workman's compensation law, while Missouri hopes to get one at the 1913 session of the legislature.

#### *The Mississippi Barrier*

The "arbitrary" on coal is part and parcel of the one great civic issue which for years has stirred St. Louis into bitter struggle. The Terminal Railroad Association, comprising most of the railroads which enter the city, controls all the railway and ferry facilities crossing the river, and the belt lines serving both sides. It contends that costly bridges warrant the high freight toll across the river, and that a flat rate of twenty cents a ton is better for the city as a whole than a mileage rate to points of delivery in St. Louis. Many St. Louis citizens, however, feel that aside from whether the Terminal Association itself or

ciation. But public sentiment was suspicious, and the assembly refused to give the franchise unless an agreement should be made to abolish the "arbitrary" entirely and bring the rate down to thirty-two cents or a mileage basis.

St. Louis' hope has been staked on the third enterprise, the Free Bridge, built by the municipality with \$3,500,000 obtained through the issuance of bonds in 1906. But an additional bond issue of \$2,750,000 to provide the approaches to the bridge has been defeated three times in the last year. The objections to the proposed approach were partly due to the fear that it is not sufficiently beyond the reach of Terminal Association control. Meanwhile, a perfectly good bridge is about as useless a public convenience as could be imagined since only one end is connected with the land. For years, therefore, despite

St. Louis' efforts to secure the same rate, the East Side has enjoyed a purely artificial advantage in the cost of coal.

Cheap land and cheap coal have thus been the greatest factors in attracting industries to which one or both are important. In the removal of the St. Louis stockyards to East St. Louis, for instance, cheap land was of course the main consideration. So it was in the development of the railway yards and terminals on the Illinois side. But in the heavy steel manufacturing which plays so important a part in the development of the whole East Side, cheap land in large tracts and a large supply of cheap coal are prime factors. The

In 1912 East St. Louis was estimated to have about 70,000 people, and Granite City—the 1910 census of which omitted two wards—about 12,000. The growth of this group of towns from 1900 to 1910 was no less than 108 per cent. St. Louis in the same decade increased only from 575,238 to 687,029, a growth of but 19 per cent. For a comparison of East Side growth with that of the western outskirts of St. Louis the data are not available.

Venice shows little growth. Its low situation exposes it particularly to the annual high water in the Mississippi. This makes it undesirable for manufacturing sites, but railroad yards are

AT HOME ON LAND OR WATER

Venice, Ill., frequently flooded by the Mississippi has many amphibious dwellings. The major part of the town now has levee protection.

East Side has rapidly become, therefore, the section of the St. Louis industrial district into which heavy industrial processes, usually the dirtiest and dingiest, have been shunted.

In 1890 East St. Louis had but 15,169 population while Granite City and Madison did not show at all in the census returns. The growth from 1900 to 1910 shows the later developments of the East Side:

	1900	1910
East St. Louis . . . .	29,655	58,547
Granite City . . . . .	3,122	9,903
Madison . . . . .	1,979	5,046
Venice . . . . .	2,450	3,718

expected to occupy parts of its territory. Formerly a little settlement at a ferry station, it is now a forlorn collection of ramshackle houses clustered around the approach to the McKinley Bridge. Its amphibious dwellings—shanties on scows, at home floating on the flood or grounded wherever the subsiding waters leave them—give a picturesque touch to its squalor. While its recurring inundations led it to claim its name, one could scarcely imagine a more incongruous contrast with the Queen of the Adriatic. The flood menace which has been so great a handicap to the whole East Side is now warded off through the recent con-

GRANITE CITY STEEL WORKS.

struction of a great levee at a cost of \$6,500,000 in which all the East Side communities shared.

### *Granite City*

To the social observer interested in the civic and community aspects of suburban industrial developments, these East Side towns present an interesting and somewhat different situation from that which is usually to be found on the outskirts of a big city. They are separated from the central metropolis of their industrial district by a great river and by a state line; they have, as has been pointed out, more than the ordinary economic advantages over it; they share its general destiny but comparatively little of its civic life.

The situation can be seen more distinctly by focusing attention on a typical community. Granite City is not only a community by itself and typical in that all the economic factors mentioned above affect it, but it has added significance in the fact that its establishment and development were definitely planned at the outset by one large industrial interest. The share of immigrants in the life of the place may also be measured the more easily since "Hungary Hollow," where they are massed, is an isolated part of the town. Furthermore, distinctive labor conditions, involving union organization and reduced hours of work, add especial interest to it as a community.

The newcomer wonders half-consciously how the name Granite City became attached to a place located on the soft soil of a great river valley. The manufacture of enameled "granite" kitchenware christened the place. It was in 1893 that F. G. and W. F. Niedringhaus selected the spot and bought 4,000 acres to provide a town for their granite ware factory, which had outgrown

its site in St. Louis. This is the only plant in Granite City which may be said to have moved over from St. Louis. The other industries which now help to employ nearly 11,000 workers in Granite City started there, largely through the initiative of the Niedringhauses. They were especially interested in starting the large plants of the American Steel Foundries and the Commonwealth Steel Company.

### *Planning the Town*

At the outset the company platted the town, improved the streets, provided sewers and water supply, planted 14,000 trees, and built one hundred houses, including fifty double ones of brick. In 1896 the place was incorporated as a city. In 1912, with over 12,000 inhabitants, it boasted the following principal plants:

National Enameling & Stamping Co. (steel works), employing .....	2,400
National Enameling & Stamping Co. (stamping works), employing .....	1,500
American Steel Foundries, employing.....	2,400
Commonwealth Steel Co., employing.....	2,100
National Lead Co., employing.....	1,400
Corn Products Refining Co., employing.....	1,000

The yearly payroll is estimated at \$6,500,000. Of the nearly 11,000 workers, it is estimated that 65 per cent live in Granite City and 35 per cent in St. Louis.

The selection of the town site on land as high as could be gotten in the river lowlands was the most important factor in its planning. This was clearly shown in 1903, when floods covered the whole area for miles around, but left Granite City and the major part of East St. Louis untouched. The streets were laid out in the customary gridiron arrangement, except that one diagonal thoroughfare was provided from the

stamping and enameling plant through the business center to a residential district in the opposite corner. This avenue bears the name of the town's founder. His sons wanted the town itself to be known as "Niedringhaus," but he objected. It may be that the notoriety in which the town of Pullman found itself that very summer had something to do with his stand, for he

way one man expressed his opinion. But the Niedringhaus interests pursue a policy of disposing of their real estate as rapidly as possible, and state that their realty company has never paid a dividend.

### *Land Profits*

From the figures given by one of the principal real estate dealers it would appear that land profits have not been small. The original value before the town was built was about \$500 an acre, though some of it was as low as \$150 an acre. An acre makes about five lots fifty feet wide. Lots in the best residence sections sell today at an average of \$800, many of them being worth as much as \$1,200, while most of those in the poorer sections are valued at \$300 and up. Some of the twenty-five feet lots and a few of the poorest larger ones sell for as low

as \$150. It will be seen that the advance in values in the nineteen years since the town was established has been great. And indeed this same real estate dealer estimated that the last four years alone have

HOSPITAL

Granite City prides itself on Churches, Schools and Hospitals, but its City Hall is small and dingy.

HIGH SCHOOL

watched keenly the developments in Chicago's paternalistic satellite. Indeed, the Pullman strike and the bearing which company house rentals had upon it are said to have materially modified the elder Niedringhaus' scheme for Granite City.

Lots were given a width of fifty feet in the original plat. In some of the more recent subdivisions real estate companies have cut the width in two for the purpose, they say, of bringing the cost of homes within the means of less skilled workmen. While the real estate company formed by the Niedringhauses has continued to be active, considerable tracts of land were sold to other companies for development. The companies claim that lots are sold at only a reasonable profit, but there is a somewhat prevalent impression among the people that all the companies have made a "good thing" out of the land values which the influx of population has created. "Why, they could operate the plants at a loss and still make money because of the land," is the

CITY HALL, POLICE AND FIRE STATION

seen an advance of 100 per cent. But a home owner expressed the opinion that average lot prices in the central part of the town are even higher than the figures cited.

A factor in boosting land values has, of course, been the construction of the levee, for land hitherto worthless because submerged nearly every spring has now been freed from this

handicap. The lowest land just back of the levee, for example, once worth \$40 an acre is now worth \$1,000, according to the real estate dealer already quoted. The assessments for the levee were spread over a large area so that on the average the apportionment amounted to only about \$2.40 per \$1,000 on the previously assessed valuation. The original purchase of land for the town included large holdings near the river so that the increase in valuation of the protected portion may be surmised. Two thousand acres along the river bank and not protected by the levee are held by the Niedringhaus interests. They were originally secured to protect Granite City from the development of inferior towns between it and the river. Their future value is dependent on East Side development sufficient to

City to move there and that the present ease and cheapness of living in St. Louis and working in Granite City would tend to discourage removal to Granite City. But the actual movement of population appears to be the other way. A real estate dealer sold 350 lots in six weeks in a new subdivision shortly after the McKinley Bridge went into operation and 75 per cent of them were to St. Louis residents who had been working in Granite City. He adduces the further evidence that there is not a vacant store or house in the town now though there were always some before.

#### *Security in Land Ownership*

The increased security in land ownership due to the fact that Granite City dwellers can now

GRANITE CITY

The older and central part of the town, containing the original company houses, compares favorably with other industrial communities. The foreign section, "Hungary Hollow" is forlorn and isolated.

warrant river bank improvement and an additional levee.

A third factor in determining land values is the McKinley Bridge, across which the inter-urban lines have now been running for two years. Prior to this time, except for the special morning and evening trains which, at the urgency of the manufacturers, the Terminal Association ran with a five cent fare, the journey from the heart of St. Louis was by way of East St. Louis and involved twenty cents carfare to say nothing of an hour's experience resembling that to be had for a nickel on a "scenic railway." By way of the McKinley Bridge a five-cent fare takes one from Granite City to the heart of the St. Louis business district in about thirty-five minutes, and cars run ten minutes apart. One would think that the former inadequate transportation would have caused St. Louis workmen employed at Granite

easily reach employment in St. Louis if the home industries have slack periods is no doubt one of the factors in the increased sale of Granite City land. This same fact, of course, makes it easy for sons and daughters of a man employed in a Granite City plant to take up office or store employment in St. Louis. It also means that St. Louis' resources for recreation, education and social life, as well as her stores, are within reach. Motor buses from the larger department stores meet every McKinley car in St. Louis. Since the opening of the McKinley Bridge it has been estimated that 70 per cent of the money earned in Granite City is spent in St. Louis. Yet the local stores are said to be in even a more prosperous condition than formerly because of the increase in the number of households, as workmen move their families over from St. Louis.

In the last eight years nearly all the company

houses have been sold to working people. They are double dwellings, not unattractive, and are built upon alternate lots, the original idea being that the occupants of each house might have a garden. As the lots in between become occupied by houses of varying appearance the monotony of a row of like houses will be broken. The sales were made on a basis of the original cost plus 6 per cent a year. Unlike the contract of sale of the Gary Land Company, there is no provision for buying houses back in case the occupant leaves Granite City. But the company has never foreclosed a mortgage. In three instances houses have been taken back and the purchase price returned. The sales of lots and houses by the real estate companies have been in the ordinary way on time payments. More than 2,500 houses have been built, and through twelve building and loan associations over \$400,000 has been loaned, most of the money coming from small country towns in the vicinity.

#### *Churches, Schools, Recreation*

From the days in which the town's founders took pride in their encouragement of churches and schools Granite City has boasted of its provisions for these institutions. At the beginning a building site was given to each church. In church buildings more than \$150,000 have been invested, and citizens are accustomed to point out how much better morally Granite City is than Madison, its adjoining neighbor. Persistent efforts drove gambling from Granite City, and recently from Madison, and this evil is said now to come no nearer than Venice. Four public schools afford the educational facilities for two thousand school children and the superintendent has guided the growth of the system since the time when he himself was the only teacher and had thirty-two pupils on the first day of school. In such ways as the provision of medical inspection the schools seem to be up to date. There is little social center work, however, though public lecture courses and night classes in the common branches are conducted.

A hospital erected and first conducted by the Lutheran Hospital Association with the financial help of the Niedringhauses is now conducted under Catholic auspices and seems to be rendering efficient service. A group of ladies from the different churches is organized to meet some of the charitable and civic needs of the place.

Restriction of saloons was prominent in the minds of the elder Niedringhauses when the town was established, and their regulations still hold that the consent of the owners representing two-thirds of the lot owners on a block must be secured before a saloon may be established in the block. This has operated to keep the number of saloons down to about thirty-two. There has been practically no increase in the last five years.

One small park was provided in the town's original plan, a little circle of formal flower beds at the intersection of streets in the center of the town. But neglect and abuse of this "beauty spot" caused it to be given up. No effort has been made even to plan ahead for a park system, as East St. Louis has done by calling in George E. Kessler as an expert. Outside of a few vacant places utilized as baseball fields, the recreation of Granite City is left to several nickel and ten cent theaters and a public dance hall or two. One club building is fairly well equipped to serve its members in a recreational way. Only one industrial plant, that of the Commonwealth Steel Company, has a club house for its employes. This has pool tables, a little gymnastic apparatus, a hall, shower baths, library and lunch room. The same company also conducts a technical night school for its employes.

#### *Hours of Labor*

Perhaps the most striking contrast in the whole round of Granite City's community life is that here is a town with the most meager provision for recreation, with only the beginnings of a public library and no Y. M. C. A.—a town singularly barren of resources for the utilization of leisure—yet in this very place are to be found advanced labor experiments in the direction of giving greater leisure to workingmen. For, as THE SURVEY has pointed out some of the steel plants in Granite City have demonstrated, to the satisfaction of their officials, the economic advantages of three eight-hour shifts as contrasted with two twelve-hour shifts in continuous processes. The Commonwealth Steel Company put their furnace and boiler crews on the three-shift plan. According to the paper of General Supt. R. A. Bull, read at the last convention of the American Foundrymen's Association, the plant has actually saved money, for the waste and inefficiency due to negligence and fatigue are reduced enough to outweigh the 20 per cent addition to the pay roll of the men affected. The same testimony is enthusiastically given by Vice-President Geo. W. Niedringhaus of the Granite City Steel Company, where they have a larger number of men working eight-hour turns than in any other Granite City plant. This applies where operations are not necessarily continuous for metallurgical reasons, but has not been applied curiously enough to the open-hearth platform where operations are continuous through necessity. The management holds that such a schedule there would distribute work unevenly between the shifts.

This possibility apparently has not proved an insurmountable difficulty at the Commonwealth Steel Company's plant which is the only one of three having such departments in Granite City

<sup>1</sup>See THE SURVEY, November 16, 1912, p. 198.

CORN PRODUCTS REFINING COMPANY PLANT

The work—mainly the manufacture of Karo Corn Syrup—employs many foreigners, few if any being organized. The railroad tracks serve the traffic of several trunk lines and separate three plants from the main part of Granite City. Many people must traverse this dangerous grade crossing daily; at only one spot is there a watchman.

not operating the twelve-four turn. The change was accompanied by an average advance of 22 per cent in hourly rate of wages, but the four-hour reduction meant that the daily wage decreased about 20 per cent. In view of this fact, the officials were very doubtful as to whether the eight-hour shift would meet with the approval of the men, but when the question was submitted to them, a *unanimous affirmative* vote was the result. Not only this, but the open hearth furnace men at the Granite City Works, and the American Steel Company's plant requested the managements to inaugurate a similar shift. This request was not acceded to.

Success, therefore, at the open hearth platform of the Commonwealth Company is bound to have influence not only in Granite City but throughout the country where its eight-hour shift is equally at variance with general furnace practice.

"We want the leisure to be with our families and do odd jobs around the house," some of the open-hearth men said to Mr. Bull. And none of them has sought to use the free time in money-making side jobs, as some of the officials of steel producing plants have contended would be the case with such a change. That there has been little bad use of the leisure the officials of the Granite City companies all agree. "Steel work is so strenuous," says Mr. Niedringhaus, "that any man who took to dissipation would be

unable to keep up his efficiency even through the eight-hour shift. The fact that we do not have to discharge any of them shows in itself that the time is not badly spent." The success of the eight-hour shift in a city so poorly equipped for the use of leisure would seem to promise much if the schedule were inaugurated in communities where recreation has developed more fully.

#### *Unions and Trade Agreements*

In this connection peculiar interest attaches to the fact that Granite City Steel Works presents one of the most strongly unionized steel producing plants in the country. And officials almost without exception agree that this was an important factor in leading to the introduction of the shorter working shift. Ever since the days of the elder Niedringhauses, who firmly believed that through the union they were apt to get the best men, yearly trade agreements have been effected between the Granite City Steel Works and the unions, including the Amalgamated Association of Sheet and Tin Plate Workers—the organization with which the United States Steel Corporation has had its bitterest fight. Organization has recently extended to the girls employed at the Enameling and Stamping Company plant, about 100 out of the 250 being now union members. This came about, according to some of those interested in the girls' organization, at the instance of the

#### COMMONWEALTH STEEL COMPANY

The general superintendent has shown that economies in production follow the use of three eight-hour shifts instead of two of twelve hours.

"burners" who had already secured the eight hour day. To strengthen their own position the "burners" brought about the organization of the girls. The company has made no objection, although the Women's Trade Union League declares that three years ago when it sought to organize the girls three of the leaders were discharged and a forelady warned the girls not to attend the meeting. Union organization is strongest in the Niedringhaus plants; the Commonwealth and American Steel Foundries plants are only partly unionized, while the Corn Products Refining Company plant has practically no unionized employees. Of all Granite City workers perhaps one-third are organized.

#### *City Politics*

With a member of the Amalgamated Association—a former worker in one of the local steel plants—as mayor of the city, elected on the Socialist ticket, it would appear that labor conditions have gotten into politics. Yet it is significant to find relations of personal cordiality between a mayor of this type and the head of the steel mill. The mayor, while of course critical of employers as a class, was glad to give the latter credit for being a fair and liberal employer. And similarly, the steel executive gave friendly recognition to the good personal qualities of the mayor, although doubting his ability to see all sides of community problems.

Aside from the strength which the Socialist Party is gaining in all industrial centers, the mayor has undoubtedly had some support from those who think that the industrial control has dominated too much the civic affairs of the town. They point to the land, to the gas company and one of the principal banks, in all of which the Niedringhaus interests are supreme. And they show how political control has also been in their hands through the election of their men as mayor and aldermen. Indeed, the present Socialist mayor, although assuming power with six Socialists among ten aldermen is now, through a recent election, confronted by a board of ten aldermen made up of three Niedringhaus employees, a painting contractor, a landlord, a saloon keeper, a railway foreman, one workingman from a foundry and only two Socialists. That some company officials seek to dominate the politics of the place seems clear. One of the superintendents has for years been a factor in the local affairs of one national party and "deeply interested," to quote his own words, in one of the municipal parties; for it is a noteworthy fact that national party names have played no part in local politics. "I want to say right now," he declared, "that people desire no more Socialist mayors in Granite City." To beat the present mayor for re-election, this plant superintendent is helping to smooth out the factional differences and unite the two older municipal parties in opposition to the Socialists. For, as in the case of Milwaukee, the election of

the Socialists came about in a three-cornered contest.

The mayor asserts that some of the business men are afraid to voice their objections to the control of the city by the Niedringhauses, but on the other hand nearly every business man will tell you what an "unfortunate thing it is for Granite City to be known to outside capital as a Socialist city," although one hears no word against the mayor as a man. The latter points out further that some of the most discerning of his supporters are members of the Amalgamated who have worked in other places and have observed what steel companies are able to do if they control the machinery of local government.

as one community it includes one of the largest settlements of Bulgarians and Macedonians to be found in this country.

There is no point in which on their civic side American industrial communities fail more conspicuously than in their handling of the lowest paid immigrant labor. The very unwillingness of such towns to have their immigrant conditions described or considered as typical is evidence of this. Yet the fact that such labor is more essential in these towns than elsewhere warrants especial attention to the conditions under which immigrants live and work. "It is true," said a factory official, "that the district is an eye sore to Granite City, yet 'Hungary Hollow' is necessary

BULGARIANS AND MACEDONIANS IN "HUNGARY HOLLOW"

It should be stated however that at no time has there been any serious antagonism between company and town over issues of civic importance.

#### *"Hungary Hollow"*

Perhaps the most important social problem in Granite City is that presented by the picturesque and isolated mass of immigrants in "Hungary Hollow." No group in the community is more neglected, unless it be the Negroes, of whom about 1,000 are employed in the plants. All the latter live, however, in nearby squalid towns since there is an unwritten law in Granite City that no one shall sell or rent real estate to Negroes. Counting Granite City and Madison

to the success of the large plants and the conditions are no different than with foreign communities of a like class which may be found in other cities. The large plants require common labor and Americans will not accept these positions." And then, as if to defend his city's prestige, he said, "Granite City is practically isolated from its foreigners and Americans do not mingle with them either socially or in a business way." But he pointed out some of the difficulties which surround efforts at betterment, by adding, "the majority are here today and gone tomorrow, adopt the least expensive mode of living and do not come to the United

States with the intention of becoming American citizens."

To a description of the work and life of the Granite City Bulgarians and Macedonians the Federal Immigration Commission devoted much space in its report, and this document has been drawn upon for much of the information here set forth. It is estimated that in 1907 the number of Bulgarians reached 8,000, though some of the best informed citizens think this figure too large. But the general industrial depression of that year sent many back to the fatherland and reduced the number to only a few hundred. The group has since increased, although temporarily

labor, and some of them on piece work in other departments earn as much as thirty cents or more. At the time of the Immigration Commission study, practically all earned less than \$600 a year; nearly 92 per cent less than \$400; and about 25 per cent less than \$200; these figures would now probably be from ten to fifteen per cent higher with the present higher rate of wages. But in addition account must be taken of other earnings during the periods in the summer when the steel plants are sometimes not in operation. As has been said, many of the common laborers go out on railway construction jobs. Some of them, however, find work in other industries in Granite City, particularly the Corn Products Refining Company which operated even above the normal output during the period of depression—affording a significant example of what diversity of industries means in a community.

#### *How the Bulgarians Live*

The standard of living however is even more interesting. Among the Magyars, more of whom have their women with them, the keeping of lodgers is well nigh a universal custom. Out of forty-four families studied two-thirds kept lodgers. Of wives whose husbands earned less

diminishing in the summers owing to the exodus for railway construction work. In the fall of 1912 as many as 600 went back to fight in the Balkan war. Of the 1,000 who were left, a large proportion lived in "Hungary Hollow." A further cause for their diminishing numbers is that plant superintendents have declared the Macedonians unsatisfactory workmen. One man said he would rather have two Negroes than three Macedonians.

More than 90 per cent are men—some single, but many with families in the old country. More than 90 per cent have been in this country less than five years. About 61 per cent are employed in the steel plants, but less than 3 per cent are affiliated with trade unions. While their sobriety is said to be above the average American standard, they are not adaptable in their work, require much supervision and are generally the least effective industrially of the immigrant races. But increasingly the younger men who have some intention of staying in this country attend school. Their earnings are from fifteen to seventeen cents per hour for common

A MACEDONIAN SALOON

than \$400 a year nearly 74 per cent either worked or had lodgers; but of those whose husbands earned from \$400 to \$600 only 53 per cent worked or kept lodgers. But by far the larger number of Bulgarians live in groups, either on the "boarding boss" plan or on a system under which household management is shared by the group. The first plan is practiced by many Bulgarians and Macedonians living in lodging houses, a couple of rooms—one for sleeping and the other for cooking—being rented by five or six men who employ a Servian, Austrian or Polish woman at a fixed amount per month to do the buying,

cooking, washing, and household work. The accounts for meat, groceries and bread are kept under one name at the different stores, and at the end of the month each man pays his share of the aggregate expense. Under the other plan the members of the group take turns in doing the cooking and housework, rent and cost of food being shared proportionately. Each man, however, does his own washing unless the group, as in most cases, employs a woman to do it.

The crowding among these Bulgarian men is very great, the average number of persons in a room being 2.78, and the average per sleeping room being 3.30. Of sleeping rooms 22 per cent have five or more persons, 48 per cent have

"By way of illustration, the cottages in 'Hungary Hollow' may be considered. These cottages usually have three rooms, although some scattered here and there have four rooms. In each of these cottages twelve to sixteen men live, paying a rent from \$14 to \$16 per month. Multiplying these amounts by twelve to get the annual rents, they are found to be \$168 and \$192 respectively. These rentals are the equivalent of an investment of \$2,800 and \$3,200. The original cost of the cottages, it is claimed, was \$1,500, although this seems to be an excessive estimate. On this basis, however, the landlords are receiving from 11 to 13 per cent gross. As the houses are badly in need of repair, practically the only deduction to be made is for taxes and insurance.

A MACEDONIAN MERCANTILE COMPANY BUILDING

In normal "full times" forty-five lodging rooms are occupied by 200 Bulgarians.

four or more, and 67 per cent three or more. According to one plant official, a tenement ordinance was once adopted establishing a minimum space for each sleeper. Foreigners were dissatisfied, he said, their departure from the city crippling the plants so that it became necessary to repeal the ordinance. While doubtless other factors entered into the labor scarcity, one can readily believe that the Macedonian and Bulgarian lodging house proprietors were those mainly responsible for the dissatisfaction. The monthly rent is about \$1.11 per man. The income which landlords derive from rent is "out of proportion to the investment, and excessive," says the report of the Immigration Commission.

The cottages are very similar to, but not so good as, those for which the southern cotton mill operatives pay a rent of \$3 to \$3.50 per month.

"As far as the rooming houses, which are conducted by the mercantile establishments, are concerned, and in which such a large proportion of the population lives, the rents are from \$5 to \$8 per room. Taking an average rental per room of \$5, which is a very low estimate, a mercantile house having 50 rooms to rent would receive \$250 in rentals per month, or \$3,000 annually. This amount represents the annual interest payment on \$50,000 at 6 per cent. In practice a parallel case exists to substantiate this supposition. A mercantile house in the community has 50 rooms for rent, from which it receives

CEMENT BLOCK HOUSES OCCUPIED BY GROUPS OF BULGARIAN WORKMEN

THE REAR: INSANITARY PRIVIES AND A WASH OUT TO DRY

more than an average of \$5 per room per month. Its building cost \$30,000. The lower floor is occupied by a saloon and two large stores. The rental from its rooms above the first floor, therefore pays over 10 per cent on the money invested in the entire building, or, in other words, the

income from the tenants pays more than the ordinary rate of return on the cost of the building, and leaves free of rent the saloon and store rooms, which are the most valuable part of the building for rental purposes.

"From these illustrations, it seems clear that although the recent immigrant's per capita outgo for rent is small because he lives in a crowded condition, yet the rent he pays by groups or families is excessive and yields an unusually large rate of return to his landlord."

OUT DOOR LAVATORY—THERMOMETER AT 15 DEGREES ABOVE ZERO

In the lodging houses owned and conducted by the "mercantile houses" as many as 200 Bulgarians crowd into 45 rooms during the full times of the winter when the steel mills are operating on their normal schedules. But the ordinary "mercantile company" conducts a varied business which often includes many such lines as grocery, meat market, dry goods and clothing shop, saloon, coffee house, bakery, bank, steamship agency, billiard and pool room, amusement hall, real estate and rental business, restaurant, and perhaps a weekly or semi-weekly newspaper. The proprietors use their position to squeeze large profits out of their fellow countrymen, but the average Bulgarian lives on so little that he is able to save much. This is shown by the fact that from one bank in Granite City no less than \$50,000 was drawn in six weeks at the time of the Balkan war. In less than three hours one Sunday afternoon a meeting held in a dance pavilion contributed \$4,600 to be sent to the Bulgarian Red Cross.

#### *A Civic "Poor Relation"*

"Hungary Hollow," it should be stated, was not developed by the industrial plants or their realty company, but by an independent real estate company, to which several large unimproved tracts were sold. Although it in turn has sold much of

the area to the foreigners it owns not a few of the houses where bad conditions obtain. This district is of course governed by the authorities of Granite City, of which it is a part, but they have neglected it shamefully. Until last year there was not a paved street and now there are but two. Sanitary supervision is conspicuous by its absence. And one of the worst features is the dangerous grade crossing which separates the neighborhood from the main part of Granite City. Across a score of tracks, carrying the freight and fast passenger trains of several trunk lines every inhabitant of "Hungary Hollow" must go to reach the business center and most of the in-

newspaper proprietor as well, is the most potent factor in the control of neighborhood affairs. He not only lodges many of his patrons but sells to all of them nearly everything they buy. And to him they look for advice in the affairs of life. He tells them of opportunities for work and advises them about accepting work which is offered.

So isolated are these Bulgarians from the American life beside and around them, that an American almost thinks himself in a foreign country when he crosses the tracks. Visit "Hungary Hollow" in the latter part of May and you may find every doorway and window framed

**BULGARIAN SECOND HAND CLOTHING STORE IN "HUNGARY HOLLOW."**

Aside from his "stock" the store-keeper's equipment consists of a row of nails in a fence and the use of a neighbor's bench.

dustries of the city. And the dwellers in the central part of Granite City who work in the two or three plants on the "Hungary Hollow" side of the crossing have the same dangerous trip to make. At only one point is there a watchman.

Scarcely any of the denizens of the "Hollow" are voters, and they have little to do with the civic affairs of Granite City. But over affairs among themselves, they have an interesting system of control which involves popular gatherings not unlike a town meeting. It rests in the main on a "boss system" analogous to that in our own city politics. The alien press has a large influence on public opinion, but the head of each "mercantile house," who in some instances is

in green boughs brought in from the nearest woodland. On all sides you will hear singing and the music of the concertina, while every saloon and coffee house overflows with all sorts of festivity. You will be astonished to learn the occasion of it all: these comparatively uneducated foreigners are having a most hilarious time—and some of them are getting uproariously drunk—in honor of the origin of the Bulgarian alphabet and the two monks, St. Methodius and St. Cyril, to whose credit that literary labor stands. During the Balkan war all such festivity as dancing and gay music was abandoned; national hymns and ballads descriptive of soldier life and bravery in death were mainly to be heard.

*The Larger Civic Problem*

Just as "Hungary Hollow" has an important and close relation with the work-a-day life of Granite City, so Granite City and the East Side are important parts of the St. Louis industrial district, and are increasingly recognized as such. And just as "Hungary Hollow" shares scarcely at all in the civic and social activities of the city to which it belongs, so Granite City and the East Side are "out in the cold" so far as the civic plans and social progress of St. Louis are concerned.

senting detailed schemes for the growth and improvement of areas much farther distant on the western side. Yet the minimizing of arbitrary governmental boundaries by the "industrial district" idea would seem to emphasize the wisdom of a similar point of view with reference to the essential social and civic unity of the same district. It points at least to the need of co-operating and co-ordinating action on the part of the several governmental authorities having jurisdiction in such a "district" and equally upon the

VACANT LOTS IN MADISON ARE USUALLY GIVEN OVER TO CROPS OF TIN CANS AND OTHER RUBBISH

Of course, there is little initiative on the part of these communities to "join in." And the inspiration which St. Louis extends to its western suburbs—identified with it in the same county and state governments—is entirely lacking in its relation to the East Side towns, whose volume of business and industrial output nevertheless it now gladly claims as swelling the greatness of the St. Louis district.

Naturally the broad river and the state boundaries break the identity of interests depending upon state, county or municipal legislation. It is easy, therefore, to understand why a city plan for St. Louis and its environs has nothing to do with the region across the river, although pre-

part of the volunteer social and civic agencies similarly involved.

The need for such harmonizing of effort is readily apparent. The St. Louis city infirmary and the relief societies are frequently imposed upon by applicants whose care is properly a responsibility of the Illinois communities. A wife deserter on either side can find refuge by merely crossing a bridge, and similarly criminals are glad to avail themselves of the state line as one additional barrier against pursuit, though the police of the two sides have some co-operative relations. Beggars come and go across the bridge, while the communities on either side make no attempt to unify

their methods of handling this problem. Prostitutes when harassed on one side readily cross to the other. And the difference in the enforcement of Sunday closing laws is an open secret among the thirsty. Yet in the St. Louis Central Council of Social Agencies which comprises about fifty organizations, there is no representation from the East Side—due largely, no doubt, to the fact that there are few live social agencies on that side of the river to be represented. But for the better handling of its own problems, if not to promote the social unity of the district, it would seem that St. Louis should take greater interest in the encouragement of civic and social effort on the East Side.

This contrast between the recognition of the industrial and commercial unity of the whole St. Louis "district" and the absence of any expression of its real civic and social unity is, of course, typical of the situation to be found in the relation of practically every large center of population to its industrial satellites. Yet here it seems to be even more sharply drawn than usual. The economic advantages of the East Side are, for certain industries, even more pronounced than is the case in the average suburban factory town; while the social and civic ties are even weaker. The East Side is valued for its industrial and commercial contributions to the district, and has the advice and help of the strongest St. Louis business organizations. But it is left to work out its own civic and social salvation.

What it has accomplished and what—through ignorance or apathy or preoccupation—it has failed to do, we have tried to outline briefly, using Granite City as a typical community. We

find a town planned, established and largely controlled by one industrial interest. Laid out in about the same unattractive fashion as other industrial towns of its class, it presents neither the showy front of some "model cities" nor the wretched conditions which are often to be found in family squalor behind such a mask. Except for "Hungary Hollow" with its crowding and exploited Bulgarian men, Granite City is not a great deal above the American average of rather monotonous workingmen's communities—few of its dwellings are of the worst sort, and none are of the attractive sort which many English and a very few American industrial towns are providing. Exceptionally barren of resources for the social and recreational life of its inhabitants, it nevertheless seems to have little of the demoralization which usually accompanies such lacks. Founded in a paternalistic way, it has managed to avoid some of the worst mistakes of paternalism. Dominated by one industrial group, it has had neither spectacular "welfare" benefits, nor arbitrary regulation of every day life in accordance with the whim of an autocrat priding himself on "his" men and what he does for them. Instead, there is a democratic spirit in the sharing of industrial power, as shown by the relations between employers and trade unions, which has worked out a more significant forward step in industrial conditions—the substitution of the eight- for the twelve-hour shift in some steel processes, continuous and otherwise, than can be shown by other places where industrial autocracy is more pronounced.

BULGARS IN AMERICA

# RING OUT THE OLD, RING IN THE NEW

## WAR AND ECONOMIC RECONSTRUCTION IN THE BALKANS

BENJAMIN C. MARSH

*[When the armies of the allies were penetrating the Turkish border, an American social worker set out for the front. His plan was to interpret to America and Americans the things of human significance back of the press dispatches. This social worker was Benjamin C. Marsh, secretary of the Committee on Congestion of New York. His correspondence from the capitals of the allies, from the firing line, and from the London conferences have been handled in several newspapers; this article is one of the first pieces of writing he has done since getting back to the United States.]*

*It has been pointed out more than once that some of the same zeal which in earlier generations went into the foreign missionary field is today applied to our city frontiers, and the number of sons and daughters of missionaries who have engaged in social work is cited as evidence. Mr. Marsh's father and mother have for forty years been missionaries in Bulgaria and Turkey.*

*Born himself in Eski Zaghra (Bulgaria), speaking Bulgarian, French and German, "though my German is a tragedy," Mr. Marsh had entré as few outsiders. It brought him into personal conference with various prime ministers, and he was asked to report the peace negotiations at London. It is not, of course, possible for the writer to quote them at this stage; neither is it possible for the reader to do more than speculate as to how large a hand an American social worker has had in shaping plans for the internal conference on the "economic reconstruction" of the Balkans.—Ed.]*

THE superb audacity of the allies is the most remarkable fact of the Balkan war, with the possible exception of the submerging of their centuries of jealousies and rivalries. This made possible their union offensive and defensive in the common cause against Turkish misgovernment and oppression. The fundamental causes of the war, with some of the implications arising therefrom are succinctly stated by Stoyan Daneff, president of the Bulgarian National Assembly and first delegate to the peace conference in London:

"The conditions of Bulgarians, Greeks and Servians in European Turkey were intolerable under Turkish misrule. We tried every method known to diplomacy to secure reforms and every effort had proved futile. Diplomacy and Turkish promises failed. Extortion, oppression, massacres of the Christians continued. War was the only course open to the allies, and we were compelled to have recourse to arms to secure the reforms vainly promised.

"While the war was originally begun to secure reforms, the outcome of the war has made it impossible for us to remain satisfied with merely another pledge of reforms in Macedonia. We must terminate Turkish misrule in Europe over all Christian peoples, and in order to do that, Turkish territory in Europe must be restricted to the limits designated by the allies at the peace conference.

"In reality these proposals of the allies merely extend the area of Turkey in Europe to be liberated from misrule, and provide for the effective

development of the peoples therein. The success of the allies in self-government and in developing the resources of their countries, in spite of the heavy burdens of defense, is the best guarantee of their ability to give the peoples in the territory ceded the same opportunity. Just and enlightened government is not an experiment for the allies. It is an accomplished and acknowledged fact. To secure these blessings to the territory we claim was the sufficient cause of the war."

Twenty-two years ago Mr. Tricoupis, then prime minister of Greece, suggested such a union of the Balkan States as was consummated six months ago. It was premature. The bitterness engendered by the Bulgarian Servian war was still strong in these two nations which have borne the brunt of the present war, their troops often fighting side by side. Greece was not prepared for any kind of a conflict as was shown six years later by its sorry fiasco against Turkey.

But the allies, uniquely Bulgaria and Servia, devoted themselves during the past score of years to preparation for the supreme effort to expel Turkey from Europe. It must be done. Stratford Canning, when ambassador to Constantinople said nearly a century ago that the Turk should be driven bag and baggage into the heart of Asia Minor. This was attempted in the Russo-Turkish War of 1877. By the treaty of San Stefano at the close of that war, the Turks were

#### THE GREEK MONASTERY OF MEGASPILAEON

This monastery, which is built into a great cave, is hundreds of feet above the valley. During the war for Greek independence the monks successfully defended it against the Turks under Ibrahim Pasha. The older Christian monasteries in Greece are located in inaccessible places for purposes of defense.

driven out of practically all of what is known as Macedonia. England, however, at the treaty of Berlin early in 1878 compelled the restoration to Turkey of nearly all the territory in Macedonia given the present allies at San Stefano. As George Washburn, for more than thirty years president of Robert College at Constantinople has justly said: "The treaty of Berlin humiliated Russia, without helping Turkey, while it ignored the rights of the provinces of which it disposed."

The reforms the powers undertook to compel Turkey to make in Macedonia were never executed. The powers preferred outrage, extortion and violence by Turkey in Macedonia, and even fomented dissensions between the Christians there, so that they might peacefully assimilate the territory. This suited Turkey, too, better than losing her territory to the allies because she might be able to sell more of Macedonia at a bargain. For an adequate quid pro quo the Porte would have ceded to Austria, part of Macedonia, even Salonica, just as in 1909 she accepted about \$11,000,000 for permitting Austria-Hungary to keep Bosnia and Herzegovina, on the ground that it was payment for property she possessed in these two provinces.

The allies knew the covetousness of the Christian powers and that they must strike soon. The terms of the federation provided that the armies should work as a unit, but each should operate in its own territory first; that after the conclusion of the war there should be for twenty-five years free trade between the four states, and that no one of the states should declare war during this period unless agreed to by three out of the four, but that all of them would unite in the defense of any state attacked. These arrangements were completed last July. Late in September Turkey refused to inaugurate certain imperative reforms in Macedonia. On October 8, Montenegro declared war against Turkey. Within two weeks, the war was raging over most of Macedonia. Of that conflict Winston Churchill said in the House of Commons:

"Here was a war which had broken out in spite of all that rulers and diplomats could do to prevent it, a war in which the press had had no part, a war which the whole force of the money power had been subtly and steadfastly directed to prevent."

The European powers had most emphatically told the allies that they must not fight. The combined armies of the powers numbered over 5,500,000. Counting every able-bodied man and boy over sixteen the allies could but barely muster 850,000. The total war strength of the Turkish army was nearly 1,000,000, although the larger part of their troops were in Asia Minor. To be sure the allies knew they could depend

A GREEK MACEDONIAN PEASANT

upon that nice alignment of jealousy and distrust euphemistically designated the "Balance of Power" in Europe to prevent the Triple Alliance and the Triple Entente from acting together to help Turkey.

Probably before this issue reaches its readers war will have been renewed. If so I will venture the prediction that Adrianople will be taken within three weeks, and the Chataldja lines broken, though at a fearful cost of life.

Readers of *THE SURVEY* are more interested in the economic conditions and social institutions of the allied states than in statistics of armies or numbers killed. The object of the war is not merely acquisition of territory, but the improvement of economic conditions, both in the allied states themselves and in the newly liberated territory. All of the allies have well nigh exhausted their resources in preparing for the war. Defense has taken from a quarter to a third or more of the national income of all four nations. Other expenditures have been crip-

MACEDONIAN PEASANTS WEAVING

pled. Even most of the chief cities are largely without sewers, and streets are unpaved, although the most important ones have a good water supply. Taxes are cruelly high and work a great injustice upon the peasants and wage earners of the countries themselves, although Bulgaria and Servia have progressive income taxes. Both of these countries, however, are looking for new sources of revenue. In Macedonia where Turkish taxes are often farmed out to the highest bidder, two to three fifths of the produce of peasants is taken in kind by the tax-collectors.

It is estimated that 70,000 to 75,000 of the allies were killed or died from disease or wounds during the war. This represents about a twelfth of their war strength. While the growth of industry in all of the states except Montenegro has been marked during the past twenty years, industry is still of minor importance. All of these kingdoms are primarily agricultural countries, and all of them need the opportunity to develop their natural resources without devoting time and money to defense against aggression.

Of the four, Bulgaria is the most advanced, partly because she has reached a practical stage. There are three agricultural schools, while the government co-operates with local commercial bodies in technical and industrial education and maintains many technical institutions. Education is free, and attendance fairly well enforced from eight to twelve years of age. The richer parents were obliged to pay about \$4 a year for each of their children attending the higher schools. There are about 4,000 elementary

schools with nearly 450,000 pupils, in addition to those in private schools. In 1909 there were 155 special technical and other schools, 292 lower middle class schools, and twenty-seven gymnasias with a total attendance of nearly 65,000. The National University at Sofia is the culmination of the education system. The government gives a yearly subvention amounting to half the cost of education (the subsidy is two-thirds for elementary schools). The rest is paid by local authorities.

The exports from Bulgaria are chiefly cereals, especially wheat. Attar of roses is also an important item. The tariffs are definitely designed to protect and stimulate local industries, and as a general rule the duty on finished products, is about double the duty on the raw material, but the highest important duty is only about 25 per cent ad valorem.

A gratifying evidence of the desire of the allies to improve conditions in their own countries as well as in the conquered territory is their plan to hold during the coming summer a conference on economic reconstruction. One of the first things, Mr. Gueshov, the prime minister of Bulgaria, asked of me when I was in Sofia, was to make suggestions for a building code for Bulgaria.

Various peace delegates at London told me a good deal of their plans for the proposed conference this summer, at which they will consider the problems common to all the countries and to Macedonia as well. The program of subjects includes their fiscal policy, means of communication, agricultural development, industrial and technical education, systems of taxation, housing, etc. The new Balkan States constitute the nucleus for the greatest power in southern Europe, and they propose to profit in their future development, even more than in the past, by the experience of all the most successful nations of the world, among which they include the United States.

A MONTENEGRIN HUT IN WINTER

February 1, 1913.

# CLEVELAND'S GROUP PLAN

A LARGE SCALE EXPERIMENT IN GOOD WILL AND CHARITABLE GIVING

C. W. WILLIAMS

ASSISTANT TO THE PRESIDENT, OBERLIN COLLEGE

*[Cleveland was one of the first American cities to launch a project to group her public buildings in a "civic center."]*

*It is the first large city to scheme out a group plan to bring all its philanthropic agencies into a new era of team work and efficiency.*

*The plan is put forward by the Chamber of Commerce, and its base is the co-operative collection of charitable support. But it is drafted along original lines, and in the views of its advocates is far more than a fiscal enterprise. To quote one of them: the plan will be a failure—*

1. *If it does not raise more money;*
2. *If it diminishes the personal quality in charity, even though twice as much money is raised;*
3. *If the federation does not have the courage to divert money to work where it is greatly needed and fails to persuade organizations to abandon fields better covered by others;*
4. *If it fails to build up weak organizations whose work gives prospect of service to the community;*
5. *If it does not stimulate new organizations to meet new needs.*

*Perhaps the most definite criticism lodged against such projects in the past has been that they would tend to bring all the social work of a community under the thumb of a few business interests. It is claimed for the Cleveland plan, on the contrary, that it will stimulate giving among vast numbers of people of moderate means, and boards of direction need no longer be lumbered up with Mrs. Gold-Rocks and Mr. Brown Stone Front. These boards, assured of support through the federation, can choose active members.*

*Cleveland's preparation and previous experience assure as favorable conditions for the experiment as any city in the country. For this very reason, other communities may well see how Cleveland fares before attempting the plan. Cleveland business men themselves consider that their several years' work through their "charities endorsement committee" is an indispensable factor in whatever chances the larger scheme has for success.—Ed.]*

A NEW method of undertaking the support of a growing city's charities, and a new way out of perplexing problems of philanthropy, were opened up on Tuesday, January 7, when the Cleveland Chamber of Commerce unanimously adopted the report of its committee on benevolent associations, recommending the establishment of a Federation for Charity and Philanthropy. At the same time it asked its president to serve with the mayor, the judge of the Probate Court, the president of the Bar Association, and the president of the Academy of Medicine in appointing a provisional federation commission for the performance of the necessary functions of the federated board, pending the organization of that body.

This action is the result of a five years' search for the cause of the constantly increasing difficulty of securing funds for maintaining and developing the work of the various charitable institutions of the city. The committee came to an appreciation of this difficulty through its work

of charity endorsement as carried on since 1900—believed to be the first such work to be undertaken successfully by a commercial organization. In 1903 the committee made an exceedingly careful investigation of the whole of the city's giving during the year 1907. In 1910 it made a similar study of the whole situation for 1909. Its findings have been studied by the committee and have given rise to the proposal of the Federation for Charity and Philanthropy as outlined in these paragraphs from the report. The organization is to be known as the Cleveland Federation for Charity and Philanthropy, and, to quote from the report, it is to be composed of a board of thirty trustees chosen in the following manner:

Ten to be elected by the organizations which become parties to the federation.

Ten to be elected by the patrons who contribute funds to the federation's support.

Ten to be appointed by the president of the Chamber of Commerce and approved by its board of directors.

The term of office is two years, half of each group to be elected each year.

The meeting of patrons is to be open to any person contributing \$10 or more to the federation during the year prior to the meeting. A donor may send his personal delegate, but this delegate is to be free to represent one person only.

No person receiving compensation from any of the constituent organizations is eligible to membership on the federation board.

Any organization is considered eligible to participation in the federation which makes to the citizens of Cleveland, without restriction to religious, denominational or other special affiliation, a legitimate appeal for funds with which to further its activities.

The relation between a constituent organization and the federation will be subject to such conditions as may be from time to time agreed and established, and will at all times be subject to the right of either party to dissolve it at the end of any fiscal year of the federation.

#### *Inter-Society Relations*

Consultation with many persons interested in the various organizations suggested the following agreement between the federation and the organizations that will join it:

1. When the federation obtains from any given person an unrestricted pledge equal to his total gifts to the current expenses of the constituent institutions during the preceding year, the federation thereupon agrees to assign to each organization an amount equal to the gift as thus previously received from that person.

When the federation receives an unrestricted pledge totaling more than 10 per cent above the aggregate thus previously given the various constituents, it agrees to divide one-half the increase pro rata among the institutions which were his beneficiaries during the year preceding the time of his gift to the federation. In case the amount is less than the total of those previously given to separate institutions, the amount shall be divided pro rata among the earlier beneficiaries.

This agreement is to continue until the end of the second fiscal year.

If the donor prefers to designate the direction of his gift, his liberty to do so is to be complete.

2. Each constituent organization is to be free to solicit donations from persons not making their gifts through the federation. When donors obtained through these efforts become federation subscribers, the arrangement above noted becomes effective.

3. Each institution is to be free—and is urged—to maintain close touch with its

friends and constituents. The federation will plan to furnish to the organizations up-to-date lists of their donors, and in every other way will seek to promote the relation between the organization and the individual. A principal duty of the federation shall be to widen in every possible manner the charitable, philanthropic and social interests of the whole list of donors.

4. For the present the agreement is to involve only the ordinary current expense budgets of each institution. Each organization agrees not to solicit gifts, nor to endeavor to obtain designations, at the hands of the contributors to the federation. The need and the method by which shall be raised funds for purposes outside of current expenses are to be in each case determined by consultation between the federation and the organization concerned.

5. Tags, tickets, etc., are not to be circulated by any organization in the federation. It shall be the aim of the federation to do away with benefit bazars, fairs, entertainments and balls. For the present, each constituent organization agrees not to arrange these benefits without consulting the federation.

6. Such reports on their current activities as may be desired are to be made to the board by the constituent organizations, and their books are to be open to the audit of the board.

#### *The Plan Before the People of Cleveland*

A conference was held on January 10 of the trustees, directors and officers of the various organizations. Each of the endorsed institutions will now be asked whether it is willing to receive contributions through the federation in line with the items of the agreement. Following action on this request will come the election and appointment of the board of thirty. Time, of course, will be required before the whole range of the possibilities can be realized, but it would be hard to imagine a better start on the road toward their realization than is already evidenced in the enthusiastic attitude of institutions, donors and citizens.

The most important considerations leading up to the organization of the federation can best be given by quoting the remarks of Chairman Martin A. Marks at the meeting when the report was enthusiastically adopted. Mr. Marks has been the head of the committee for a number of years. How earnestly he believes in the social and philanthropic possibilities of the plan can be seen from his words. They are given in substance on the two succeeding pages:

After more than five years of what I think I may call as conscientious a study of a difficult and a decidedly delicate problem as I believe any committee of the Chamber of Commerce has ever made, the proposals put before you seem to the committee not only reasonable proposals but positively inevitable proposals, if the problem of philanthropy in Cleveland is to be solved.

In the first place, let me remind you of the great extent of the charitable and philanthropic enterprise in Cleveland. As stated in the report, in 1909 seventy-three institutions were attacking the problem of social betterment from almost every possible angle. They owned endowments worth nearly \$4,000,000. They were taking the full time of several hundred people and were calling for the annual expenditure of one and one-half millions of dollars—a sum equal to \$3 for every man, woman and child of Cleveland. They were asking each year for direct contributions of about \$1 per citizen, or, roughly, \$650,000.

Now let me contrast with that the size of the body of people that make possible this splendid enterprise and this splendid expenditure of \$3 per inhabitant. This body numbers 5,386—only 5,386! Less than 1 per cent of Cleveland's population.

The smallness of this number was one of the first jolts received by your committee after it set out in the attempt to get the facts which would explain why it was becoming each year more and more difficult to secure the gifts needed to carry on the city's works of good will.

But the study of that number itself brought further surprises. Six people were giving 42 per cent; 54 people were giving 55 per cent; 253 persons were giving nearly three-fourths of all the money contributed. Only 2,521 persons, or less than half of one per cent of the population of Cleveland, were practically making possible the whole great enterprise described to you.

Even the small number of larger givers is constantly getting smaller still.

In 1907, the investigation showed that 13 people were giving 35 per cent. In 1909, as I have said, only 6 people were giving 42 per cent. In 1907 74 persons were giving 51.5 per cent. In 1909 54 persons were giving 55 per cent. And so on, a constantly decreasing number of chief givers.

The total number of givers shows a similar decrease. In 1907 there were 5,733 persons contributing to 61 institutions, with total budgets of less than a million dollars; in 1909, 73 institutions with budgets of one and one-half millions were being assisted by only 5,386 single givers! The commit-

tee believes that this decreasing number is serious enough in itself, but it is also serious because it is a symptom of the difficulty that is certain to underlie the competitive method of canvassing for funds. As the difficulty of securing funds increases, as the result of the increased number and need of institutions, each institution carries its troubles to the offices of the few big givers, disregarding the cultivation of the small giver and the general education of the non-giver. In a time of financial strain such cultivation and education are too slow with their results. In prosperous times they seem unnecessary. Even the broadest minded institution has, furthermore, to think twice before undergoing the expense of a broad educational campaign when it knows that a certain part of the results of such a campaign will go into the treasuries of other organizations. The expenses of such an educational campaign have to be carried several years before they come back. The expense of getting money is already very large—nearly \$1,000 per institution, or over 10 per cent of the gifts directly solicited. And it is getting larger constantly. On the present basis, if a good representative can get the hearing of the large giver, his institution's success is certain. This overemphasis of good representation as compared with good institutional work is not good for the extension of the work of amelioration as a whole—not good for the advancement of the city's welfare as a whole.

\* \* \*

Your committee has tried to keep in mind not only the institutions and their work, not only the donors and their good will, but, combined with both, the welfare of Cleveland as a whole. The committee's problem has been, therefore, to devise a plan which should:

First, increase the amount given and so relieve the institutions of the present financial strain and also make possible still further enlargement of the work for the benefit of the needy, and the improvement of general conditions;

Second, to increase the number giving, thus furnishing a larger part of the body of citizens with a kind of stockholders' interest—if I may call it that—in everything that touches the welfare of the rest of the citizens;

Third, to do this in a manner that shall not depend upon the ability with which this particular work or that happens to be presented to the givers, but rather upon its proper relation to the other activities equally worthy and to the work as a whole;

Fourth, to accomplish all this not so much by a board of thirty as by means of a great

body of givers better educated to the all-round needs of the city than is any other body of citizens in any other city today;

Fifth, to create this great body of educated givers by spending in broad social and philanthropic education a part of the money which now goes simply to making one form of charity seem more attractive than another;

Sixth, to simplify the whole problem in every way by doing away with the idea that the various institutions represent unrelated, separate needs and fields. If they are efficient they cannot go at the problem of need in that way. It is one big problem and all the agencies are attacking only different parts of it. They are doubtless very efficiently attacking these different parts of it as separate institutions with distinct boards. In many ways they are already co-operating efficiently, as distinct organizations, but they still continue to lose the value of co-operating with each other when it comes to the matter of sitting in the anteroom of the large giver's private office.

Lastly, to accomplish these aims, not so much by means of, as under the direction of, a small body of citizens chosen from the various interested constituencies and as representative as possible of the city's best abilities, its best judgments, and its best hopes and aspirations.

\* \* \*

The plan proposed differs in essential points from any devised or practiced in any other city. It is not a federation of institutions alone, as in Denver; not of givers alone, nor of both together. It is a federation for advancing charity and philanthropy, of institutions, of givers and of citizens. It does not intend to be a mere collecting agency, as is the Liverpool project, though it does not wish to assume to direct gifts to this or that work until it has had at least two years of experience, and then only on the request of the individual contributor. It will hope to produce its results in the way of a wiser distribution mainly through a better educated giver, rather than through its own action. In this I am referring to "Item of agreement No. 1," according to which, in the absence of designation or restriction, a gift through the federation will continue for two years to follow the direction of the gifts last made directly to the separate institutions.

It does not, furthermore, plan to do away with the financial activities of the various constituent organizations, but to direct these activities towards the non-giver in the hope

of bringing him into the fold. Every person in the city, therefore, is today and will continue to be as open as ever to the canvass of any or all of the seventy-three institutions up to the moment when the constituent organizations receive word that this or that person has signified his willingness to become a subscriber to the federation for an amount not less than his previous aggregate gifts to the separate institutions. Please notice that this makes the plan very different from that originally talked of, by which the board was to assume the whole of all the various budgets. According to the present plan, the effectiveness of the federation will depend entirely on the wishes and the choice of the donor. If at any time a donor decides he does not care for what the federation is aiming at, he can return to the former way of making gifts direct; for him the federation comes to an end.

\* \* \*

Between the federation's subscriber and the good work of Cleveland as a whole, the federation plans to establish a closer relation than at present. The committee realizes fully that in the long run the financial success of the plan will depend on its ability to maintain and develop genuine, personal interest. The co-operation of every organization will be enlisted and this co-operation ought easily to ensure a better showing than in 1909 when 66 per cent of the givers gave to one institution only, and only 33 to 16 or more.

For the institution, the plan should mean a larger life because of more money, without that money being purchased at the cost of the time of the superintendent. For the donor, it should mean larger satisfaction, without the pleasure of one gift being spoiled by the unhappiness of ten refusals. For the citizen, it should mean a better Cleveland. For all, your committee believes the plan will mean the establishment of good works upon the basis they deserve,—the basis, that is, where they will be thought of as a legitimate and proper part of the city's life and progress, by citizens whose social interest and view-points have been stimulated and developed as the result of a broad, united and sympathetic educational movement directed by a board of thirty leading citizens.

\* \* \*

Then, in that day, I believe, we shall, wherever we go, be able to hold up our heads as "citizens of no mean city"—Cleveland, first city to organize itself for becoming "the city of good will."

## THE DYNAMITE CASE

JOHN A. FITCH

AUTHOR OF THE STEEL WORKERS

**W**HEN on December 28, the jury in the United States District Court of Indiana brought in a verdict of guilty with respect to thirty-eight out of forty defendants, it brought to a close one of the most amazing cases ever tried in an American court. In the past decade only three other labor trials have excited similar interest, those of Haywood, Moyer and Pettibone in Idaho in 1906, that of the McNamaras a year ago at Los Angeles and the recent one of Ettor and Giovannitti at Salem.

But those cases involved charges of murder.

The charge at Indianapolis was not murder nor the dynamiting of buildings; it was a charge of conspiracy to transport explosives on passenger trains from one state into another, and aiding and abetting in accomplishing that end.

If other facts were lacking it would seem strange that a trial on such charges should challenge the attention of the country. A violation of the law against such transportation of explosives would be complete if a man crossed a state border on a passenger train and carried with him a stick of dynamite which he intended to use for blowing up stumps.

Very evidently, the district attorney meant something besides the particular counts in the indictment when he called the offense for which the men were being tried the "crime of the century." More than one newspaper called for the maximum punishment for the defendants and a New York journal expressed regret that capital punishment could not be inflicted. In view of the fact that no reasonable person, even if

ignorant of the law, could maintain that anyone should be punished by a court for a crime for which he was not on trial, this attitude is comprehensible only when the sinister facts in the background of the trial are taken into account—facts not to be palliated or gainsaid.

The whole story is more than that of a court trial. To get it in its proper setting, we must know what had happened prior to the indicting of fifty-four labor men. In 1905 the American Bridge Company had a closed shop agreement with the Bridge and Structural Iron Workers' Union. There was also an arbitration clause in the agreement, and a third clause of importance which said that "none of the definite articles of these rules shall be subject to arbitration." Some time in 1905 the American Bridge Company sublet a contract to the Boston Bridge Company, a concern that did not employ union labor. The union objected to this as a violation of the closed shop clause and when it was unable to induce the American Bridge Company either to abrogate its contract or to compel the Boston Bridge Company to unionize its work, a strike was ordered. The ordering of a strike without first submitting the matter in controversy to arbitration was, the company insisted, a violation of the arbitration agreement. The union replied that the strike was over a "definite article" of the rules, that is, the closed shop clause, which under the agreement was not subject to arbitration. From a local strike in New Haven the breach widened until a general strike against the work of the American Bridge Company all over the country was declared. The Bridge

Company retaliated by declaring for the "open shop."

Next the National Erectors' Association entered into the controversy. This association and its predecessors had been for several years in the habit of signing annual agreements with the Structural Iron Workers' Union. The last one was signed January 1, 1905, and expired one year later. On May 1, 1906, the Erectors' Association adopted what is known as the open shop policy, and joined its most important member, the American Bridge Company, in its conflict with the union. This brought into the fray the leading construction companies of the country, including, beside the American Bridge Company, the Fort Pitt Bridge Works, the Hinkle Iron Works, the McClintic-Marshall Construction Company, the Pennsylvania Steel Company, the Phoenix Bridge Company, the Pittsburgh Steel Construction Company, the Riter-Conley Manufacturing Company, the Wisconsin Bridge and Iron Company and many others. The American Bridge Company is a subsidiary of the United States Steel Corporation.

Then began and continued from 1905 to 1911, a struggle surpassed in violence in the labor history of this country only by the Molly Maguires. Assaults on individuals became a commonplace; bridges, buildings and structural material in all parts of the country were damaged or destroyed by explosions of dynamite and nitroglycerine, and human life was placed in jeopardy in countless ways. The whole country finally became aroused by the blowing up on October 1, 1910, of the building occupied by the *Los Angeles Times*, when twenty-one men at work in the building were killed.

The National Erectors' Association has published a list of ninety-six assaults on "non union foremen and men in the employ of open shop contractors of iron and steel erection work" occurring from December 2, 1905 to June 13, 1912, and a list of "depredations, dynamitings, attempts, etc." to the number of 102, extending over the period from the summer of 1905 to October 16, 1911. While no connection has been shown to exist between all of these assaults and depredations and any activity on the part of the Iron Workers' Union, the McNamara case proved that union officials were responsible for some of the worst of them, and the Indianapolis trial demonstrated their responsibility for many more.

It is the last chapter to date in a book of staggering revelations. Walter Drew, counsel for the National Erectors' Association, had testified last summer before the Judiciary Committee of the United States Senate, that there were in 1905 two attempts to dynamite open shop erection work. He testified that in 1906 there were three explosions and four attempts; in 1907, six explosions; in 1908, nineteen explosions and four

attempts; in 1909, twenty-two explosions and two attempts; in 1910, twenty-five explosions, and in 1911 up to the arrest of J. B. McNamara and Ortie McManigal on April 12, there were ten explosions. One of the questions that perhaps never will be answered is how a dynamiting campaign of such magnitude could have been carried on for six years, involving in its scope the width of the continent, and having for its victims the greatest steel construction companies in the United States, including the United States Steel Corporation itself, before one important arrest was made or one dynamiter convicted of crime.

However that may be, the McNamara arrests brought into the hands of the officials of Los Angeles County and of Marion County, Indiana, evidence of great importance which was ultimately turned over to the federal authorities. On the basis of this evidence a grand jury, convened in Indianapolis, returned indictments against fifty-four men, charging them as has been stated with conspiracy and with aiding and abetting in the transportation of dynamite and nitroglycerine on passenger trains from one state into another. Forty of these men had their cases considered by the trial jury. The fourteen who were eliminated included the two McNamaras now serving sentences in California, McManigal and Ed Clark who had pleaded guilty, one man who was never found and one who had a broken leg and so was prevented from appearing. Three men were discharged at the beginning of the trial on the motion of the district attorney, who announced that he could not make a case against them, and four more were discharged on the motion of the district attorney at the end of the submission of the government's evidence. Later one more defendant, Clarence E. Dowd, was discharged on the motion of his own attorney.

Of the forty who stood before the court at the close of the trial all were members of the Structural Iron Workers' Union except Hiram Kline, a carpenter, and Olaf A. Tveitmoe, a cement worker and secretary of the San Francisco Building Trades Council. It was practically the labor officials of one trade and of that trade only, who were at the bar of the federal court, or who were involved in the far-flung skeins of evidence which were unraveled day after day. The reckless efforts which the California unionists were making to break into open-shop Los Angeles and the bitter hostility of the editor of the *Times* was what led to the transfer of these tactics to an outside field and ultimately led to exposure.

The United States District Court room in Indianapolis is divided nearly in two by a rail. Behind the rail are seats for onlookers and in front is the judge's raised desk, the jury box, tables and seats for counsel and seats for defendants. It was never anticipated by the archi-

fect that forty men should be on trial at one time inside that rail. They were ranged along, in front of the rail, three rows deep, nearly the entire width of the room. When a table for the newspaper men, and seats for especially privileged visitors were added, scant space remained.

As I sat in the court room studying the faces of the defendants, I thought of what I have often heard about character showing in a man's face. They didn't look like criminals, those men. One was sitting erect, twirling his hat on the top of his cane. He looked for all the world like a professional man with, you would probably have added, a taste for music. I learned that this was Tveitmoe, whom the district attorney denounced as a murderer. Another reminded me strongly of a certain social worker who is a terror to evil doers. Some looked to be exactly what they are, strong muscled men who have worked with their hands for a living; others seemed more like prosperous business people. But one I fixed upon as evil, through and through. That man, I said to myself more than once, is a criminal if ever I saw one. But he turned out to be one of those against whom the evidence was scanty and largely circumstantial; and was not classed even by the prosecution as one of the ringleaders. He received one of the lighter sentences.

What had happened to bring to the hither side of that dividing rail these men who, so far as the eye could tell, might have been ordinary onlookers?

When on October 1, two years to a day after the Los Angeles explosion, the government opened its case it based it largely on the testimony of Ortie E. McManigal. McManigal had been arrested on April 12, 1911, by Burns detectives, along with James B. McNamara, charged with complicity in blowing up the *Times* building. He turned state's evidence at Los

Angeles and confessed that he had carried dynamite and blown up buildings under the direction of J. J. McNamara, then secretary-treasurer of the Structural Iron Workers' Union. The government brought him to Indianapolis to tell in detail of his dynamiting exploits.

For days this man sat in the witness chair and told how he had gone about the country on his mission of destruction. He declared that he had set the bombs for some twenty-three of the explosions shown by the prosecution to have taken place.

JUDGE ALBERT B. ANDERSON

"A great public service was performed by prosecution and court. When state and local authorities weakly and shamefully neglected to interfere in a campaign of violence which led inevitably to bloodshed, the United States authorities, through the halting medium of a law designed only to protect the travelling public from ignorant carelessness, uncovered the conspiracy and punished the conspirators."

Only corroborative evidence and the almost unbelievable acts of other defendants, proven to have taken place, would avail to convince one of the truth of his story which, had it been written out instead of lived, would have been too lacking in plausibility to find a publisher. Think of checking a suit case full of dynamite in a railroad station! McManigal testified that he not only did that but that he took dynamite to his home in Chicago, piled it on the radiator to thaw out, and then went out to look over a "job"! When he returned he found his little girl playing with the sticks of dynamite on the floor.

It is according to the book to expect that a man even partially in his senses, if about to commit a crime, will try to conceal his identity, to cover up his tracks, and in every way to make it difficult for anyone to recognize him or to trace the course of his

journeys. McManigal did use several aliases. One of them, said to have been used also by Hockin, was the particularly unobtrusive one of "Ping." But he always took scrupulous pains, apparently, that some one of his various names should appear on a hotel register, wherever he went to set off an explosion.

He got acquainted with night watchmen, guarding property that he intended to destroy. He even tried on one occasion to get the watch-

man to go to a theatre with him, so that he would not be injured when the bomb exploded. Failing in that because the watchman "got suspicious," McManigal went away and prepared a second bomb. He risked a return to the building guarded by the now "suspicious" watchman, set this second bomb at a point remote from the first, timed to go off five minutes before the other, so as to draw the watchman to that point in time to save his life from the initial bomb. Having taken these precautions, this careful dynamiter boarded a train.

McManigal had his picture taken at one place where he had gone in his professional capacity and finally, as if fearful that sufficient clues were still lacking, he formed the habit of sending to his wife souvenir spoons of the towns where he caused explosions.

For all that, there was no lack of evidence of many different sorts in substantiation of his story. Hotel registers showed his signature; hotel clerks identified him. Attorneys for the defense on cross examination failed to break down his testimony.

McManigal's story must have left a strong impression on the jury, for he told how again and again he met different officers and business agents of the Iron Workers' Union—not the McNamara's alone, but many others—and conferred with them regarding proposed explosions. But the strongest of all the corroborative evidence—showing direct connection between leading officials of the union and the dynamiting campaign, and indicating that there was conniving at and participation in other forms of violence—appeared in the hundreds of letters written by officials, business agents and others, which were taken from the files of the Structural Iron Workers' Union, and which were read into the evidence.

And here appears another thing to wonder over in this most amazing of trials. If McManigal acted with incredible nonchalance as play-actor with the steel industry as his property man, what can be said of the precaution of the score of other men involved, most of whom wrote, not once but again and again, letters so incriminating that McNamara, replying to one of them, protested against putting such things on paper: "The Lord only knows who sees these letters!" he said.

And then McNamara *kept the letters on file!* It is a common practice in business offices to destroy letters, except those of especial importance, after a few years. Some of these "dynamite letters" were kept in the union headquarters five years, and only then taken away when the place was raided by officers of the law!

Day after day District Attorney Miller read these letters into the record. They dealt with

all sorts of matters from finances to "repair work." Not many of them perhaps referred in plain and obvious terms to dynamiting and other forms of violence, but taken in connection with the dynamiting campaign that was on, many have a very plain and incriminating significance.

It had been brought out in evidence that for a long time, John J. McNamara used funds to the amount of a thousand dollars a month without giving any account of them. The stubs of the checks so drawn were usually marked "set aside for organizing purposes by the executive board." The first thousand dollar check was drawn in December, 1909. On August 7, 1908, J. J. McNamara had written to Frank C. Webb of New York, a member of the executive board, that he thought the board should set aside from a thousand to three thousand dollars for emergency purposes to be drawn on by himself.

McNamara wrote:

"I believe it will be up to the executive board to arrange so that things can be charged so that no official can be charged with the expenditure of a large amount of money."

The letter further mentioned that the expenditures of large sums of money by any individual officer led to investigations and kicks.

On July 1, 1908, Ed Clark who, along with McManigal, pleaded guilty to the charge of transporting dynamite, and confessed that he had caused at least one explosion, wrote to McNamara regarding some structural work that was about to be started in Cincinnati. Clark wrote,

"If you think it would help any, it would be easy to put their hoisting engine on the bum now."

McNamara replied that Hockin (who succeeded McNamara as secretary and treasurer, when the latter was convicted), would be in Cincinnati and

"he can take up with you the matters mentioned in your communication."

On July 23, Clark informed McNamara that Hockin had been in Cincinnati and on August 7 Clark wrote,

"I may as well tell you that there was an explosion on the Grainger job last night."

July 30, 1908, Philip Cooley of New Orleans, a member of the executive board, wrote to McNamara that there were two scab jobs under way there, adding:

"Now, Joe, it will take about \$250 to do any work. There is a few good fellows in this local at this time who can do the trick and get away with it."

McNamara replied that Ryan would be in New Orleans shortly and Cooley had better take

the matter up with him. "You can arrange matters much better that way than you can by mail," he said.<sup>3</sup>

On December 29, 1909, Cooley wrote to McNamara:

"I was able to secure the proper stuff for that proposition I mentioned to you in a former communication, and I would like to know just what this kind of a job is worth, as I would not like to offer something and not be able to go through with it."

On February 5, 1910, Hockin wrote to Cooley:

"In answer to your favor of February 2, I have just sent you a wire ordering you to cancel the repair work on derrick, also the yard work you speak of, as the price is altogether too high. I might say that our expenses for the last month have been rather high and we have not got the money at present to make repairs at such a high price. We have been doing considerable organizing work throughout the country, so for some time we will have to keep our expenses down. You say you have considerable idle men down there. Under them conditions, the repair work ought to be done very cheaply."

M. J. Hannan of Scranton, Pa., a business agent, wrote to J. J. McNamara on September 7, 1907:

"I wish to say that it is a shame to let this bunch of snakes leave here without trimming them. . . . Now I think you should send some money here on the quiet and I promise the goods will be delivered. If No. 23 [23 was the number of the Scranton local] had a million, I would not do a job for them, as they don't know how to keep their mouth shut and I don't feel prepared to serve time. . . . I am prepared to do anything, but you know how careful a man should be in a case of this kind."

It was in regard to this letter that Frank A. Ryan, president of the union, admitted under cross examination on the stand that it had "looked a little suspicious" to him.

William C. Bernhardt of Cincinnati wrote to McNamara on October 22, 1907, about an accident that had happened on some work that a non-union contracting company was doing there in which some of the union members were accused of being responsible, and some had been arrested. Bernhardt said that he had footed some of the bills himself, because the matter was of such a nature that "it could not be brought up." The same letter refers to a police judge

who was friendly to the iron workers, and who said, "For God's sake, don't bring that bunch around here any more or I'll have to do something."

An unusually frank letter was written on February 25, 1908, by Ed Clark, in which he said:

"We're going to do something to the Grainger Company that will be of benefit to the whole membership in general. . . . We have made up our minds to go after them in the right way. . . . Joe, being so well known here, I do not think it advisable for me to buy any explosive. Could there be such a thing as you sending me from Indianapolis what I need?"

A letter written by Ryan on April 27, 1910, figured prominently in the trial. It was in this letter that Ryan apportioned "jobs" among the various members of the executive board. Ryan wrote:

"Let Legleitner attend to the jobs in his district. Let Butler attend to the jobs at Rochester and Buffalo. Hockin can attend to Detroit, Cleveland, Cincinnati, Davenport, Kansas and Peoria jobs."

The district attorney attempted to show that the reference in each case was to the dynamiting of non-union construction work in each district. It was also shown that within a few months after this letter a number of explosions took place in several of the districts where the "jobs" were to be looked after.

Some of the most interesting letter writing was done by J. E. Munsey, business agent of the union in Salt Lake City. On June 13, 1909, Munsey wrote to J. J. McNamara about a conference that he had had with the president of the Minneapolis Steel Company. He said that the president had left Salt Lake City for Minneapolis, but

"he left his lap dog, Holstrom, here. We have tried to get him, but he won't venture out in the night time. He packs a big gun all the time."

A new hotel was being built in Salt Lake City, and on September 29, 1909, Munsey wrote to McNamara:

"They are going to run open shop on this Utah Hotel. There is no question. But just wait until they try it and you watch me."

On December 13, 1909, Munsey wrote:

"There is a fellow by the name of Delaney working on the job, and he sent after me the other night. He gave me the address of John Smith, Cardiff, Alabama, and said if I wrote him about him I could find out what kind of a man he was. I asked him what his motive was in working there, and he told me he followed that kind of business up, and if I wanted to put the job on the bum, he would do it. He said he

<sup>3</sup>Cooley also wrote to McNamara at one time that he had met a scab in a saloon and struck him on the jaw. He said that the blow made the man pretty sick because he hit his head on something as he went down and he heard afterward that he had had to have a silver plate put in. Cooley was afraid that he might get into trouble at first, but he wrote that he had hired two witnesses to testify that the scab had hit him first. Then he had a friend of his see the judge so he was hoping to get off easily.

OLAF A. TVEITMOEN  
Secretary of the San Francisco  
Building Trades Council. Influ-  
ential Pacific coast labor leader.  
Six years' imprisonment.

JOHN T. BUTLER  
Vice-president of the Structural  
Iron Workers' Union. Sentenced  
to six years' imprisonment.

MICHAEL J. YOUNG  
Business agent of the Structural  
Iron Workers' Union in Boston.  
Sentenced to six years' imprison-  
ment.

worked for this John Smith during a strike in Alabama and for me to write in regard to it. Smith, he claims, is president of a local there. So I wrote Smith, but I was careful not to say anything in the letter that could be used against me or against the local. . . . I wish you would try to find out if you can; they might be trying to double cross me. Now I don't know anything about this Delaney; never heard of him before. Of course, I am pretty wise, and I am not going to let him lead me into anything on me. Now he wants me to wait until I hear from this Smith, then he says he will be ready to do business. Of course, I didn't mention that I wanted to do anything or say anything pertaining to it, so I think it would be advisable to write Lewis and see if there is such a man as Smith or if Delaney did do this work."

McNamara replied to this letter on December 20:

"I note your statement relative to this fellow Delaney. Do not frame up with any of those fellows. Some of our people done it at New York and to their sorrow. If I am not greatly mistaken, he wants to lead you into a trap. If I were you, I would feel this Delaney out again, and then tell him that you had taken the matter up with some of the officials of the local union, and that they turned the proposition down and gave you to understand that they were not doing business along that line. If he is crooked, and everything indicates that he is, he will, of course, take this information back to the people he is working for."

Later on there were explosions on the Salt Lake City work. February 24, 1910, Munsey wrote to McNamara:

"I am positive it would pay to send an organizer to this particular part of the country. . . . The Kearns and Utah Hotel buildings are

coming along very slowly. But I still think there is a possible chance to square the Kearns Building."

On March 2 he wrote:

"The Utah Hotel is practically at a standstill. They can't cut the mustard, and I think there will be something doing there pretty soon."

On March 3 he wrote:

"Jones is practically up against it, and if he don't do any more in the next three months, he will never finish the job."

Writing again on March 7, he said:

"I think I have Jones on the hip in regard to the Kearns building, and we will then attend to the Utah Hotel."

On March 29 McNamara replied:

"I wish you are able to run Jones not only out of Salt Lake City, but also out of the state of Utah. I presume he told you what I have in mind, and if it can be gone into in a safe way, I will be on the job."

On April 18 the Utah Hotel was dynamited a second time.

I have quoted all these letters because it is important that the readers of THE SURVEY should know something of the evidence that was introduced in the trial. No one could read these letters, see the various exhibits introduced by the government, and consider corroborative evidence of a dozen different kinds, including the manner of some of the defendants on the witness stand, without being convinced that many of them were personally responsible for much of the violence and destruction of property which had taken place for half a dozen years past. That impres-

HERBERT S. HOCKIN

Succeeded J. J. McNamara as secretary-treasurer of the Iron Workers'. Six years' imprisonment.

FRANK M. RYAN

President Bridge and Structural Iron Workers' Union. Sentenced to seven years' imprisonment.

JOHN E. MUNSEY

Iron Workers' agent in Salt Lake City. Accused of hiding J. B. McNamara after Times explosion. Six years' imprisonment.

sion was strengthened in my mind as I sat and listened to the attorneys for the defense making their final arguments to the jury.

The defendants had an imposing array of counsel. At the head was W. N. Harding, a prominent attorney of Indianapolis, and associated with him as co-leader of the band of fifteen attorneys was John W. Kern, formerly special assistant United States district attorney, Democratic nominee for the vice-presidency in 1908, and now United States Senator from Indiana. Among the defendants' attorneys were a former assistant district attorney in Philadelphia and a former United States attorney in Missouri. They came from a half-dozen different states, from cities as far apart as Minneapolis and Philadelphia. Some represented one defendant, some two or more, and all were represented by Harding and Kern.

For the prosecution there were three men—District Attorney Charles W. Miller and Assistant District Attorneys Noel and Nichols. Miller was appointed by President Taft in 1909. He was attorney general of Indiana from 1903 to 1907, and has held various other positions of importance both in politics and in business. For more than a year these men had concentrated on this one case. They are deserving of great credit for their tenacity and industry in going through the appalling mass of evidence, for mastering it as they did, and drawing out into the open this conspiracy which had eaten at the heart of a great labor group. Attorneys for the defense repeatedly complimented the prosecution for their able presentation of the case, and it was no mere flattery. It was not only in having the weight of evidence in their favor, but in their

intellectual grasp of that evidence that the prosecution was stronger.

On the bench sat Judge Albert B. Anderson, who was appointed to that position by President Roosevelt in 1902. It was, incidentally, Judge Anderson who afterward decided against the president who had appointed him in the famous Indianapolis *News* libel case, and who was the hero of Mr. Roosevelt's remark that the judge was "either a fool or a knave."

The jury was made up mostly of Indiana farmers—dyed-in-the-wool Hoosiers, as the eye could see. In the final arguments before the jury each side was allotted four days. Assistant District Attorney Noel opened for the prosecution, and when the defense had had their four days, District Attorney Miller took two and a half days for closing.

As I have intimated, the arguments of the defense did not for the most part impress me favorably. It seemed fitting and proper that the attention of the jury should be directed, as Senator Kern did most effectively, to the solemn responsibility of having in their hands the liberty of a fellow man. I am no lawyer, but it seemed to me only right that the jury should be reminded of the seriousness of its duty, dulled as their sense of it might have become after three wearying months of hearing evidence.

But I did not feel an equal measure of fitness and scrupulous propriety as lawyer after lawyer stood before the jury and made pleas for sympathy, reminding the jury of the homes where these men were "loved as those in your homes love you." Some of them quoted poetry. One read Abou Ben Adhem to the jury. Another read the poem entitled *The House by the Side*

of the Road, where the poet wished to dwell and "be a friend to man." Several of the attorneys used the same formula in closing their appeals. "I leave my clients, with all they have, with all they love and with all who love them, in your hands."

Of them all, I think only Attorney William A. Gray of Philadelphia, appearing in behalf of Michael Cunnane, and Judge Krum of St. Louis, who defended J. H. Barry and P. J. Morrin, refrained from making that kind of appeal.

It was the duty of defendants' counsel to make the best arguments they could for their clients consistently with the truth. But when I found them devoting, in the aggregate, hours of their precious time to such appeals as these, instead of marshalling the evidence, I could not help concluding that their cases were weak and that they knew it.

So far as the prosecution was concerned, I could not help thinking of another trial recently the feature of the newspapers—that of Police Lieutenant Becker in New York for the murder of Herman Rosenthal. In that trial the newspapers reported that Assistant District Attorney Moss not only did not interrupt the defendant's counsel when he was making his final argument before the jury, but that he retired from sight of the jury in order to give the defendant's counsel opportunity to speak for his client unhampered by any counter influence which even the presence of the prosecuting attorney might exercise.

At Indianapolis, District Attorney Miller sat directly in front of the jury all the time that the attorneys for the defense were making their closing arguments. He not only interrupted from time to time, but he did so in a manner that frequently surprised me, with such remarks as these: "Counsel knows that every word that he is saying is untrue," or "I wish counsel would try to tell the truth at least part of the time."

And then his speech to the jury surprised me in its bitter attack upon counsel for the defense. He taunted them with being there to defend a bunch of criminals "at so much per day." He intimated that Senator Kern had abandoned his duties at Washington, which the people were paying him to perform, to defend men guilty of murder. Such things, he declared with bitter scorn, "will men do for money." I gathered that he thought the defendants should not be represented by counsel.

The trial ended; the jury convicted thirty-eight men; acquitted two. Judge Anderson sentenced one man to serve seven years in prison; eight men to serve six years; two men four years; twelve men three years; four men two years; six men one year and one day; and five

men, together with Ed Clark, who pleaded guilty, he released under suspended sentences.

And now that it is over there is a tendency to feel relief because the story has come out and justice has triumphed. The pity of it is that neither thing has happened. The matters dealt with in the trial were too complex to be thus easily made known to all men, and justice is too complex a thing thus easily to triumph. And I am not sure that unless, or even if, we limit our definition of justice as the court was obliged to do, can we say that it triumphed here. It will help if we first consider an important phase of the trial itself, and then turn to a more important question—what was it all really about?

The old doctrine on which our criminal procedure continues to be based is that it is the crime, and not the man, that comes before the court for judgment. Given this procedure, if justice even in a limited sense is to prevail, two things among others are extremely important. One is that if a man is suspected of having committed a crime, he should be placed on trial in a court that has jurisdiction. The other is that, having been placed on trial in any court, he should be tried on the charge named in the indictment, and not on some other charge.

District Attorney Miller is not to blame because the men convicted at Indianapolis were not tried on the direct charge of dynamiting buildings. That is not a matter for the federal courts. The fact that they were not so tried by state and county courts, and that long since, is a national scandal. Perhaps the magistrate who said, "For God's sake, don't bring that bunch here again or I'll have to do something," could tell why they escaped local prosecution. Judge Anderson took occasion to remark in the course of the trial that had the local authorities done their duty, the matter never need have come to his court.

Mr. Miller's strict responsibility was to present the evidence against the defendants on the several counts of the indictment, all of which had to do with the transporting of dynamite across state lines. Yet this was not the burden of his attack upon the defendants. He called them dynamiters and murderers. Tveitmoe he singled out for especial condemnation, and seldom if ever referred to him without an epithet. "Contemptible" and "infamous" were the adjectives most commonly attached to his name. "If I were district attorney of Los Angeles County," he said, "Clancy and Tveitmoe would have been tried for murder, and if an honest jury were in the box they would have gone to San Quentin prison to join the McNamaras."

So it was that some of those who heard the

testimony said: "These men are guilty of dynamiting buildings"—which was true of most of them—"so I hope the judge will send them to prison for life"—which would have been wholly contrary to the law, since the men were being tried for something else. Even Judge Anderson, when sentencing the convicted men, admitted that he would have to exercise some will power not to sentence them for murder and destruction instead of the crime of which they had been found guilty. Yet this incessant, reiterated picturing of the defendants as guilty of the worst crimes, even up to murder, the presenting of evidence to show that such crimes had occurred, could not have failed to rouse in the minds of the jury a righteous indignation against the defendants. Not being lawyers they would naturally lose sight to some extent of the real charge, and vote the men guilty just because they ought to be in jail. I do not know whether that was what they did, but if it was hard for the judge to keep his mind on the issue before the court, how much harder it must have been for the jury.

Moreover the burden of admitted testimony exposed the dynamitings as a motive for carrying explosives, but threw no light on either hardship or provocation as a possible motive for the explosions. If the court was right in admitting the one, was it consistent or just in failing to bring out the other? The prosecution was permitted to bring in as germane all the evidence it could gather regarding explosions and deeds of violence. The strictness with which on the other hand economic facts were excluded was illustrated when the defense tried to introduce evidence tending to show that the deaths in the union numbered twenty a month, that 80 per cent of these deaths are due to accidents occurring while at work, and that the average age of the iron worker is 34 years, and they were ruled out. Neither was evidence introduced showing possible reasons for the bitterness of the fight as carried on by the workers. Nothing was said of the employers' way of fighting.

This leads to a more fundamental question than whether personal injustice was done these men: What was the trial really about, not legally or technically, but actually? What was the meaning of the facts disclosed? That it amounted to more than the mere charge of carrying dynamite needs no affirming. The record of the trial proved, if legal proof were necessary, that dynamite and nitro-glycerine had been used by labor men in a struggle with anti-union employers. It is idle to suppose that the Structural Iron Workers' Union got into the hands of a set of leaders all of whom were natural-born safe blowers and who found that the easiest

way to make the world give them a living.

I asked an experienced reporter, who had covered the trial from the first day, what he thought of the defendants. He answered, without a moment's hesitation:

"There are some bad men here, I think—some of the worst criminals in the United States. But only a few are like that. Most of them are the product of their environment. The danger of their work calls for red-blooded men—men of recklessness and courage. In their fight for union recognition they found themselves up against a bitter struggle with the Steel Corporation, and they actually believed, many of them, that the only way to avoid a loss of the eight-hour day and complete subjugation was through the use of dynamite."

This view may seem more than ordinarily puzzling if we note that it was the structural iron workers, with their eight-hour day and their \$5 wage, who came to believe they must embark upon a career of dynamiting, instead of some sweated, underpaid group of workers. Yet it is common psychology that men will go to greater lengths to hold what they have than to gain more. A \$3 man strikes harder against a wage cut than a \$2 man will strike for a raise. It is significant that nearly all discussion of this matter in labor circles turns sooner or later to the condition of the other workers in the steel industry—their twelve-hour day and seven-day week, their low wages and their unorganized helplessness.

In an address delivered in New York last fall, Anton Johannsen, one of the men under indictment in California for transporting dynamite, expressed this point of view. The following is taken from a stenographic report of his speech:

"About a year and a half ago the United States Congress appointed a committee to investigate the steel trust. . . . That committee—not a labor union committee or a Socialist committee, but a committee from the United States Congress, that very seldom does anything, but they did this time—found that . . . the steel trust employed 260,000 men and boys. They found that they worked them for twelve hours a day for an average wage of \$409 a year, not a month. What else did they find? They found that in that industry every single labor union had been completely destroyed and annihilated with but one exception—the Bridge and Structural Iron Workers' Union. You can draw your own inference, but every union was destroyed by the steel trust, and all those men who had lost their organization worked twelve hours a day for \$409 a year as the average wage. We have a Congressional report to back us up as to the facts. What are the facts in connection with the Iron Workers' International Union? In seven years, during the administration of John

J. McNamara, the union increased its membership from 5,000 to nearly 14,000 members. They established an eight-hour day from the Atlantic to the Pacific, from Texas to the Canadian line, and they established a wage scale of \$4.30 as compared with \$2.20. . . . I do not know, but I suppose that the McNamaras became convinced that no amount of pleading, no amount of argument, no amount of logic, no amount of Christianity, no amount of politics, would convince the steel trust that they could give eight hours and give them living wages. Labor would have to organize.

"The steel trust had what they called the National Erectors' Association, one of the tributaries of the steel trust, and the National Erectors' Association had what they called the American Bridge Company, another tributary of the steel trust. . . . How long do they expect those 260,000 men and boys to work in the steel industry for \$409 a year, twelve hours a day, without becoming imbued with animosity and despair? How do they expect it? If a man says to me, McNamara should be condemned, my reply is, all right, we will condemn the McNamaras; we will also condemn the Carnegies. If a man says to me that the Iron Workers' Union should be condemned, I say, all right; we will also condemn the steel trust. If they say we want light, we want justice; all right, light up the iron workers and light up the steel trust—light up labor and light up capital. Put on the searchlight for both parties, and we are willing that our sins shall be compared with their sins."

In spite of Johannsen's inaccuracy—for, while there is a large element of truth in his statement, his figures are wrong—he brings out how in the minds of the iron workers there was the fear of the loss of their eight-hour day and of the good wages now prevailing, fear of the helplessness that they have seen is the lot of the unorganized steel workers.

That would not lead the public to tolerate their placing bombs under bridges; but it does show that this dynamite campaign has been part of a larger struggle. It is one of the most sinister manifestations of that struggle. Nevertheless it is a part of it, and we must not think that the matter is settled when we have the dynamiters in jail. The court can perform its necessary function, but after the men have been tried and sentenced what about the causes that make dynamiters?

The utter inability of a criminal court to deal with these larger aspects of the problem—the incapacity of the tribunal in this particular case to understand them and the danger lest its procedure of punishing reckless passengers should lend itself wholly to the uses of one party in the industrial conflict—was shown in one significant fact that came under my observation. In his closing remarks to the jury, Senator Kern charged the prosecution with having turned the

letter files of the union over to Erectors' Association detectives. This angered District Attorney Miller. "I would like to see the man," he shouted to the jury as he began his closing argument, "who would declare that the letters and papers were put into the hands of or in charge of a detective of the Erectors' Association after they came into the custody of the district attorney."

If the district attorney had said "representative" instead of detective, his question might have been answered. I do not know whether J. A. G. Badorf considers himself a detective or not, but before I went to Indianapolis I learned from the headquarters of the National Erectors' Association in New York that that was the name of their representative in Indianapolis, and that his address was 202 Federal Building. When I arrived in Indianapolis I found that 202 Federal Building was the office of the United States district attorney. Only the day before this statement of Mr. Miller, Mr. Badorf had taken me into a carefully guarded room in the Federal Building. The guards smiled and made way for us, and he showed me in that room the various exhibits of the government, including hotel registers, infernal machines, the nitro-glycerine carrying case, the books of cancelled checks of the union, *and the files of letters taken from the Iron Workers' offices.* At another time, when I had a talk with Mr. Badorf, he came out of that room to see me and returned to it again when we were through with our conversation. In view of his easy access to the exhibits it seemed to me that whether or not he had charge of them was a mere quibble.

But if he had, what then? It must be remembered that the Erectors' Association has been active for years in another direction than that of apprehending criminals. It exists for the purpose of smashing a labor union. In the steel industry proper for men even to meet together means discharge. The structural trade has not swung that far toward domination by the employer. Men with union cards, who stay quiescent, work alongside the others in its open shop work. But the impropriety of permitting an agent of the Erectors' Association to have access to the 60,000 or so letters, of which evidently the vast majority had to do with the legitimate activities of the union, since only a few hundred were used in the trial, ought to be obvious to any one.

For it must be remembered that there are 12,000 members of the Structural Iron Workers' Union. There was no evidence brought out at the trial to show that the overwhelming majority of these workers had any more direct responsibility for the dynamiting than, say, the policyholders of the mutual insurance companies bore to the offi-

cial acts which were the subject of the Hughes investigation. And it is the association of these 12,000 men that the Erectors would destroy.

To permit this employers' organization to have free access to the records of the union showed either that the district attorney and the judge had no appreciation of the economic struggle that has been going on for ages, or that they did recognize it and desired to put ammunition in the employers' hands. I prefer to believe the former.

But, either way, what a light it throws on the machinery upon which we still rely for bringing justice into industrial as well as civil relations. As Judge Anderson said, the union was not on trial. Even if this unnecessary misuse of the union itself had been avoided, it was beyond the power of this criminal court to clear up the deeper problems of justice between employer and employee.

That is a larger problem than dynamiting, and it can never be settled by a court or any number of courts, or by any body other than all the people. The people must co-operate for justice all along the line. We must stop the lawbreakers. If necessary, we must put them in jail. But if we do no more than that, we shall have gone no farther toward stamping out wrong and injustice than the doctors would toward eradicating disease if they contented themselves with sending their patients to the pest-house.

The science of criminology aims to discover the causes of crime. It is a valuable and respected science. The average citizen has more in common with the criminologist than he has with the trial court judge. His mental jurisdiction is not limited. A civilized people cannot regard and treat all crimes as individual acts, and never seek to find the causes of crime committed through mass or group action. I have no patience to discuss the question with those who claim recently to have discovered that the causes of crimes of violence in labor disputes ought not to be studied or talked about. If the wrongdoing of capital has been a contributing cause it ought to be known; now, of all times, when the red

herring of labor crime is being so assiduously applied to the trail.

We need to know more of the very things with regard to which the Indianapolis trial has left us so much in the dark—the terms between man and man in industry—between a democratic people and the corporations whose jobs mean livelihood. The Indianapolis trial shows us the failure of a criminal court to supply us with such information at a critical juncture.

My particular criticism of that tribunal is that through one ruling it permitted the prosecution to bring into the record its whole exhibit of the crimes of violence, for which the men were not on trial, while through other rulings it prevented the attorneys for the accused men from introducing such evidence as would have been admissible had they been on trial for those crimes of violence.

Even so, a great public service was performed by prosecution and court. For, when the state and local authorities weakly and shamefully neglected to interfere in a campaign of violence which led inevitably to bloodshed, the United States authorities, through the halting medium of a law designed only to protect the traveling public from ignorant carelessness, uncovered the conspiracy and punished the conspirators.

But the very competence of this criminal court to do this thing shows by contrast the ineffectiveness of any agency we now have to get at an understanding of the facts and forces of the economic struggle which lay back of that conspiracy. This very lack is what gave occasion to the movement for a Commission on Industrial Relations which would take up the larger aspects in ways commensurate with their importance and with their neglect. The Indianapolis trial has thrown this need into bolder relief.

For one other thing the trial accomplished. It showed unmistakably that there is a disease in the land. It did not fully reveal its nature, and it showed only one aspect of its ravages. There is another aspect. We shall not be free from its pestilential advance until we shall have found the source of it and made it clean. And that is the real lesson of the dynamite case.

# SOCIAL WORKERS AND LABOR VIOLENCE

FABIAN FRANKLIN

[At the request of THE SURVEY, Mr. Franklin sets forth in a single article views that have been expressed by the New York "Evening Post" in its editorial columns on various occasions. The Indianapolis convictions seemed to offer an exceptional text for bringing them together, so that social workers might have the preaching as a whole before them. Mr. Franklin has been associate editor of the "Evening Post" since 1909, and was editor of the Baltimore "News" from 1905 to 1908. Previous to that he was professor of mathematics at Johns Hopkins University, but had also frequently written on economic and political subjects.—Ed.]

THE exposure of the McNamara dynamitings a year ago brought out a great explosion of feeling on all sides. The conviction of thirty-eight labor men by the promptly unanimous verdict of the Indianapolis jury the other day was an event fully as extraordinary, and yet it has been received with a tranquillity in striking contrast to the agitated emotions of a twelve-month ago. That the effect of the convictions will none the less be profound and lasting is unquestionable. Precisely what that effect will be upon the trade unions themselves time alone can tell; but there ought to be no doubt of the impression which it should make in the ranks of social workers and among sober leaders of humanitarian opinion. Surely this outcome of a most extraordinary case is of sufficiently striking character to deserve the most serious attention of such men and women, and to cause them to ponder well the question of their own duty in the face of that ever-recurring issue of which these dynamitings furnish merely an unusually conspicuous illustration.

The attitude of social workers and other sympathizers with organized labor toward the question of strike violence has of course, except in the case of avowed advocates of a revolutionary program, never been that of explicit approval. In the case of a large, perhaps a predominant, portion of this body, however, condemnation of such violence has been rare, and what little there has been has been distinctly perfunctory. The explanation of this phenomenon is doubtless of a two-fold character. Sympathy with the hardships of the workers, and even resentment at the shortcomings or the inhumanity of employers, would not of themselves have sufficed to make an attitude very like acquiescence in crime comfortable to these men and women. If they had been insistently confronted again and again with a clear and undeniable identification of the strike with the crime, they would have been bound to face the issue, and there can hardly be a doubt of the position they would have felt compelled to adopt concerning it. But they have formed the habit of

taking refuge in the obscurity in which the facts in any given case are enveloped; and although decades of experience, and hundreds upon hundreds of strikes sustained by violence, have furnished cumulative evidence of the true state of the case, they seem to have felt themselves absolved from the duty of speaking out on it in a way befitting the gravity of the issue.

The Indianapolis convictions tell us nothing especially new; what they do accomplish is to remove such little excuse as may have heretofore existed for this know-nothing attitude. The customary position of labor leaders, when violence occurs in connection with a strike, is that the violence is done by irresponsible persons and that to hold organized labor responsible for it is a gross injustice. In this very matter of the dynamitings, this was the position taken, first in reference to the McNamaras and then in regard to all the labor leaders except the McNamaras. The verdict of the jury has done away with all that. But in a thousand other cases what may not be susceptible of legal proof is sufficiently evident to any man of common sense. The responsibility of the union for violence may be infinitely less deliberate, and may indeed consist simply in refusal to discourage or discountenance lawlessness, but the responsibility is none the less real. Henry White, formerly president of the Garment Workers' Union of the American Federation of Labor, writing in the *World's Work* from extensive experience, says:

"Responsibility for disorder I put on the leaders. It was my observation that violence could be stopped when the officials really wanted it stopped; but such instances were exceedingly rare, so rare as to be worthy of public notice. Yet it was the leaders' habit loudly to disclaim sympathy with disorder and especially at respectable gatherings. I never knew such disclaimers to be accompanied by the disciplining of followers for beating scabs. On the contrary, when arrested, these members were always defended by the union's counsel and, when convicted, the fines were paid and every effort, political and otherwise, was made to save them from punishment. It was highly important that 'martyred'

brothers be protected. Expenditures for such purposes were a heavy drain upon local treasuries, and not infrequently the national union office was asked to contribute. A class of lawyers grew up that specialized in defending assault cases for the unions, and it was well known that one duty of these practitioners was to advise clients how 'entertainment committees' could operate with the least risk."

This, to be sure, is only a bit of reminiscent writing, but does anyone seriously doubt its truth? And occasionally there comes a naïve confession in the very midst of a strike, and almost in the same breath with an indignant protest against the interference of the officials of the law. "You can say for our council," said Mr. Ashton, the leader of the garbage men's strike in New York in November, 1911, "that if there is a disposition to credit the cessation of rioting to the use of police clubs, the public is fooled. Rioting has stopped because our council has ordered it stopped to show that we are law-abiding citizens." And yet this same leader was complaining that "the whole power of the police is employed against us," and doubtless many well-meaning men and women regarded this as a cruel hardship.

Nor is silence the only offence with which many of these good people may be charged. Having shut their eyes to the lesser things that are going on all the time, they are apt to be thrown into a state of hysterical excitement when a great and spectacular crime on the part of organized labor is suddenly brought to view. This is what happened in the McNamara dynamitings. "The workers have been driven until at last even they are turned," exclaimed the secretary of an important association for labor betterment, writing in *THE SURVEY*'s symposium on the McNamara case. And he went on to talk as though labor violence were a new thing under the sun, and to predict that we were now going to have more and more of murder and arson unless we quickly mended our ways, using language so extreme and inflammatory that no labor man could read it without feeling that it justified every act of lawlessness which might be committed in the name of the cause.

This utterance, to be sure, was an extreme and not a typical one. But the idea that in point of fact labor violence had entered upon a new stage with the McNamara dynamitings, and that those responsible for them must be treated rather as a belligerent power than as individuals who had offended against the criminal law, was so widely expressed that we believe it is correct to say that it was the dominant note in philanthropic circles. And yet the Molly Maguires, the railroad strike of 1877, the affair of the Chicago Anarchists, and the 1894 trouble, which

seemed to portend almost a civil war, are not so far back in the past as to excuse serious persons for being swept completely off their feet by the fact that a series of structural steel dynamitings had been planned and executed by a set of labor-union conspirators.

There is one more count in the indictment which can hardly be omitted. Not content with fighting shy of the issue as long as possible, nor with the magnification and distortion of it under the influence of sudden excitement when it is dramatically forced to the front, our humanitarians frequently indulge in a kind of comment which, so far as its practical effect upon the general mind is concerned, operates as a defence, or at least a very effective palliation, of labor violence. Perhaps the most effective possible way to dull the edge of indignation, to promote a feeling of tolerance for crime, is to point out that some other thing which is not branded as crime is, either in point of moral baseness or in point of aggregate evil effect, worse than the crime under consideration. One of the clearest-headed of our moral teachers, while emphatically declaring that the dynamitings were "not war but murder," so far yielded to the prevailing weakness as to dwell on the fact that "the number of lives blotted out in mines by the criminal carelessness of capital is far greater than the number of deaths from the placing of dynamite bombs," and that "the railroads every year are killing people whose lives would be spared by expenditures for safety devices." The thing is true enough, but the very time *not* to say it is the time when enemies of law and order have flung down such a challenge to the sober citizenship of the country as that of the McNamara dynamitings. We have got to do all we can to stop the sacrifice of lives in mines and on railroads and in factories—yes, and in kitchens and nurseries and school rooms, for that matter. But these are tasks for the steady work of reformers and legislators and administrators and scientists, part of the uphill work which mankind has been doing for ages and will have still to do for ages yet to come. To class this kind of thing with the upholding of those primal laws on which the safety of society absolutely rests, and has always been acknowledged to rest, is a most dangerous darkening of counsel.

That opponents of labor unions are guilty of faults equal to those that can be charged against their advocates I would not for a moment deny. There are those who are blind to the sins of capitalists and who are swift to cover with indiscriminate condemnation everything that emanates from the labor side. There is abundance of wild and intolerant language in

capitalist organs. But surely no man or woman enlisted in the work of social betterment can regard unfairness or extravagance or blindness on the part of "reactionaries" as in the least justifying the commission of like faults by themselves.

It is impossible to deal frankly with the situation without taking into account another factor in its psychology. There is a consideration in the case which puts a severe strain on the loyalty of many persons to the cause of law and order, though they would hardly acknowledge so much even to themselves. This consists in the notion that after all it is only with the aid of violence that the grievances of the workers can actually be redressed. That the immediate facts of many individual strikes lend support to this belief it would be idle to deny. But upon those who with serious mind are working for substantial and lasting benefit to the masses of mankind rests the duty of taking a longer view—of looking not to immediate and superficial results in isolated cases, but to the enduring effects of any policy or course of conduct. Every victory won for labor by means of violence is won at a cost not only to society at large but to the cause of labor itself, which ought to be evident to any sober thinker. Within the ranks of the labor organizations it is sure to strengthen the hold of the less sagacious, as well as the baser, elements in their composition. Upon the outside public it has the effect of associating the endeavors of organized labor with acts and purposes intensely abhorrent to the most solid elements in the community. No one can estimate in what measure the growth of a public sentiment friendly to the aspirations of the working people for every kind of betterment in their condition has been retarded by this instinctive association of the idea of unionism with the idea of violence. And it must be a very unimaginative person indeed who should venture to assign a limit to what might have been accomplished by the pressure of public sentiment had its growth not been thus retarded. What is thought on this subject by the ablest and most devoted champions of the cause of the working people may be judged from this passage on the relation between trade unionism and violence in Sidney and Beatrice Webb's *Industrial Democracy* (1897):

"But the whole controversy as to violence and intimidation, in connection with trade unionism, has really passed out of date. The serious crimes which disgraced the workmen's combinations in Dublin and Glasgow at the beginning of this century, and which lasted in Sheffield down to 1867, have been for many years entirely unknown. Individual workmen still commit assaults when their blood

is up, in connection with trade union as with all other disputes. So far as trade unionism itself is concerned, we do not think that any fair-minded student would hesitate to conclude that, especially for the last thirty years, so far from inciting to or causing crime, it has exercised a wonderful restraining influence. The more strongly organized is the union, the more efficacious is this influence for peace. The most powerful unions of the present day, the most exacting in their demands on the employers, have gone a stage further, and have laid aside the whole system of picketing, with its intangible annoyance and easy transition into breaches of public order. In the great five months' strike of the cotton-spinners in 1893, and in the gigantic stoppage of the Miners' Federation in 1894, practically no pickets were posted or needed. 'It is not worth the risk, trouble, or expense,' writes a leading trade union official, 'of resorting to the practice. . . . Every wage-earner is able to read and write, and discern the difference between right and wrong; and with the assistance of the public press a full knowledge can be gained as to the reasons why a strike takes place. Hence no one is required to hang about a workshop where a strike is going on for the supposed purpose of giving information to persons who may desire to apply for work on the employer's conditions'."

And in our day there is less excuse than ever either for violence or the countenancing of violence, since the extraordinary increase in the number of men and women of the well-to-do classes who are devoted to the work of social betterment makes possible a far more effective appeal to the sentiment of the community, and even to its material support, than was ever the case in former times.

The sympathy of these men and women, their readiness for self-sacrificing effort, the value of their support and assistance, are well understood and prized by the labor people. They are accordingly able to exercise great influence on the course of events, and upon them rests a corresponding responsibility to use that influence to the best possible purpose. Let them make it plain that the sympathy which they are so ready to give is absolutely conditioned on the law-abidingness of those to whom it is extended. Protest and warning from such friends would be more efficient to prevent lawlessness than any amount of condemnation and menace from those whom labor people look upon as hostile or at best indifferent. Such a position unmistakably taken and firmly adhered to by workers for economic reform and social betterment would immeasurably strengthen the hands of the best elements within the unions, and could not fail gradually to build up a consistent policy of law-abiding endeavor, in place of that all-but-avowed alliance between lawful effort and

infamous criminality which has formed so conspicuous a part of the history of organized labor in this country.

Surely the time has come for deliberately and manfully making choice between this clear-cut, humane, and far-seeing policy and continuing in the nondescript course that has hitherto been followed. Instead of either ignoring, or evading, or beclouding the issue, let it be squarely faced. The simple responsibility of loyal upholding of the law, taken in itself, should surely be felt by these men and women in at least as high a degree as it is by good citizens generally. But if this be insufficient to key them up to the required point, a just consideration of the interests for which they are most concerned should impress this duty upon their hearts and minds. Let them consider the splendid opportunity which the coming years open up for them if they will but steadily keep their endeavors upon that high plane on which they ought to rest. Let it be known to labor men

and to the general public alike that these workers are not only animated by high and unselfish purpose, but are controlled by firm and sober thought. Let it be known that they will not rashly countenance every strike, but will duly judge of its justification and expediency. Above all, let it be known that they will under no circumstances give countenance to violence, but on the contrary will sternly visit upon it the penalty not only of condemnation in words, but of withdrawal of their sympathy and support from the contest in which it is enlisted. What a vista of steadily growing power and influence the adoption of such an attitude would open up—influence to restrain evil tendencies in the unions; power to impress the public at large in a way that is impossible so long as they lie under the imputation of a weak emotionalism; and, last but not least, the consciousness of playing a truly great, because a strong and consistent, part in the world's struggle with one of its largest and most difficult problems.

## A. F. OF L. AND THE IRON WORKERS

SAMUEL GOMPERS

*[On Monday, January 6, Samuel Gompers, president of the American Federation of Labor, appeared before the sub-committee of the United States Senate which is considering the Clayton anti-injunction bill, and made a statement of the attitude of his organization toward the convicted members of the Structural Iron Workers' Union. The following is a condensation of his remarks, taken from the A. F. of L. Weekly News Letter.—Ed.]*

**W**ITH the understanding mind and the spirit taught by the teacher of old who said, 'Let him who is without sin cast the first stone,' I would have you consider these men now pilloried by public opinion and adjudged by the court guilty of crimes against society and humanity. I would have you ponder how it is said that among people professing to believe in the brotherhood of man and the gospel of love, men, American citizens, came to look upon violence, dynamite, terror, as the only defense left them against the grinding, conscienceless tyranny of those controlling hours, wages, and conditions of work. That is a terrible charge against society.

"There are many ready to heap upon the structural iron workers, not alone the men adjudged guilty but every member of their union, condemnation and humiliation; many ready to wrap the robes of saintly justice tightly about them, lest contact defile them; ready to withdraw from these men every good and uplifting influence and to cast them out to the mercy of whatever interest might profit by their helplessness.

"And as to these who counsel harshness and deny mercy—are they the men who have fought the fight in the world of men and conquered without blemish to themselves? Are they men who know the world of work and toil, who have

felt or know the powers pitted against the weaker elements, who have felt or know the cruelty and heartlessness of the world of profits, where men succeed by climbing over and standing upon those they have struck down and defeated? Do these self-appointed censors, so positive and assured of their own virtue that they hesitate not to judge fellow-men, really know this world of toil and fight; have they themselves been a part of it and prevailed over it?

"These men who are accused of doing these grievous wrongs, of waging a warfare dishonorable and reprehensible, thereby inflicting upon all the workers trouble and heartaches—what manner of men are they, and what is their life? Turn to the great cities whose growth has been one of the striking characteristics of the past sixty years. In those cities marvelous structures seem to stretch upward, almost touching the cloudland, expressing the infinite ambition of men—structures overwhelming, well-nigh unbelievable in conception and execution, reaching upward twenty, thirty—yea, more than fifty—stories, and downward into the depths of the earth. Or turn to the mighty, yet exquisitely delicate, structures spanning rivers and chasms, that the forces of civilization may conquer every barrier—the bridges, the great engineering achievements in the heart of civilization or in the lone places of the earth. Watch one of these

constructions in the process of erection—the iron skeleton as it rises skyward, the frame about which building materials are to be gathered and fashioned. As the girders and separate pieces are lifted into position, watch the workers moving along narrow places, boldly poised on perilous, dangerous heights, securing bolts and rivets. Watch the human worker as he stands on an iron skeleton of a building thirty stories up from the earth's security and he lifts his head upward—there is nothing between him and the vast, bare expanse of the heavens. As he looks out upon the city, the handiwork of his craft and his fellow-workmen, and down, down into the narrow passageways below, there tiny, specklike men scurry to and fro like ants occupied with little plans and business. Then ponder well—what manner of man is this builder of our modern civilization? He lives a bold, open life; his very breath is danger and conquest.

\* \* \* \* \*

["Officers in various corporations which alone (the American Bridge Company) were unable to destroy the organization of these workers banded themselves together as the National Erectors' Association, and under the banner of the most implacable of labor's foes, the National Manufacturers' Association, and backed by the United States Steel Corporation, declared war to a finish upon the Structural Iron Workers' Union of America."]

"For six years the fight went on. All of the forces of organized society were used against these men; subtle minds were scheming and plotting that legal authority and practice might aid in the breaking of these men. You say that these men resorted to forbidden methods of violence, and even sacrificed lives. You condemn their methods of fighting as elemental, brutal. Of any of those who are guilty, the condemnation is true; but I ask you, were the methods used by the employers less deadly to humanity and freedom? Do you think that one side can play with the forces of injustice and tyranny and not lead to a defensive move on the part of the other? Each will protect his own interests—would anybody else do that for him? Indeed, our very social organization seems to be on trial. And how little does society understand. Even the judge who tried the case, smugly assured of personal irresponsibility, fatuously declared that—

"The evidence in this case will convince any impartial person that government by injunction is infinitely to be preferred to government by dynamite."

"The worthy judge had blindly chanced upon one of the causes, but had failed to realize causal relationship. The words to him were simply a conventional epigram. He does not know that there is a law of life just as immutable as the law of gravitation; of attraction and repulsion; a law of life which meets tyranny and injustice by resistance. The inaptness—aye, the unwarrantable character of this utterance of the judge—discloses how far afield outside of the case he went to take another slap at labor. If ever the time

shall come (and let us hope and work that it never shall come) when government by dynamite shall be attempted, it will have as its main cause the theory and policy upon which is based government by injunction—personal government foisted upon our people instead of a government by law.

"Just what is the social interpretation of the alleged crimes, the trial, and the conviction? Whether or not there was a conspiracy to do violence by some labor men, is there any doubt that there was a conspiracy by 'big business' to disrupt organized labor? Concede, for the sake of the argument, that the convicted men are guilty—and I earnestly trust that their appeals may be successful and upon a new trial their innocence may be demonstrated—but are the monster industrial corporations and hostile employers' associations guiltless of conspiracy to destroy the labor organizations, thereby rendering the workers helpless to the death-grinding process in which so many industries abound? Let me read you a resolution passed by the United States Steel Corporation's executive committee on June 17, 1901, six weeks after that corporation was organized, and which the president of that corporation was instructed to instruct the presidents of subsidiary companies to enforce. It is as follows:

"That we are unalterably opposed to any extension of union labor, and advise subsidiary companies to take firm position when these questions come up, and say that they are not going to recognize it—that is, any extension of unions in mills where they do not now exist—that great care should be used to prevent trouble, and that they promptly report and confer with this corporation."

\* \* \* \* \*

"Will organized labor repudiate the Structural Iron Workers' Unions and leave them helpless and at the mercy of organized capital and insatiable, uncurbed greed for profits? Such a course might win the praise of the pharisaical and unmerciful good, but those with the love of humanity in their hearts will join in the pledge to sustain and strengthen the Bridge and Structural Iron Workers' Unions.

"Men cannot hold a place of responsibility and trust; men cannot be in positions to exert great influence for the welfare of those intrusted to their keeping without incurring opposition and encountering temptations to betray the trust. But the man who would neglect, pervert, or betray; who would do aught but give the best that is in him to protect and advance the rights and interests intrusted to him, in order to secure his own ease, protection, and advancement, is unworthy of confidence or respect. Though detectives may hound us, though threats be hurled at us, though charges and insinuations assail us from all sides, yet will we fight on for the liberty and betterment of those who do the world's work, and pay the price of our civilization with their blood and bodies—yea, verily, with their very souls. Men who would ease the

*weltschmerz* must not fear criticism and opposition, prosecution or persecution.

"Though all censure those whom men may deem guilty of dynamite conspiracy, none feel the terrible consequences of the Indianapolis trial more keenly than the men of organized labor. There have been added heartache and sorrow to our already heavy burdens. The men accused and sentenced cannot suffer the penalties alone—upon them and all workingmen fall the suffering and penalty. But what of the conspiracy of organized capital—the conspiracy to murder the liberty of the toilers, to tear from them the means of protection by which they have bettered their condition, to leave them bare and defenseless in the competitive struggle? Is

not such a conspiracy sufficiently dastardly to incur some odium? Should the conspirators, with their hands stained with life blood of men's ambition, happiness, liberty, be accorded nothing but honor, power, respectability? Should they be allowed to continue to manipulate the powers of government, the administration of justice until the oppressed find the burden intolerable? More wise it is to seek social justice while yet we may. The judge who presided at the trial realized one of the issues—government by injunction, lawless, autocratic, irresponsible exercise of governmental authority, according privileges to the strong and denying justice to the weak."

## THE PARTING OF THE WAYS IN AMERICAN SOCIALISM

MARY BROWN SUMNER

*[This is the first interpretation, outside of the party periodicals, of the struggle now at its height, between the dominant element of the American Socialists and the insurgent industrialist wing. The writer is an industrial Socialist, and while giving a fair analysis of the points in controversy, endeavors to set forth the less understood program of the newer group. Their direct and widest appeal is to the unrest which is astir among common labor throughout the world; and however one may regard their revolutionary philosophy or their fighting tactics, it would be a dull observer who failed to see that this ferment in the lower levels of industry is bound to affect not only the Socialist Party and the old line trade unions, but the structure of civil society itself, by shifting to a greater or less extent from geographical divisions to those of industry.—Ed.]*

WITH the Socialists alone of political parties the recall is a reality. The present month they are torn in a bitter struggle over its application to William D. Haywood, a member of the national executive committee.

Any three state committees of the Socialist Party can cause a referendum to be taken to the full party membership if they believe that a national official has failed to support the principles of Socialism. In Haywood's case the recall was initiated December 14 by local New York, which at the same time recommended to the Denver local of which he is a member his expulsion from the party. The referendum was called for by New York, New Jersey and the District of Columbia. The voting will be closed February 12.

This action directed against the fighting leader of the "industrial Socialists" in the United States brings to a head efforts which have been made for some time past to suppress an insurgent movement in the Socialist ranks. It is an exemplification in America of the lack of harmony observed in many countries between, on the one hand, the international Socialist movement, which in its political campaign has tended to pin its faith to the ballot box, and, on

the other hand, growing labor groups which, with the mass strike and other class conscious tactics, would promote revolution through the work shop.

England, France, Spain, Italy and America have each, in the last few years, shown signs of this movement, which has been called by its exponents the "coming of age" of labor, on the ground that it is an uprising not of leaders but of the masses thinking for themselves. The bearing of the Socialist Party toward it has been commented on by such observers of social phenomena as Werner Sombart, Gilbert K. Chesterton and Hilaire Belloc. Within the party membership the Hungarian, Odon Porri, writes of it as follows:

"The new class consciousness of the workers . . . is eager to manifest itself, and wants to enlarge the activities of the Socialist movement. This movement has done its part to bring this about by education, but the traditional methods of Socialist parties are in conflict with the new methods of the workers."

In every country some members have left the party for this reason, and in every country also, a minority within the party has fought for the new tactics.

*Industrialism in America*

In America, the struggle has centered about William D. Haywood, and there are chapters in his experience which throw light quite as much on why revolutionary industrialism has found soil and spread in the New World, as on why this transplanted New Englander, a pioneer with generations of pioneers behind him, came to be its leader. To the general public Haywood is widest known in connection with his trial and acquittal in 1906, together with Moyer and Pettibone, for the murder of Ex-governor Steunenberg, following the labor war in Colorado. What is of more significance in an understanding of the philosophy of the present struggle in the Socialist Party is the fact that the Western Federation of Miners, of which Haywood was secretary, was the earliest and most formidable of the industrial unions we have had in America; and the added fact that he is a pioneer member of the Industrial Workers of the World. This body, since its organization in the Middle West in 1905, has represented the same causes and has carried them east and west to the coasts.

The trend toward industrial organization is natural in the mining regions, where the whole life of a community is bound up in the one occupation. Even in the anthracite districts all the men in the pit, skilled and unskilled alike, are organized together. The western miners made mass unionism, class unionism; and avowed economic revolution as their goal. They saw more chance for controlling their own lives through acting together as organized laborers than as citizens. The I. W. W. has spread largely among groups who have still less of a foothold in political life—the migratory voters: lumbermen and railroad construction gangs of the Northwest, the disfranchised Negro timbermen of Louisiana, unnaturalized immigrants and voteless women and children of the textile districts.

It is to the lower levels of all industries that industrial unionism makes its appeal, to common laborers who have been left to sink or swim by the old craft organizations, but whose numbers have been swelled to an unheard-of bulk by the introduction of machinery and through immigration. In certain organizations, such as the United Brewery Workers and the United Mine Workers, the form of union has responded to this changed situation; all men in the trade have been admitted to a common membership. At the recent Rochester convention there was a determined effort by a minority composed both of Socialists and non-Socialists to spread this scheme of organization to other fields.

The program of the I. W. W. is, however, not one of form merely. It aims at a larger unit than the single industry. In its class warfare it uses sabotage as well as the mass strike, and refuses to countenance time contracts—which will bind the workers from striking again and again—or any of the other conservative methods in dealing with employers which are accepted by craft and industrial unions alike in the American Federation of Labor. In the industrial field it long since incurred the enmity of that organization. It has now come in the person of Haywood to a clash with the dominant element in the organized movement which, in the political field, is striving to accomplish the same

*Courtesy of the Metropolitan*

WILLIAM D. HAYWOOD

revolutionary purpose as itself.

During his connection with the Western Federation, Haywood joined the Socialist Party and attempted, according to a former secretary of the Colorado state committee, to organize it along the lines he had found effective in his union. In 1911 he was elected a member of the national executive committee of the Socialist Party. It is significant that while the effort is on to oust him from his standing in that party, for what are regarded as "industrialist heresies," among the voteless majority in the I. W. W. he is regarded as conservative for retaining his membership in the Socialist Party.

### *The Charges Against Haywood*

The specific charge on which Haywood's recall and expulsion from the Socialist Party were recommended on December 14 was that in a speech delivered in New York on December 1 (it was at a mass meeting for Ettor and Giovannitti following their acquittal at Salem)—he repudiated political action and advocated sabotage in violation of Article II, Section VI of the party constitution.

His advocacy of sabotage was in so many words.

His repudiation of political action is assumed from his statement:

"I have never asked a worker for his vote—particularly women, children, the disfranchised and the foreign-speaking workers. Instead I have taught them the class struggle."

At another meeting, later in the same week, and before the charges were filed, Haywood said: "I do believe in political action, because it gives us control of the policeman's club." In answer to a question, he added that political action was of great educational value to the workers. In making the charges of December 14, these later statements in support of political action were entirely disregarded.

To understand the case against Haywood, it is necessary to go back over the steps of a controversy which began with a discussion of tactics and has led into the basic principles of social revolution. In the fall of 1911 Morris Hillquit, member of the national executive committee, and recognized leader of the majority group, the so-called "political actionists" in the party, criticized the tactics advocated by Haywood in the following passage in his pamphlet on Industrial Socialism:

"When the worker, either through experience or the study of Socialism, comes to know this truth (the economic foundation of modern ethics and jurisprudence) he acts accordingly. He retains absolutely no respect for the property 'rights' of the profit takers. He will use every weapon which will win his fight. He knows that the present laws of property are made by and for the capitalists. Therefore, he does not hesitate to break them. He knows that whatever action advances the interests of the working class is right because it will save the workers from destruction and death. A knowledge of economic determinism places the worker squarely on his intellectual feet, and makes him bold and independent of mind."

This outline of the workers' attitude toward capitalist law Hillquit maintained to be diametrically opposed to the accepted policies of Socialism. Said Hillquit:

"Socialists do not advocate law breaking or the use of 'any' weapons in the working-class struggles. We maintain that modern law is in

the main class law, capitalist law made to enslave the workers, and we urge a complete change of the juridical system along the lines of the Socialist program. But we advocate the introduction of such change by the regular and lawful methods established for the purpose. To preach to the workers violence and law breaking is ethically unjustifiable and tactically suicidal. The laws of political democracies, in the last analysis, always represent the will of the majority of the people. The remedy of the minority aggrieved by the law is to convert their fellow citizens to their views—to turn their minority into a majority and thus get possession of the legislative machinery for the interests and policies represented by them. Whenever we obtain control of the legislative machinery of the government, we will exact obedience to our laws upon the same grounds upon which we now yield obedience to capitalist laws."

This orderly conduct of the class struggle without infringement of the law has been, Hillquit maintained, the policy of the international Socialist movement since its inception. The tactics advocated by Haywood were, in his estimation, the use of crime and violence. He modified his statement in regard to the orderly legislative methods by which Socialism could be furthered, however, by saying:

"It is not impossible that before we reach the final stage an attempt will be made by the ruling classes to frustrate our victory by force—in that case we will fight like tigers, and mount the barricades, if need be. But then we will be fighting not as a mob of lawbreakers, but against such a mob."

As this question of tactics comes up later on in the dispute in more detail, the statements of the two divergent schools of thought can be left to speak for themselves for the present.

### *Socialism and Labor*

It was at this juncture that Haywood accepted nomination to the national executive committee of the Socialist Party and published a letter in the *Call* which contained a statement of his beliefs in regard to the proper relation between Socialism and labor.

It should be known that the party has laid down a so-called neutrality principle to the effect that, while assisting the workers in all their industrial struggles, it would refrain from participating in, or in any way interfering with, the internal affairs of the labor unions, and further that it would preserve an impartial attitude toward rival labor organizations. In spite of the statement of neutrality, it was well recognized that while all Socialists believe in theory that organization by industries is the only form fitted to modern industrial conditions, the political actionists have favored active co-operation with craft unions for purposes

of vote getting, and claimed that by continuing their method of "boring from within," they could also ultimately remold them into the industrial form. Thus it has been that while Samuel Gompers and other prominent union officials have attacked Socialism, Victor Berger, a political actionist, long since became the leader of a growing minority of Socialists in the American Federation of Labor.

With the rise of the I. W. W. the industrial Socialists just as frankly stood for co-operation with the new organization and this not only on the ground that the majority of the craft unions have no place for the craftless, unskilled workers who make up nine-tenths of the wage-earners. They held furthermore that the craft unions are in effect undemocratic and are often in the control of conservative or corrupt leaders who would stand in the way of their remolding; and that even in those cases where industrialism could be introduced, it would be a matter of the form of single industries alone. The unions would have neither the spirit nor the form of revolutionary organizations of the whole working class.<sup>1</sup>

But the divergence in the two conceptions reaches even deeper. To the political Socialists, the form of the unions is comparatively insignificant, as they believe them to be mere temporary bodies which will pass out of existence with the coming of the co-operative commonwealth. To the industrialists on the other hand, unions of the mass of the workers organized like the I. W. W. not only present the most effective engines for the class struggle today, but they are conceived of as the component parts in building the industrial commonwealth of the future. In their view, therefore, if either the form, the framework, or the spirit of the older unions remained, the coming of Socialism would be impeded.

### *A New World Development*

Some French syndicalists have held that the craft form of their organizations is an impediment, but for the most part in European countries at the present time it has been thought possible to attain revolutionary class solidarity in the industrial field through the existing craft unions. This attitude of the American industrial Socialists, therefore, is a distinctive New World development.

In his letter of acceptance, Haywood put their challenge. He charged that the party had not observed its professed neutrality and that there were "members vigorous in their efforts to co-operate with the decadent craft unions." He continued:

<sup>1</sup>The two concepts may be distinguished by the terms industrial unionism and revolutionary industrial or revolutionary class unionism.

"The Socialist Party being a working class organization, it is my belief that our purpose will never be fully achieved until we carry to the working class the message of industrial unionism, which means that the productive workers shall be organized as the capitalists have assembled them in the industries. Therefore, the work of the national committee and the national executive committee of the Socialist Party should include the education of the working class to the end of industrial as well as political solidarity."

In spite of this outspoken statement of his views on the relations of Socialism to trade unionism, Haywood was elected to the national executive committee, his vote being next largest after that for Berger and Harriman in the vote for the seven members. It was larger than that for Hillquit, or Kate O'Hare or Irvine or Spargo.

In March, 1912, while Haywood was in charge of the Lawrence strike, the central committee of Local New York carried a resolution calling for his recall. The branches rescinded this action of their delegates, however, and the motion was withdrawn. The attack on industrialist tactics and theory was thus postponed.

It was felt that the great struggle at the presidential nominating convention in May would be upon the attitude of the party toward the labor movement, both with regard to party activity on the industrial field and to its neutrality toward the rival labor organizations.

Both groups were represented on the Committee on the Relations of Labor Organizations to the Socialist Party. To everyone's surprise a report was handed in by this committee espousing neither labor body to the exclusion of the other. This report was a change from those of former years, in that it gave up that part of the neutrality principle by which the party refrained from taking part in the internal affairs of the unions, and undertook a campaign to urge the unions to organize the unskilled workers and to throw their doors wide open by abolishing onerous conditions of membership and artificial restrictions. The struggle of the Socialists for an industrial form of organization at the recent convention of the American Federation of Labor<sup>1</sup> may be regarded as in part an outcome of this resolution. There is no doubt that it was the "menace of industrial Socialism" which caused the majority group to enlarge their activities to this extent in the industrial field.

Haywood congratulated the convention on the fact that he was by this report given the right to preach organization on the economic field from the platform of the Socialist Party. He was not, however, as the event showed, to have the right to preach the sort of industrial organization which he believed essential.

<sup>1</sup>See THE SURVEY, December 7, 1912, p. 271.

### *The Amendment and Those Back of It*

The report of this committee was followed by a direct attack by the convention on the revolutionary industrial unionism which he represented. The political Socialists wished to re-affirm their belief that Socialists should advocate in their struggles none but the orderly legal methods outlined in Hillquit's letter quoted above.

Therefore the following amendment to the constitution was introduced:

SEC. VI. Any member of the party who opposes political action or advocates crime, sabotage, or other methods of violence as a weapon of the working class to aid in its emancipation shall be expelled from membership in the party. Political action shall be construed to mean participation in elections for public office and practical legislative and administrative work along the lines of the Socialist Party platform.

This will be seen to do two things: it defined and sanctioned political action; it made a concrete statement of those extra-legal tactics which in the belief of the political actionists were meant by that passage in Haywood's pamphlet already quoted, in which he advocated "any and every means" as methods of warfare. These it banned. It was by the reference to sabotage, which the I. W. W. alone of the two groups of unions advocates, that the amendment made a specific attack on that organization.

The amendment was passed by a two-thirds vote of the convention, and subsequently by a two-thirds referendum vote of the party membership. Since the passage of the amendment, its opponents have attacked it, not only on the controversial grounds set forth in the succeeding pages, but on the ground of illegality, as both the amendment and a substitute were passed by a majority vote. Only one-fifth of the party membership took the trouble to vote on this important question.

The grounds of the two-thirds vote for the amendment are ably presented in the passage from Hillquit's letter (p. 625). In the opinion of those who voted for it, crime, violence and sabotage are ethically unsound and tactically suicidal. The ethical grounds on which the advocacy of crime and violence was opposed are obvious.

On the score of tactics the argument against them is well presented by a letter from the German Socialist, Karl Kautsky, based upon the experience of the German Social-Democratic movement. Reasoning from the other side of the water, and basing his argument on the statement of the case given him by the supporters of Section VI, he held that tactics such as those intended to be prohibited by that section, are calculated to exasperate the capitalist, and to in-

duce reprisals on such a scale and of such a nature as the party is at present incapable of resisting. Mere exasperative acts can, he held, do the party no good, but only lay it open to serious injury.

The one-third opposition to the amendment does not in reality measure the strength of the industrial Socialists. There were those, for example, who resented the assumption by the party of the right to dictate in matters outside its field. There was also that small following to whom the term "revolutionary political actionists" is sometimes applied, in contradistinction to the "evolutionary" or opportunist group represented by Hillquit. These came to the defense of the tactics, though they did not accept the whole social philosophy of the industrialists.

The opposition pointed out in the first place that many of the supporters of the amendment were careful to distinguish between "advocacy" and "use," thus, they said, practically acknowledging the use of the forbidden tactics in strikes but attempting to get out from under responsibility for them and conciliating middle-class public opinion at the expense of the workers. Practically all the weekly and monthly news periodicals throughout the country later congratulated the party on having attracted to itself the support of public opinion by taking this stand for law and order. The industrialists characterized Section VI as a vulgar bid for such public favor, and called its supporters the "Yellows," themselves the "Reds."

### *Crime*

The opposition objected also to the implication that either the Socialist Party or the labor movement had ever been law-abiding or peaceful movements. Crime, violence and sabotage were the three things tabooed by the amendment. The opposition contended that crime was by the common agreement of all lawyers and criminologists a purely technical classification, meaning the infringement of laws. Both Socialist and labor movements were, they held, born and nourished in crime, in view of the fact that laws had been made expressly to repress them and they had continued to exist only by the breaking of these laws. They instanced the early history of German Socialism, when the party thrived on laws designed to suppress it. They cited the use of local traffic ordinances in American cities today to keep Socialists as well as members of the I. W. W. from speaking on the streets—ordinances which had brought about not suppression, but vigorous free-speech fights. They pointed also to the disregard by the labor movement in the past of laws forbidding the organization of trade unions, to anti-boycott, and anti-picketing laws and the injunction. They held that in the case of all these and of other laws the attitude of

the labor movement toward their violation had never been to consider whether it was ethically justifiable, but whether it was tactically expedient. And they maintained that the history of the labor movement showed that its very existence depended on such law-breaking.

### *Violence*

Opposition to law frequently involves violence. Violence, in the ordinary sense of injury to human life, or wanton destruction, the industrialist does not advocate as a principle; but he does not repudiate the workers, whether of his own or any other group, when they use it in the imperfectly organized industrial struggle of today. To illustrate: the I. W. W. is at present engaged in the defense of a seaman, a member of an industrial union, who, during the strike of the Atlantic seaboard workers, shot a policeman in a street fight. It never repudiated the McNamaras and has criticized the attitude of the Socialist Party toward the structural iron workers on trial at Indianapolis. But in so doing it does not preach assassination or dynamiting.

By far the greater part of strike violence is not, the industrialist says, a matter of advocacy by any group of workers; it is what happens. It has been, and probably will be, an accompaniment of all labor struggles until the principle of solidarity is fully grasped. Until then, he will stand by the workers who take part in it, whether spontaneously or as part of strike tactics. He holds that the riots of the Belgian Socialists, which procured for them the first extension of the suffrage, and the food riots in Budapest, which caused the removal of some of the import taxes, go to show that as tactics today violence is not always "ruinously exasperative."

On the ethical side, the opposition held that as in ordinary warfare the ethical principle of patriotism supersedes that ethics which aims to prevent murder, so in the class war they believed that the ultimate object of the liberation of the workers—and with them the whole of humanity—supersedes any narrow moral obligation toward those who in their view are the enslavers of the workers. Following out further their analysis of the repressive nature of laws dealing with labor in its relation to capital, they held that since capitalist law is nothing but codified brute force, it will inevitably at times engender brute force on the workers' side. They pointed out in this connection Hillquit's willingness to mount the barricades to oppose one form of brute force, but this they held is an outworn view of the class war, as the struggle of today is no spectacular barricade fighting, but the running battle of the workshop.

### *Sabotage*

The two principal weapons which the industrialists look to in that battle are sabotage and the mass strike. These they speak of as the "new violence," and they are the only forms of violence which their philosophy advocates. "The solidarity of labor (the general strike)," says William E. Trautman,<sup>1</sup> one of the founders of the I. W. W., "is stronger than violence and makes destruction of life needless and useless."

Sabotage is a term so new in this country that few people know its meaning; so new even in Europe that it has been applied to all sorts of private acts of vengeance and destruction. It is to make their meaning clear that the French *Confédération-Générale*, in which the practice of sabotage is most developed, specifically exclude injury to persons in their definition of the word. In their philosophy sabotage is not murder. It is not the destruction of machinery. It is the organized hampering of production. This sabotage may accomplish in one of two ways: by the so-called "withdrawal of efficiency" or by the intermittent interference with work. This last would, for example, be practised by workers who quit their jobs for a while, then return to work till the plant is in normal working order, only to withdraw again without notice; repeating this at intervals until their object is attained. The "withdrawal of efficiency" is practised in several forms. One is the minute observance of rules—as is often done on the railroads of France, wreaking havoc with the time table—or the slow and meticulous carrying out of orders from overseers. It may take the form of seemingly inadvertent but persistent mistakes, the misdirecting of packages in the express service, the wrong mixing of materials in some other industry, or the addition of something that will spoil color or taste of the product and make it unsaleable. It may take the form of the removal of a bolt, or other essential part of a machine, so that it is temporarily useless.

Sabotage may be used not instead of, but in connection with the strike, as when miners persuade pump men and engineers to come out with them, and thus leave no force to prevent the flooding of the mines. It may be used again to redeem a lost strike, the strikers on going back to work making reprisals, if only by repeating the same bungling methods at their work as were used by inexperienced strike-breakers; or it may be used in cases where a strike is won if leaders are discriminated against, in order to procure their reinstatement. It is not part of the philosophy of sabotage that it shall be used for purposeless revenge. Destruction of property and

<sup>1</sup>Direct Action and Sabotage. By William E. Trautman. Socialist Publishing Company, Pittsburgh. Price 5 cents.

machinery such as occurred at the beginning of the Lawrence strike, which can only react on the worker by keeping him longer out of work, is specifically instanced by industrialists as characteristic of unorganized workers and in direct contrast to the purposeful methods of sabotage.

Sabotage is the industrialist's active weapon. The "folding of arms" in the general strike is his passive violence.

So, too, is the free speech fight, where inexhaustible armies of men "ride the rods" from end to end of the continent to take their places successively on the soap box, thence to be led to jail without resistance. No labor struggles have on the strikers' side been freer from violence in the ordinary sense than the Lawrence strike after the strikers came under the control of the I. W. W., or the San Diego free-speech fight, and probably no struggles of the last few years have cost both property owners and tax-payers so dear. By stopping profits sabotage and the mass strike represent to the industrialists that arch violence which is most effective against the capitalist.

#### *The Cleavage Over Political Action*

It remains to take up the fundamental difference of opinion between the supporters and the opponents of Section VI in regard to political action. The industrialists criticise the functions of political action as interpreted by the majority, and make their own interpretation.

All those industrialists who retain membership in the Socialist Party believe not only in the ultimate goal of Socialism, collective ownership, but in political action as one of the means to that end. That group of industrial Socialists who believe in industrial action as the exclusive way of revolution, have already left the party. The cry of Anarchism raised against the former group referred not to any abandonment of the principle of political action, but to the tactics of violence and sabotage already discussed, incident to their program of industrial action.

Article 11, Section I, of the constitution of the Socialist Party of America contains the words: "Every person . . . who subscribes to the principles of Socialism, including political action, shall be eligible to membership." This expression, say the industrialists, speaks for itself; political action need not be accepted by a party member as the only, or even as the most important, function of the party, but it must be accepted as one function. So much for principle—as a matter of practice, the tendency of Socialist parties in many countries to more and more pin their faith to parliamentary action is a natural outgrowth of the fact that Socialists have in the last decade more and more got into legislative and administrative office.

The Socialist Party of no other country has,

however, so circumscribed its political activities as has the American party by the definition in the amendment to its constitution already discussed. On the industrial field the party's functions are limited to aiding the workers in their strikes, and, by the amendment to the neutrality clause already discussed, encouraging them to organize on a basis more democratic and better suited to present industrial conditions. These functions must, as far as any statement to the contrary can be found, be purely transient, as in the view of the dominant political actionists, unionism is only a temporary expedient. Section VI limits the political functions, which they regard as their permanent work for the bringing in of Socialism, to taking part in elections for office, and to legislative and administrative activity. With the political function still left them by Section VI the political actionists trust, apparently, to be able to dissolve capitalism and to legislate the Socialist commonwealth into existence. Such an act as Congressman Berger's resolution urging the government to take over the New York, New Haven & Hartford Railroad suggests in piecemeal what they would propose to do wholesale, with the ultimate result that the people as a whole would own the means of production. The industrialist's criticism is that their program includes no outline of an administrative or legislative system which is convincingly different from the state whose dissolution they desire, except that profit, interest and capitalist control are to be abolished. The Socialist state, as conceived by the political actionists, would apparently be ruled by a political legislature, as now. They put forward no constructive scheme by which the workers in the various industries could control their own conditions. These would have no rights except as citizens of the state.

#### *Industrial Action*

To the industrialist such a system would be an intolerable bureaucracy, from which the most that the worker could expect would be the "same physical care that is given to working cattle." The only means by which the worker can in his opinion gain self-government, and with it manhood, is by having the right to control the conditions under which he works. Furthermore, as the workshop and its conditions are intimately known to him, while the ballot and the whole political machinery are a bewildering mystery and one that seldom touches his life, the industrialist believes that this control of industry would be the only true and practical democracy. On the democratic foundation of organized self-governing industries he would build an industrial commonwealth whose central body—the "one big union," as phrased by the I. W. W.—would be

the machinery by which the industries would regulate their relations to each other.

The Socialist commonwealth which the industrialists aim to create cannot in their view be legislated into existence through the machinery of the present state. Nor do they consider palliative legislation, "immediate demands," an important function of political Socialism, except as they think that the menace of the Socialist vote will force palliatives from the capitalist parties.

They hold that an even greater pressure in this direction will come as a reflex from the workers' "direct action" at the point of production—their "immediate demands" on the industrial field, backed by the strike. They believe that the pressure in this field will often even gain for them from the legislatures some such recognition of their basic demand for the fruits of their labor as the British miners' minimum wage, and they point in contrast to the fact that an attempt made to obtain a minimum wage law (males) through the "legislative activity" of a labor member of Parliament about a year before the miners' bill, was killed.

In the main, the workshop and not the legislature will, in their estimation, be the place where, by enforcing progressively shorter hours and higher pay, the workers will legislate profit out of existence, and by the same act bring in the industrial commonwealth. They are willing to face the probability that the whole of profit cannot be seized without a final revolution brought on by the possessors who see themselves dispossessed.

As trade unionism is to the political actionists, so political action is to the industrialist—merely a transition field for the workers' activity, serving as a support to their constructive activity in building up Socialism on the field of production. With this limitation, they recognize all those functions of political action recognized by the International Socialist Movement, some of them now, as they claim, for the first time excluded from the meaning of the term by the definition of Section VI. The revolutionary political actionists agree with the industrialists in repudiating this narrow definition of the term.

Political action has in practical use throughout the history of the Socialist movement meant the use of such means as will bring pressure on the government, and enable the workers to control it; it has not meant merely electing to public office and the use of the legislative and administrative functions of government. By revolutionary Socialists the menace of the pressure on the other parties of a large Socialist vote is regarded as even more important than parliamentary action. So, too, is the mass protest like that used in Germany recently when war with France threatened. So, too, is the

mass or general strike, such as was used in Belgium as a protest against the limitation of the suffrage and such as was threatened recently by the extraordinary International Socialist Congress held in Basle as a protest against the possibility of the Balkan war becoming general.

Such use of the mass strike for political purposes would be excluded by the definition of political action in Section VI. The industrialists are as keen to use the strike for political as for industrial ends—on the government as on the employer. The value of the pressure of the Socialist vote as a means of forcing legislation has already been spoken of.

The other functions of political action recognized by the industrialists are fourfold. First, by putting legislative and administrative office in the hands of Socialists, political action can, they believe, give them "control of the police club" and thus enable them to protect the workers in their industrial struggles, or enable them, in the words of Karl Kautsky, the foremost German Marxian, to "deprive the government of the power necessary for violent measures against the working class." Second, the Socialist political movement still is, they believe, as it has been in the past, the great body for educating the public in the principles of Socialism and the iniquities of capitalism. It was as this purely educational force that Socialism gained for the German workers the fundamentally ameliorative social insurance legislation.

Without this educational body, indeed, the industrialist movement—at any rate, an industrialist movement with the definite aim of collective ownership—might never have come into being.

Third, the industrialist believes that the Socialist vote serves to register the support that the workers can expect for their struggles on the industrial field, and tends to prevent abortive revolution.

In the disappearance of the state, the Socialist will perform his fourth and last political function. He will use his power as a legislator to hasten on the dissolution of governmental institutions, and thus clear away such vestiges of the old state as might hamper the new industrial commonwealth. "When the state becomes the representative of the whole of society, and not one ruling class," says Friedrich Engels, joint author with Marx of the Communist Manifesto, "nothing remains to be repressed, and a special repressive force, a state, is no longer necessary. State interference in social relations becomes in one domain after another superfluous, and then dies out of itself; the government of persons is replaced by an administration of things and by the conduct of the processes of production." These words of Engels' might be called the text of industrial Socialism.

# CONTROL OF SANITARY STANDARDS

JULIUS HENRY COHEN

*[In the garment trades now on strike in New York the strikers muster over a hundred thousand men and women, and the establishments themselves run up into as large numbers as does the membership of a trade union of one of the smaller cities.]*

*The author of this article is attorney for the Manufacturers' Protective Association which, following the exhausting struggle of 1910 entered into a so-called protocol with the Cloak, Skirt and Suit-makers' Union;—is attorney for the Dress and Waist Manufacturers' Association which on January 18 last, after less than a week's strike, entered into a similar protocol with another branch of the International Ladies Garment Workers;—and is attorney for the United Manufacturers (the Independents) who, in the present struggle in the men's tailoring branch of the trade, have stood for conference and arbitration as a means of settlement.<sup>1</sup>*

*The protocol of 1910 provided a system of industrial adjustment and it created a joint board of sanitary control. Such a label as Mr. Cohen here proposes is provided for in the new shirtwaist protocol.—Ed.]*

THE Joint Board of Sanitary Control in the Cloak Industry owed its existence to the suggestion of the employers as an institution to make effective the "protocol of peace" entered into between the unions and the employers settling the strike of 1910. It took into account three parties to the controversy—the employers, the workers and the public. Seven members were selected by counsel for both sides, two representing the employers' association, two representing the unions and three representing the public. The unions and the employers are both obliged to enforce the standards established by the board to the full extent of its power. For the first time in the history of the industry a complete inspection of every shop was actually made and the results tabulated. This inspection has been and is to be repeated semi-annually. The standards set up by the Board of Sanitary Control have been enforced to such an extent that already 65 per cent of the workers (33,689 persons) are employed in shops having the sanitary certificate issued by the board. The board now has a sanitary survey of 1,888 shops. The result of its three semi-annual inspections shows that the number of shops with no drop ladders from fire escapes has been reduced from 236 to 21, or from 13 per cent to 1 per cent, the "doors opening in" were reduced from 94 per cent in the first inspection to 79 per cent in the second, and to 48 per cent in the third inspection, and 39 per cent in the last inspection. The increase in the number of dressing rooms is indicated by a reduction from 79 per cent of shops with no dressing rooms in the first inspection to 58 per cent in the second, 34 per cent in the third and less than 2 per cent in the last. In protecting the workers from eye-strain the number of shops unprotected from glare was reduced from 83 per cent in the first inspection to 73 per cent in the second, to 51 per cent in the third and to 1 per cent in the fourth. Only about 2 per cent of the shops owned and operated by members of the Manufacturers' Association are without certificates, and the failure to secure certificates in these cases is due to the delay in making structural changes in the buildings in which the manu-

facturers are located, this duty resting upon the owners of the buildings.

This splendid result has been accomplished in less than eighteen months of actual work at an expense of less than \$7,000 per annum, borne equally by both sides. The board has demonstrated in a practical way the utility of sanitary control in an industry through the combined collective effort of workers, employers and public. Not an unimportant part of the work consists in the education of the workers themselves respecting the value of sanitary control. And to quote Rose Schneiderman:

"It takes a good many arguments to convince them [the workers] that the body is nourished by fresh air, cleanliness and sunlight as well as food."

To meet this need for education, the board secured the co-operation of the Board of Education and lectures are held in public schools. The subjects include Factory Legislation, Factory Education, Industrial Poisons and Factory Sanitation. Articles have been written for the official journals of the workers, shop sanitary committees have been organized in 301 shops and a general educational campaign is being conducted by the unions. This is not work done in the spirit of "welfare work." The employer is not doing the work alone. He is doing it in co-operation with his employees and in co-operation with the public. Why should this method not be extended to other industries? The first difficulty in the way is that it involves a permanent collective agreement between the unions and the employers and this *ex necessitate* involves a strong union and a strong employers' association. By this is meant not merely strength of numbers, but strength of character. The employers' organization must be led by enlightened men who have a deep sense of responsibility and a broad outlook upon life generally. For exactly the same reasons, the union must be led by men who recognize that industrial statesmanship involves thought, study, reflection, careful planning and slow upbuilding, and that the largest returns come through education. As rapidly as working people and employers are organized with such sound leadership on both sides, the method here outlined and adopted in the cloak industry may be applied to other indus-

<sup>1</sup>See The "White" Protocol, page 557 of this issue.

tries. But even this method is not as efficient as it might be.

The responsibility for the existence of conditions that are unsafe for the worker is a responsibility resting upon the entire community. It should be shifted neither to the shoulders of the employers nor to the workers, nor to both combined. The public itself is responsible. If women's wear is manufactured under such conditions as to make for unsound men and women, society as a whole is responsible. It seems to the writer that before we get right standards of living for the community the whole basis of purchase by the consumer must be changed, and he believes that the time is almost at hand when this would seem practicable. The present basis of purchase is, as it has been for centuries, almost wholly a matter of price and adaptability to use. The question that the buyer asks is, how cheap is the garment and does it fit. The result of this is a demand on the part of the public for "bargains," and inevitably leads to an attitude on the part of the retailer of entire indifference to the conditions or surroundings under which the garment is made. The most scrupulous buyer of a department store must shut his eyes to the environment under which the garment is made. He concerns himself solely with the question of price and style, texture and work in the product. Whether it contains germs of disease, or has injured the operative in the making, must concern him not at all. The result is pressure upon the manufacturer from the consumer's end—to manufacture as cheaply as possible, regardless of the conditions under which the worker operates, and from the same consuming public pressure from another direction—higher wages and shorter hours for the worker.

There is justice in the plea of the enlightened manufacturer that he is being squeezed between these two opposing forces and that he is penalized whenever he attempts to raise conditions. The remedy would seem to be at hand if all parties would agree to it—employer, employee and the public. It is this: Whenever complete and regular inspection of an industry is under way by all three parties, as in the cloak industry, and certificates are issued to shops maintaining adequate standards, the chain of evidence should be carried one link farther—the garment itself should be certified by the board, so that the consumer will know what garment is made under "protocol" conditions and what is not. An extensive advertising campaign, conducted by both parties, would inevitably educate the public to a realization of its responsibility for the maintenance of unsanitary conditions. The responsibility from consumer to producer would be made direct and real and could not be evaded. A label on each garment would furnish the purchaser with unmistakable evidence of its conformance or non-conformance with the standards of living maintained by the best in the industry. Already in the cloak industry the union is making a campaign throughout the country for the exclusion from the industry of what are called "non-protocol" cloaks; that is to say, for the exclusion of garments made in factories that have not come

under the protocol. This work is ineffective now because there is no way of furnishing the consumer with prompt and satisfactory evidence of the facts concerning each garment. The retailer today is not called upon to distinguish between "protocol" cloaks and "non-protocol" cloaks.

It is perhaps a little unfortunate that the suggestion came first from a lawyer, and, worse still, from a lawyer representing employers. It will doubtless take a very considerable time before the feeling of suspicion and distrust on the part of working people is eliminated to such an extent as to make the plan acceptable to them. Some retailers will resent this interference with the liberty of buying upon the lowest possible plane, and it is true that it insures the permanence of a relation between an employers' organization and the union, and is therefore the strongest possible "recognition of the union." If it be said that it ties the union to a peaceable solution of problems in the industry, it must also be said that it ties the employers likewise. But if in all other respects the collective agreement is fair and above board and makes for no monopoly on either side, why should either reject it? So far as the public is concerned, ought it not to insist that methods more enlightening should be adopted in the permanent uplift of industry than those of warfare and heat? If there is to be a reorganization of industry in which workers, employers and public participate, and legislation is enacted by the workers themselves in counsel with their employers, and not by state legislatures, is it not high time that the consuming public should assume its fair share of responsibility for the creation and maintenance of sanitary standards?

The next steps in the control of sanitary standards seem to the writer to be two, (a) the fixing of responsibility, and (b) the completion of the chain of evidence. With a system of tripartite control of an industry and a complete chain of evidence fixing the identity of the garment and the manner of its production, the germane idea underlying the work of the National Consumers' League will mature and develop. If it prove workable in the women's wear industry, it will be extended to other industries as rapidly as statesmanship takes the place of warfare between the two great industrial bodies.

The need for such control is obvious. Dynamite hardly makes for permanent sanitary conditions, nor does sabotage. Order and law are essential. In joint session employers and workers should, as they best can, determine both the needs and the remedy. Certainly the twin principles of collective agreement and arbitration receive new vigor from this modern demonstration of the necessity for methods of control in industry. The enlightened employer needs his organization. The worker needs his union. The public needs both, and each needs the other. If we can substitute rational methods for physical warfare and contests of reason for contests of physical endurance, we may approach a truer American democracy and realize a higher standard of living for all.

# THE SURVEY

Volume XXIX, No. 19

February 8, 1913

## IN FOUR MONTHS

THE SURVEY ASSOCIATES have mustered half the membership (800) set as goal for the first year under the new form of organization.

423 readers have enlisted as co-operating subscribers at \$10 each. This is 100 contributors (\$1,000 in contributions) more than on February 1, 1912.

The work of THE SURVEY has increasingly become national. The question when it was launched as an independent venture last fall was:

*Could it look to national sources for adequate support?*

The Charity Organization Society of the City of New York had for years appropriated \$3,000 annually to the educational work of magazine and committee. This it could not do to an outside organization.

The question became two questions:

*Would former contributors renew under the new form of organization?*

The great majority have already done so.

*Would enough other SURVEY readers—if the magazine were practically turned over to them as an adventure in co-operative journalism—come forward with new contributions to make the \$3,000 good?*

100 have answered "Yes."

We need 200 more answers of just that sort.

Before printing the names of the January contributors who have been elected Survey Associates, there is room on these pages to put forward a "best foot" or two—if that is not too idiomatic a way to refer to the venerable practice of quoting from friendly letters. Some adverse letters will be put forward quite as frankly later. But, after all, nine out of ten of those received have been full of encouragement and constructive criticism, of downright interest and loyalty toward the venture.

They have been of the sort which make staff and council feel that this plan of carrying forward THE SURVEY as a co-operative enterprise in not so preposterous an undertaking as at first sight it may have seemed.

\* \* \*

"The idea of THE SURVEY'S going under is not to be thought of," ran a letter from the far Northwest last summer, when we were bending every effort to clear up an overhanging deficit before entering upon the new basis. "It is the one magazine that we social workers could not do without." And that same spirit has been manifested by many a reader enlisting as a co-operating subscriber under the new form of organization.

Here is a letter from a mining engineer:

"I cordially approve of the efforts you are making to obtain and present an unbiased view of our underlying economic and social conditions, and wish you every success."

And this, from an attorney who for eight years was general counsel for a great railway system:

"I have your letter, and am so fully in accord with what you say of THE SURVEY that the ten dollars seem quite an anti-climax. It has been my professional experience to have considerable to do with publications that answer to the name of uplift magazines. There is no doubt that these have accomplished prodigious quantities of good. But where an editor's ultimate criterion must be whether his articles are 'acceptable,' he cannot eternally pound away on one theme, nor can he mention with their just emphasis many subjects that are far from being acceptable to many of his readers. THE SURVEY can do, and thank goodness it does, both of these things."

"It is a real satisfaction," wrote the head of a consumers league in a mid-western city, "to feel that I have ever so small a part in helping to maintain THE SURVEY."

\* \* \*

Here is a letter from a young college graduate:

"Although I have not received one, I understand that you are sending circular letters to subscribers stating the need of \$10 from each, so I am now enclosing to you my check for same."

This, from the dean of a woman's college:

"The magazine is making a vast contribution to the general welfare, and we are all indebted to you for your work."

And this, from the chairman of the division of engineering sciences of an eastern university:

"THE SURVEY I regard as one of the best periodicals of the present day devoted to human progress, and I feel it merits support from every citizen who has the spirit of human uplift at all at heart."

An eighth and last letter from a New England public official:

"There is no magazine that comes to my desk that I appreciate more.

"I have just put in four years of rather strenuous work as mayor of the city, so that I have had an opportunity to see some of the city's problems from the human standpoint; and your SURVEY coming regularly has helped me to see them clearly."

SURVEY ASSOCIATES, Inc.

Acknowledgment has already been made by the Survey Associates of contributions received from October 1 to December 31. During January, forty-six readers of THE SURVEY renewed their co-operating subscriptions of previous years. Sixty-six readers who had hitherto been just regular \$2 subscribers enlisted as \$10 co-operators.

Seven others have given larger amounts. These larger contributors are:

William Guggenheim, New York, \$1,000	Frank Muhlhauser, Cleveland	\$25
Julian W. Mack, Washington	Albert Gehring, Cleveland	25
Miss Ida M. Mason, Boston	Miss Lucy Lowell, Boston	20
Wm. S. Mason, Chicago		50

The following co-operating subscribers, whose contributions were received during January, have been elected annual members of the Survey Associates:

AENEAS, GEORGE B., New York City	GRINNELL, MRS. E. M., New York	MORGANSTERN, ALBERT G., New York

## A BIT OF A RE-MINDER

¶ No word has been received from 92 co-operating subscribers, who a year ago sent in \$10 each between October 1 and January 31. ¶ We hope to count them in under the new form of organization.

**SURVEY ASSOCIATES, INC.**  
105 East 22d Street, New York City

No. 424

I enclose \$10 as a co-operating subscription to the Survey Associates.

Name.....

Address.....

Note: The \$10 is to cover the renewal of my regular \$2 subscription to THE SURVEY, plus a contribution to the educational work of magazine and National Council.

## THE PITH OF IT

**G**OVERNOR WILSON gives social workers a hearing. P. 639.

**A**NOTHER advance in the laws with respect to United States prisoners—life-term men have been brought under the benefits of the parole law. This is a reform which Attorney-General Wickersham has long urged. P. 633.

**B**ECAUSE of the objections of a single member of Congress, a bill for a federal inquiry into jail conditions has been stalled. P. 633.

**C**AN you read Yiddish—or Russian or Spanish? At length, questions like these have been written into an immigration bill by both houses of Congress. Late advices were that President Taft would veto it. P. 645.

**R**EADERS of THE SURVEY will remember Dr. Salmon's article (November 4, 1911) on The Hazards of Deep-Sea Fishermen and the need for a hospital ship which would make America's protection of her fishers somewhere near as adequate as that of the old countries. The bill for such a ship is hung up in a congressional committee. P. 634.

**T**HE Crawford-Sulzer bill, calling for an international inquiry into the cost of living, is still on the stocks. Will it get off at this session? P. 636.

**R**EADERS of The Promised Land, the autobiography of a Jewish immigrant girl, would have been interested in the meeting of the New York Consumers League last week. For Mary Antin spoke and interpreted the stories of a group of immigrant strikers. P. 637.

**E**VEN Mexico has a law providing indemnity for errors of justice; not so the United States. P. 643.

**T**HE moving picture show has reached a point in its development when the forces for good and evil in it are at war. The New York Board of Aldermen is the scene of a pretty thorough skirmish. P. 643.

**A**NATION-WIDE search for good and bad alike—such is the scope of an inquiry into industrial conditions which Ralph M. Easley proposes for the Civic Federation. P. 638.

**T**HE safety experts have long been bagging for the engineering schools; now it is the experts in industrial hygiene who want to bring the medical schools round to courses in industry and health. P. 638.

**I**N its amended form the Rockefeller Foundation bill has passed the House by a two-thirds majority, and is now in the judiciary committee of the Senate where it is reported to be encountering some division of sentiment.

# THE COMMON WELFARE

## TWO PENAL BILLS BEFORE CONGRESS.

Both Houses of Congress have acted favorably on the bill to parole United States prisoners, and the measure was signed with little delay as the friends of the measure expected by President Taft. The bill is in the form of an amendment to the act of June 15, 1910, and its object is to extend the benefit of the parole law to prisoners who have been sentenced for life terms. It has been recommended by the members of the federal boards of parole, by individuals interested in prison reform, and by the attorney general in two annual messages.

A number of the states have set an example to the federal government in extending the right of parole to life prisoners. Yet such is the inadequacy of existing machinery for collecting statistics on penal matters that it is impossible to list all those which have taken such action. It is almost always required that a specified number of years be served before parole can be granted; such as thirty-five years, less "good time" allowances in Minnesota; twenty-five years in Nebraska, Ohio and Utah; fifteen years in Louisiana, Oregon and Virginia; ten years in Texas; eight years in California and five in Kentucky. Under a new Iowa law all commitments to the state prisons are from one year to life, and all prisoners are eligible to parole. Montana permits life termers to be paroled when they have served thirteen years and three months, and Nevada when they have served seven years. A number of other states, or their governors, pardon life prisoners occasionally, some executives making it a Christmas practice to do so.

In a letter to Senator Brandegee of Connecticut, Mr. Wickersham thus described the bill and its purpose:

<sup>2</sup>A portion of the argument in favor of this bill made by the attorney-general before the American Prison Association in 1911 may be found in *THE SURVEY* of Oct. 28, 1911, page 1084.

"I concur in the recommendations made by the boards of parole in their report that the law should be modified so as to include within its provisions prisoners undergoing life sentences by providing, as is done in the statutes of a number of states, that such prisoners shall be eligible to parole when they shall have actually served some long period of years. There are now upward of 200 prisoners serving life sentences in federal penitentiaries. At present the only hope of a life prisoner, no matter how exemplary his conduct may be, lies in the exercise by the President of the power of executive clemency. I believe it to be more to the interests of society that such prisoners should be liberated on parole, subject to the supervision and regulation which is possible under the parole law, than that they should be discharged absolutely by executive pardon. In this connection I invite careful attention to a consideration by Congress of the desirability of adopting the indeterminate sentence for prisoners, such as prevails in many of the states. That system is an important, if not a necessary, adjunct to a parole law. The system has produced excellent results and is regarded by the most enlightened penologists as embodying the most successful method of dealing with the punishment of crime."

## THE JAIL INQUIRY

Because Representative T. U. Sisson objected, House bill 21594, the object of which is to secure the appointment of a commission "to consider and report upon the general subject of the treatment of juvenile offenders, together with the best system of detention of federal prisoners," was recently stricken from the unanimous consent calendar of the House. Some other parliamentary way to consider it must now be found if a vote is to be had on it. Mr. Sisson did not give any reason for his objection.

This bill has the warm endorsement not only of Attorney General Wickersham, but of the International Prison Congress and of many social work-

Minor in the St. Louis Post-Dispatch.  
Now it's the railway firemen who threaten to go out.

ers. The Committee on the Judiciary, which reported it to the House recommended one amendment, namely, that one member of the commission be appointed by the attorney general. Representative Houston of Tennessee, the author of the report, explained that the object of the bill was very plain and that it had been drawn in response to a general demand all over the country for some concerted and uniform method of treating juvenile offenders.

The great difficulty that arises constantly in the treatment of young offenders against United States laws is that in the case of all over seventeen years the national government is entirely dependent on state institutions. Mr. Wickersham has stated that there is but one institution to which we can now send such federal prisoners. That is the Elmira Reformatory in New York. Most state reformatories will not receive a federal prisoner who is not subjected to the complete discipline of the state, and there is no power in law whereby a federal prisoner can be subjected to the indeterminate sentence obtaining in most states.

A pressing reason for the appointment of the commission is the condition of the jails to which federal prisoners have to be sent awaiting trial. "The condition of many of these jails is worthy of the middle ages rather than of modern times," says Mr. Wickersham.

The measure is now placed on the committee calendar and must await its turn. It is possible

that it will not be reached before the end of the present Congress.

#### THE CASE FOR THE HOSPITAL SHIP

The case for the Hospital Ship has been, formally laid before the House Committee on Merchant Marine and Fisheries, and the bill introduced by Representative A. P. Gardner of Massachusetts, providing for its establishment, is now under consideration by the members. The need for and purpose of such a vessel to follow the Gloucester fishing fleet was described in *THE SURVEY* of November 4, 1911, by Dr. Thomas W. Salmon of the United States Public Health Service. In effect this "ship of mercy" would be an ocean extension of the Marine Hospital Service; the vessel would steam slowly about the fishing grounds, calling wherever sickness or accident made its services necessary, and removing, if need be, men who required hospital treatment.

Congressman Gardner, in introducing the witnesses for the measure, announced a change in plan. Whereas formerly it had been the idea to purchase a schooner with auxiliary gasoline power, it was now thought best to ask for a sea-going vessel, costing something like \$100,000, and capable of going under her own steam. Mr. Gardner suggested that the type of vessel best adapted to the work was that used in the North Sea for similar purposes. Charles F. Wonson, president of the board of directors of the

THE ALPHA

A mission hospital vessel of 275 tons, engaged in service among the fishing fleets of the North Sea. Such a ship is needed in American waters.

THE ST. FRANCOIS D'ASSISE

The hospital ship which crosses the Atlantic every summer to care for the men on the Grand Banks near the French Islands, Saint Pierre, Miquelon. Many American fishermen have to depend upon this ship for medical aid.

Gloucester Fishermen's Institute, Charles Skentelbery, representing the Boston Chamber of Commerce, Captain William H. Thomas, master for twenty-one years of a Gloucester fishing schooner, Richard W. Freeman, secretary of the Gloucester Board of Trade, and Constance D. Leupp appeared before the committee in support of the bill. No one opposed it.

A significant remark made by the chairman of the committee, Representative Joshua W. Alexander of Missouri, indicated the nature of the objections which the Hospital Ship will meet in Congress. He said, in effect:

"You are asking the government to aid a private industry. I am inclined to think that this would be a departure on the part of the government to do so. In other countries private contributions have in large measure sustained hospital ships."

This, of course, brings up the whole question of federal aid, workmen's compensation, sickness insurance, and so forth. Should the Gardner bill become involved in this kind of discussion it would probably be delayed in passage, if not defeated. The view of it which appeared to strike the committee as the most logical was that the Hospital Ship would merely extend the services of the Chelsea, Mass., Marine Hospital in such a way as to save lives which otherwise might be lost, and to give medical and surgical attendance to those who need it promptly if they are to receive any benefit from it at all. As Miss Leupp pointed out, there are annually many cases of fishermen who are brought to land too late to be helped, and one may see today in Gloucester

cripples whose loss of limbs was due solely to their tardy treatment.

The bill is now before the committee. Its members are:

Joshua W. Alexander, Mo., chairman.

Rufus Hardy, Tex.	James Young, Tex.
Joe T. Robinson, Ark.	J. D. Post, O.
William B. Wilson, Pa.	John M. Faison, N. C.
Charles D. Carter, Okla.	William S. Greene, Mass.

James Wm. Collier, Miss.	E. Stevens Henry, Conn.
Steven B. Ayres, N. Y.	Asher C. Hinds, Me.
John A. Thayer, Mass.	Stephen G. Porter, Pa.
Michael E. Burke, Wis.	Wm. D. Stephens, Cal.
Claude U. Stone, Ill.	Thomas Parran, Md.

## DREDGE WORKERS AND THE SENATE

In the history of labor legislation the world over some of the bitterest controversies have centered about the establishment of an eight-hour work day. The history of the movement has been much the same in the United States and Australia, in England and on the continent; the same forces have contended for supremacy. A chapter was added on the floor of the United States Senate on January 24.

The bill to limit the hours of dredge workers on public construction to eight per day had come up for consideration. Through a curious technicality dredge workers are the only class of laborers now deprived of the benefits of the federal eight-hour law. The House had already passed the measure giving them equal privileges with other laborers. The Senate committee on education and labor had favorably reported it. Said Senator Shively of Indiana, the senator in charge of the bill:

"This bill contemplates no organic change of policy on the part of the federal government on

the subject of the length of the work day. That policy was projected over forty years ago. . . . From 1892 to 1907 it was believed by the federal authorities that dredge workers were covered by the language of the act. . . . The bill passed by the Senate, and on which reconsideration is now moved, supplies a manifestly unintentional omission in the Act of 1892."

Serious and prolonged objection, nevertheless, was made on the part of several senators. It was urged that the government would lose money, and it was argued that the bill had been reported from the wrong committee. These objections were finally put aside and a roll call ordered. It is reprinted here because it serves as an index of the Senate on an important piece of labor legislation in which, while only a few people are affected, one of the basic demands of the labor movement was involved. The bill passed by a vote of 31 to 27.

#### Those who voted against the bill were:

Bankhead, Ala.	Gallinger, N. H.	Page, Vt.
Brandegee, Conn.	Gamble, S. Dak.	Percy, Miss.
Bristow, Kans.	Gronna, N. Dak.	Perkins, Calif.
Burnham, N. H.	Guggenheim, Colo.	Sanders, Tenn.
Burton, Ohio.	Jones, Wash.	Smoot, Utah.
Catron, New Mexico	Lippitt, R. I.	Stephenson, Wis.
Clark, Wyo.	McClumber, N. Dak.	Sutherland, Utah.
Crawford, S. Dak.	Nelson, Minn.	Townsend, Mich.
du Pont, Del.	Oliver, Pa.	Wetmore, R. I.

#### Those who voted for the bill were:

Ashurst, Ariz.	Johnston, Ala.	Poin Dexter, Wash.
Bourne, Ore.	Jordan, Tex.	Pomeroy, Ohio.
Bryan, Fla.	La Follette, Wis.	Shively, Md.
Chamberlain, Ore.	Lodge, Mass.	Simmons, N. C.
Chilton, W. Va.	McLean, Conn.	Smith, Ariz.
Clapp, Minn.	Martin, Va.	Smith, Ga.
Clarke, Ark.	Martine, N. J.	Smith, Md.
Dixon, Mont.	Myers, Mont.	Smith, Mich.
Fletcher, Fla.	O'Gorman, N. Y.	Stone, Mo.
Helskell, Ark.	Overman, N. C.	Swanson, Va.
Hitchcock, Neb.	Paynter, Ky.	Thomas, Colo.
Johnson, Me.	Perky, Idaho.	Thornhill, Cal.

Thirty-one did not vote, being paired either for or against the bill. From the record it is impossible to determine exactly which of these would have favored, and which would have opposed the bill.

### CONGRESS AND THE COST OF LIVING

Readers of THE SURVEY who are interested in the project for an international inquiry into the cost of living, should write representatives and members of the committee on rules in the House, urging that the Crawford-Sulzer bill be brought to a vote at this session. The Crawford-Sulzer bill provides for an appropriation of \$20,000 to enable the President to call an international conference on the high cost of living.

The project has the endorsement of President Taft (who wrote a special message in its favor a year ago), of ex-President Roosevelt (who laid emphasis on the plan in the Progressive platform), and of President-elect Wilson. In other countries its advocates include: President-elect Poincaré of France; Lord Courtney of England; Baron Sakatani, formerly finance minister of

Japan; Bernhard Dernburg, colonial secretary of Germany; Robert Meyer, finance minister of Australia; S. Nitti, minister of agriculture of Italy; G. Findlay Shirras of the Finance Department, India, and G. H. Knibbs, statistician of Australia.

Many letters urging the calling of an international conference on the cost of living were published in the twenty-eight page report favoring this project, of the House committee on foreign affairs (Report No. 711).

The history of the bill dates back to its recommendation for passage by President Taft in a special message a year ago this month. Senator Crawford and Congressman Sulzer, now governor of New York, simultaneously introduced the bill in both houses on March 7. It was brought up by unanimous consent in the Senate and passed that body unanimously April 15. It was unanimously favored by the committee on foreign affairs in the House on May 15. It has never been a party issue.

Friends of the measure ascribe its failure to pass the House last summer to the tactics of certain members who thought it good politics to postpone consideration of the bill until after election. Now, with a full calendar, it is said to stand a good chance of being crowded out.

The situation is put this way by one of the advocates of the bill before the International Congress of Chambers of Commerce when the representatives of forty nations endorsed the plan:

"If time for such a bill cannot be found in the present Congress, it is not likely that it would be found in the special session and so would have to go over until next December, when it would again slowly take its course and at best come to a vote in the winter or spring of 1914—if at all. If the bill is once brought up for vote, it is regarded as almost certain of passage, for no valid objection to it has been offered. If there is a studied plan by any man or group of men in Congress to throttle the bill without allowing the public to know why, this plan should be ascertained and thwarted. The committee on rules, of which Mr. Henry of Texas, is chairman, can easily bring in a special rule under which the bill can receive consideration. Once brought up, the bill would probably not take more than five or ten minutes' time."

Simple as is the Crawford-Sulzer bill, its proposers believe that it would lead to clearing away some of the mysteries surrounding the problem of the world-wide rise in the cost of living and by comparison throw light on why in America the rise has been more rapid than abroad. It should lead to better statistics on which to make deductions and more of them. In particular it would doubtless result in making the statistics of our Bureau of Labor, the Canadian Labour Office, the British Board

of Trade and the official statistics of other countries more readily comparable, for at present no two countries have constructed index numbers for the same commodities or by the same methods.

Among the ultimate results, prophesied as effects of the passage of the bill, are that it would lead to "economies in industry, the extension of agricultural credit; the extension of the open door policy for international trade; wiser and more economical methods of controlling corporations; extension of scientific management; the elimination of needless wastes, of middlemen, etc.; stabler and better systems of banking and currency, and many other suggestions which have been made by individuals but never considered in the light of experience of different nations."

Sir Horace Plunkett's plan for co-operative selling by farmers has spread only from Ireland to certain parts of Scotland and England. Why should it not be adopted in this country? Raiffeisen banks have spread with great rapidity in Germany, but we know practically nothing of them as yet in this country. New Zealand seems to have practically retarded the rise in the cost of living there by twice reducing her tariff on certain imports. Why should not her experience be made useful to us and other nations?

It is such practical queries as these which have

been used in the arguments for the conference and for interpreting its scope in the broadest terms. The depreciation in the purchasing power of gold, its causes and possible remedies, have been as yet considered only by a few special students and without a sufficiently wide basis of fact to convince the public of the desirability of any line of action. Such an international conference would lead to inquiries which could be conducted by statistical bureaus already existing.

To quote Prof. Irving Fisher who has been the pioneer proponent of the plan:

"There has seldom been an opportunity for the whole world to gain so great results with so little effort and expense."

#### KEEPING THE PROMISE OF THE PROMISED LAND

It was through the *Atlantic Monthly* that Mary Antin made American readers see the immigration problem not as a problem merely, but as a vivid human experience. The Promised Land has found a place on many book shelves alongside of Riis and Steiner. It was this same immigrant author who undertook at the annual meeting of the New York Consumers League last week to show how American organizations can stir the hearts of immigrant girls with patriotism and can help make more of the promise come true.

She told of the helplessness of these workers, which makes it easy to exploit them in a strange land where there are strange customs and where there is a strange language. She told of her cousin Dora who, as the daughter of a wealthy Jewish family in her own country, was not obliged to earn her living by manual labor, but who, in this new land without friends or relatives, went to work in a shirtwaist factory at long hours and a starvation wage. Had it not been for Mary Antin herself, Dora would still have been working under such conditions with no idea of a higher level of life. Like thousands of girls, she would still be living in a crowded district and working in an underpaid shop without knowing that there were friends ready to interest themselves in her barren surroundings. To quote Miss Antin:

"Such girls as these know Socialism as the only savior in their distress, since their only reading has been literature of a Socialistic nature. They do not realize that although Socialism is one of the agencies for working out our national problem, it is being supplemented by the aid and interest of many societies like the Consumers League, which are trying to emphasize the fact that liberty means liberty for all; not liberty to exist, but to live, to enjoy, to develop."

This work of applied patriotism, she went on,

teaches love of country 365 days a year. A report on laundry workers is of more value in instilling love of country and love of fellow man in these newly arrived immigrants than any Fourth of July oration. The cry that our country is being overrun by an ignorant, uncivilized horde and that the integrity of the home is being demolished by work outside the home in dirty and ill-ventilated shops is hollow, "if," said Mary Antin, "in sending our washing around the corner we send our hearts after the bundle of wash and learn of a world of men and women who once were unknown to us."

And then as witnesses to her appeal, six tired-looking, white-faced girl strikers, filed across the stage of the Astor theater, where the meeting was held, two of them bare-headed, all in cheap and shabby clothes. Two of them spoke. The first was Ethel Riebeck, "chairlady" of the Smith Underwear Company, a seventeen year old girl who had been in this country only a few years. Although Ethel Riebeck had learned her speech by rote and her voice quavered with nervousness as she spoke before these "foreigners" who live beyond her boundaries of the Bowery and Fourth Street, the effect of what she said was stronger than if she had delivered an oration. She said:

"We work all day, and then we only make about \$4, \$5 or \$6 a week and we don't get that, either, for the summertime when work is slack, we only get \$2 or \$2.50 a week. . . .

"And we don't work in shops that are very sanitary, either. Sometimes they are not swept for many days, and we have to push away from us the dirt with our feet. And the insects run over us. Our machines are not cleaned and they smell badly, and because we are not allowed to spend more than half an hour or twenty minutes at our luncheon, we must eat sitting by the machines which are not clean."

Next a little kimono worker, Sophie Rosenberg, got up. She trembled as she spoke in her own dialect. The audience could not understand a word of what she said, but the feel of it brought wet cheeks throughout the hall. Mary Antin translated the story:

"This child of sixteen years makes \$4 a week, and part of that she must send home to aged parents in Russia. She works so many hours in the factory, from eight o'clock in the morning till six o'clock at night that when she comes home in the evening she falls, literally falls, into the house, she is so tired. She would like to learn something for education, but it is not possible, she is so tired."

"True to Mary Antin's prediction," said an officer of the league afterward, "these girl strikers found perhaps for the first time that they had unknown friends who wished to hear about their life, who wanted to lighten their hardships, who

were interested in helping them win their cause for real liberty." For besides expressions of sympathy and friendship more than \$200 was collected for distribution among needy strikers.

## INDUSTRIAL HYGIENE AND THE MEDICAL SCHOOLS

Two movements are now on foot to get the medical schools to give practical instruction in industrial hygiene. In fact, the situation is very similar to that in the engineering field where John Calder and other active experts on the prevention of industrial accidents have succeeded in getting some of the technical schools to add courses in safety engineering.

At the session on industrial hygiene of the annual meeting of the Efficiency Society held last week in New York, Dr. Winthrop Talbot of Cleveland, editor of *Human Engineering*, read a letter which he proposed be sent to the various medical schools of the country. This pointed out the need of instruction in industrial hygiene and urged the addition of such courses in the medical schools of the country.

The following outline was proposed as covering some of the more important topics which should be included in such course:

I. Education of the Medical Man; Training of Medical Students for their Responsibilities to Industry and the State. 1—Sanitary inspection with required clinical experience; 2—Mechanical and clerical operations in industry, with especial reference to their physiological and psychological effects; 3—Accidents; 4—Disease; 5—Fatigue; 6—Industrial legislation.

II. Relation of Employer to Physician.

III. Relation of Physician to Employee.

IV. Relation of Physician to the State and Municipality.

V. Economic and Social Results Already Obtained in the Prevention of Accidents and Disease.

VI. Conditions Conducive to Industrial Health. 1—Work environment; 2—The worker; 3—The work.

VII. Home Environment. 1—Municipal; 2—Private.

In urging his resolution, Dr. Talbot called attention to the fact that there is only one course in industrial hygiene in any school in the country, and that not in a medical school—Prof. C. E. A. Winslow's course in Teachers College, Columbia University. A few other schools have taken up some of the individual phases of the health question with which the social worker is most concerned today, but the necessity of preparing young men who intend to become physicians for their responsibilities in the industrial field has not yet commended itself to the medical schools of the country.

It was pointed out by Dr. Rosalie Slaughter

Morton that two years ago the American Medical Association had recommended that the schools extend their courses in this same direction. Committees are now at work on the complementary problems of reducing the present curriculum and adding courses in industrial hygiene and other factors in the prevention of disease.

Dr. Talbot's resolution was carried unanimously.

#### CIVIC FEDERATION ON INDUSTRIAL PROBLEMS

A noteworthy proposal was made by Ralph M. Easley at the meeting of the National Civic Federation in New York on January 29. In his address as chairman of the executive committee of the association he reviewed at length and optimistically the progressive social movements that are making headway, but added: "There are yet very many black places and perplexing problems demanding attention." Continuing, he said:

"This leads me to the proposal that the National Civic Federation organize a commission of national scope, composed of representative men and women from various walks of life, which shall make a national survey of the progress that has been achieved in this country during the last fifty years, and which, while looking for the good, shall also ascertain where there are social and industrial ills demanding eradication. Such an inquiry, thoroughly and honestly conducted, and given wide publicity, would naturally operate as a stimulus to help better the conditions under which the wage-earners of this country now work and live, and would also furnish material that would confound the libellers of American institutions who seek their overthrow and destruction."

#### GOV. WILSON AND THE SOCIAL WORKER

Castle Point, Hoboken, was the scene recently of an informal conference between the president-elect and representatives of a group of nationwide social movements. Castle Point is the home of Mrs. C. B. Alexander, a personal friend of Governor Wilson, and long a leader in philanthropic activities in New Jersey. It was through Gaylord S. White, head-worker of Union Settlement, New York, and a Princeton graduate, that the meeting was arranged.

Governor Wilson's attention was called to the social needs of the national capital; to certain changes which are hoped for from the government as an employer; and to the service which the federal government can render in the fields of health, immigration, prison labor and industrial relations. Emphasis was placed not so much on the direct action which the federal government can take in these fields, as its common service to the states through research and

statistics, and in placing the experience of one part of the country at the service of another. This division between state and national activity was even more emphasized by Governor Wilson.

Joseph P. Byers, state charities commissioner of New Jersey, acted as chairman of the conference after the informal getting together, and the proceedings took on something of the nature of a hearing on the state of the country.

A. J. McKelway, secretary for the southern states of the National Child Labor Committee, and chairman of the Juvenile Advisory Committee of the Children's Council of Washington, spoke on the District of Columbia. As Governor Wilson said afterwards, Mr. McKelway put under his nose a fresh trail, the kind of a trail that he always follows with zest. Mr. McKelway described the complicated system by which the District is governed. While its citizens are disfranchised, and its control nominally in the hands of the federal government, he claimed that in reality Washington is a boss-ridden city. He said:

"It is a triangle of profit and power manned by a triumvirate. Of this triumvirate one is president of a National Bank, with connections in speculative real estate. The second is president of a trust company, with connections in speculative real estate. The third is also president of a trust company, with connections in speculative real estate. The situation is controlled in three ways: By control of taxation, which is lowest in the privileged district and highest in the home districts; by control of credit—investments within the speculative area are encouraged, those in other districts discouraged; by control of Congress, through the committees of the District in seeing that improvements ordered by Congress work for the pockets of the triumvirate."

Josephine Goldmark, author of *Fatigue and Efficiency*, and representative of the National Consumers League, put forward the subject of industrial legislation respecting the District, and spoke in favor of the bill now pending in Congress to limit the hours of working women. The responsibility of the federal government as an employer was taken up by Prof. Henry R. Seager, former president of the American Association for Labor Legislation, who described the defects in the present federal employees' liability act, and told of the movements under way for reform.

In the field of national service, Lillian D. Wald of the Nurses' Settlement, a member of the former New York State Immigration Commission, made a plea for an internal policy toward immigration which should throw the protection of state and federal governments over the newcomers during the first year or two of their settlement. Owen R. Lovejoy, secretary of the National Child Labor Committee, outlined the scope and purposes of the Children's Bureau

and the need for increasing its appropriation so that it can perform an adequate service in revealing the facts of childhood. A beginning has been made in the direction of promoting better birth registration, as a first step in the understanding of the child problem.

Mrs. Florence Kelley, secretary of the National Consumers League, advocated the bill now before Congress, enabling any state to prohibit the sale within its boundaries of prison-made goods, produced in other states under conditions which would be illegal in its own institutions.

Homer Folks, president of the National Association for the Study and Prevention of Tuberculosis, showed that the federal government is spending on health much less than some of the states, and pointed out the opportunity for combining the various branches of the government's activities in this field, now scattered through several federal departments. A unified health service, would afford adequate statistics and tend to stimulate sanitary regulation and efficiency in different parts of the country. Disease germs know no state boundaries, and the health of one district is the health of all.

Samuel McCune Lindsay, chairman of the Committee on Industrial Relations, told of the movement for a federal inquiry in that field. President Taft's nominations to the commission have not as yet been confirmed by the Senate, and Mr. Lindsay felt that as the greater part of the work of the commission would fall under Governor Wilson's administration, it would be appropriate for the latter to appoint its membership. He expressed confidence as to the calibre of the commission Governor Wilson would nominate.

#### FEDERAL AND STATE ACTION

In his reply, Governor Wilson made the point that the government is not so much an initiating agency as a responsive one, depending on the vigorous action of citizens. He evidently confused the Children's Bureau a bit with the Beveridge child labor bill, which was before Congress several years ago and which undertook to prohibit interstate commerce in child-made goods. Child labor is only one of the subjects coming before the bureau, which has chosen birth registration as its first concern; and its function is that of gathering information, not of making or enforcing laws. Governor Wilson's underlying point, however, was a clear one—that of emphasizing the adherence to state action by a large element of the Democratic Party, and of informing social workers how best they could help his national administration in taking up matters of social concern. Those who attended the meeting came away with the feeling

that under the Wilson administration the proposals of social workers would receive, to use Governor Wilson's own words, "not only an interested but a thorough consideration." He spoke somewhat as follows:

"Several of those who have spoken have described this as a valued opportunity to them. I can speak of the opportunity as mine rather than theirs. It is seldom a man in my position hears from so many who know what they are talking about. I have the opportunity every day of hearing from those who do not.

"Every subject treated here today engages my deep interest and enthusiasm. My enthusiasm is in proportion, generally, to the practicability of a scheme. I have always been eager to forward general principles, but I do not feel the breath fill my lungs until I see the practical plan. I hope you will always come to me with plans, and you may count on me to consider those plans with interest and with friendliness.

"Most of the things that you have spoken of are without political embarrassment. One that does have political embarrassment. One that Department project. Already in dealing with medical education in New Jersey we have had political difficulties, because of the various independent schools of medicine that have sprung up on all sides. There is a fear in many minds that we are about to set up what has been called a medical trust, and it is very desirable to remove that idea. I have never seen any serious proposal to put any particular school of medicine in charge of the national health.

"With regard to the Children's Bureau another similar difficulty exists. My own party in some of its elements represents a very strong state's rights feeling. It is very plain that you would have to go much further than most interpretations of the Constitution would allow if you were to give to the government general control over child labor throughout the country. It is important to make it generally understood that the purpose of your bureau is to collect and co-ordinate information on the subject.

"I want, above all things, to enjoy the confidence of, and to have at my service the information and counsel of, those who are engaged in these fundamental things. Most of the vitality of public action comes from outside the government. The government does not originate. It responds to public opinion. You are all to regard yourselves as forces playing upon the government, and I hope that during the next four years you will find a sensitive part of the government at the top."

#### GOVERNOR SULZER'S HEALTH COMMISSION

Governor Sulzer has given the people of the Empire State an earnest of what he intends to do for public health by the appointment of a special commission. For this commission he has chosen men of experience, some of international repute, in matters pertaining to public health. The chairman is Dr. Herman M. Biggs, general med-

ical officer of the New York City Department of Health. He is a member of the board of directors of the Rockefeller Institute for Medical Research and honorary fellow of the Sanitary Institute of Great Britain. The secretary is Homer Folks, secretary of the State Charities Aid Association; commissioner of charities of the city of New York during the administration of Mayor Low; and president of the National Association for the Study and Prevention of Tuberculosis. While commissioner of charities he established the first municipal tuberculosis hospital in the United States, and it was at his suggestion and under his general direction that a state-wide campaign against tuberculosis was undertaken in the state in 1907.

John A. Kingsbury, assistant secretary of the commission, was formerly assistant secretary of the State Charities Aid Association and had charge of the state-wide tuberculosis campaign until January, 1911, when he became general agent of the New York Association for Improving the Condition of the Poor.

The other five members of the commission are: Dr. Edward R. Baldwin of Saranac Lake, who has for many years been in charge of the Trudeau Laboratory for Investigating Tuberculosis; Dr. W. E. Milbank of Albany; M. Adelaide Nutting, professor of nursing and health at Teachers College, Columbia University; Dr. John C. Otis, an authority on the prevention of typhoid fever; and Ansley Willcox, president of the Buffalo Charity Organization Society.

This commission is charged with the duty of revising the health laws of the state, of formulating new laws in so far as that is necessary and advisable, and of making recommendations in relation to the organization and administration of the State Department of Health. The commission is to report its recommendations to Governor Sulzer by February 15. Those who advised the governor in this matter urged that the information regarding health conditions in New York and indeed public health work throughout the country is years in advance of statutory formulation and administrative performance.

The commission has been quickly assembling material, holding public hearings in order to give both experts and laymen opportunity to make suggestions. It is announced that "the commission is informing itself as to existing facilities and resources within the state departments, the relations between the state and local health authorities as they are and as they ought to be, the relations between health authorities and the medical profession, the extent to which needed hospital provision has actually been made by local authorities for the isolation of contagious diseases which cannot otherwise be adequately segregated, and the best means of

making the latest advances in sanitary science and preventive medicine widely known among the people generally."

In 1911, the last year for which the figures are available, the total number of deaths in New York State was 145,538. The following table shows some of the principal causes and the number who died from each:

Pulmonary tuberculosis .....	14,179
Other forms of tuberculosis.....	2,339
Diphtheria .....	1,921
Typhoid fever .....	1,310
Scarlet fever .....	1,147
Measles .....	977
Whooping cough .....	810
Syphilis .....	629
Diarrhœa and enteritis (under two years of age) .....	7,290

All of the above are recognized as partially, if not wholly, preventable. The commission is assuming in its work that if these diseases are preventable, or to the extent to which they are preventable, the machinery with which to prevent them should be established without delay. It will recommend striking from the public health laws obsolete provisions which stand in the way of effective work by the state and local health authorities. It will suggest additional legislation. It will specify the further steps which can be taken by the state and local health authorities in relation to provision for incipient and advanced cases of tuberculosis; in relation to the reduction of typhoid fever to a point at least as low as that which already exists in some other communities where the problem is no more complicated than ours; in relation to the substantial reduction of the mortality from diphtheria, scarlet fever, measles, whooping cough, as well as a further and substantial reduction of infant mortality.

#### THE BLIND IN NEW YORK STATE

As the result of a recent conference in New York, workers for the blind throughout the state are uniting in an effort to secure an appropriation of \$25,000 at the present session of the legislature for the establishment of a permanent state commission for the blind.

In 1906 a temporary commission was appointed by New York state to investigate the condition of the blind. Its report urged the creation of a permanent board. The bill drafted for that purpose, however, was not passed. Last year a bill providing for a permanent commission was vetoed by Governor Dix.

Believing that the subject would come up again for discussion this year, the State Charities Aid Association undertook to do two things: first, to verify and bring down to date the census of the blind in New York state outside of New York and Buffalo, which the 1906 commission had made; and, second, to call a conference of institutions and organiza-

tions interested in the welfare of the adult blind in New York to secure harmony of action.

The conference was attended by upwards of eighty workers, representing all the more important organizations and institutions for the blind in New York state. Many of those present were either partially or totally blind.<sup>1</sup>

Homer Folks, secretary of the State Charities Aid Association, presented a summary of the census just completed.

The 607 found living in institutions may be classified as follows:

in hospitals for the insane.....	283
" almshouses .....	179
" institutions for the feeble-minded.....	36
" other institutions .....	109
	607

The 2,050 living in families may be classified as follows by means of support:

	Under 20	20-60	Over 60	Not stated	Total
Independent and comfortable..	4	78	249	30	361
Self-supporting .....	6	248	109	48	511
Dependent on family.....	101	283	373	39	796
Dependent on community.....	2	30	146	15	193
Very poor .....	2	8	12	2	24
None .....	8	34	49	5	96
Not stated .....	21	36	42	70	169
	144	717	980	200	2050

A striking feature of this report is the number of blind persons over 60 years of age: 980 of the 1,841 not in institutions, whose age is stated, or 53 per cent. This explains why it is that of 4,388 persons on the earlier lists about whom information was sought, 1,080 had died since either 1906 or 1910. It is for the aged, helpless blind that aid is especially needed.

The discussion at the conference showed most of those present to be in favor of a state com-

mission, though there was some difference of opinion as to the powers and duties with which it should be entrusted. A committee, consisting of C. A. Hamilton of Batavia, William Sheehan of Buffalo, Felix M. Warburg and Winifred Holt of New York and E. P. Morford of Brooklyn, was appointed to consider whether there should be a state commission, and if so, what its duties and powers should be.

This committee, which was instructed to report its findings to the legislature on behalf of the conference, has decided unanimously in favor of a state commission. With some amendments, it proposes to support the bill known as the Malone bill, already introduced into the legislature. This provides for the appointment of a New York State Commission for the Blind to consist of five persons appointed by the governor, without compensation, for a five-year term.

The duties of the commission will be to prepare and maintain a register of the blind; to aid the blind in finding employment and to teach them industries which may be followed in their homes; to establish and maintain one or more schools for industrial training and workshops for the employment of suitable blind persons; to promote visits and teaching in the homes of the blind; to make inquiry concerning the cause of blindness; and to inaugurate such preventive measures as seem wise. The bill, as introduced, provides that two members of the commission shall be blind; the committee, however, will recommend that this mandatory provision be omitted, though it will urge that one or more blind persons be appointed. The committee will recommend also an amendment to the bill, providing that in the employment of officers and agents the commission give preference to blind persons. More unique is the provision, which is to be recommended unless it is unconstitutional, that no person officially connected with any institution or organization for the blind may be appointed a member of the commission. The bill, as amended, will call for an appropriation of \$25,000.

If the bill is passed, New York will be following the lead of other states which have commissions for the blind. Massachusetts was the first to create such a body in 1906; Ohio followed in 1908 and New Jersey, Delaware and Utah in 1909. The powers and duties of the Massachusetts, Ohio, and Utah commissions are similar to those of the proposed commission for New York. The New Jersey commission, which has only three members, is not empowered to conduct schools and workshops or to provide industrial aid or home teaching. The Delaware commission, with seven members, is concerned chiefly with the education of the blind and may employ instructors for that purpose.

<sup>1</sup>Among these were W. I. Scandlin, field agent of the New York Association for the Blind; E. P. Morford, superintendent of the Industrial Home for the Blind in Brooklyn and a member of the 1906 commission; F. L. Frost of the Albany Association for the Blind; Edward Tyson of the Brooklyn Blind People's Club; and William Sheehan of the Buffalo Association for the Blind. Joseph H. Choute, president of the State Charities Aid Association, presided. Among others present were Homer Folks, secretary of the State Charities Aid Association; John M. Glenn, general director of the Russell Sage Foundation; Dr. E. Park Lewis of Buffalo, president of the State School for the Blind at Batavia; Winifred Holt, secretary of the New York Association for the Blind; Louisa Lee Schuyler, chairman of the Committee on the Prevention of Blindness of the New York Association for the Blind; Howland Davis, president of the New York Institution for the Blind; C. A. Hamilton, superintendent of the State School for the Blind at Batavia; Felix M. Warburg of the New York Association for the Blind; Prof. E. A. Allen of Perkins Institution, Boston, and a member of the Massachusetts Commission for the Blind; and O. H. Burritt, secretary of the 1906 commission and now superintendent of the Pennsylvania State Institution for the Blind at Overbrook.

### INDEMNITY FOR ERRORS OF JUSTICE

JAMES P. HEATON

Because we have persisted in the assumption that only guilty persons are ever convicted of crime, the United States has failed to provide legal reparation for the victims of the errors of justice. Andrew Toth, convicted of murder, after lying for twenty years in a Pennsylvania prison, was found to have been innocent. He was released and left stranded by the state without the slightest redress under the laws of the commonwealth. The legislature even declined to pass a special act of compensation. The British Parliament has several times done this under similar circumstances, as for instance in the famous case of Adolf Beck who was sentenced to penal servitude largely on the testimony of a number of women and on the careless examination of identification marks.

The case so shook the faith of the English people in the fallibility of the courts as to bring about an important change in the judicial system of the entire kingdom, and a Court of Criminal Appeals was established. In our own country it was only through the generosity of a private citizen that Andrew Toth secured a modest pension to stand between him and starvation. This enabled the unfortunate man to return to Hungary, his native country. Unlike ten European nations and Mexico, we apparently balked at putting on our statute books any law which concedes that our system of justice may through an error deprive a citizen of his liberty. If the state takes private property, the owner is recompensed. In certain minor cases when the individual is compelled temporarily to give up his liberty for public purposes such as for jury or witness duty he is compensated. But if the public unjustly imprisons a man by mistake, puts him to a heavy expense for lawyers, cuts off his power to earn a living and perhaps exacts a fine, the government offers no compensation. Yet the Federal Court of Claims is a striking example of the fact that the state should scrupulously fulfill its obligations and right its wrongs by judicial inquiry.

An act to correct this situation in cases arising under federal jurisdiction has been drafted by Edwin M. Borchard, law librarian of Congress. The bill has been introduced in the United States Senate by Senator George Sutherland and provides that any person who after a conviction proves to be innocent may within six months petition the Court of Claims to be in-

demnified for the pecuniary injury he sustained. The claimant has the burden of proving not only his innocence but also that he has not by his acts or negligence contributed to bring about his sentence. The granting of the relief is discretionary and the amount limited to \$5,000.

The bill can easily be adapted to the judicial systems of the various commonwealths for state cases. In fact this year the subject is being urged in Massachusetts, New Jersey, Wisconsin, Missouri and Illinois. Massachusetts by an act passed in 1911 already authorizes compensation for lost income to acquitted or discharged persons confined in excess of six months while awaiting trial. The reason why serious consideration has not been given this reform in the past lies partly in the basic principle that personal sacrifice must often be borne for the general good and partly in the fact that it is nobody's interest to agitate for such a law. No business interests are affected and no considerable numbers of citizens are directly concerned. Only casual victims suffer, though their number is greater than any one realizes, and they have not enough influence unaided to secure the passage of such an act of justice. Yet the obligation of the state in this matter is so obvious that as Jeremy Bentham, the first champion of the reform in England, declared it is a question whether an attempt to demonstrate it does not obscure the issue.

### FILM SHOWS AND LAWMAKERS

JOHN COLLIER

People's Institute, New York

New York city, after a four years' struggle for the intelligent regulation of its motion picture theaters, is still waiting for the Board of Aldermen to enact the first constructive legislation for which it will have been responsible in half a decade. The situation, apart from a recent set back which marks a crisis, is not unique. No American city has as yet regulated its motion picture shows in a scientific way and any attempt to do so runs counter both to thoughtless prejudice and powerful special interests.

It is well to point out just what is involved in the question of motion picture theater regulation. New York has 800 motion picture theaters; the United States has 16,000. The total audience is over 400,000 every day in New York and fully 7,000,000 in the country at large. About 60,000 children attend the New York picture theaters daily. The motion picture has become one of the dominant agencies in what Tolstoi calls the "unconscious education" of the people.

THE SURVEY of January 20, 1912, contained an account of the Folks Ordinance. This measure proposes to increase the seating capacity of pic-

ture theaters from a maximum of 300 to a maximum of 600. It creates a motion theater with music, song and recitative, but without vaudeville in costume. It goes minutely into the conditions of ventilation, sanitation, lighting and safeguarding against fire. It reinforces the authority already possessed by the license bureau, in which the responsibility for regulation is centered, to control the programs morally through a power to revoke licenses for moral offense. The measure also provides inspectors to enforce the powers of the license bureau.

This ordinance was framed by a committee appointed by the mayor after six months of work, and was endorsed by most of the civic and social agencies of New York. Month after month passed and the aldermen did nothing. The opposition came from the vaudeville interests, which would suffer from the effect of the ordinance; from the theaters, which feared the competition of the enlarged and improved motion picture shows; from the small exhibitors, who feared the competition of improved shows in their neighborhoods; and finally, from people who insisted upon the censorship of films before they were first publicly exhibited.

The effective opposition came from the special interests; the plausible argument from the advocates of advance official censorship. Tammany agreed with these people and insisted on burdening the Folks ordinance with a clause providing for a pre-publicity censorship of films.

The fusion members of the board of aldermen finally agreed to accept the censorship amendment on the plea that the mayor could veto the amendment separately. Tammany thought the mayor had no such power, and the ordinance, thus vitiated, subject to the mayor's doubtful power to exercise a discriminating veto, was enacted almost unanimously. The mayor decided that he could not select as between desirable and undesirable features and vetoed the whole ordinance because of the censorship amendment. The mayor thought pre-publicity censorship was fundamentally unconstitutional and was likewise, in its immediate application, unnecessary. The mayor said in part:

"In our fundamental instruments of government in this country, which we call constitutions, we expressly guaranteed from the beginning free speech and a free press, and prohibited the passing of any law abridging the same. The provision in the constitution of this state on that subject is substantially that publications, whether oral, or printed or by writing, or by pictures, shall not be restrained in advance, but that everyone shall be free to speak or publish what he sees fit, subject to being prosecuted afterward for libel, immorality, obscenity or indecency therefor.

"When I became mayor I had an official ex-

amination made of all moving picture theaters in this city. The result was actual proof and an official report that there were no obscene or immoral pictures shown in these places. And that is the truth now.

"At all events the criminal law is ample to prevent the exhibition of such pictures. I have asked these people who are crying out against the moving-picture shows to give me an instance of an obscene or immoral picture being shown in them, so that the exhibitor may be prosecuted, but they have been unable to do so."

The mayor concluded by urging the aldermen to enact the original Folks ordinance.

As a net result, New York is still without a law for the regulation of its picture theaters. The minority who refused even to consider the separate enactment of a censorship and insisted on the injection of censorship into the Folks ordinance, are without censorship, and the city is without a law regulating the structure, sanitation, etc., of picture theaters.

What the aldermen may now do is problematic. They may conceivably over-ride the mayor's veto and pass the ordinance with its amendment, in which case the amendment and possibly the whole ordinance will be tied up in court review for a long time to come. Or the Board of Aldermen may finally, after the past year's agitation, enact the original Folks ordinance.

There are several morals to draw from the efforts to regulate motion pictures in New York. One of these is that the regulation of motion picture theaters is a complex matter requiring scientific study and involving the solution of almost new problems of municipal regulation. Another is that any thorough-going attempt to regulate motion picture shows will excite the same silent but potent special-interest opposition that always confronts a sincere attempt to regulate any of the commercialized amusements.

The third moral is that the special interests and their representatives are always glad to use the emotional clamor of good people as a cloak behind which they can get what they want.

Meanwhile, New York's wage-earners and children suffer.

That this statement is no exaggeration is proved by the death in New York on February 2 of two women and by injuries to nineteen people in an accident in a moving picture theater. This case, which illustrates the need for intelligent regulation, happened after the main part of this article was in type. Nearly 1,000 people were crowded in a theater arranged to seat 300. A puff of smoke from the film booth led to the cry of "fire" and a panic followed. The fire commissioner said correctly that the place had conformed to all the laws and was just as safe as dozens of other shows in New York.

## THE IMMIGRATION BILL

KATE HOLLADAY CLAGHORN

New York School of Philanthropy

After many vicissitudes the immigration bill of the winter session of Congress started on its way to the President for approval on February 1. We say "the bill" rather doubtfully, for it is a question whether so many things as the bill has been can be covered by one name.

Starting out as the Dillingham bill of last year, a literacy test was inserted somewhat less drastic than that dropped in last year's session, and then it was shorn of all its remaining provisions. The bill in this form was passed by the House, but rejected by the Senate, throwing the whole matter back to the conference committee. Here a bill was framed which again included a literacy test and also a number of other provisions along the line of the original Dillingham bill. This was promptly passed by the House. One new provision not noticed before its passage aroused instant and vigorous protest—the requirement of a certificate of character from immigrants coming from countries which issue such certificates. It was explained that this clause was framed particularly to exclude members of the so-called "Black Hand," "Camorra," or other bands of criminals, and that it would apply to Italy alone—the only country which grants such certificates. Those who opposed the provision felt, however, that it might easily be made a means of religious or political persecution by a foreign government, and was dangerous and obnoxious on that account. The offending clause was accordingly stricken out, and after another journey to the conference committee to correct an error in draughting, the bill was finally passed by both Houses.

Among other changes, the new bill provides for an increase in the head tax from \$4 to \$5; excludes aliens not eligible for naturalization; establishes heavier penalties against steamships advertising illegally or bringing ineligible aliens; provides for the stationing of matrons, inspectors and surgeons on immigrant ships and for experts in insanity at the large ports of entry; provides for the establishment of immigrant stations in the interior; and orders the deportation of aliens who become criminals in three years subsequent to entry. The most radical change—or what has seemed the most radical—is the literacy test. As framed in this bill, it excludes persons over eighteen years of age who are unable to read in some language, but permits any admissible immigrant to bring in or send for a father or grandfather over fifty-five years old, or the women of his immediate family, if otherwise admissible, whether they can read or not. This amounts practically to the exclusion only of adult males unable to read.

So much has been said for and against the literacy test on the supposition, shared by both sides, that it would exclude the great mass of our unskilled labor force, that it seems worth while to consider a little more closely just what effect it would have.

In 1911, the last year for which we have illiteracy statistics for immigrants, 122,735 of the 878,587 immigrants admitted were males of fourteen years and over who could not read. Of these 51,347 were Italians; 40,800 were Slavs of the various stocks, or Magyars or Roumanians; 9,715 were Greeks, Armenians, Syrians or Turks; 6,453 were Hebrews, and only 2,845 were from all the principal north and west European countries. Not all of these would have been excluded, as those from fourteen to eighteen would have been let in according to the present test. Even if all had been excluded, this would have meant a cut of only 14 per cent in the total immigration, and while nearly all those excluded would have been the southern and eastern peoples, their proportion to the total immigration would have been reduced very little—from 68 per cent, as the record actually shows, to 63 per cent.

The same relative reduction in our heaviest recent year of immigration, 1907, would have given a total of 1,105,401,—a figure considerable in itself and far above that of any ordinary "light" year.

It would seem, then, that both those who fear and those who hope for a radical change in the volume and character of our immigration are likely to be disappointed.

Furthermore, it is strangely taken for granted by both sides that the illiterate immigrant is a fixed quantity. On the contrary, we will venture to predict that a literacy test for immigrants to this country will be the last decisive spur to the peasants of Italy to take advantage of the rapidly developing school system of their country and become a literate people. Much the same thing will happen in Austria and Hungary; while the Hebrews from all these countries need no further stimulus, since less than 7 per cent are now recorded as illiterate within the definition of the new law.

It is strange, also, that in all the discussion of the literacy test no one has seemed to look at it as a positive advantage to the immigrant.

Those who wanted to help the immigrant opposed the test; those who favored the test did so mainly because they thought it would keep the immigrant out. Yet illiteracy is helplessness, and it is the helpless immigrant who is underpaid, overworked, cheated and despoiled, maimed and injured, and trodden under foot generally, to become a sorrow to himself and a burden to the community.

## THE TREND OF THINGS

THE following is the record, according to Robert W. Bruere (Where Philanthropy Fails, the *Metropolitan*), of a true case copied from a dispensary record. It is used to illustrate how medical, and other, philanthropies "handle their cases without reference to the industrial causes which produce them."

It is perhaps a better illustration of the lack of centralization of responsibility for charity cases attended by medical students:

Booth, Mrs. David. Case reported by society nurse who had been visiting a patient in same building. Obstetrical nurse sent at once. Found woman in serious condition: Tem. 103; P. 128; R. 28. Bathed mother and baby.

Learned following details from a neighbor, who has been with patient off and on during illness: Woman's first baby. Husband earns \$5.00 a week when on full time; is on part time and threatened with loss of place if he stays out one day. No one to look after woman but neighbors; often alone for hours. Baby came Friday night, five days ago. Delivered by "Hospital Doctor," and left without ordinary attention. Until nurse called, patient had not had hands or face washed; in absence of proper wrappings neighbor had bound old rag about her; no bedside attendance.

On Saturday, woman very ill; suffering severe pain. Second "Hospital Doctor" called; assured woman that she was getting on well, that suffering was natural. Each succeeding morning, different "Hospital Doctor" called, one ordering an ice cap, the next a hot water bottle, but none taking radical measures to relieve woman's condition. (These were student doctors.)

On fifth day, Professor brought in (by a student doctor who had a perplexed conscience as well as a puzzled judgment). Professor immediately saw cause of trouble; said woman must go to hospital for operation, but must wait a few days until stronger. Ordered her to be propped in Fowler's position, but as there was no one to prop her, order not carried out. Wednesday, Society nurse found woman in condition reported above.

Thursday. Found baby crying pitifully from hunger. "Hospital Doctor" told mother she must not nurse baby because her milk is not good, but did not tell her what to give instead; for twenty-four hours, baby has had nothing but sugar and water and a little fennel tea. Mother a little better; encouraged by Professor's visit.

Friday. Mother very much worse,—high temperature and frequent chills. Found neighbors gathered in back room of the two-room flat, tensely discussing situation. They

had repeatedly telephoned to Hospital's district office; finally one woman had gone in person and said, "If something is not done quickly, she will die," and was told, "We can't help that—we are doing all we can." Though themselves very poor, they decided to send out and pay a doctor to see Mrs. Booth. Dr. K— of S— St. came, but refused case when told it was in charge of "Hospital Doctors." He 'phoned, however, to ask why Hospital did not take woman in. They asked who he was, and why he interfered. But at 9 P. M. they sent doctor. Neighbors now in a frenzy. One woman called doctor aside and rebuked him for neglecting Mrs. Booth. He became angry, and without looking at patient left, saying: "Since you know my business better than I, you doctor her. I dismiss the case; I refuse to have anything further to do with her."

Saturday. Neighbors again sent for private doctor this morning. Dr. G— came, but like Dr. K— declined the case. Nurse called this afternoon and found patient in desperate condition. Tem. 105; P. 136; R. 30. Repeated chills, vomiting, and agonizing pain.

'Phoned to Hospital at once. Was told that case had been dismissed for good reasons, and they did not care to discuss it. Reported to Society. Head Worker got Hospital Superintendent on 'phone, and after stormy interview received promise that woman would be received. At 7 P. M. ambulance called.

\* \* \*

IN ITS announcement for 1913 the *Youth's Companion* promises an article by Sir Horace Plunkett, founder of the Irish Agricultural Organization Society, which is to bring out the point that "as European farmers were driven to co-operation by competition of other countries, so the American farmers must organize to hold their own against other interests in their own country."

Henry Wallace, president of the National Conservation Congress, will contribute an article during the year on the Socialization of Farm Life.

The Girls' Page, the Boys' Page and the Family Page will be supplied with material by representatives of no less than twenty-two universities and thirteen colleges. Teachers in six technical schools, thirteen agricultural colleges, numerous private schools and the public secondary schools of nine cities will also give authoritative information in their especial fields. Eleven normal schools will be represented in the forthcoming series of articles on teaching as well as the departments of public instruction of twelve states and eight library commissions. In the planning of the pages six governors or ex-governors have given their counsel.

\* \* \*

CHARLES E. WOODRUFF of the United States Medical Corps tells us in effect in the *Medical Record* that we have in the high

cost of living a benevolent force paralleled only as a check to the Malthusian law by the plague of the Middle Ages and the famine of the Orient. He puts it thus:

A certain percentage of every society—the least efficient—are in such chronic want that proper nutriment is beyond their reach. It won't do to say it ought to be given them when we see shiploads of food leave our harbors to be purchased by abler men abroad. We cannot prevent the owners from selling to the highest bidders while there are thousands who are underfed here. We witness children growing up into degenerates the world over through sheer underfeeding. Nor will it do to say that in time we will raise enough food for all, as man has been at that very thing ever since he planted the first grain. That is, there is always a demand for more food than exists, and man is always trying to raise more to prevent the distress and cause more to survive, but the only result has been more survivors with the same percentage on the poverty line, and many beyond, to die at the first poor harvest. A thousand years will not change a phenomenon which has been going on for many millions, and which is the cause of all advances by survival of the fittest for survival.

#### UNTO OTHERS

GEORGE W. PRIEST in *Collier's*.

A song of those within the desert places—  
The dull, the strange, the erring of all lands;  
Who face the future with despairing faces,  
And stretch forth pleading, unavailing hands.

The heirs of poverty, the slaves of weakness,  
The arrogant who will not heed commands;  
The spiritless who wear a coward's meekness,  
The desperate who spill life's creeping sands.

Oh! holders of the prized and vantage places,  
Oh! slayers of the peaceful, happy days,  
Oh! scions of the wise and favored races,  
Oh! revelers along the sunny ways—

I beg a moment's pause, with earnest faces,  
That common blood and Fatherland demands;  
A prayer for those within the dreary places  
Who stretch forth pleading, unavailing hands.

**McCLURES** has started a department by Inez Millholland, directed particularly to the interests of women. An article on the suffrage in last month's issue by Wallace Irwin and Miss Millholland expressed the belief that, the vote won, the work of the women citizens of the future shall be

To compel decency in party management;  
to grant the poor the right of beauty in removing unsightly buildings and hideous signs from our river-fronts and woodlands;  
to give to little children the real justice of light, food and play; to make war unnecessary; to make our cities fit to live in and our streets safe for the young; to dignify motherhood by protection from the slavery of the mills; to increase the standard of living and reduce its cost; and to supplant by

Minor in *St. Louis Post-Dispatch*.  
THE WOLF AT THE DOOR

enlightened industry the dull torpor of our submerged mass.

\* \* \*

**NO WORKER** for public or private corporation has a harder job than the traffic policeman at a windy crossing, especially on a winter's day. According to the *Scientific American*, the city of Indianapolis recognizes this fact, by appropriating \$700 for placing small heaters at twelve downtown street crossings, on which the traffic policemen can stand to keep his feet warm.

\* \* \*

#### DISCONTENT.

**BERTON BRALEY** in the *Industrial Worker*, an organ of the revolutionary labor movement.

I am Discontent.

I am the Poe of Things as They Are.

The Fighter for Things as They Ought to Be.

It was my unrest with Chaos that brought about the ordered Universe.

And my presence in the brain of the Anthropoid Ape was the beginning of Human Progress.

Through the ages I have burned in the hearts of men, driving them ever forward to better things.

I have been the inspiration of poets, the Urge of warriors, the impulse of statesmen and the Ardor of martyrs.

Good and Tyranny and Sloth and Privilege have ever reviled me, for they held me in fear, knowing me for their inevitable doom.

Kingdoms and Empires have risen and fallen because of me, deserts have blossomed for me. Creeds and religions have come and gone for my sake.

I am the spirit of Invention, of Achievement, of Reform.

I am the lover of True Order, but the hater of Established Evil and Vested Injustice.

I am the flame in which the Dross of things is consumed that the Pure Metal may remain.

I make the Thinkers think and the Dreamer dream.

I am Doubt, I am Change, I am Progress.

I am Discontent.

SOME months ago the *Outlook* published the recollections of a prisoner in a New York state prison under the title *Behind the Bars*. An editorial note explained that although the name of the author was withheld the magazine was assured by trustworthy evidence that the article was from the pen of a prisoner and was the record of actual experience. This article gave rise to correspondence between the author of *Behind the Bars* and a well-known, public-spirited physician of New York. *THE SURVEY* is permitted to print the following interesting extracts from the correspondence of the prisoner.

"You probably noted that in my article I did not name the particular prison in which I was confined nor the county jail where I was detained. I hardly care to in this letter, but I will say to you that to my certain knowledge men waiting trial in the jails of Erie, Onondaga, and Oneida counties are allowed to mingle with other men so situated. Frankly, I do not approve of it. It tends to make the younger men in crime familiar with the 'triumphs' of older men who, themselves satisfied to fight society, embellish their deeds until they seem to be real achievements.

"I recall one instance that came under my observation. A man but three months out of prison assaulted and robbed a citizen in an up-state city. He was arrested and spent some weeks in the same jail where I was. I had taken a great interest in a young lad, not twenty, who was detained as a burglar. The man to whom I refer used to sit by the hour telling the lad of his adventures and throwing around them a glamor which made him appear a sort of

Robin Hood. Result: the lad pleaded guilty and was released on a suspended sentence. Within one week he was trying a 'crooked' scheme this man had taught him.

"I sincerely believe that on the whole the prisons of New York are decently managed but it is a disgrace that all three are structural anachronisms. Think of locking men in cells as small as are the ones I describe. The doors are grated and at Sing Sing the lower half is solid. There is no free circulation of air at all and that the general health is so good is remarkable. I presume the new prison at Comstock is free from this objection.

"I could not speak of what follows in an article such as the one I wrote the *Outlook*. What General McGlaughry calls the 'hellish cell bucket' is still used for all excretions. The 'morning walk' to which I refer in the article is taken that each man may empty his bucket. On Saturday\* they are emptied in the morning, then the men have to live with them until the following Monday morning. The stench Monday mornings is often almost unbearable. If the state cannot build new prisons it could at least tear out the cell blocks and put in new, steel construction with modern closets that can be flushed. It does seem as though a rich state like New York might spare the money for this needed improvement."

\* \* \*

#### GRIM HUMOR

"He's one of our most successful financiers."  
"That so? I didn't know he was rich."

"He isn't. But he's supporting a family of five on \$12 a week."—*New York Call*.

#### THE TWELVE-HOUR DAY

Had you ever thought of working twelve hours in one day? At one task? Before a row of two or three thousand degree furnaces? Amid the rattle of wheels and chains, the roar of air-blasts, the hiss and sputter of metal, and the crack of cannon-like explosions? All about you a vast menagerie of ponderous and awesome machinery, darting long arms, swinging huge caldrons of liquid-fire in the semi-darkness over your head, twirling mighty Bessemer converters with their grumbling molten maws, or pushing past you coffinlike shapes of white-hot metal that glowed incandescently? Always the intense heat, always the presence of danger, always the spur of the speeding-up system to keep you stumbling forward, intent on getting out the tonnage?

Had you thought of doing that for one hour? And then for two? And then for three, and four, and seven, and finally for twelve hours? Had you? . . . That is the barbaric twelve-hour day which obtains in the steel industry.

—P. C. MacFarlane in the January *Metropolitan*

## PERSONALS

**I**F you could have seen "Don" North, crowned with a chaplet of green leaves one night last August, leading the initiation at the Springfield Boys' Club summer camp up in the Berkshires, and bidding his fiercely mustached henchmen administer the Royal Niagara or Royal O-tis-Why to candidates, you would have found the fun contagious and have voted him a real "boys' man." But had you seen him exactly one week later, you would have realized that he is a rare spirit, one who is fit to actually lead, not merely direct, boys. On this evening the boys who had brought the mail from the distant Berkshire post-office burst into camp with the bad news that a "state farm boy" had burned the house in Springfield where Mr. North was staying.

Piqued, because he had been asked to sleep in a tent instead of in the house, he had destroyed Mr. North's furniture, records, library—all the property he possessed, even including his wardrobe. An hour afterward the writer, coming to the campfire, saw this leader of boys talking to a group; there were the usual upturned faces, and the frequent laughter that one expects when Donald North is on deck. Thinking of what a loss he had just suffered, it seemed certain that the boys had spared him the news of his loss. How else could he be so light-hearted now? And so he was asked whether he had seen the account of the fire, and if he was insured. But he only smiled thoughtfully and put his arm around the smallest boy (whose parents are dead), saying, "No—now I'm just as hard up as you, eh, Jiggy?" and the fun went on.

Afterward I found out why he smiled so thoughtfully after this particularly hard knock. His early boyhood was spent in the shadow of Southwark Cathedral and Lambeth Palace, in the heart of London. His father, who was an architect, had his office "atte Bowe," opposite Chaucer's Southwark Inn. Luck broke against him early and, while a mere boy, he was fighting hard for a living. Of these days his friend, George Budd, now of Holyoke, Mass., writes, "At eighteen he sat in the paybox of the Allan Line on East India Docks, London, and kept his nerve when gunshots came through the window. When ill luck came his way he tackled any rough job. When a Malay cook came at him with a kriss he knew just how to show that cook what is meant by 'a kriss for a blow,' or when there was a strike, he took on a wharf or engine-room job. In an incredibly short time Donald reached a responsible position in the service, and became his captain's intimate and personal friend. He never came home from any voyage without tokens of appreciation from some good men, and many were the invitations he had to settle in all the four quarters of the globe."

Although scarcely twenty-five years old, he was a self-made man already. Then his ship was wrecked. Many opportunities ashore were beckoning to him. Life's pleasantest ways were

opening to this young man, whose freshness of spirit and unselfish tact had made him a favorite with wealthy people as well as with the less fortunate. At this time he saw the forking of the ways, but chose to cast in his lot with the friendless.

He entered the physical directors' course at the Young Men's Christian Association College at Springfield, Mass. There he soon became a leader, not only in studies and athletics, but particularly among the class of boys who need help. For two years he was volunteer superintendent of the small local Boys' Club. When he graduated he was at once recognized as the one man to continue the work.

Within two years he had so stirred the business men of Springfield that he was able to build a clubhouse for the 2000 boy members. The citizens subscribed \$60,000 for this purpose in one week.

The boys themselves did much to secure this sum, and certainly the business men themselves helped a great deal. But what really worked the miracle of making the hard-headed western Massachusetts Yankee chip in so generously was the clean-cut, square young man who seems born for this work. For there are few people who are as hard physically as Don North, or as tender spiritually. Children appreciate such people. It makes no difference how selfish a boy has been made by indulgent parents, or how hard by cruel and drunken parents—they all follow him as though he had the pipe of the piper of Hamelin.

Mr. North is juvenile probation officer of the city and county, and it is interesting to note that there is a truly scientific method to his work. He is emphatic in warning those who deal with young "offenders" that they must avoid at any cost "snap" judgments. He urges that special, not uniformed police officers should be detailed regularly to look up the antecedents and records of boys and girls who are brought into court. He is a keen diagnostician of character. He never ends his experiments with boy character. They are practical, too, these experiments. During the six years of his work with boys the number of youths brought into court in Springfield has been reduced more than 60 per cent.

Every agency is at work in this Springfield Boys' Club. Athletics of every sort, from boxing and wrestling to pool and games before the open fire, are encouraged. Last year there were over 1,000 lessons given in carpentry, and many more in pottery, cobbling, drawing. Every kind of gymnastics is taught. The club has a savings bank, an employment bureau, an orchestra, and a swimming pool which is not yet completed. Several patrols of boy scouts are active.

It is not strange that Catholics and Jews, fine ladies and policemen, clergymen and "hard guys" all fall into the same tone when they speak of this man. With unending sympathy in his heart and a quiet smile on his lips, he goes on hoping where he cannot believe, always working like a Trojan for the friendless, the poor and even the criminal boy.

WALDO ADLER.

R. M. LITTLE

**R. M. LITTLE**, who recently accepted the general secretaryship of the Philadelphia Society for Organizing Charity, is a graduate of Monmouth College and of the Allegheny Divinity School. He was also a graduate student in the University of Chicago, and a student in the Chicago School of Civics and Philanthropy. While serving in a pastorate in Chicago, he became interested in social work, particularly in the field of charity organization.

Francis H. McLean, general secretary of the National Association of Societies for Organizing Charity, writes thus of Mr. Little and his work:

"The force of his personality, and his natural abilities of leadership made him very soon one of the most valuable volunteers in the Chicago Bureau of Charities. He served an apprenticeship in the Woodlawn District, and then became chairman of the general advisory committee. Later he was a member of the central board.

"Mr. Little took charge of a church in Bellevue, a suburb of Pittsburgh, about the time that the Pittsburgh Associated Charities was organized. It may be safely said that the fate of that organization depended in the early troublesome days upon the service which Mr. Little gave it outside of his regular duties. The writer remembers vis-

iting Mr. Little and insisting that he must lend his personality and his large and varied experience in the work to the new organization which, born at the time of a financial crisis, was desperately struggling for life. Since then his service has been continuous, and his knowledge of the work as intimate as that of a paid worker."

Mr. Little has served upon many committees and boards of other social agencies. He was the prime mover in the campaign resulting in the establishment of the Allegheny County Industrial and Training School for Boys. At the present time he is a member of the boards of the Boys' School, Woods Run Settlement, and the Milk and Ice Association. Last year he was president of the Pennsylvania Conference of Charities and Corrections.

\* \* \*

**A** FEW weeks before the death of Mary Graham Jones of Hartford, Conn., who did so much during her life for the betterment of child life and neighborhood life in her native city, she submitted to the city authorities a plan for providing small local playgrounds for young children in various parts of the city. Her scheme was that each playground should be near enough to its neighborhood to make it convenient and safe for the children to reach and use it. The report recommended the leasing from the city at nominal rent of a dozen or more vacant lots, the preparation of the lots to be in the hands of the park department and their supervision in the hands of the department of education.

The juvenile commission of Hartford petitioned the Board of Aldermen for permission to lease these lots and for an appropriation to pay for their support. The request was granted and \$2,500 was allowed for the first year's expense. Nearly all this sum was expended and the work was carried out under the supervision of the superintendent of parks, with various successful results. It seems highly probable that the work will be continued another summer and perhaps something may be done during the winter to provide for skating and like sports.

Thus the citizens of Hartford feel that Miss Jones has left their children a city-wide playground system as an enduring legacy. The Mary Graham Jones Playground is the name given by the North Street Settlement of Hartford to a place set aside for all neighborhood children under nine years of age. Miss Jones had spent sixteen years in settlement and child welfare work in Hartford. In 1900 she became head-worker of the North Street Settlement.

**THE** American Home Economics Association asks the co-operation of all who are interested in establishing a memorial to Ellen H. Richards, first president of the association and founder of the *Journal of Home Economics*, who died last year. The memorial is to take the form of a fund to start with \$10,000 for research, investigation and publication along the lines of the work of the association. Benjamin R. Andrews, Teachers' College, New York, is secretary.

## COMMUNICATIONS

### THE NATIONAL CONFERENCE

[THE SURVEY is glad to publish the following letter, at the joint request of sender and recipient.—Ed.]

MR. FRANK TUCKER, President  
National Conference of  
Charities and Correction,  
New York, N. Y.

DEAR SIR:

I attended my first Conference of Charities and Correction last year in Cleveland. I had been told, "Go to the National Conference to get acquainted, and you will be inspired by meeting and talking with the foremost leaders in this work."

I stayed at the Hollenden, wore a badge to show I was a member of the conference, and attended the meetings. No one spoke to me and I indeed felt a stranger in a strange land.

Each day for a week I saw the same people, meeting them sometimes in the elevator or the restaurant of the hotel, or in the business headquarters of the conference. I saw people who knew each other having the pleasantest kind of times together. I saw these same people at the meetings and heard them speak of co-operation, etc.; yet how are we new people to meet up with the conference members if no one even passes the time of day with us?

I am not the only one who feels this way. I heard two women talking on this subject. One said she had been going to the conference for five years and knew very few people. She said, as my friend had told me, that in personal conversation with co-workers one gets more out of the conference than at the meetings. Besides this year the people from the same state could not get acquainted, for at the morning session of the states it was not arranged as usual for the people from the same states to sit together. I heard many people complain of this.

I am twenty-five years of age, a college graduate, and well dressed. I am willing to meet people half way. I write this letter to commend the man who from the platform at one of the sessions said "conference members should be more friendly, they should welcome new faces."

Would it not be possible at the Seattle conference, where in all probability fewer delegates will be present, to begin the practice that every person wearing a conference badge must speak and make an effort to be friendly to those wearing the same kind of badge.

As president, Mr. Tucker, this will be your conference. Do this for the conference members. Speak to all yourself and ask such as Dr. Devine, F. H. McLean, Jane Addams, Mary Richmond, Alice Higgins, E. P. Bicknell, C. C. Carstens and H. Folks, to do the same. The others will do as you prominent people lead.

Before the conference begins have notices sent to all the members that the slogan of the fortieth Conference of Charities and Correction be "LET EVERY ONE SPEAK TO EVERY ONE ELSE," and

let it be the phrase for the future of the greatest gathering of people in the country, viz the National Conference of Charities and Correction.

I write this in the name of the many lonely people who attend the above mentioned conference.

Yours very truly,  
A MEMBER OF THE CONFERENCE.

### COUNTY CONFERENCES

TO THE EDITOR:

Following the suggestion in THE SURVEY of December 14 that the time is ripe for the organization of county conferences of charities and correction, it is encouraging to report that the suggestion has been approved by the Board of County Commissioners of Hennepin County, Minnesota, and a resolution promising co-operation on the part of the board has been adopted. The addition of health to the subjects charities and correction was made at the suggestion of the state health department, the officials of which participated in the last state conference of charities and correction.

The county conference is not intended to take the place of any existing organization, but it is intended to provide a way for an intelligent survey of the county as the field of study, to discover the causes contributing to poverty, delinquency, and disease, the character and cost of the means appointed for their prevention and relief, and ways whereby efforts may be unified, and better team work promoted.

The resolution referred to is worthy of publicity here:

"Resolved: That in pursuance of the request that this board invite and co-operate with other organizations to secure the organization of the Hennepin County Conference of Charities, Correction, and Health, we will so co-operate, and will grant the use of our rooms for their meetings."

With this for a starter, county conferences may come into fashion.

C. E. FAULKNER.

Minneapolis, Minn.

### THE SALEM TRIAL

TO THE EDITOR:

I am much obliged to Mrs. La Monte for her comment upon my recent letter in reference to Ettor and Giovannitti.<sup>1</sup> It shows that I did not make myself clear. Let me try again.

There was a strike at Lawrence. In the course of this strike some innocent persons were killed. It became the duty of the state to investigate the facts and, if possible, to detect and punish the persons who were guilty of the crime. In this case, as in the recent case of Becker, it was plain that the persons who instigated the shooting were the most culpable. Suspicion fell upon the two persons referred to. They had come to Lawrence, not to make peace between the contending parties, but to convince the strikers

<sup>1</sup>See THE SURVEY, Dec. 14, 1912, page 330.

that they had been suffering great wrongs from their employers. Their language was inflammatory: they naturally fell under suspicion. At least thirteen citizens of Massachusetts composed the grand jury, who agreed that there was probable cause to believe that these two persons were guilty of instigating the crime of murder. Accordingly, they were put on their trial.

Now, it seems to me that if we are going to have protection for innocent hard-working people and they are to be secure in walking our streets without being shot, the state could not have done less than it did. What I objected to in my letter was the giving of sympathy, under the circumstances, to these two persons. It is true that the trial jury rendered a verdict of not guilty; but all this verdict means under our law is, that the evidence did not prove them guilty beyond all reasonable doubt. Our law is very merciful, and they got the benefit of the doubt. I hope that the fact that they were tried and kept in prison for a time, even though finally acquitted, will be a warning to those persons in this country who think that revolution and dynamite are the best way to redress social wrongs; and who forget that a great majority of our working people are prosperous and happy, and that they are entitled to protection against mob violence and mob law.

EVERETT P. WHEELER.

New York, N. Y.

## OF CERTAIN SMALL COERCIONS

TO THE EDITOR:

In his editorial comment of January 4, Professor Patten not only addresses certain questions to the social workers of the country but draws vivid contrasts between "dozens of little coercions" and "doses of freedom." It is not my purpose to undertake to answer his questions. The program of the social workers has been so definitely outlined by action taken at Cleveland in June at the time of the National Conference of Charities and Corrections, and is so definitely formulated in the platform of the Progressive Party, to which Miss Addams gave her adherence, that further reply seems superfluous.

I should be glad, however, to ask Professor Patten in return to consider more carefully the nature of certain "small coercions" against which the women of the country and the social workers as well are now protesting. Professor Patten contrasts the value of a "suffragette agitation" with the value of a "clearer vision." He cannot, however, be ignorant of the fact that the efforts of women to become politically free have revealed as no other agency has been able to do, the nature and extent of the coercion, exercised over the voters of the community by the organized forces of vice and alcohol. The women think that in their efforts to secure political freedom so that they may be able to serve the community, they should have Professor Patten's acquiescence in increased control exercised over these common foes of the race. In Professor Patten's judgment the "only effective check to the natural expansion of clear ideas and social

emotions is offered by the members of the degenerate, defective or dependent classes." Commercialized alcohol and vice may be included in these groups; but will the classifications likewise include the competitor who remains in the market by adulterating the food supply of the people, the unintelligent producers of unclean and unsafe milk, the employer of children in the southern cotton mills, those who fatten on the labor of underpaid girls in our department stores and factories? I fancy these "enemies of the people" would be greatly surprised to find themselves so classified. Nor is the strength of their position or the disastrous consequences of their freedom lessened by so characterizing them. "Little coercions" upon them mean "large doses of freedom" to the child, the women workers, the men helpless before conditions of physical hazard in our industrial establishments.

Political action without philanthropy is of course like the human skeleton equipped perhaps with muscle but lacking the nervous and circulatory systems. Philanthropy on the other hand without political capacity is like an invertebrate structure, inert and incapable of efficient self direction. It seems entirely in accord with her general experience of helplessness when relying on philanthropy alone and with her observation of the social aimlessness of the older political parties that Miss Addams should demand that the strength and stability of one be added to the life and persistence of the other.

SOPHONISBA P. BRECKINRIDGE.

(Chicago School of Civics and Philanthropy.)

## SEX HYGIENE

TO THE EDITOR:

I am sorry to see that some of the patent medicine companies are taking advantage of the popular interest in sex hygiene teaching to advertise their goods. This will tend to throw discredit on the movement itself.

I have come across a woman who is traveling for the Viavi medicines. This Viavi is made from herbs which are picked by moonlight, on a magic date, and kept in retorts for eight or nine years, hardly failing to have incantations said over them.

At each of the towns which this woman covers, she gives a free public lecture, showing charts of the female organs and describing alarming symptoms, common to everyone, which call for Viavi. In one Alabama town she obtained permission from the superintendent of schools to lecture to the high school, which she did, calling her talk sex hygiene. One can readily see what a morbid apprehension might be aroused in the boys and girls by this sort of talk.

This evil is to be classed with that of the quack doctors for men's diseases, and the social hygiene societies generally realize the danger from the latter. I would like to point out the work of the Social Hygiene Society of Portland, Ore., in suppressing these quack doctors, as a good example to be followed everywhere. Finally, let me say that proper and adequate sex hygiene

teaching will protect our boys and girls, and later our men and women, who are now such frequent dupes and victims of these frauds.

MARGARET F. ELIOT.

Dallas, Texas.

[The *Journal* of the American Medical Association has issued a pamphlet on this subject under the title: *Viavi, a Widespread Fake Founded by the Law Brothers of San Francisco*. The contents is detailed and thorough. Its substance is well indicated by this sentence from Samuel Hopkins Adams printed on the cover: "A fake concern called the Viavi Company, which preys on impressionable women, has organized an elaborate 'lecture bureau,' mostly women and clergymen, to spread its doctrines, the chief of which is that every woman has something wrong with her, and that whatever it is, Viavi preparations will cure it."—Ed.]

## CO-PARTNERSHIP WITH WAGE-EARNERS

TO THE EDITOR:

In an address to the British Labor Co-partnership Association (profit-sharing) Earl Grey, late governor general of Canada, said:

"The events of last year have forced the nation to realize that it is necessary to set its industrial house in order, with the view of preventing the recurrence of experiences which, if they were repeated on any sufficiently frequent and extensive scale, would quickly reduce this country to an intolerable condition of insecurity, poverty and despair.

"The time would appear, therefore, to be opportune for asking the public to consider the reasons why we, the members of the Labor Co-partnership Association, believe that in the successful application of co-partnership principles to productive enterprise lies the chief hope of industrial efficiency and industrial peace."

We have had warnings enough in our own country. There is an irrepressible conflict between the buyer and seller of labor. There is an increasing class of wage-earners, depending for a living on hired jobs, from railroad presidents down to day laborers. Ready money begets extravagance. The self-reliance, self-control and foresight of a farmer is lost in specialized work and wages. There are millions of farm acres to be had for the cost of the improvements, but men prefer the town work for ready money and no responsibility. The employer has no power to compel a farmer to quit farming and work for him: he offers the opportunity, the farmer and immigrant do the rest. Farm products bring twice what they did in my time before the war, and still the factory and clerking wages and town attractions keep crowding on the employer. Then arises the question about wages, not free wages, but forced wages, backed by strikes and boycotts and assaults. Then the irrepressible conflict, the general strike, the appeal to arms.

Unless we can so educate the country people as to keep them on the farms, the crowding of factories and the scarcity of the food supply must make serious trouble, so serious that tariffs and trusts and currency fade into insignificance.

Co-partnership with wage-earners is one way to restore the equilibrium in incomes and restore

a sense of responsibility and mutuality. I started it twenty-seven years ago. All my employees and customers are my partners and associates. They own a large majority of the capital and will own it all. Mr. Carnegie approved of it long ago and said in his last book it must come. Mr. Roosevelt put it in a message. The highest authorities agree with Earl Grey and with me. Let the employers generally adopt it and let the unions insist on it in a fair division of the proceeds between capital, management and labor.

Nothing is more discreditable to a class of reformers than the cynical charge that profit-sharing aims at advantage over employees. On the contrary, it is always the opening wedge to a genuine mutual interest and understanding.

There is great unrest, not alone on the part of the lowest paid, but of the majority of all classes. There is not enough of what people want to go around. If one faction gets more, it comes out of the other wage-earners. Shorten the hours and you reduce the total supply. Raise wages and you raise prices and the cost of living. It never comes out of the rich or the employer: they only add it to the price. But in co-partnership more is produced because all get the benefit, it is more evenly divided, all fare better. There will still be room for discussion about relative wages and shares, but there is little room left for class conflict or unrest.

N. O. NELSON.

## WAGES FIXED BY LAW

TO THE EDITOR:

The country has lately passed through the throes of a political revolution, the dominant note of which has been the desire to secure greater equality of social justice. All the various political parties have had more or less to say on the subject of the relations existing between capital and labor, while one of them has declared for a minimum wage law. That legislation along these lines is sorely needed is manifested by the reign of industrial anarchy as a result of an utter lack of method or system, and the absence of a system indicates the presence of a graft.

The report of the United States Bureau of Commerce and Labor for 1910 states how labor received only 20 per cent of the value of the product which it served to create. High prices for the cost of living have depreciated the purchasing power of the wage-earner's money until he has actually received only about 17 per cent. The report also shows that after all expenses and charges are left, there still remains over two billion dollars surplus to be divided as profits among the employers.

Robbing labor is the mother of all graft and is the primary cause of the unequal distribution of wealth, with its by-products of millionaire and tramp. It is also the direct cause of all differences which may exist between capital and labor. Strikes, lockouts, dynamite plots, private detectives, poverty and prostitution are simply its effects. Heretofore many attempts have been made to remedy the effects while ignoring the causes.

I herewith present a simple yet comprehensive plan for removing the cause of industrial unrest, confident that when that has been done its evil effects will speedily disappear. Congress should pass a compulsory arbitration act containing a clause stipulating how in no event shall the award to labor be less than 33 1-3 per cent of the value of the product which labor has worked to create. Approximately one-third would pay for the raw material and fixed charges, one-third would go to the employer as profits and the remaining third to labor as wages.

This is the scientific and absolutely correct method of determining just what compensation the worker is entitled to; namely, how much value did his labor create? Based on that he should receive a fixed proportion to be determined by the law-making body of society. Dividends are based and declared on the value which the invested capital has earned; why not wages also?

The operation of such an act would virtually establish a minimum wage, the goal of all labor unions, thereby eliminating the necessity and expense of the same to the workers. It should also prove the proper antidote for the higher efficiency, speeding up, bonus and piece work systems and automatically increase wages in the proper ratio to the increased cost of living. It would place all employers on an equality in so far as the wage scale affects them and save society the cost and annoyance of strikes.

The weaker wage-earners—women, children, nonunion men and foreigners—are now preferred by the employer because their necessities and lack of organization compel them to accept a low wage which has increased their numbers to an abnormal extent. A guaranteed equal wage would anticipate the demand for equal suffrage which is merely the preliminary to the demand for an equal wage; minimize the evils of child labor; insure industrial liberty, and check the growth of anarchy among foreigners by demonstrating that there are some laws in favor of his class. It would restore the equilibrium in the number of individuals of various classes employed which would mean more tramps at work, more women in the home, more children in school; bring an end to the war over the closed shop and check the excessive immigration of undesirable aliens.

JAMES DEEGAN.

San Pedro, Cal.

#### MR. RUBINOW REPLIES TO MR. FOX

TO THE EDITOR:

I am constrained to impose again upon your valuable space in regard to the question of the brewers' compensation and pension fund.

Mr. Fox's chief objection to my criticism is based upon the charge that I "have no knowledge of the brewing business." To this indictment I cheerfully plead guilty. I would never presume to teach the members of the United States Brewers' Association anything in regard to methods of making or selling beer; but the

treatment of injured and superannuated employees and the organization of compensation schemes and pension funds presents many problems of its own that should not be approached without technical knowledge, which is required for their proper solution no less than for the brewing of beer.

Mr. Fox most emphatically states that my assumption that the plan only provides for compensation in case of total disability is "entirely unwarranted" and that that assumption "did not occur to any one of several experts and attorneys who have studied the subject." I can only reply that these experts and attorneys have evidently read something into the language of the by-laws which is not there. I challenge anyone to find in the by-laws as published by the association a single reference to partial disability. As a matter of fact, of all cases of permanent disability less than 5 per cent are total and all others are partial. That alone is sufficient indication of the expert skill with which the plan was prepared.

Notwithstanding his charge of ignorance and prejudiced hostility, Mr. Fox really admits most of my allegations. He admits that in a number of cases the scale of compensation is lower than is provided by compensation laws already passed. It may be "an ordinary business precaution" to force the employee to accept less than is guaranteed to him by the law, but that sort of precaution is neither just nor legal. Mr. Fox evidently entirely misunderstands the situation. Under the system of employer's liability when the injured employee cannot recover unless he proves negligence on part of the employer, the employer may well say to his employee, "Here is a modest compensation for you. You are welcome to take it or sue; you cannot do both." But when there is a compensation law on the statute books of the state, the employer has absolutely no right to force the employee to accept a smaller amount than is guaranteed to him by that compensation law.

Furthermore, will Mr. Fox kindly explain why a man's rights for an old-age pension should be endangered by any procedure he may take in connection with compensation for an injury? Mr. Fox cannot see the point of my objection to the Brewers' Association fund acting as a liability insurance company for the employer, and this very inability to see the point is, I think, quite characteristic. For the 1½ per cent of wages which the employees contribute, they want an unlimited insurance against compensation and employer's liability, which alone would cost them twice as much at any private casualty company, and they do not for a moment care whether such unlimited liability might not ruin the fund financially and wipe out all accumulated rights of the members.

Mr. Fox dismisses rather lightly my question as to the rights of the employee who is forced to leave the brewing industry. While it may be true that the demand for labor is more steady in that industry than in many others, nevertheless, the fluctuations in it are not insignificant.

<sup>1</sup>See The Pension Plan for the Brewing Industry by Mr. Rubinow in THE SURVEY for December 21; also the reply by Hugh F. Fox in the same issue.

The census of 1911 records that the greatest number of persons employed at any time during the year in the brewing industry was 43,363, and the least number 36,523, giving a difference of 6,941 between the maximum and the minimum. The average number of persons employed from month to month fluctuated between 37,000 in December, January and February, and nearly 40,000 in July and August, so that there is, Mr. Fox notwithstanding, a decided seasonal fluctuation in the trade.

The second charge which I made against the fund, as the reader will remember, is that of financial inadequacy. THE SURVEY is hardly a place for thrashing out differences of actuarial opinion; nevertheless, I think I can indicate in very simple English the gross errors that were committed in computing the probable cost which led to the perfectly ridiculous conclusion that 2 per cent of wages is sufficient to pay accident compensation as well as old age pension.

In order to determine that rate, a special investigation was undertaken. Workmen were asked through a question blank to state whether they had suffered any injuries and the replies indicated a rate of about 60 accidents per 1,000 employes per year. Of course, no information could in this way be obtained of the fatal accidents, and therefore the actuary estimated one fatal accident per 2,000 employes per annum. The experience of Germany and Austria shows nearly one accident per thousand employes, or twice as many as were assumed in computing the probable cost of insurance and surely no one would for a moment suppose that the brewing industry in this country is safer than it is in Europe. The weakest point of the computation, however, is the utter disregard of permanent injuries. There is no indication at all that some of the injured employes might not have been able to return to work, and might be at present somewhere outside of the brewing industry. Now, again referring to European statistics, there are at least seven permanent injuries per annum to each thousand employes, and thus in computing the probable cost of accident compensation, the Brewers' Association's actuary, on a basis of 40,000 employes, has disregarded the cost of 20 fatal accidents and 280 permanent injuries per annum, and the cost of these permanent and fatal injuries, even though they may be few, is greater than the cost of numerous temporary disabilities.

Then again Mr. Fox does not agree with my criticisms of the proportion of  $2\frac{1}{4}$  per cent as indicating the number of employes over sixty years of age. Taking the male population of this country over fifteen years of age as a whole, 9.7 per cent of them are sixty years old or over. Taking the men in gainful occupations only, the percentage is 8 per cent; in mechanical and industrial pursuits it is 6.7 per cent. If it be true that the percentage is only  $2\frac{1}{4}$  per cent in the brewing industry, the question is, what becomes of the others? Does the brewing industry kill them off so rapidly, or does it drive them to natural retirement or other occupations?

"It has been," says Mr. Fox, "the general custom of the American brewers to retain their old employes, even though they cannot do efficient work."

With all due respect to the brewing industry, that is the purest cant and nonsense. An employer may, out of humane consideration, keep a worker for some time after his highest efficiency is gone, but I have yet to hear that the brewing industry of America is an eleemosynary institution for the tender care of the weak and aged. It is true, the plan need not be final and provision is made in the by-laws for its revision, but while sections 8 and 9 of Article III very generously provide for the increase of benefits, nowhere is there the slightest indication that the contributions to the fund might be increased also.

Finally, Mr. Fox refers to my Latin motto as an evidence of "prejudiced hostility," and charges my criticism as lacking constructive value, in extenuation of my display of bad taste in quoting Latin, I might say that the intention was rather to explain the causes for the unfavorable referendum than to indicate my own attitude toward the matter. The meaning of Virgil's old saying is that we all fear the gift from persons we are suspicious of. That was undoubtedly the attitude of the brewery workers who cannot be supposed to go into such detailed analysis as I have made. My personal attitude is entirely different, and I do not at all consider the contingent plan proposed as a suspicious gift. I look upon it as a very businesslike effort to curtail the cost of accident compensation and solve the problem of superannuation without cost to the industry—an effort which is both impossible and vicious.

I. M. RUBINOW.

New York.

## STATE INSTITUTIONS AND EDUCATION

TO THE EDITOR:

State institutions, almshouses, and all custodial keeps are overcrowded. The problem for their care and maintenance is becoming more and more weighty.

At the close of 1908 the New York state charitable institutions reported 30,458 inmates, or one in every 208 of the state's population. In 1901, 5,301 were admitted. Of these 12 per cent or 644, were over sixteen years of age. Three-fourths of the 644 were married and 69 per cent were in comfortable circumstances. In almshouses and public hospitals there were in 1909 93,856 patients; in state insane asylums there were 32,658. These together make 127,271 or one for every 56 of the population.

Statistics show that in these institutions syphilis was the cause of commitment in 19 per cent of all male cases and 5 per cent of all female. Of these, 16 per cent of the males and 3 per cent of the females were of urban rearing while 3 per cent of the males and 2 per cent of the females were from the rural districts. Even in these institutions, sufficient statistics are as yet, lacking. As an indication in a slight way of the conditions outside, an authority in one of our second class cities quotes 1300 recorded cases of

syphilis in unmarried girls under his observation. These facts are, however, sufficient to indicate the prevalence of this vile invader of the social body. Until the race has mounted to that intellectual plane, where its individual members can see the real advantage of self-restraint and having seen the advantage shall have the power to practice it, this social evil will persist, remain a menace to the public, and overflow our now too-crowded institutions.

Various methods are now on foot to eradicate this evil. We are all familiar with them. They are, it is true, highly commendable and doubtless do much good; but do they reach the right people? One is surprised at the number in our cities and towns who have not heard of syphilis. Still more deplorable is the fact that only a few appreciate its full and awful meaning. Many are so ignorant that, having contracted the disease, they not only take no care of themselves but even go so far as carelessly to further its spread. It is needless to say that until a positive cure for this disease is found, marriage of leutic cases should be forbidden; though this would not eradicate the trouble, for unmarried people are sowing, broadcast, this neapolitan disease. Here, we pass those much-discussed subjects of the enormous prevalence of the disease and its dangers to public health, the dangers to the innocent members of society, the dangers to the off-spring, etc.

But how can the campaign be most effectively carried out? Even in this age not all people can read, but thank God, the majority can at least think a little, and most of them can see. These people must be reached, instructed and given glaring examples. In all, we may not arouse an interest in social welfare and high moral standards. These must be reached through that powerful sense, Fear.

A contribution to the solution of our problem is dominant in the institutions of our state. First of all, we need a burning desire and a concerted action to wipe this plague from the land. Then we need experienced, earnest men who will tackle the work, *con amore*. At present we have nineteen state hospitals for the insane, seventeen state charitable institutions, ten private institutions supported by the state, and county and city almshouses, to say nothing of the prisons, lockups and reformatories. Statistics show that on an average, one-fifth of all the persons held in these keeps are there as a result of syphilis. The state may well afford to set aside certain days every week or month as may seem fit for the purpose of enlightening the public. On these days competent men would be in attendance. The people would be notified and sufficient inducements held forth if need be, to have all see and learn. At this time lectures could be delivered drawing for illustration upon the abundant material at hand in these institutions. If one doubts the impressiveness of the method, he has only to visit one of the many institutions and walk through one ward. He will then be convinced. How much more strongly would one

think, if, on attending a series of lectures and demonstrations a clear explanation of conditions with their causes, dangers and modes of prevention were set forth, not in a morbid way, but so presented that even the depraved mind would grasp its significance and think. No man or woman can see conditions set forth, having had their significance explained by lucid descriptions, and straightway turn aside and forget all.

Another advantage of institutional demonstrations is this: some people, often the ones who most need instruction, are in such circumstances either through poverty, pride or modesty that they would feel too much out of place in a lecture or demonstration given elsewhere. Few there are who would hesitate to visit an institution. Inducements can be found by which all will desire to attend. When once people feel they are welcome, that efforts are being made to help them and that all will receive equal recognition and attention, half the battle is won.

The campaign against tuberculosis has not been without avail, but it is a fact well recognized by the medical profession that syphilis by lowering the vitality and weakening resistance produces a condition favorable to the development of tuberculosis. Until the spread of syphilis is effectively checked, the fight on tuberculosis will be but partially successful. The campaigns must go hand in hand.

From an economic standpoint, we may well afford to pay competent men liberal salaries for this work. As an average \$8,648,023.61 is yearly expended for supporting our state patients. Taking one-fifth of this as our syphilitic maintenance fund \$1,729,604.72 could be saved a year by eradicating this trouble. Well can we afford liberal salaried men for such a cause looking forward to the almost sure outcome. We could see the now over-crowded institutions gradually but surely lessening their census and so a lessened state expense. We have the proposition to face, we have the material with which to face it. Why not use them? Can you not even now see the result of such a movement?

CHESTER T. STONE.

Syracuse, N. Y.

## THE SURVEY AND THE PULPIT

TO THE EDITOR:

I am enclosing your letter of recent date asking me to subscribe. In reply I would say that while all you say in your letter is true, it seems to be no paper for a preacher to take. I read it regularly for two years at the Akron Public Library, and it was my undoing. In the first place, I felt led to teach Dr. Strong's Studies of Social Christianity in my Sunday School class and the superintendent waited upon me and told me it must stop. There was objection to it on the ground that all the men were becoming Socialists. Then I took the material of THE SURVEY into the pulpit and lost my pulpit thereby; at least, when my conference met, I had to move. So you see, whatever I may think personally of your periodical it has an *unsettling*

effect upon me. I simply cannot read the material in *THE SURVEY* and keep my mouth closed. So I am not going to take it this year. Next year I will read it again.

In the meantime I will read Thomas à Kempis or some other "good" reading, and do you go on publishing the same stuff for there is indeed nothing else like it in America. And at least this much I do and will do when others ask me where to get information on matters of this kind, I *always* say "Get *THE SURVEY*."

AN OHIO MINISTER.

## THE BURNETT BILL

TO THE EDITOR:

Isn't the Burnett Bill rather shortsighted? If there is no obscure aim behind its clannish or political motive the bill is simply despicable.

Ability to read or to read and write has already been confuted over and over as a wise test of exclusion. The criminals are seldom illiterate. If they have no trade, immigrants, whether illiterate or not, will find difficulty in securing employment, unless they will serve as common laborers.

But most important of all is the need of liberal immigration for the development of the country. The most prosperous countries are the most thickly populated, such as Belgium and Holland; and the least prosperous are those which were slow to see the advantages of immigration. It is true that a new arrival will bring keener competition in some trades, but even those very occupations will profit indirectly by it. Every newcomer, even if he is not a first class producer, is a full fledged consumer. All the activities of commerce and industry must be put in motion to provide for him lodging, clothing, feeding and transportation. There is not a trade that will not benefit by it, either by securing his services or by supplying him with its wares.

The main trouble is to be found in unwise and incompetent distribution of immigrants. I would recommend that more ports be opened as terminals for immigration. The contract labor law should also be so modified as to encourage collective settling and pioneering under intelligent supervision. This may seem reactionary, but if we look back to our early history we find that our forbears generally came in groups and small colonies either banded together under the leadership of some strong personality, or else under contract with some prosperous colonist. Nobody would have dreamt of tackling a new continent single-handed. Most of the pioneers were really under contract labor. With the experience of the past, it should not be difficult to devise a middle way to secure a proper distribution of immigration, that will develop our resources.

The reading test will not exclude undesirables but sturdy, healthy and honest immigrants, who by natural law wander to seek and enjoy happiness.

ALEXANDER GAZZOLA.

Cedar Manor, N. Y.

## JOTTINGS

### AID FOR JEWS IN THE BALKANS

An order from the Supreme Court of New York has been issued directing that the balance of the fund raised by the American-Jewish committee for the relief of sufferers in Russian massacres be transferred to this committee for "the alleviation of the consequences of persecution of Jews in any part of the world, and rendering them all assistance in the event of the threatened or actual invasion or restriction of their rights, and to afford relief from calamities affecting Jews wherever they may occur." Five thousand dollars of this fund, which amounts to about \$190,000, was thereupon appropriated for the purpose of helping the Jews in Turkey and the Balkans who have suffered from the Balkan war. In response to the appeal issued by the committee to the American public, over \$18,000 had been raised independently for the same purpose.

### WINNERS OF ECONOMIC PRIZES

Not so very long ago essays in political economy were almost sure to be concerned chiefly with the technical phases of the production or distribution of wealth. This month, however, the committee which passed judgment upon the papers contesting for the economic prizes offered by Hart, Schaffner and Marx, makers of men's clothes, gave the first prize of \$1,000 to the author of an essay entitled *Industrial Education, Its Problems, Methods and Dangers*. The winner was Albert H. Leake of Eglinton, Ontario, inspector of technical education for that province. The second prize of \$500 was awarded to Harry E. Smith, instructor in economics, Cornell University, for a paper entitled *The United States Federal Internal Tax History from 1861 to 1871*.

### FOCUSING PUBLIC OPINION IN THE NORTHWEST

By making more than one hundred promoters of social legislation in the state of Washington acquainted with their law makers and with the actual process of translating community needs into effective statutes, those responsible for the state conference of charities and corrections last month feel that it accomplished a valuable purpose. The legislators became acquainted also with subjects that lie close to the hearts of a large group of earnest citizens.

The conference, held in mid-winter during the session of the legislature, was preceded, weeks in advance, by free legislative institutes. These were held in Spokane, Seattle, Tacoma and Wenatchee. Proposed legislation was thoroughly discussed at these meetings, so that when the conference came together, it was able to represent much of the public thought throughout the state and focus this opinion at the capital city while the legislators were at work. The purpose of the institutes was educational. While it was the intention to formulate needed social legislation, no vote upon definite measures was taken. The conference itself refused to become

a lobby and voted not to take a stand upon any specific measure.

The topics that most deeply engaged the attention of the meeting were: a state bureau of immigration, employment agencies, the minimum wage, mothers' pension, protection of the feeble-minded, a court of domestic relations, sterilization of the unfit, the "Iowa Red Light Injunction and Abatement Law," increased appropriation for the state board of health for educational work in sex hygiene, adult probation and wages for prisoners.

#### TIN PLATE ORDINANCE IN PORTLAND

Portland, Ore., has passed the "tin plate ordinance." This provides that on all hotels, rooming houses, lodging houses, tenement houses, apartment houses and saloons, the name of the owner of the building and his address shall be fastened near the main entrance so that it can easily be read. The measure is one of a number recommended by the local vice commission to solve the social evil. Those who do not comply with the ordinance will be subject to a fine of \$100 on conviction in the municipal court. The proprietors of hotels, rooming houses and tenement houses are preparing to contest the bonding ordinance passed on the recommendation of the vice commission. Proprietors of such buildings are required by the measure to file a surety bond of \$1,000 with the city as a guarantee that they will not permit immoral conditions to exist on their premises. The act provides that the bond shall be confiscated after a second conviction of a violation of its terms.

#### LINCOLN'S BIRTHDAY CONFERENCE

The seventh annual Lincoln's Birthday Conference for social workers in New York city will be held at the Union Theological Seminary, Broadway and 120th Street, on February 12. It is the purpose of the seminary faculty, in arranging these conferences, to bring together men and women who, although they may differ radically in convictions, still share the common aim of promoting social justice and good will.

The speakers at the morning and afternoon sessions include: Rev. Thomas C. Hall, Rev. Dickinson S. Miller, Rev. William Adams Brown, Rev. John Haynes Holmes, Owen R. Lovejoy, secretary of the National Child Labor Committee, Anna Garlin Spencer and Rev. John P. Peters.

#### FEDERAL WORKMEN'S COMPENSATION BILL

After a delay of nearly a year the House of Representatives committee on the judiciary has reported favorably the Sutherland Workmen's Compensation Act, which has already been passed by the Senate. The bill as amended applies to employees of express companies as well as to those of railroads, and gives state courts concurrent jurisdiction with federal tribunals in its enforcement. The House committee increased from \$100 to \$120 the maximum monthly wage to be used in calculating the percentages of compensation—which ranges from 10 to 50 per cent. As some of the committee questioned the

constitutionality of the act, a "saving clause" was added, providing that no employee or dependent who shall have lost the right to compensation under the act, by reason of its invalidity, should be deprived of any other right of action he might otherwise have.

#### LECTURES ON MUNICIPAL ACCOUNTING

A series of eighteen lectures and conferences on the accounting tests worked out in the government of New York City is being conducted by the Bureau of Municipal Research. Students of city administration will have an opportunity to learn at first hand from men who have cooperated in the reorganization of the accounting and business procedure of New York departments the specific methods which have been elaborated. Heads of divisions and responsible employees of city departments and members of the bureau's staff, will explain the method of approach that has been employed with most success in the field studies of municipal departments.

#### SEX EDUCATION OUTSIDE OF SCHOOLS

The Matter and Methods of Sex Education Other Than Instruction in Schools is the subject that will be discussed at a meeting of the Society for Sanitary and Moral Prophylaxis which is to be held at the New York Academy of Medicine, 17 West 43rd Street, February 13, at 8:30 P. M. The main speakers will be Dr. Eugene LaF. Swan, Nellie W. Smith, Laura B. Garrett and Mabel M. Irwin. The discussion will be started by Dr. Ira S. Wile, Dr. Rosalie S. Morton, Dr. Mary Sutton Macy and Harriet E. McDaniel.

### THE SOCIAL WORK OF THE FEDERATED CHURCHES

Every social worker should obtain the report of the Commission on the Church and Social Service presented at its quadrennial session in Chicago.

It includes the statement of principles adopted by the Commission and gives a remarkable survey of the progress of the churches in this part of their mission.

This report is only one title in a large amount of instructive literature regarding the progress of the social movement throughout the Churches, some of which gives surprisingly hopeful information. It is all issued free.

The Commission on the Church and Social Service is a department of the Federal Council of the Churches of Christ in America, which includes 30 denominations.

# THE COMMON WELFARE

## A DETERMINED SIEGE OF OUR LAW MAKERS

It was over the LaFollette-Peters bill limiting the hours of labor for women in the District of Columbia—the "model" bill prepared by the National Consumers' League. The besiegers were: Maude Younger of California; Mrs. Florence Kelley and Josephine Goldmark of the National Consumers' League; Dr. George M. Kober of Georgetown University; Miss Obenauer, special agent of the Federal Bureau of Labor; and Grace Coulon, a laundrywoman employed in Washington, D. C. Representatives Peters and McCall also took part in the siege.

The besieged were the members of the House Committee on Labor and the Senate Committee on the District of Columbia. Joining the fray, more as besieged than as besiegers, were half a dozen merchants and laundrymen of the District, with an attorney, Joseph I. Weller.

Several solid mornings were occupied by the hearings, and it was evident that the bill and the principle underlying gained sympathetic interest, from both committees.

The testimony of Miss Obenauer, the agent who made the investigation for the Labor Bureau, was the most effective. She found the worst conditions in the department stores and laundries—there are practically no factories in Washington. Barring Christmas week, she discovered that 80 per cent of the department store women worked from fifty-five to fifty-nine hours per week. During the holiday rush, overtime was worked by a large proportion up to seventy hours and over each week. Overtime, she found, was rarely paid for. On Saturdays 58 per cent of the women individually interviewed worked from eleven to twelve hours, except during two or three months in summer.

As to pay, it was learned that the average weekly wage for department store saleswomen, as reported by the pay rolls covering 1,760 women was \$6.55. The poorest paid, excepting the apprentices, were cash girls at \$2 a week.

That these facts were startling to the Senate committee may be gathered from Senator Gallinger's surprised question: "Do

you mean to say that a woman behind the counter receives \$6 and a fraction?"

Just as Miss Obenauer's evidence was in its field expert, so also was that laid before the Congressmen by the other advocates for the bill. Mrs. Kelley's clear and patient explanation struck at the "stock" objections to such measures, notably the old criticism that an eight-hour day would drive customers from the stores before they had finished their shopping. Maud Younger related the twenty-months' experience of her state with a similar law. Miss Goldmark marshalled evidence as to the constitutionality of the legal principle involved in the bill, and quoted medical testimony as to the effect of fatigue upon the physique of women. Mrs. Coulon, the laundrywoman, tersely told the conditions under which doubtless many statesmen's shirts and collars are washed.

An amusing incident occurred when the attorney for the retail merchants and laundrymen, proposed an amendment to the bill shortening its enumeration of the classes of employment involved. When he concluded Senator Works of California exposed the effect of the proposed version by drily remarking: "Why, that leaves out your business entirely, doesn't it?"

The merchants, laundrymen and other employers who opposed the bill urged that an eight-hour law for the District of Columbia would give an undue advantage to neighboring cities where there is no such restriction of women's hours of labor.

The chief emphasis was laid on the fact that without the so-called privilege of overtime work the earnings of the women would be insufficient to live on. Employer after employer emphasized this point, seemingly without realizing the true bearings of the admission. Seven

employees in all testified before the Senate Committee and about an equal number before that of the House. But more significant and tragic were the letters addressed to Senator LaFollette and to members of the committees by working women who urged the passage of the bill, but did not dare to appear openly in its behalf for fear of losing their positions.

ON February 19 at Albany there will be a public hearing of the bills proposed by the New York State Factory Investigating Commission. Among these are bills to abolish child labor in canneries and in tenements, to end night work for women in factories, to minimize fire hazards, to reorganize the Labor Department on a new and more efficient basis, and to establish a Minimum Wage Commission. Since all these bills are of vital social concern the various organizations having to do with labor legislation urge that the New York readers of THE SURVEY make every effort to be present at this hearing. Those who can attend are asked to notify the New York City Consumers' League, the New York Child Labor Committee or the American Association for Labor Legislation.

The hearings, while they did not result in immediate favorable action on the bill, were encouraging to its sponsors. The passage of this model eight-hour bill for women in the District of Columbia would mean more than a local forward step. Favorable action by the nation's law makers would have great influence in twenty or more states where similar legislation is pending. Unless the bill is passed before March 4, the siege will start all over again. For the present the fate of the bill lies with these committee members:

*Committee on District of Columbia (Senate.)*

Jacob H. Gullinger, N. H.	Thomas S. Martin, Va.

Wm. Schley Howard, Ga.	Willis C. Hawley, Ore.
	Wm. S. Vare, Penna.

## PENSION LEGISLATION FOR NEEDY MOTHERS

Mothers' pensions are an issue in more than a third of the forty-two states whose legislatures meet this season. Definite information is at hand regarding such bills in fifteen states. In some of them several bills are competing for the lawmakers' approval. In four of these states, Ohio, California, Minnesota and Pennsylvania, public investigating commissions are proposed by those who believe that the questions at issue are too important to be passed upon without a more thorough knowledge of conditions than is now possessed.

In Massachusetts, the commission appointed a year ago has made a divided report. Two members favor "subsidies" (Bostonese for pensions) while one opposes the plan. The bill urged by the majority creates a special state administrative body, the Commission on Subsidies for the Children of Widows. In this commission is vested the power to make the initial investigations and to grant the pensions. Disbursement and follow up work, however, are to be in the hands of the local Overseers of the Poor. The state and the localities furnish the funds jointly. A unique provision forbids the commission to ask private societies for help in making up the pension or to call upon relatives except those who are legally responsible for the support of the pensionaire. Another bill, supported by the opponents of this measure, reads case work standards into an existing statute. Under this adequate money relief may now be given by the Overseers of the Poor or the State Board of Charity. The bill also provides for supervision by that board of all families having dependent children under fourteen years of age who are aided by overseers. Separate reports on these families must be made to the state board. Both these bills are in committee.

Two bills are being considered in New York state. One is a state wide measure. The other is limited to the city of New York. In its present form it establishes a board of trustees to conduct a "department of home assistance" to administer directly, and also by grants, to private societies, public assistance to widows with two or more dependent children in their own houses. This department is to be separate and distinct from the Department of Public Charities which is by law now charged with the responsibility for commitment of dependent children institutions.

Conferences have been held between social workers favoring and opposing this bill. A voluntary committee is planning to make a thorough inquiry intended to ascertain the facts of the situation and specifically what further assistance should be provided to widows and their children by private agencies or by governmental action.

The New Jersey bill, also still in committee, is meeting with strong opposition. At a conference of representatives of various child saving organizations held in Trenton, January 20, the following resolution was adopted:

"Resolved, That this conference feels that the time is not right for the passage of a mothers' pension law, but that the chairman of this conference appoint a committee to study the question in its relation to existing sources of relief in New Jersey, said committee to report to this conference at its next meeting."

By the bill the pensions are to be granted by the Courts of Common Pleas out of county funds.

All four of the Pennsylvania bills are in the hands of a sub-committee and a hearing was held on February 5. Three of them allow local courts to grant the pensions and one creates for this express purpose a state commission composed entirely of women. A group of Pittsburgh social workers is urging a commission of investigation.

Ohio's pension proposal is embodied in the Children's Code of the commission appointed to codify the laws relating to children. A hearing has been held. The agitation for some pension legislation has gained great headway. Certain leading social workers, however, are urging delay until a commission can study the subject thoroughly and impartially.

In Indiana, a mothers' pension bill has passed one branch of the legislature after a hard contest, but its further progress is uncertain.

Iowa sentiment strongly favors the bill now in committee in the legislature. No organized opposition to the proposal is apparent.

The Minnesota House of Representatives has reported the Campbell bill favorably. There is opposition to it, however, and the counter proposal of an investigating commission is urged by leading social workers.

Two mothers' pension bills are before the Nebraska legislature. Both are apparently still in the hands of the committees to which they were referred.

In Colorado, where a pension law adminis-

ed by the Juvenile Court went into effect on January 21 a bill has been introduced to repeal it and to substitute the public relief authorities as the local pensioning agencies.

A pension bill has been reported out by a committee of the House of Representatives in the state of Washington. More opposition is looked for in the Senate. Public sentiment, so far as expressed, favors the bill. The Congress of Mothers is responsible for the Oregon bill, which is now before the state Senate, having passed the House unanimously on January 24.

Several bills are pending in California in spite of the fact that mothers' pensions have been granted for several years in a few cities of the state under certain general provisions of the Juvenile Court Law. As in other states, the opponents are urging a commission to study the subject.

Bills have just been introduced in Michigan and Tennessee. In Illinois there is almost general agreement among those who have had experience with the administration of the present law that it must be amended in important particulars. The question of whether the administration of the law shall remain with the Chicago Juvenile Court is now under consideration in that city.

A bill is expected soon in the Arizona legislature. In Wisconsin there is strong sentiment in favor of such legislation. A bill is being prepared by the Legislative Reference Bureau, which has been corresponding widely with persons in touch with such laws in this country and abroad.

### SOME CO-OPERATIVE SOCIETIES IN EUROPE

Co-operative societies are constantly extending their field of activity in Europe. The Society of Consumers in Hamburg with 57,000 members has a yearly trade of four million dollars. Two model bakeries of this society, as well as their slaughter house and sausage factory have been most successful. Recently a large farm was bought for supplying dairy products, cattle for the market and rye and potatoes for distilling alcohol.

The drivers of Madrid have formed a co-operative society with the object of acquiring the sole ownership of their vehicles. Until the purchase is completed, the owners of the vehicles share the profits.

The Co-operative Alliance of Switzerland a few years ago went into the manufacture of shoes. Recently the syndicated milling interests refused to furnish flour to some co-operative bakeries, whereupon it was decided to acquire one of the largest flour mills in Zurich which will supply flour at a much lower price. The members of the co-operative glassworks in Albi, France, who are both stockholders and workers, recently went on a strike, because the director

tried to equalize wages which ranged from seventy-five cents to \$2.40. A correspondent with a German's love for sociological differentiation writes: "In spite of the fact that everybody in the glassworks was an organized workingman and an adherent of most radical Socialist principles, the individualistic and egotistical spirit dominated in their communistic society." Only with great difficulty did the Socialist Party succeed in ending the strike.

### SIX WEEKS OF STRIKES

Last week was the sixth of the garment strikes in New York. Among the men's tailors the outlook for settlement was gloomy. In women's wear, in none of the three divisions in which strikes were in progress had the International Ladies Garment Workers approached a settlement comparable to the protocols to which it is a party in the shirt waist and cloak, suit and skirt trade. All but the Brooklyn local of the kimono and wrapper workers had concluded agreements with their employers' associations. The white goods workers had as a group rejected a protocol which was in other respects a gain for them but did not establish the preferential shop. In all three divisions of the trade, on the other hand, the solidarity of the workers has been broken by single shop settlements.

With six weeks in the street, the pressure of need is being felt by the strikers. Some strike benefits are being paid and a dozen or so lunch kitchens for pickets have been set up by the union, the Woman's Trade Union League, the Socialist Party and other organizations. The strikes of the workers on women's garments alone are said to cost the union \$1,200 a day.

Mass picketing, on the model of that carried out at Lawrence, has been tried by the United Garment Workers and there were some clashes with the police and detective agency men when this method was first put into effect. There have been individual cases of "beating up" on both sides and some egg-throwing on the part of girl strikers. Following the precedent set in the shirtwaist strike two years ago, the use of the word "scab" is held by the authorities to be a form of violence and adequate cause for arrest and fine. Among others, one of the organizers of the Woman's Trade Union League, Leonora O'Reilly, was arrested and fined on this charge, which she emphatically denied. Many fines and, for men, some workhouse sentences have been imposed. To the women strikers no workhouse sentences have been given, few have been kept in a cell over night and only one group, the women in the United Garment Workers employed on men's tailoring, have been forced to appear in the night court.

As the white goods and kimono workers are as a group exceptionally young girls, so young that one of their organizers calls their strike the "Children's Crusade," it is a matter of congratulation that their lawyers have been able to keep them out of the night court, which played such a conspicuous part in the shirt waist strike of 1910.

But some of the dangers to which the night court would have exposed them have come to them in other ways. At one strike headquarters at least, strange men have been reported as loitering, giving out cards, advertising places where the girls could get "easy employment." The girls' stories of what was said to them—though their broken English makes it hard to get a very full statement—can not point to anything other than that these men were procurers or cadets, quick to seek their quarry in the midst of strike idleness and want. Since these first experiences precautions have been taken by the strike leaders to keep out all men who could give no proof of their right to enter the halls.

#### ECHOES FROM THE BALKANS

Even the Balkan war enters into the story of human struggle bound up in these Manhattan strikes. The agreement which the State Arbitration Board drew up for the East Side branch (some 2,000 strong) of the Kimono and Wrapper Workers' Union, and the East Side Kimono and Petticoat Manufacturers Association was in no sense a protocol. The explanation lies in part in the personnel of the trades.

It must be remembered that the waist makers who the fortnight before came under the "white protocol" had behind them a union with an aggressive membership who went out with previous experience of strikes and with a very definite knowledge of what they wanted to get and a pretty good assurance that they would get it. Negotiations had been going forward for weeks. The kimono workers on the East Side, on the other hand, were until this strike began totally unorganized.

They are most of them very young girls and many of them are included in the latest immigration to this country, a migration of Spanish Jews, resident in Turkey and the Balkan states who have been making their way to this country to some extent for the last two years, but in new and greater numbers since the Balkan war began. Most of them are abjectly poor and speak no language but Spanish and some one of the Balkan tongues. They do not for the most part work in the same shops with Russian Jews or associate with them; they are just the sort of new immigrant labor which easily becomes the victim of exploitation. The strike organizers

believe that something has been accomplished in the beginnings of organization among them more important than the concessions embodied in the agreement drawn up before the arbitration board. Under this agreement, which is to be in force for one year, hours are limited to fifty, with four hours overtime—"and these four hours shall be worked in four separate days." A promise is made by the manufacturers that no discrimination will be made against strikers or against union members. Other clauses provide that both employes and manufacturers shall co-operate to improve the sanitary conditions of each factory and all new employes engaged by the members of the association shall be furnished with sewing machines free of charge, and all machines shall be kept in order at the expense of the employers.

The wage scales are low for both piece and week workers. For the latter it is vaguely provided that "all who have not received an increase within the past three months shall receive an increase from fifty cents to a dollar according to efficiency." For piece workers the following scale is set:

NAME OF ARTICLE.	CENTS PER DOZEN.
Aprons, 2 pockets.....	15
Aprons, 1 pocket.....	12
Aprons, Butcher.....	20
Aprons, Princess.....	40
Aprons, Savana.....	20
Aprons, Savana Fruta.....	25
Bibs.....	20
Dress sacques, Ribb.....	45-50
" " Scallop.....	15-20
" " square neck, short.....	40
" " " " long.....	50
Sailor sacques.....	50
Long Scalloped.....	8-10
One piece kimono.....	2-3
One piece trim.....	15
Petticoats.....	12-14-20-25
Rompers.....	40
Yokes, kimono, long.....	50
" " " " short.....	25-35

Future wage adjustments are to be made through the Board of Arbitration. The three thousand kimono workers on the West Side have, as this issue goes to press, concluded a protocol along the lines of that in the waist industry.

#### THE STRIKE OF THE MEN'S TAILORS

The big employers in the men's trade have had their backs to the walls from the beginning of the strike. The outlook last week was that the workers must ultimately give in, and the employers for their part lost the season.

A more hopeful attitude was taken by the smaller employers organized as the United Manufacturers' and Merchants' Association (Wolf Elias, president) and the United Clothing Contractors' Association (Charles Gross, president).

Here the hitching in negotiations has come, not from the employers but from certain of the labor

leaders who are accused of resorting to outright jingoism.

Conferences of representatives of these employers with Thomas A. Rickert, president of the United Garment Workers' Union and other union officials, were held for three days and thrashed out the details of a proposal drawn up by Julius Henry Cohen, as attorney for the manufacturers. The terms of the agreement represent concessions on both sides. The union demand for hours was, for instance, forty-eight; the employers felt that they could not go below fifty-four, but fifty-two was finally reached as a compromise with the following concession of principle by the manufacturers:

"We believe in the ultimate forty-eight hour week in our industry, and will be ready to put it into operation just as soon as competitive conditions will justify."

On wages an immediate increase of 5 per cent was conceded, with a further increase of the same amount to take effect in April.

Though no effort was made to put into effect a full protocol agreement, as neither side felt that the industry was yet ready for it, the agreement provided in a wage board and arbitration board some of the machinery for the permanent adjustment of relations between employers' and workers' organizations. The acceptance of these clauses by the representatives of the unions is said to have come only after considerable controversy between the national and the local union organizers. The latter preferred to retain the old method of single shop strikes, with settlements through the interposition of union officials. They are afraid, it is charged, that they will lose their hold, if not their jobs, under the orderly adjustments of shop difficulties by the protocols, and for their part, they charge that the protocols tie the hands of the men. Other factors doubtless enter into the situation. The agreement was referred to a referendum vote and was rejected.

The two bodies of employers who would have accepted the proposal claim that they now cover 90 per cent of the men's wear trade. The older, and for the most part larger, manufacturers are organized in the New York Clothing Trade Association. To quote the words of a committee of citizens, they "refused to enter into any dealings with the union, refused to arbitrate, and insisted upon an immediate truce as a preliminary to further negotiations." This committee was composed of R. Fulton Cutting, Canon George William Douglas of the Cathedral of St. John the Divine, Cleveland H. Dodge, William Church Osborn, Charles L. Bernheimer, chairman of the Arbitration Committee of the Chamber of Commerce; Rabbi Stephen S. Wise, Prof. Jeremiah W. Jenks of Cornell University, William

Jay Schieffelin, Felix Adler, and Henry Moskowitz.

### COLONEL BOPE'S ADDRESS

Colonel Bope's address, published on page 701 is at once the most compact and the most effective statement yet made by an officer of the United States Steel Corporation on the welfare policies of that organization. It is, by the same token, one of the best statements made by any of the big corporation leaders in the country of what might be called their conservation program with respect to the human resources in American industry.

That the largest employer of labor in the United States should have so developed safety work, sanitary supervision and relief plans is stimulating; but if the impression got abroad that only the large employer could afford to do these things, it would be unfortunate. Colonel Bope points out that the Steel Corporation is expending \$5,000,000 a year in these directions. The manager of a small plant in a small town can not spend a million or perhaps even a thousand dollars a year.

It is to be noted, however, that the Steel Corporation employs over 200,000 wage-earners and its outlay approximates \$25 per man. The work therefore is at once brought within the capacity of a small plant. In its leadership in these fields the Steel Corporation is showing not only what the great employer can do, but what the small employer can do.

It is the announced policy of the head of the Steel Corporation that the conditions in its mills shall be better than those which the men could secure through unions. Colonel Bope's article is an amplification of just what that policy means on its constructive, pro-welfare side. The flare-ups among the workmen of the Pittsburgh district within the last few weeks illustrate its limitations—its negative, anti-union side. Evidently there is not entire acquiescence among the 200,000 employes of the Steel Corporation in having all decisions made for them from above. Early in the year there was a strike of a thousand railroad men who handle the switch engines and cars in the Carnegie plant at Homestead. This was the first time since the great strike of 1892 that those mills have been practically tied up by labor troubles. The Edgar Thompson works at Braddock were also shut down, and the Carrie blast furnaces across the river banked. The strike failed and the men filtered back to work.

On January 25, 1,250 men employed in the American Steel and Wire Mill at Rankin struck for higher wages, abolition of the tonnage

system of payment, and reinstatement of men who, it is alleged, were discharged for trying to organize the shops. A bystander was shot in a disturbance while the strike was on, and later the American Federation of Labor threatened a strike in every mill of the Steel Corporation. General Manager Jewett said to the men, "You will have to decide whether you want

Steel Corporation has not as yet included as a welfare item the substitution of the eight for the twelve-hour day—although the practicability of the three shift system in continuous work has been demonstrated in the independent plants at Granite City, and although it was recommended a year ago last month by the stockholders' committee of the Steel Corporation itself.

#### A CANNER'S PLAYGROUND

The canners of New York have long contended that the "sheds" of a canning factory are not a part of the factory proper, and that the labor of the children in these sheds is not factory work, but merely "play." In 1905 Justice Mayer of the New York Court of Appeals, in line with this contention, ruled that children so employed were exempt from the provisions of the regular factory law.

Miss Chamberlain made an extensive investigation of the canning industry for the New York commission last summer, and one of the proposed bills of the commission would abolish the work of these little children in the canning sheds.

to work for us or for the labor agitators." The same policy holds true with respect to self-constituted workmen's organizations in time of peace. The Steel Corporation will neither recognize nor bargain with them.

It is thus that we have the contrast, pointed out by Mr. Fitch in his articles on the steel industry last year, of a corporation which stands above all others for co-operation in business dealings, which has applied the principle to its safety and welfare work, but which—when wages or hours are up for consideration—refuses to apply it even to the extent of bargaining with two men together out of its pay roll of 200,000 employees.

However this policy be regarded—as making for industrial efficiency or as violating the instincts of democracy—one thing is clear. It puts entire responsibility for work conditions on the employer.

This brings us to a further contrast which will be noted by readers of Mr. Taylor's article on the steel plants at Granite City in the February magazine number of *THE SURVEY*. The

## THE NEW BEAN BAG

MARY CHAMBERLAIN

Assistant Secretary, New York City Consumers' League

The canners have discovered a new outlet for the spirit of play in an amusing game called "snipping beans." We are entirely indebted to the canners themselves for this discovery. Froebel with all his genius never thought of including snipping beans in the kindergarten "gifts." To common knowledge no recreation center or public school has realized the wonderful effect of snipping beans on the mind and body of the child. The new Montessori method utterly fails to estimate the psychological value of breaking off the tips of beans all day long. Even Noah Webster of dictionary fame evidently had no thought of snipping beans in mind when he defined play as "any exercise not for task and not for profit." For this "snipping" game, although not in the least harmful like "craps," is rewarded at the end of eight or more hours by twenty-five, fifty or ninety cents according to whether the con-

testants are under ten years, ten to twelve years, or twelve to fourteen years old respectively.

Of course, it is not to be expected that the child who receives these benefits could fully appreciate such advantages. In fact last summer one child who was brought to the attention of the New York Factory Commission had glorious opportunities of play which all of us might envy for our own children and yet this ungrateful little wretch gave no word of thanks except to grumble "I'm awfully tired" and to murmur because this healthy exercise split her fingers! This ten year old ingrate, Milly Vacanti, played on August 20 from 4:30 in the morning to 9:30 at night, a total of 12 1/3 hours. On August 21 she evidently begged to be roused early again, for she frolicked from 4:30 A. M. till 5 P. M. in all, 11 1/2 hours. The next day, August 22, was Sunday, and although some more lenient parents allowed a few hours recreation to their children, Milly's orthodox mother refused to let her go out in the sheds, but kept her home working in the "shack" all day long. And then the next day, alas! It rained so heavily in the morning that no bean toys could be garnered in the fields, so that poor Milly and the other disappointed children had to satisfy themselves with stupid games like tag or hide-and-seek out in the yard in the afternoon. But on August 24 the reward came in eleven hours of merry "snipping," on August 25 in a scant seven hour measure of fun, and on August 26 in one long unalloyed day of pleasure from 4 o'clock in the morning until 10 o'clock at night.

What a shame it is that the canners have formed this "play trust," when here in our own city thousands of little children who cannot play in bean sheds must work long hours in dirty, ill-ventilated sweatshops.

Just as there are a few discontented souls among the children, naturally we expect to find some self-satisfied people who are slow to welcome any innovation whether it is in work or in play. When Mr. Potter, who directed the canery investigation for the Factory Commission, reported that of the Buffalo children who emigrated to canning factories in the summer 50 per cent were backward in their classes, a few old-fashioned fogies were caught mumbling that "all play and no work makes Jack a dull boy!" If these people would only remember that no amount of "reading, riting, and rithmetic" can make up for the health and spirit generated by wholesome recreation, they would stop throwing stones at the canning industry and give their attention to the servant problem or something else that really needs improvement. But every reform—dress reform, tax reform or play reform—must always be hindered by certain unthinking, unprogressive members of the community.

## "PENSIONS" AND THE SOCIAL WORKER

MARY E. RICHMOND

Russell Sage Foundation

Of all enviable gifts commend me to the one which enables a man to think both quickly and justly at a time of emotional excitement. It was at such a time, when the Venezuelan message of '95 had just been sent to Congress, that an editor of my acquaintance, who had unbounded admiration for Mr. Cleveland, announced sorrowfully but without a moment's delay that the President had blundered. Newspapers of every political faith were shouldering their muskets and marching to the front by the relatively safe approach of the editorial column, but this one man was almost alone in seeing at once what a good many people did not find out until a week later.

Social workers are facing at the moment a more puzzling tangle than the eastern boundary of Venezuela ever was. It must not astonish us that many of them hesitate, for mothers' pensions is not one question but a dozen.

In the first place, it contains two distinct ideas that are often confused: the idea of a payment on the basis of *proven need* that cannot be humanely met otherwise, and the idea of a payment on the basis of *service rendered*. The latter is a pension; the former is relief.

After true Oriental fashion, in the second place, pension advocates attempt to set our widows in a class apart. How surely this must fail in the Occident is shown by the various state pension measures just drawn, some of which include not only widows remarried, but the wives of husbands totally disabled, insane, feeble-minded, imprisoned, or deserting, and mothers who are not wives at all. Some bills "for constitutional reasons" even include both parents.

This drift is inevitable. In so far as pensions are intended to be used in caring for children who live with their natural guardians, the laws granting them are neither more nor less than laws granting public relief to families. Their champions may "run the chromatic scale up" in asseverating that their provisions are justice and not relief, but the only law under which such payments could become a true pension would be one granting a stated sum or sums to all of the same class, to all widows with children, for instance. It is true that we social workers have been using the word "pension" loosely in connection with relief work, to cover a good many kinds of grants, and that we are responsible, in part, for the present confusion of terms.

There are many, however, who accept every implication of the word "pension" and who urge motherhood as such upon our attention as a service which justifies endowment by the state; and

those who take this view are writing in favor of and campaigning for the public relief measures (miscalled mothers' pension bills) that are now before fourteen different legislatures. They regard them as an entering wedge to another and quite different social policy. We must give attention to this endowment of motherhood idea—it concerns all social work—but, reserving this separate subject for another occasion, let us ask ourselves, as social workers, what our responsibility is for the scores of bills with varying provisions that are now in committee.

These bills assume, most of them, that a grant of six, eight or ten dollars per child per month will automatically assure improved health, improved morals, and improved citizenship. In so far as this assumption is widespread, is not the fault partly ours? Have we not failed to make clear the only conditions under which material relief can be transmuted into human values? The fixed sum per child takes no account of these, nor of the readjustments that must be made to changes in bodily health, in temper, in power of endeavor, and in natural resources.

Many of the current proposals also ignore public and private provisions now existing for meeting the same needs. One bill is fantastic enough to enjoin the public officials who are to administer the proposed law from seeking supplementary or substitute aid from any private agency; and most of the state-wide measures would create a central relief authority charged with the same duties as those of the present county relieving officers, without suggesting any means by which to readjust or regulate the duties of the latter. But is not this merely an exaggerated example of our own attitude? Have we not, for the most part, turned our backs upon the administrators of public outdoor relief in this country, and busied ourselves about everything under the sun rather than about their work? The danger of new and conflicting public relief authorities is obvious enough. The new departments are to set about an old task under a new name but with no new or else with very inadequate new machinery. But what do they or we, for that matter, know about the old machinery? It has the great advantage of being on the spot, and of having the well localized form of organization which is absolutely necessary for relief work, but what, beyond that, do we know as to what it is doing or what it is neglecting to do? Content with a general suspicion that the work was not being very well done, we have not thought its processes worthy of study, and now a new public outdoor relief is impending, to be administered independently and contemporaneously with the old, but for neither the new nor the old have we any basis of fact—statistical or otherwise—to show the extent of the needs that it aims to meet, the probable cost of achieving the results aimed

at, the fundamental conditions of success, the qualifications necessary in those who are to bring this success about, or the relation of the whole process to the other functions of government. These are not administrative details, as some would have us believe. The difference between the work of the ward surgeon who operates and kills and the one who operates and cures is not a difference of operative detail, but of fundamental skill and knowledge; a difference of nice adjustment; that is, a means to ends.

Good documentary evidence could be produced to prove that, during the last decade, many private social agencies engaged in family work have made great advances in the adjustment of means to ends with child welfare in view, that they are now throwing many more safeguards around child life in families than ever before. We have no body of evidence from the public agencies charged with the same duty; no plumb line has been dropped into their daily activities. Should we not bestir ourselves, community by community, to discover what is happening to this fundamental work for families? Should we not, in all our town surveying and stock-taking, make an inventory of family relief too, and, on the basis of its showing, strive to create in each community something more than a perfunctory interest in the task of the outdoor relief official? The state can help by investigating, by stimulating local interest, by encouraging an interchange of ideas, and by frequent inspections, but the community itself must care, and must take part in the process of making better things happen.

There are few more specious appeals than the claim that mothers' pensions are an emergency measure, that we must legislate somehow, anyhow, at once, and trust to getting the question onto a right basis later. It was not time wasted to get the facts and to base our legislative program solidly upon them in the recent factory investigations of New York state, nor to do this in the workmen's compensation campaigns of several states; we are applauding the long-delayed but now well-launched effort to study the social evil in all its ramifications before rushing into we know not what, we know not why. Here is an equally important cause in which we must also make haste slowly. Bills have been introduced into some of the legislatures creating commissions to study and report upon the question of mothers' pensions. They have been drafted not by obstructionists, but by those who are deeply interested in the welfare of all neglected children. Without attempting to marshal the further arguments on either side of this much disputed matter, suffice it to say that the need of more facts and of more deliberation should lead all practical social workers, whether they favor pension legislation or not, to favor these commission measures.

## CONFERENCES

### FEBRUARY AND MARCH CONFERENCES

**CHILD LABOR**, Ninth Annual Conference of National Committee on. Jacksonville, Fla., March 13-16, 1913. Gen. Sec'y, Owen R. Lovejoy, 105 E. 22d St., New York.

**CHILDREN**, Conference on Dependent and Delinquent. New York, March 7-8, 1913.

**RELIGIOUS EDUCATION ASSOCIATION**, Decennial Convention of. Cleveland, Ohio, March 10-13, 1913. Information may be secured from the Religious Education Assn., 332 S. Michigan Ave., Chicago.

### LATER MEETINGS.

#### INTERNATIONAL.

**BLIND**, Fourth Triennial International Conference on the. London, England, 1914: probably July 20. Sec'y, Henry Stainsby, 206 Great Portland St., London, W.

**CHILDREN'S WELFARE**, International Congress for. Amsterdam, Netherlands, 1914. President, Dr. Treuh, Huygenstraat 106, Amsterdam.

**PRISON CONGRESS**, Quinquennial. London, Eng., 1915. Sec'y, F. Simon Van der Aa, Groningen, Holland.

**SCHOOL HYGIENE**, Fourth International Congress on. Buffalo, N. Y., Aug. 25-30, 1913. Sec'y Gen., Dr. Thomas A. Storey, College of the City of New York.

**STUDENT CHRISTIAN FEDERATION**, World's. Lake Mohawk, N. Y., June 2-8, 1913. Gen. Sec'y, John R. Mott, 124 East 28th St., New York.

**UNEMPLOYMENT**, International Association for Fight Against. Ghent, Belgium, 1913. American Corres. Officer, John B. Andrews, 1 Madison Ave., New York.

**YOUNG MEN'S CHRISTIAN ASSOCIATION**, International Conference of. Cincinnati, May 15-18, 1913.

#### NATIONAL.

**BOYS**, General Assembly of Workers with. Culver, Ind., May 17-30, 1913. Information may be secured from the Boys' Work Dept., Y. M. C. A., 124 E. 28th Street, New York.

**CHARITIES AND CORRECTION**, National Conference of. Seattle, Wash., July 5-12, 1913. Sec'y, Alexander Johnson, Angola, Ind.

**HOME ECONOMICS**, American Association of. Ithaca, N. Y., June 27-July 4, 1913. Information may be secured from Marguerite B. Lake, Forest Hill, Md.

**INFANT MORTALITY**, American Association for Study and Prevention of. Fourth annual meeting. Kansas City, Mo., Oct. 23-25, 1913. Exec. Sec'y, Gertrude B. Knipp, 1211 Cathedral St., Baltimore.

**MEDICINE**, AMERICAN ACADEMY OF. Thirty-eighth Annual Meeting. Minneapolis, Minn., June 13, 14, 1913.

**MOTHERS**, National Congress of. Boston, May 15-20, 1913. Sec'y, Mrs. A. A. Birney, 808 Loan and Trust Bldg., Washington, D. C.

February 15, 1913.

**PRISON ASSOCIATION**, AMERICAN, Indianapolis, Ind., Oct. 11-16, 1913. Sec'y, Joseph P. Byers, Trenton, N. J.

**YOUNG WOMEN'S CHRISTIAN ASSOCIATION** of the United States of America, Fourth Biennial Convention of. Richmond, Va., Apr. 9-15, 1913. Gen. Sec'y, Mabel Cratty, 600 Lexington Ave., New York.

### STATE AND LOCAL.

**BAPTIST CONVENTION**, NORTHERN, Detroit, Mich., May, 1913. Cor. Sec'y, Rev. W. C. Bitting, St. Louis.

**CHARITIES AND CORRECTION**, Ohio State Conference of. Akron, O., October, 1913. Sec'y, H. H. Shlirer, 1010 Hartman Bldg., Columbus, O.

**CHARITIES AND CORRECTION**, New York City Conference on. May 14-15, 1913. Sec'y, John B. Prest, 287 Fourth Avenue, New York.

**EDUCATION**, Society for Advancement of, in the South. Chattanooga, April, 1913. Sec'y, H. E. Bierley, Chattanooga, Tenn.

**SOUTHERN SOCIOLOGICAL CONGRESS**. Atlanta, Ga., April, 25-29, 1913. Gen. Sec'y, J. E. McCulloch, Nashville, Tenn.

## EXHIBITS

### LOCAL.

**CHILD WELFARE EXHIBIT**, New Britain, Conn., April 26-May 2. Sec'y, E. W. Pelton.

**CHILD WELFARE EXHIBIT**, Rochester, N. Y., about April 1.

**CHILD WELFARE EXHIBIT**, High School, Newport, R. I., last week of March. Chairman, Harriet E. Thomas, 263 Thames Street.

**CHILD WELFARE EXHIBIT**. Atlanta, Ga., April 28-May 3. Chairman, Walter E. Rich, Atlanta.

### NATIONAL.

**CONSERVATION EXPOSITION**, NATIONAL, Knoxville, Tenn., Sept.-Oct., 1913.

### INTERNATIONAL.

**KINEMATOGRAPH EXHIBITION AND CONFERENCE**, INTERNATIONAL, "Olympia," London, Eng., March 22-29, 1913.

**PANAMA-PACIFIC EXPOSITION**, San Francisco, Cal., Feb. 20-Dec. 4, 1915. Social Economy Department—Frank A. Wolff, Washington, D. C.

**PANAMA-CALIFORNIA EXPOSITION**, San Diego, Cal., Jan. 1-Dec. 31, 1915. Director of Exhibits, E. L. Hewett, San Diego.

**STUDENT CHRISTIAN FEDERATION**, World's. Lake Mohawk, N. Y., June 2-8, 1913. Exhibits including "social study and service." Gen. Sec'y, John R. Mott, 124 East 28th Street, New York.

**SCHOOL HYGIENE**, Fourth International Congress on. Buffalo, N. Y., Aug. 25-30, 1913. Chairman, Committee on Scientific Exhibit, Dr. Fletcher B. Dressler, Bureau of Education, Washington, D. C.

# INFORMATION

**CHILD LABOR**—National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y., 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

**CHILD HELPING**—Department of Child-Helping, Russell Sage Foundation, 105 East 22d St., New York. Correspondence and printed matter relative to institutions for children, child placing, infant mortality, care of crippled children, Juvenile Courts, etc.

**CONSERVATION OF INFANT LIFE**—American Association for Study and Prevention of Infant Mortality, 1211 Cathedral Street, Baltimore. Gertrude B. Knipp, Exec. Sec'y. Literature on request. Studies preventable causes of death and illness; urges birth registration, maternal nursing, parental instruction.

**SCHOOL HYGIENE**—American School Hygiene Association. Pres., David L. Edsall, M.D., Harvard University Medical School; Sec'y., Thomas A. Storey, M.D., College of the City of New York, New York. Yearly congresses and proceedings.

**MENTAL HYGIENE**—National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of the insane, social service in mental hygiene, State Societies for Mental Hygiene.

**MENTAL DEFICIENCY**—The American Association for the Study of the Feeble-minded publishes the proceedings and papers of its annual meetings in the *Journal of Psycho-Asthenics*. Address Dr. A. C. Rogers, secretary, at Faribault, Minnesota.

**EUGENICS**—Eugenics Record Office, Cold Spring Harbor, L. I., N. Y. (American Breeders Assoc., Eugenics Sect. Charles B. Davenport, Sec.). Membership \$2. a year. National repository of data on hereditary family traits. Schedules for family records furnished free. Advice as to suitable matings. Publications at cost. H. H. Laughlin, Supt.

**NATIONAL HEALTH**—Committee of One Hundred on National Health. E. F. Robbins, Executive Secretary, Room 51, 105 East 22d St., New York. To unite all the government health agencies into a National Department of Health to inform the people how to prevent disease.

**TUBERCULOSIS**—National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M.D., Exec. Sec'y. Reports, pamphlets, etc., will be sent upon request. Annual transactions and other publications free to members.

**SEX HYGIENE**—Society of Sanitary and Moral Prophylaxis, Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y. 22 affiliated societies. Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

**WOMEN IN INDUSTRY**—National Consumers League, 106 East 19th St., New York, Mrs. Florence Kelley, Gen'l Sec'y. 87 branch leagues. Reports, pamphlets sent on request. Minimum membership fee \$1.00 includes current pamphlets. Minimum wages boards, protection of women workers, pure food, sweatshops, etc.

**WORKING WOMEN**—National Women's Trade Union League, to better industrial conditions through organization and legislation. Information given. "Life and Labor," events in industrial world. Three months for 25c. Mrs. Raymond Robins, Pres., 127 N. Dearborn St., Chicago.

**EVENING CLUBS FOR GIRLS**—National League of Women Workers, Hotel Savoy, New York. Organizing Sec'y., Jean Hamilton.

Recreation and instruction in self-governing and self-supporting groups for girls over working age. Monthly magazine—"The Club Worker," Twenty-five cents 1 year.

**YOUNG WOMEN**—National Board, Y. W. C. A., 600 Lexington Ave., N. Y. C. Official magazine: The Association Monthly. Pres., Miss Grace H. Dodge. Gen. Sec'y., Miss Mabel Cratty. The advancement of Christian Social Service. Free literature (all departments).

**HOME AND INSTITUTIONAL ECONOMICS**—American Home Economics Association, for Home, Institution, and School. Publishes *Journal of Home Economics*, 600 pp. per vol. \$2.00 per year. Conducts Graduate School of Home Economics. Meeting: Boston, June 27-July 4, 1913—Address, Roland Park, Baltimore, Md.

**FOURTH OF JULY SUGGESTIONS**—Division of Recreation of the Russell Sage Foundation, 400 Metropolitan tower, New York City. A pamphlet giving information on plans for Fourth of July programs and legislation. Material gathered from local experiences in 1912. Price 10 cents.

**RECREATION**—Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y. Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

**BOY SCOUTS**—National Headquarters of the Boy Scouts of America, 200 Fifth Ave., New York City. James E. West, Chief Scout Executive. Local Councils organized in principal cities, towns and counties. Literature on request. Monthly magazine, "Boys' Life" \$1 a year. Memberships: Associate \$3, Sustaining \$10.

**MUNICIPAL PROBLEMS**—National Municipal League 703 North American Bldg., Philadelphia. William Dudley Foulke, Pres.; Clinton Rogers Woodruff, Sec'y. Charters, commission government, taxation, police, liquor, electoral reform, finances, accounting, efficiency, civic education, franchises, school extension.

**CITY PLANNING**—National City Planning Conference, 19 Congress St., Boston, Mass. Frederick Law Olmsted, President. Flavel Shurtleff, Secretary. A Seminar for the Discussion of City Planning Problems. Publishes Annual Proceedings. Membership at \$5 a Year Includes All Literature.

**THE SMOKE NUISANCE**—Send 25 cents, stamps or coin, for American Civic Association Bulletin on "Smoke Abatement; How to Organize for Pure Air; Model Ordinances, etc." Address American Civic Association, 914 Union Trust Bldg., Washington, D. C.

**SHORT BALLOT and COMMISSION GOVERNMENT**—The Short Ballot Organization, 383 Fourth Ave., New York City. Woodrow Wilson, President; Richard S. Childs, Sec'y. National clearing house for information on these subjects. Pamphlets free. Publishers of *Beard's Loose-Leaf Digest of Short Ballot Charters*.

**CHARITY ORGANIZATION**—Charity Organization Department of the Russell Sage Foundation, 105 E. 22d St., New York City. To study, teach and publish in the charity organization field. Pamphlets on family treatment, community study, relief, transportation, etc., sent free.

# DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but memberships not required of those seeking information. Correspondence is invited. Always enclose postage for reply.

**CHARITIES AND CORRECTION**—The Proceedings of the National Conference of Charities and Correction sent free to each member. **BUREAU OF INFORMATION** on any topic of philanthropy, penology and kindred subjects free to members. Alexander Johnson, Sec., Angola, Ind. Next meeting, Seattle, July 5, 1913.

**ORGANIZED CHARITY**—American Association of Societies for Organizing Charity. Francis H. McLean, gen'l sec'y., 105 East 22d St., New York City. To promote the extension and development of organized charity and of community co-operation in social programs in the United States.

**THE CHURCH AND SOCIAL SERVICE**—The Federal Council of the Churches of Christ in America operates through its Commission on the Church and Social Service. For literature and service address the Secretary, Rev. Charles S. Macfarland, 215 Fourth Ave. (at 18th St.), New York.

**STUDIES IN SOCIAL CHRISTIANITY**—*Jany.*: Poverty, *Feb'y.*: Wealth, *March*: Socialism. See the lessons for classes and individuals in *The Gospel of the Kingdom*, published monthly by the American Institute of Social Service, 82 Bible House, New York City. Price 50c. per year.

**EPISCOPAL SOCIAL SERVICE**—The Joint Commission on Social Service of the Protestant Episcopal Church. For literature and other information address the Field Secretary, Rev. F. M. Crouch, Church Missions House, 281 Fourth Avenue, New York City.

**UNITARIAN SOCIAL ADVANCE**—The American Unitarian Association through its Department of Social and Public Service. Reports and Bulletins free. Lecture Bureau. Social Service Committees, Rev. Elmer S. Forbes, Secretary of the Department, 25 Beacon St., Boston.

**METHODIST SOCIAL SERVICE**—Methodist Federation for Social Service; Literature; Bureau of information, Speakers' Bureau; Reading and study courses; Invites all Methodists to extend its usefulness and use its facilities. Rev. Harry F. Ward, Sec'y., 2512 Park Place, Evanston, Ill.

**BAPTIST SOCIAL SERVICE**—Baptist Department of Social Service and Brotherhood. To study social questions, publish findings, suggest ways whereby Christian men may become socially effective, and co-operate with similar bodies. S. Z. Batten, Secretary, 1701 Chestnut Street, Philadelphia.

**CONGREGATIONAL SOCIAL SERVICE AGENCY**—The Congregational Brotherhood of America, Henry A. Atkinson, Secretary, 19 S. La Salle Street, Chicago, Ill. Programs and information furnished. Study Course; Speakers' Bureau; Publications. Service available for Institutes, Conferences and Addresses. Correspondence and inquiries invited.

**PRESBYTERIAN SOCIAL SERVICE**—Bureau of Social Service, The Presbyterian Board of Home Missions; Rev. Charles Steizle, Supt., 156 Fifth Ave., New York. Sociological surveys made. Clearing house for city problems of the Church. Correspondence Course in Applied Christianity. Methods for Church Publicity.

**THE AMERICAN SEAMAN'S FRIEND SOCIETY**—Rev. J. B. Calvert, D.D., pres. George McPherson Hunter, Sec'y. The national seamen's society has stations in the United States and abroad, relieves shipwrecked and destitute seamen. Annual membership includes all literature, \$5.00 a year. C. C. Pinneo, Treas., 76 Wall Street.

**REMEDIAL LOANS**—National Federation of Remedial Loan Associations, 31 Union Square, N. Y. Arthur H. Ham. Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

**SOCIAL BETTERMENT FOR NEGROES**—National League on Urban Conditions Among Negroes, 281 Fourth Avenue. E. R. A. Sellman, Chairman; G. E. Haynes, Director. Develops welfare agencies. Trains social workers. Aids travelers. Supports probation officers. Seeks industrial opportunities. Correspondence invited.

**NEGRO AND RACE PROBLEMS**—National Association for the Advancement of Colored People, 26 Vesey Street, New York. O. G. Villard, Chairman, Board of Directors; M. C. Nerney, Secretary; W. E. B. Du Bois, Director Publicity. Publishes Crisis Magazine. Investigation, Legal Redress, Literature, Lectures, Lantern Slides.

**IMMIGRATION**—National Conference of Immigration; Land and Labor Officials, 22 East 30th Street, F. A. Kellor, Sec. Information affecting aliens *after admission*, especially in reference to labor, land, education, protection and distribution. No matters of admission or restriction dealt with.

**IMMIGRATION**—North American Civic League for Immigrants, New York-New Jersey Committee, 95 Madison Ave., N. Y. C. Protection, Education, Distribution and Assimilation of Immigrants. Printed material furnished upon request. Grace E. J. Parker, General Secretary.

**IMMIGRANT GIRLS**—Council of Jewish Women (National) Department Immigrant Aid meets girls at docks; visits, advises, guides; has international system safeguarding. Work in Religion, Philanthropy, Education, Civics, Invites Membership. Address Sadie American, Exec. Sec., 448 Central Park West, New York.

**AID FOR TRAVELERS**—The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex. For literature address Orin C. Baker, Gen. Sec'y., 238 East 48th Street, New York City.

**SURVEYS AND EXHIBITS**—Department of Surveys and Exhibits, Russell Sage Foundation, 31 Union Square, New York City. A national clearing house for advice and information on social surveys and exhibits and for field assistance in organizing surveys and exhibits.

**PROBATION**—National Probation Association. The Capitol, Albany, N. Y. Arthur W. Towne, Sec'y. Advice and information; literature; directory of probation officers; annual conference. Membership, One Dollar a year.

**LABOR LEGISLATION**—Workmen's Compensation; Industrial Hygiene; Labor Laws. Official Publication: *American Labor Legislation Review*, sent free to members. American Association for Labor Legislation, 131 East 23d St., New York City. John B. Andrews, Secretary.

**PRISON LABOR**—National Committee on Prison Labor, 319 University Hall, Columbia University, N. Y. City. Thomas R. Slicer, Chn.; E. Stagg Whitin, Ph. D., Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

**SETTLEMENTS**—National Federation of Settlements. Develops broad forms of comparative study and concerted action in city, state, and nation, for meeting the fundamental problems disclosed by settlement work; seeks the higher and more democratic organization of neighborhood life. Robert A. Woods, Sec., 26 Union Park, Boston, Mass.

# FOOD IN HEALTH AND DISEASE

By N. S. Davis, Jr., M.A., M.D.  
Northwestern University, Chicago.

Octavo. Cloth - - \$3.50 Postpaid

The first part of this book reviews the underlying principles concerning the nutritive and other qualities of different kinds of foods, discusses briefly their relation to the digestive organs, and traces the changes that food must undergo before it can be appropriated to the needs of the human system. This is followed by detailed consideration of the proper diet indicated for the various conditions of health and disease, each condition being taken up seriatim with concise, plain directions, and diet lists.

*A descriptive circular with list of contents will be sent upon request.*

### Step No. II

## FIRST AID TO THE INJURED

is often necessary in medicine to relieve pain.

Acute suffering due to urgent need must be met promptly.

This emergency relief holds the same place in our service to the poor that First Aid to the Injured holds in medicine.

It is often necessary but never final in solving the problems of poverty.

Although not primarily a relief society, the Charity Organization Society obtained and spent during the last year for immediate relief \$78,215.93.

**The Charity Organization Society**

105 EAST 22d STREET

NEW YORK

*Supported Entirely by Voluntary Contributions*

BUSH PLAYGROUND, BROOKLYN

The Bush Terminal Company, following the example of a number of other industrial concerns, as part of its social welfare work has set aside this playground which is administered by the Parks and Playgrounds Association.

## CIVICS

### IRRESPONSIBILITY IN THE SMALL TOWN

A FORMER RESIDENT

In our big cities today we are developing every conceivable phase of social, mental, moral and physical activity for the betterment of the people—particularly the young people. We are building great public libraries, lofty-spired churches, magnificently equipped public school buildings, Young Men's and Young Women's Christian Association plants, the most effective sort of social service settlements. That is to say, we are trying to occupy people's minds and lives with thoughts and activities along the line of good to such an extent that the preponderance will more than offset what is sometimes a stronger attraction along the line of evil.

But what of the small town—the town or city of from 3,000 to 10,000 people—where men and women live as neighbors and where the enormous power of unlimited money for the promotion of these same social, mental and moral phases is lacking? Is it not time that an urgent plea was made for some sort of community consciousness which will awaken the self-satisfied residents of small communities to a proper sense of their civic responsibility? People who live in congested cities—as well as people who live in villages—believe that the vices and evils of the world are found in the cities. It is apparently a lack of thought that is responsible for the ignorance and apathy concerning this vital subject.

Those who were born and reared in a small town and have since gone to larger communities always love to go back at graduation time. A visit "back home" during commencement festivities is most enjoyable. The writer, a few months ago, enjoyed these sensations and revelled gloriously in them.

Then, in the midst of these reveries, I asked a friend what had become of little Jimmie Brown, an old playmate and school companion. My pleasant dreams of the long ago came to an abrupt end. Jimmie Brown was dead—dead of syphilis. I asked another old friend, a physician, how prevalent the disease was. He told me that he was treating five similar cases.

The population of this small town was just three thousand. How many other young men and young women were similarly afflicted there was no way of telling, except by interviewing the other doctors. Even then the figures would not have been accurate, for the shame of having such a loathsome malady no doubt drove a number of victims to other towns for treatment.

Next, I inquired about some of my girl school-mates. A majority of them had married, several were teaching school, others had moved away. Still others, alas, had been ruined at home and could now be found, I was told on the best authority, at addresses in questionable neighbor-

hoods in several large cities. Boys and girls had always strolled about the streets until late at night during the summer months. There was no other amusement or entertainment for them except an occasional melodramatic or wild west show. Unescorted girls were still in the habit of meeting the late night trains, though nowadays if this practice was indulged too freely the town marshal interfered. One house of prostitution was openly operated—and is still. The proprietress is referred to by both men and women as "Aunt Tom and her girls."

I began to wonder what local forces were at work for the moral regeneration of the community. Inquiries showed that the Woman's Club is the leading social factor. It has more than a hundred members, seventy-five of whom are active. All are prominent socially. The club sessions have been so well attended that it has become necessary to abandon the use of members' homes and engage a lodge hall for the meetings. And can you imagine what these women were doing at that very moment for the so-called "good of the town" in which they were rearing their boys and girls? They were spending their club funds and energy in the work of improving the driveway and the general appearance of the cemetery!

They were trying to keep fresh and green the memory of the dead and meanwhile were allowing the lives of their children to fester and rot away! While their own boys and girls were being contaminated by the prevalence of a virulent form of the social evil, the women were absorbed in cutting the grass and straightening the cinder paths over the dead bodies of their local heroes and heroines. Even the work at the cemetery was not what it should have been, I was told, because the outgoing president had appointed committees which the incoming president claimed the privilege of nominating.

I am not attacking women's clubs. They are doing a noble work where their energies are not misdirected. But, oh, what brilliant opportunities they do miss in the smaller communities! In my home town the most capable woman from every standpoint had just completed her term as president and the next in ability had succeeded her. Either might easily have led the entire club membership in a battle for some worthy object among living beings. Neither of them saw the large opportunity for a moral campaign.

Perhaps the young men and women are not entirely blameworthy for falling into the evils which are lurking in every community. There was no Christian Association for either boys or girls. One moving picture show flourishes, but it is used more as a meeting place than for educational or instructive amusement. There are at least a score of men who, by the expenditure of a small fraction of their comfortable fortunes, might easily build and equip a Young Men's or Young Women's Christian Association plant or some other institution equally profitable from a social standpoint. Yet nothing of this sort has been done.

This small town has a public library stocked with several thousand books, the gift of a now

famous native son who wished to do some real good. But the library is open to the reading public only one afternoon and three evenings a week. Lack of sufficient funds for the librarian's salary is responsible for this short period of usefulness. Nor is there any connection between the school library and the public library. The school trustees asked for a branch of the library in the school building, but because the trustees would not permit the library to control school books the library officials refused the request.

It was amusing to see the look of suspicion and distrust in the faces of those to whom the social center idea was merely suggested. This is not because the residents are benighted, for they are not. There are good roads, well paved city blocks, a magnificent little court house, efficient schools and thriving business. But the proposition of utilizing a large public school investment for twelve months in the year instead of seven, was almost too advanced an idea even for the local and county school superintendents.

In attempting the moral regeneration or "clean-up" of a small town, there is always one factor to be encountered. It is a compact public opinion which is more than likely to ask: "What are they getting out of it?" It is the dreaded existence of Mrs. Grundy which deters many a battle against what is recognized as a civic and social menace. This is exactly where a women's club acting as an organization has a distinct advantage over any individual. It can do things with concerted action with a fairer chance of winning public sentiment.

One day I was accompanying a friend home. He carried a loaf of bread under his arm. I asked him if the bakeries were good and he replied that two of them were, but the other was not much patronized because a consumptive baker was employed there. I asked him why he didn't do something to get the man out of such a place for the good of the community. He replied, "Well, I guess not. It's none of my business. We don't buy bread there. Besides, I've got enough enemies in town already." What a blissful existence it must be to have no enemies!

Fear of making business or social enemies is probably the most important reason why the public of the small town is lacking in civic responsibility. My home town is no different than thousands of others. A dozen, yes, more than a score, of towns of varying sizes which are in the same moral predicament and suffering from the same physical blight have come under my own personal observation.

In these towns are hundreds of intelligent and capable women interested in some frivolous movement or social game. If the women's clubs of the score of towns of from 3,000 to 10,000 or 15,000 population with which I alone am familiar were to direct the energy they now fritter away on the social game or club politics against some of the insidious evils which beset the paths of their own boys and girls a social revolution would follow. What a power in any community such a body of women would be! No movement would dare defy them long. This is not a dream, for the women of some communities have made it a glorious reality.

## THE EDGE OF THE CITY

UDETTA D. BROWN

*[We have heard so much of the housing evils in the centers of our cities, great and small, that perhaps many of us unconsciously think of the edges of the city as a paradise, at least by comparison. Yet when we come to look at these fringes which year by year are spreading over the country side we find them often not better but in many respects worse than the crowded districts of which we are growing ashamed. Here, on the neglected vanguard of our advance, we are creating new slums to plague us in the future when they shall have grown so large and foul that we can no longer continue our neglect.]*

*Miss Brown's brief description of conditions in Shadyside might, with a change of names, be applied to similar villages on the outskirts of a hundred of our growing cities. There is nothing peculiar about Shadyside except that it has for a background the majesty of the Palisades. On the edges of level cities in the Middle West, of cities among the New England hills, of cities in Canada and in the South, similar conditions exist. But here and there organizations like the Committee of the Palisades show that our leaders are beginning to recognize the evil promise of these conditions.—Ed.]*

From Riverside Drive, New York's beautiful parkway, one looks across the Hudson to the Palisades on the Jersey shore. A few years ago this region across the river was open country with here and there a little village as completely absorbed in its own affairs as if the metropolis were half way across the continent. Today all this has changed. On top of the cliffs suburban towns have germinated and grown until they form an almost continuous chain. Meanwhile the New Jersey cities have shared the growth of the metropolis and have pushed their borders constantly farther and farther, surrounding and transforming the villages they found in their way. Among these is Shadyside, lying between the foot of the Palisades and the river. With the coming of the factories along the water's edge came a cosmopolitan population of Germans, Italians, Hungarians and Slavs who now far outnumber the Irish founders of the village.

The commuters who have established homes on the top of the Palisades once contented themselves with the glorious distant views of the Tappan Zee and the lower bay or the monumental buildings taking form on Manhattan, quite ignoring the ragged little community nestling beneath their feet. But lately they have become aware that to ignore is no safeguard; Shadyside, for good or ill, has its influence upon those who live above it, upon their health, their morals, their peace and their government. So they began to consider Shadyside, and to make its acquaintance.

Their study of Shadyside revealed the usual housing evils. The privy vault is all but universal; open sewers and surface drainage are the rule; contaminated wells are still in use to some extent; uncared for garbage and stable refuse and filthy unpaved streets are added difficulties in the way of good living conditions; and overcrowding both of lot and rooms is a growing evil.

The dwellings are as varied in style as the inhabitants are in nationality. The houses range

from three-story, brick tenements to the rough board and tar paper shack. Some tiny cottages, one-story high, with peaked roofs and trellised porches, still recall an older day. Here and there are found substantial stone or brick buildings, either two family houses or tenements. Up on the hillside is an old colonial mansion, many of its windows agap, its front lawn replaced by cow sheds and bare earth; its great rooms now divided to make homes for many families.

The only toilet conveniences provided for most of these dwellings, whether occupied by one family or half a dozen, is the yard privy. Many of these privies and the ground near them are filthy beyond description; this is especially true where the out houses have been built over flat ground instead of over vaults. Where proper vaults have been constructed most of them are neglected and foul, a menace to the health of the community. Many of the shelters are so poorly built that they offer little privacy. Sometimes these closets are placed near the house, but more often they are fifty feet or more from it. It is unusual to find a closet clean, well-kept and with the door locked for privacy.

Indeed the whole sewerage problem is a difficult one. There are no proper sewers built and maintained at public expense. Instead the sew-

WINDOWS DARKENED BY HILLSIDE.

OPEN SEWER

Near this point it flows into the Hudson

ers of Shadyside consist of wide, deep ditches along the side of the road, through which waste water from the houses and surface drainage flow when they are unobstructed. Some of the yards are provided with made gutters leading to the street but in most cases the waste and surface water runs to the road in a gully or lies in puddles in the yards. Pipes and culverts under the road are designed to carry the waste water from the roadside sewers to the large open sewer which flows into the Hudson.

Unfortunately, these sewers are so clogged and the pipes are so poorly graded that much of the waste water stands for days stagnant and slime-covered, an offense to sight and smell, a menace to health. Here and there efforts have been made to board over the sewer in order to keep down the stench. Waste water from the houses is sometimes brought down to street sewers or to wooden troughs leading to them in iron pipes from which spasmodically come forth soap suds, bluing water or beet juice, according to the household activities. Often the water just spills out of the waste pipe onto the ground and thence to the street in a water-worn gully.

The water supply is adequate and good. It

has been piped into most of the houses, but a limited number of them still use wells. These are often placed so near the vaults that contamination by seepage seems inevitable. It would probably be a matter of small expense to install water pipes in the remaining dwellings.

Beside the foul privies, surface water and open sewers which disfigure the out-premises of the dwellings, there are many stables, chicken houses and pig pens. One stable occupies a large part of a back yard, leaving only a narrow passage across the rear of the house. Old bedding straw from this stable has been raked out to the side yard, where the filthy mess of straw and manure breeds flies for the neighborhood. In several yards there are pig pens. Both pigs and goats roam about freely, the pigs preferring the low muddy road, the goats taking to the hillside and roof tops.

The general sanitary problem of Shadyside is further complicated by the question of garbage disposal. No collections are made. Some of the more careful housewives take their refuse to the dumps at least once a day; others throw ashes and scraps into the street or yard; once a small boy was seen to bury a bucket of garbage half an inch deep under the ashes in the front yard. Garbage is quite often thrown into the privy vaults. The dumps are on one side of the main road, opposite the dwellings. They are unsightly and unwholesome—a source of disease. Here pigs, goats and chickens feed on the refuse.

Neither road nor streets are paved in Shadyside, except where short ends of tar paper from a nearby factory are laid over the mud of the sidewalk to make the way passable. River Road, which is the main thoroughfare, is a veritable slough. After every rain the heavy automobile trucks from the factories sink almost hub-deep into the soft mud. Many of the women throw their garbage and ashes into the muck. In this filth wallow huge hogs, nuzzling for food and grunting when a passing auto disturbs their meal.

Although there is plenty of open space at Shadyside we find the lot overcrowding so characteristic of mushroom communities. The dwellings are huddled together with little regard for lot lines and with no apparent effort to secure adequate light and ventilation. Though

SHADYSIDE'S SCAVENGERS.

the windowless room is present here to only a limited extent, lot overcrowding and the custom of placing houses within a few feet of the hillside makes many rooms gloomy and dark in spite of large windows.

Especially among the more recent immigrants some room overcrowding is found, although no special study was made of this condition. Three or four beds, crowded into a single room, gave ample evidence of this evil; still more convincing was a glimpse of a room fairly filled with sleeping men. "Seven", the woman explained in broken English, "they work nights."

Such is Shadyside—unhealthy, unsightly and squalid, like an overgrown awkward village, pressed into a narrow area instead of spreading out along the river and to the heights above. The task of housing betterment is a difficult one, but is rendered more hopeful by the spirit of co-operation among the residents and their realization of many of the existing evils. With proper leadership most of them would bear a good part in the right kind of civic housekeeping which would go far toward remedying many of the existing evils.

### SOCIALIZING THE PUBLIC LIBRARY

LOUIS H. PINK

"Wider use of the school plant" has now become a byword throughout the country. The idea that attractive buildings owned by the people should not be closed at night, is winning approval. But as yet only in a relatively few places has it occurred to people that if the public schools should be used to their maximum why not libraries and other public buildings? Los Angeles, Cleveland, Newark and Chicago are among the few that have acted upon this idea.

An inquiry into the extent to which the public libraries in Brooklyn serve as social and educational centers discloses some of the causes which hamper their wider use at present. Similar reasons apply in other cities. Nine of the branch libraries which are located in Carnegie buildings have auditoriums. Six branches have no auditoriums but contain club-rooms. But no member of the general staff is charged with the supervision of the social activities of the libraries nor are any of the assistants assigned to the various branches directed to organize and conduct such work. The organization of the library service does not provide for the adequate social use of the library buildings.

The auditoriums are used occasionally for public lectures and a few of them have been rented by taxpayers' organizations as meeting places. A charge of \$5 a night is made to neighborhood organization for such use. The last report shows that but \$70 was received from this source. Several of the branch librarians, who are interested in the extension of the social activities, have made it a point to notify the organizations of the district that the auditoriums and club-rooms exist and can be used, but no systematic plans have been made and the auditoriums and club-rooms are today practically unused.

The libraries close at nine o'clock, so that it is impossible for clubs of older young men and women to utilize club-rooms in the evening with any satisfaction. The adequate use of such rooms by the younger children in the afternoon and early evening is handicapped by the lack of organization of the work, and of leaders for such activities.

The nine o'clock rule does not apply to the auditoriums but they have been little used, excepting for the public lectures, and for classrooms in connection with the library work. Organizations of young folks are unable to use the club-rooms of the library because of the early closing hour, and cannot afford to pay the fee for the use of the auditoriums.

The fact that although no attempt was made to secure applicants, thirty-seven clubs of younger boys and girls applied at one branch for the use of the library as their club center, shows how easily the work could be developed. Sixteen of these were accommodated. Of these, five were debating clubs, four literary, five athletic and two social and religious. One of the clubs was conducted entirely by one of the boys. Another called the Girl Pioneers was conducted along the line of the Camp Fire Girls. The alumni associations from several neighborhood schools applied for the use of the club-rooms as they could not get accommodations at the school building, but hired a private hall because of the early closing hour. One reason why this branch was used so extensively even without special encouragement was that there are no public recreation centers in the neighborhood and no playgrounds, settlements, or other social agencies.

To provide for the adequate social use of the buildings there should be some department of the library service, or some person responsible for the organization and conduct of the social extension work. There should be a definite plan of work. If possible, one of the regular employes at each library should be assigned the duty of the supervision and control.

If a local committee or Board of Directors composed of those interested in the churches, the civic and social organizations, boys' clubs, settlements, and other public-spirited citizens could be formed for each branch library having an auditorium or club-room, the movement would be more democratic and more vigorous. Such local committee could be given the use of the rooms and liberty to make the most of them. It would be the duty of the local committee to secure volunteer workers to take charge of clubs and activities, to organize clubs and advertise the use of the library throughout the district. They might well consider it within their province to organize neighborhood councils, conferences on local improvements, even dances, entertainments and motion-picture shows.

The use of the auditoriums and club-rooms by literary and debating societies, social clubs, athletic clubs, especially by civic organizations, should be encouraged and the library should be made, within its limited territory, a "peoples' center" in the full sense of the term.

THE NEW BOSTON CITY CLUB BUILDING

## NEW BUILDING FOR BOSTON CITY CLUB

The Boston City Club will shortly begin the erection of its new home, the largest and finest city club building in the country, on the corner of Ashburton Place and Somerset Street. In addition to the \$500,000 previously assured, the sum of \$200,000 was necessary to finance the proposition, and the club decided upon a ten-days' campaign to raise that amount. The work was divided among ten teams, and in seven days \$220,000 was subscribed. Three-fourths of this amount came in comparatively small sums from the club membership.

The club has now 3,500 members with about 700 names on the waiting list. The future home will provide for 5,000 members and the limit will be raised to that number. The new building will be ten stories high, and will contain an auditorium seating about 1,000. The dining requirements of the members will be provided for by a large grill room two stories high, vaulted and designed to give it a distinctive character, a main dining room on the top floor, occupying nearly the entire space and commanding excellent views, and by twenty small dining rooms seating from ten to thirty people, the latter for small banquets. The main lounge will take up nearly one entire floor, being arranged so as to have many nooks for quiet conversation, with the fireplaces, settles, and other homelike features that have so charmed both members and visitors in the old building now occupied. A distinctive feature of the new club house will be the numerous entrances. The strangers' entrance will be entirely distinct from the members' entrance, giving access for the public to the auditorium, art gallery, and private dining room floors, entirely apart from the others.

The club has never, as a club, sponsored any particular movement for civic betterment, but has provided a forum where all such questions

can be freely discussed, but various movements which have contributed to the civic improvement of Boston have had their origin in such meetings as, for example, the present Chamber of Commerce.

## THE CITY CLUB OF CLEVELAND

Cleveland has joined the list of cities now maintaining vigorous and active city clubs. The movement was started during the sessions of the Charities Conference in June, 1912, when a number of representatives from other city clubs were in Cleveland. Several meetings followed and in November, the club was organized with a membership of 152. D. E. Morgan, former member of the City Council, was elected president. The club now has a membership of over 400 and is planning to have permanent quarters.

The framing of a new charter under the home rule amendment will be the subject to which the club will first give its attention.

The new club is organized on the plan of the Chicago City Club. It will take no action, as such, on any public matter. For the first two or three years it is the intention of the organizers of the club to confine its work to discussion.

A program is now being arranged for the rest of the season. Mayor Brand Whitlock was the first speaker, and discussed some impressions of municipal government in European cities.

Mayo Fesler, secretary of the Municipal Association, is secretary of the Club.

## FEDERAL LEGISLATIVE REFERENCE BUREAU

That the legislative reference bureau plan is a live idea in the national capital, and that the proposal to equip the Library of Congress with a department of this kind will probably, in the near future, be actively pushed, was indicated during the consideration by the Senate of the legislative, executive and judicial appropriation bill. Senator Owen of Oklahoma brought up an amendment proposed by himself providing for such a bureau, but the senator in charge of the bill made the point of order that the amendment was not germane. Thereupon Senator La Follette said:

"I have made a partial canvass of the members of the Library Committee and I believe we will be able to have a bill more complete and comprehensive than any amendment which could now be offered reported from that committee before another appropriation bill passes the Senate. Then I hope, Mr. President, to take the time of the Senate very briefly to set forth what has been done in Wisconsin by the establishment of the legislative reference department."

There is now pending in the House a bill of this kind, introduced by Representative Nelson of Wisconsin, hearings on which were held almost a year ago. It is apparent that the idea, though new to many Congressmen, is one that is growing in favor.

## HEALTH

NEWSPAPERS have recently announced that Prof. F. B. Mallory of the Harvard Medical School has just discovered the bacillus of whooping cough. Professor Mallory himself makes no claim of discovery. The bacillus he found in the respiratory tract of two fatal uncomplicated cases of whooping cough he holds is the same as that discovered in 1900 by two French observers, Bordet and Gengou. These men succeeded in 1906 in obtaining the bacillus in pure culture, and then they showed that the blood of persons suffering from whooping cough contained a substance defensive to these germs. Their work was confirmed, and the bacillus is now generally accepted as the cause of whooping cough.

Professor Mallory's work consists in demonstrating how the bacillus causes the symptoms of whooping cough. It seems that the effect is very largely mechanical. The bacillus, which is very minute, is found in enormous numbers between the cilia of the cells which line the respiratory tract. These delicate, hair-like projections normally have an active motion toward the upper part of the tract, and in this way secretions and particles of dust are moved on until they can be coughed up. But when the cilia are interfered with by the lodging of these bacilli the secretions are retained, and as a result we have the spasmodic cough characteristic of this disease. There is also some evidence of a mild poison formed by the bacilli.

\* \* \*

MANY associations devoted to public health and to social reforms are now turning to the cinematograph as a valuable aid in popular propaganda. But Dr. George M. Gould of Atlantic City, in the *Journal of the American Medical Association*, raises a voice of warning of the evils of eye strain which follow in the wake of this much admired form of amusement and instruction.

"The symptoms do not in my experience differ essentially or greatly from those commonly caused by eye strain of any kind or from any variety of abuses of the eyes. The most common, of course, are headache, sick headache, migraine in one or several of its thousand protean forms. A few symptoms that are perhaps more frequent and emphasized more than others are intense ocular and cerebral weariness, a sort of dazed 'good-for-nothing' feeling, lack of energy, of appetite, etc., to which almost as frequently may be added 'upset stomach.'"

These symptoms are, of course, increased if the person has some defect of sight which has not been remedied by proper glasses. Dr. Gould enumerates four causes of eye strain in moving picture shows. First, the tremulous, jerky move-

ment of what should be fixed solid points for the eye to rest on. Both the mind and the eye are confused by this utterly unnatural movement. The second comes from the fact that the individual images which make up these pictures are often superposed so slowly that they are perceived separately, instead of being fused into a flowing unity. In this way the retina receives a swiftly passing series of slightly differing pictures, instead of what should be a continuous one. "Eye and brain have never had to endure such a series of disconnected stimuli as this unendurable fluttering." The third cause is found in the fact that the points in the individual pictures demanding the attention of the eyes are first in one part and then in another, so that the eyes dance from one point to another in order to follow the continually shifting interest. The fourth cause is the wretched lighting of these pictures.

The growth of the cinematograph business in the last twelve years has been enormous. Dr. Gould estimates that in our country alone there are between 12,000 and 20,000 moving picture theaters.

"The total investment in the business is thought to be about \$50,000,000. It is seriously proposed to carry on a large proportion of school teaching and of medical, hygienic and scientific instruction by means of the cinematograph. . . . If it is true that about 5,000,000 spectators are in daily attendance at the picture-show theaters, the consequent eye strain injuries and sufferings must be enormous, however conservatively estimated, and there is little likelihood of their exaggeration by hygienists and physicians."

\* \* \*

ANY one who has carefully followed the discussions of biologists, sociologists, physicians and statisticians on the vexed question of alcohol as a poison, must realize that there is probably no subject, except perhaps the psychology of sex, on which it is more difficult to take an impartial stand, one absolutely unaffected by unconscious prejudices. Even when prejudice is conquered there still remains the difficulty of collecting and handling the facts bearing on this question with any real accuracy. How can we, for instance, report on the question of racial degeneration consequent on alcoholism when we can never eliminate all other factors of degeneration in the class we are studying? We cannot even find any absolutely normal non-alcoholic class to serve as a basis of comparison—what the biologists call a control. This is one place in which the value of animal experiments becomes evident, for it is possible to do away with both these sources of

## TRACHOMA, A NATIONAL MENACE

ALFRED C. REED,  
M. D.

### A MOUNTAIN CABIN IN KENTUCKY

This is the type of dwelling in the region where the investigation of the United States Public Health Service showed that trachoma is a menacing danger.

In the mountains of Kentucky live a people of the purest American ancestry. Stalwart, brave, unmixed with other blood, they are of the same mettle as were the pioneers who followed Boone to the virgin wilds beyond the ranges. Pocketed in the inaccessible mountains, the mighty train of American development has swept by them, leaving them sidetracked, forgotten and neglected, in the hills of their adoption, an unknown people in the midst of a busy, careless nation.

The poorer among them live for the most part in small log cabins, which are scattered sparsely through the mountain region. The families of these mountaineers number usually from ten to fifteen members. All eat, sleep and spend their home life together in the one room of the cabin. They use a common wash-basin, often a large stone with the surface hollowed out, just outside the door. Hanging next to it is the large family towel which does duty for days in succession. The cabins which have windows at all have only small ones. Ventilation is always bad, and all openings are scrupulously closed at night in the winter time.

Close intermarriage, lack of even rudimentary sanitation, and monotonous, ill-suited diet result in the children being predisposed to tuberculosis, infectious diseases, and other ills. Ring-worm of the scalp, uncorrected defects of vision, adenoids, enlarged tonsils, and hookworm infection are common obstacles that prove insurmountable for large numbers of the children. Their unkempt and neglected condition is pitiable. Of mentally backward and defective persons there are many, although the typical mountaineer is intelligent and wide-awake even though illiterate.

The social and economic needs of these mountaineers of Kentucky, Tennessee, Carolina and

Virginia are beginning to be recognized, but it has remained for Dr. John McMullen of the federal Public Health Service to call striking attention to a serious danger now menacing them. In a recent investigation Dr. McMullen found that trachoma is present to an alarming and unsuspected degree among the mountaineers and that the blindness and defective vision resulting from it are responsible for an incalculable impairment of social, economic and intellectual efficiency.

Trachoma is a communicable disease of the eyelids which, if untreated, usually progresses to blindness, and practically always causes more or less interference with vision. Dr. McMullen examined about 4,000 persons, and found 500, or 12½ per cent, to have trachoma. From 3 per cent to 18 per cent of the school children were affected. Most of the cases receive no treatment, and each case becomes a local focus of contagion. One of the important factors in the spread of the disease is the common family towel. It appears that the disease must be of long standing in these mountains, and that it is getting progressively worse.

Trachoma is characterized by its chronic course, resistance to treatment and tendency to relapses and exacerbations. As a consequence, treatment must be long-continued and carried on with persistent, unremitting care. The prevention of the spread of the disease among the southern mountaineers must be furthered by a campaign of education in personal sanitation and hygiene. Dr. McMullen emphasizes particularly that the mountaineers must be shown the importance of sanitation, fresh air and clean homes. Stereopticon lectures in public buildings and schools, showing right and wrong methods, would have a good influence. District visiting nurses and social workers can preach the

A GROUP OF TRACHOMA VICTIMS

The attitudes of the people in this group are those naturally taken to protect and shade their eyes.

gospel of sanitation in the individual home. All such social work must be carefully organized to include the entire affected territory. Especially in school children, cases of trachoma should be isolated. Proper lighting and ventilation of schools must be combined with correction of refractive errors in the pupils and proper school instruction in personal hygiene.

The actual care and cure of existing cases offers the greater problem. Public clinics ought to be established similar to the one now conducted by Dr. J. A. Stucky, under the auspices of the W. C. T. U. Settlement School at Hindman, Ky. Movable field hospitals in connection with these clinics could afford surgical treatment to those cases requiring it. The work of the field hospitals should be supplemented by district visiting nurses, and the same territory should be covered periodically. Great patience and long-continued effort as well as considerable money will be needed to eradicate trachoma from these mountains. But the task can be accomplished with persistence and enthusiasm.

Trachoma has been found most destructive among the American Indians, particularly among those living on reservations. In some of the reservations in the Southwest trachoma is found in from 65 to 95 per cent of the Indians. Over 6,000 Indians were treated in 1911 for trachoma, and at the trachoma hospital of the Indian Service at Phoenix, Ariz., over 800 were operated upon and treated.

Dr. M. H. Foster, in a report to the secretary of the treasury on January 23, 1912, stated that of 1,364 Alaskan natives examined by him, 15 per cent had some eye trouble, and 7.2 per cent from all parts of Alaska suffered from trachoma. In some sections of the southwestern portion of Alaska the disease was present in 25 per cent of the native population. Dr. Foster urged the great need of a government home for blind natives in Alaska, and the provision of some trade or occupation to relieve their present pitiful condition.

In the fiscal year 1911, 2,504 cases of trachoma were certified in immigrants. In the fiscal year 1912, 718 cases were certified at Ellis Island alone. Considering the pitiful results in the victims of the disease, the serious extent to which it is already prevalent in the country, and its economic and social menace, it is doubly important to prevent the entrance of new cases and new foci of contagion.

Trachoma has been shown to be a public health problem of national concern, and prompt, persistent and energetic measures must be undertaken both by local, state and national health officers to prevent its further spread and to eradicate it where already present.

### COLD STORAGE FOOD

Newspaper tirades and hastily compiled magazine articles have led the public to believe that cold storage is a device for cornering the market, for making fresh food dear when normally it would be cheap, and for hoodwinking the consumer into buying old and deteriorated farm products under the impression that they are fresh. Strong as is this prejudice, it must be admitted that most people really do not know just what cold storage is or what it should be. Certainly the public is not ready to go back to the days before refrigeration and be content with the restricted winter diet of the last generation.

The American Public Health Association has helped to clear the confusion on this matter by a conference on the subject. The conclusions drawn by those who took part seemed unanimous that cold storage is unequivocally a blessing, but that it needs regulation. This must be directed, not so much to the storage plant, which usually represents a triumph of engineering skill, but to the selection of the food which is to be stored. As Professor Winslow says, public health suffered in the pre-storage days because of the difficulty of providing a proper variety of food during all seasons. Cold storage food may be bad, but that means that it was bad when it went into storage.

"I believe that instead of taking so much pains about what comes out of cold storage," says Professor Winslow, "the proper place for health men to operate is on the placing of things in cold storage. If we could keep out of the warehouses that food which is just on the edge of spoiling and is put there only to save it for a little time, we should make a great gain."

The same fact is insisted on by H. D. Pease in his paper on the storage of fish and mollusks.

It is the treatment of the fish before refrigeration that determines whether or not the stored product will be fit to eat.

As to the time element, Professor Winslow believes it is comparatively unimportant and that attempts to place a limit by law of three months, six months or nine months are futile.

"They may be of consequence to the public purse, but nature limits these things, and the proper basis should be seasonal periodicity. A year is the natural and should be the legal limit in climates like ours, because then the next crop comes into competition with the old crop, and if any limit is needed,—which I do not believe,—then it would be natural and proper to have it the limit nature has set to production. I do not believe that any limit is necessary, and my reason is this, that the accumulation of the charges for storage, interest, taxes and all those things, will, in 999 cases out of 1,000, oblige the packer of foods in cold storage to get rid of them, even at a great loss, before the next season's crop comes in."

The physics of refrigeration described by P. H. Bryce evidently presents a problem of great difficulty to the sanitary engineer. It involves not only the maintenance of a proper temperature, but a system of ventilation which will abstract humidity from the incoming air when the humidity outside is great, lest the dampness favor germ growth. The ventilating system must also add humidity when the incoming air is too dry, lest the food dry up, and secure the circulation of air around the whole surface of the stored food, for if two surfaces touch each other and exclude the air the food may spoil.

The flood of ill-designed, crudely drawn bills presented to legislatures in the different states on the subject of cold storage is criticised in an article by H. E. Barnard. The passage of many of these bills would have meant the destruction of the cold storage industry in that state, yet the importance of cold storage is recognized increasingly every day. The Canadian government has adopted the policy of subsidizing the construction of refrigerating warehouses. A committee appointed by the French government to study the increase in the price of foodstuffs in that country has reported that an important factor in food prices is the lack of facilities for cold storage in France.

Mr. Barnard was chairman of a committee appointed by the National Association of Food Officials in 1911 to draft a model cold storage bill, and he summarizes as follows the provisions of such a bill:

"The committee defines cold storage as a warehouse for the holding of food products at or below a temperature of 40 degrees Fahrenheit. It assumes that the states have already at hand machinery for the sanitary control of food-producing establishments, and it provides that the operators of cold storage warehouses shall obtain a license from the State Board of Health for conducting the business after a sanitary inspection has shown the warehouse to be in satisfactory condition. The bill provides

*Roll on, thou stiff and dark old towel-  
roll,*

*A hundred hands are wiped on  
thee each day;*

*Thou leavest mystic records, like a  
scroll,*

*And finger prints off all who pass  
thy way.*

*And where be those who saidst thou  
should not stay?*

*They pass, but thou rollest thy  
length immense.*

—Judge.

that a complete record shall be kept of all goods entering storage and that a quarterly report of such facts shall be presented to the State Board of Health.

"It is believed that such reports will prevent the cornering of the food supply. It provides that no article of food shall be placed in storage if not sound and in good condition, or unless it has been prepared in accordance with the Pure Food and Sanitary Food Laws.

"The committee is unanimous in its belief that cold storage legislation should not antedate pure food and sanitary food legislation, but rather should follow and supplement it.

"When food is placed in storage the date of entry is plainly marked on the container, and when removed it is again marked. No goods shall be held in cold storage for a longer period than twelve calendar months, except under certain conditions referable to the State Board of Health. It provides that goods which have been in storage must be labeled 'Cold Stored' in such manner that the consumer knows when he purchases his eggs, for instance, that they are storage eggs. It provides that the State Board of Health may make all necessary rules and regulations to secure a proper enforcement of the law.

"As an evidence of the honest desire of cold storage operators for reasonable legislation, it is worthy of note that the preliminary draft of this bill, except in certain minor points, is acceptable to the cold storage interests."

## JOTTINGS

### MEDICAL DEPARTMENT FOR THE BELL COMPANIES

In connection with the pension plan of the American Telephone and Telegraph Company, the Western Union Telegraph Company and the Western Electric Company, a system of medical supervision and preventive sanitation is to be gradually established. The purpose is to preserve the health of the employees. Dr. Alvah H. Doty, former health officer of the port of New York, has been employed as medical director of the Employees' Benefit Fund Committee. In announcing the appointment of Dr. Doty, President T. N. Vail of the telephone company said:

# EDUCATION

## WORK AND CITIZENSHIP

### THE WISCONSIN EXPERIMENT IN INDUSTRIAL EDUCATION

H. E. MILES

PRESIDENT WISCONSIN STATE BOARD OF INDUSTRIAL EDUCATION; CHAIRMAN COMMITTEE ON INDUSTRIAL EDUCATION, NATIONAL ASSOCIATION OF MANUFACTURERS

Providence seems to be waiting with innumerable suffering children on one side and an abundance of willing and competent teachers on the other—waiting only for the old-fashioned school teacher to open the door of his prejudice and inexperience to let the social and industrial forces that have built up this country share in a common-sense direction and control of our chaotic educational situation. Such a control has been accomplished to the satisfaction of the educators and people of Wisconsin. When will the rest of the country wake up and act? The way is clear and simple.

#### *A Perfect School in a Month*

In any progressive, up-to-date community a substantially perfect industrial school for children of fourteen to sixteen years of age can be started in from four to twelve weeks. What is more, it can secure superior teachers who will incidentally exert a reflex influence upon our present out-of-touch, out-of-date school workers to the untold betterment of the present common schools.

There is nothing of speculation in this statement. It is a statement of simple fact demonstrated in most, if not all, the places where it has been tried. Such a school was started at Racine, Wis., a year ago on about forty-eight hours' notice from the state authorities, and on four weeks of preparation by the local authorities. Twenty-five such schools were started in other places in Wisconsin last September. In Sheboygan, for instance, a bright, prosperous industrial community of 40,000 people, the class in woodworking is taught by a splendid German of middle age with heart as young as the children's. He was an apprentice in Germany, then a journeyman, and then, in this country, journeyman, foreman and employer, successively. No seventy dollar a month common-school teacher has a tithe of that man's experience and ability as an instructor.

At the end of six weeks there were 350 children, fourteen to sixteen years old, from the industries in this school, with 100 more on the waiting list, and estimated still 150 more to come in when the authorities fully enforce the law as they must.

#### *Teachers in Abundance*

Industrial education must begin with the millions of industrially inclined children fourteen years of age. The buildings are ready in our present school plants, adequate with little or no extension, and there are so many more teachers than are needed as to make this question neg-

ligible. I have given the experience of Sheboygan and Superior, industrial towns without college or other so-called superior sources of supply. Racine is the same sort of town; she started with a teacher of woodworking, professionally trained. He soon left for a higher salary. In the emergency the foreman of the pattern room in one of the big factories took his place and was found to be one of the best teachers on the force. He discovered, too, that the professionally trained teacher had made no allowance in his pattern work for the shrinkage in the metal, and had been making patterns that would not "draw" out of the sand.

Says the superintendent at West Allis: "We are especially fortunate here in getting men teachers from the shops who have had college training. In the West Allis shops we find college men from the best technical schools of the country who are serving as apprentices. Our nearness to Milwaukee enables us to get women, too." Says Mr. McIver of Oshkosh: "We have no difficulty in getting teachers for our carpentry, etc., or for the girls' work in sewing, etc. I find that men who have had actual shop experience in commercial work, together with some school training, are the most desirable."

The charge that there is lack of teachers can only be made by those who are quite uninformed, more especially by teachers and public educators themselves. This is because they turn their backs upon the real source of supply and look to normal schools and to teachers of their own sort for instructors in vocational education. Germany and other countries that have successful vocational training do not admit such instructors. They require that vocational instructors shall have spent a considerable period, usually three years, in actual employment in the industries.

If those who are responsible for this new phase of education in this country will look to the industries for men to teach the vocations, as they would look to the law for men to teach law or to dentists for teachers of dentistry, and theologians for theology, they will find more efficient teachers than they need.

#### *Wisconsin's Demonstration*

By the Wisconsin law the local industrial schools are in the control of a committee consisting of two employers, two employes and the city superintendent. This union of the social forces most interested becomes a new social leaven and is directly responsible for splendid results. It cannot be said which is happiest and

## THE NEW EDUCATION

[For years public education in the United States has been criticized as being too aloof from life. Manufacturers and social workers, progressive educators and even unlettered parents (in their own way) have been as one in feeling that precious years, to a greater or less degree, are being wasted. To dislodge academic inertia and to preach that these years should be ones of real preparation for life and labor is the common program of the growing movements in the field of vocational education.

When it comes to the method by which this end is to be obtained there is divergence. One is to give boys and girls who have reached fourteen the practical vocational training calculated to help them to become efficient producers.

Mr. Miles, who recently retired from the presidency of the Racine-Sattley Company of Wisconsin, makers of implements and vehicles, is an ardent promoter of this method. He has brought the manufacturers of the country, in their national association, to his way of thinking and he was instrumental in instituting the vocational schools in Wisconsin. He conceives them as a means for turning out a working citizenship that will more than match Germany's and that will conserve the country's greatest waste (beside which all others are insignificant) i. e., human capacity. Mr. Miles believes, moreover, that the development of vocational education should be separate from the present school control, and that the shaping of the new schooling should be entrusted to the experience and vision of men actually engaged in the world's work. Massachusetts started out with a separate industrial board; and now both industrial and elementary schools have been brought under the same supervisory agency.

There are those, on the other hand, who fear that pressing industrial needs may, if unchecked, skew elementary education as far in one direction as the commercial demands of a generation ago skewed it in another. Their program is to reorganize the present structure of elementary education rather than create a new wing. By introducing manual, industrial and social activities into the existing curriculum, they believe that children may be given a broader and more permanent cultural and vocational foothold.

This presentation of Wisconsin's experience by one of the men who has thrown himself into it is of wide interest at the present moment, as the subject of industrial education is to the fore this winter in Illinois, Indiana, Pennsylvania and other states whose legislatures are in session.—Ed.]

most devoted to the work, the employes, the parents, the employers, the school teachers or the pupils.

The following word comes from the city superintendent of Superior:

"My experience with the work thus far in Superior has been exceedingly encouraging. The quality of young men who are seeking help in the industrial school leads me to believe that many young men will be far more serviceable to their community, and will be helped much personally by the opportunities they have in the industrial school.

"Our day continuation school is not only interesting boys and girls who never were much interested in the regular day schools, but it relieves the regular day schools of problems which were a constant source of annoyance, and problems which they could not personally solve, and leaving them free to expend their energies on others who are being benefited by their efforts. There is hearty co-operation on the part of everybody concerned, and at present every permit pupil

in the city that comes under the law is attending the continuation school regularly."

The influence of this sort of work, the effects of the wonders to be accomplished by approaching the mind through the motor activities, the creative desires and everyday interests of the young people will almost revolutionize the practice of the common school teachers, as they themselves now declare.

## Where Shall the Control Be?

Be it known in particular that the views here expressed concerning the necessity of separate and practical boards of control are not primarily the business man's views, though he is wholly devoted to them. They are primarily the views of the most enlightened of our educators, the Wisconsin law being written and advanced by her foremost educators, and accepted devotedly, intelligently and determinedly by all her people upon the initiative and suggestion of these educators.

Back of these educators and their findings lies the experience of all the foremost industrial nations of the world, who, by sore experience, found a teachers' control in the end impossible

and unendurable; and the joint control humanly perfect.

The teachers who wish to keep in their own hands this control are either selfish at the great expense of the child life of the nation or are uninformed. Sherwin Cody of Chicago, secretary of the permanent committee on commercial studies of the National Education Association, says of the proposed law in Illinois that at bottom this is the question, "Will the educators accept 49 per cent of the control, and give the business men 51 per cent, or will they insist on having 51 per cent or nothing?"

If any state or community expects to play with this question by leaving attendance at vocational schools optional, its effort is too inconsiderable for attention. Vocational education is not a boon, nor a privilege. On the part of the child it is a birthright; upon the state it is an essential, inescapable obligation. We are trying now to live "half slave and half free," half educated and half uneducated. The difficulties in so doing are everywhere apparent.

Surely no student of our social life can believe that the working people and the captains of industry will yield a point that vitally affects millions of our people, except as they be assured in advance that the schools will take the life of the day as it is, and fit the children thereto. In this matter of assurance is the crux of the question, and that assurance comes through the appointment of special state and local boards, consisting substantially, as in Wisconsin, of equal numbers of employers, employees and educators.

You cannot "fool all the people" for long, nor often. As a leader in the National Society for the Promotion of Industrial Education says: "We educators have fooled the public twice, once with mechanical drawing, and then with manual training, making both remote, unrelated, of very little practical value. Shall we try to fool the people a third time? If we do there'll be worlds of school teachers looking for jobs."

In Illinois, Indiana and some other states the school teachers insist on keeping the control. In so doing they would only fulfill the prediction of C. A. Prosser, substantially this: "It seems, in some quarters, that we shall begin wrong, and cut and fit as Germany did for fifteen years before we get right."

#### *Connecticut and a Single Board*

It has been said that insistence upon separate boards of control befores the real issue, which is only a matter of the quality of instruction to be given, and that, for instance, Connecticut is doing well with a single board of control. It might similarly be said that it makes no difference what sort of a board of directors a corporation has, if only its executive officers are right. What assurance is there that the executive officers will be right, unless the directors are such as know how to choose the executive officers, and require right procedure from them? The present Connecticut board consists of four manufacturers, two lawyers and one educator.

We might well be satisfied with so practical a board. It is like giving to the friends of vocational education their own sort of board, and then abolishing the other board, the old-time board as it exists in some of the states, and giving to the vocational board all the schools of the state.

Connecticut, however, is doing little more than experimental work in vocational education, spending what might be called a large sum of money in two cities only, Bridgeport and New Britain. When she gives vocational education to every child that needs it, to newsboys, cash girls and all, she will find that it is all that a specially selected state board, assisted by special boards in each locality, can do to institute and develop fully the new system. She will find it worth while to profit by the experience of five European nations, infinitely ahead of us in this respect.

Indiana has a state board of professional educators. In negotiations for legislation for vocational schools this board absolutely refused to admit to its membership any laymen. Then it conceded two, and at last three or four out of eleven, and also "advisory" committees in the localities.

Illinois and about two-thirds of all the states have no state boards, but, instead, state superintendents elected by the people—"the essential quality in the superintendent being that he is a 'vote getter.'" The state superintendent in Illinois is a professional autocrat, desirous, apparently, of perpetuating himself. He has proposed and advocated only bills so perpetuating himself and his powers. The last bill I have seen having his support provides for a state board of education of which the state superintendent shall be chairman, and which would "give him advice and suggestion." How is that for a substitute for the real thing?

#### *Cultural Values*

It is here that the school teachers' propaganda is weakest. Culture is what you *do not* get in our common schools. It is what the children in Wisconsin's industrial schools get all the time, and through every pore: love of work, industry, concentration, accuracy, appreciation of ordered processes, fellowship in service, instant and constant appreciation of cause and effect—all these and other things added to courses in hygiene, citizenship, rights and obligations, etc.

Culture is the training of the mind and body. Too long has it been made a matter of the closet and failed of real development in the great body of our people.

The immigrant population hunger for this schooling. The first man I saw in the evening class was from a German University, and better looking than those of us who were inspecting the school. Whatever may be said of immigration, this must be granted—if we receive the immigrant, get, as I believe, great value in his service, and give him the franchise, we must educate him in the principles that underlie our institutions and in our language. In some places restriction is temporarily put upon the number

of immigrants; otherwise, the schools would be overwhelmed.

### A False Perspective

We judge a tree by its fruit. And all too often by the fruit that comes to market. We don't look under the tree at the windfalls, the corrupted and lost.

Those who see the splendid school buildings, good looking teachers, vast expense, and the few children who graduate and judge by this are pretty content.

See the truth. Note that half of all the fruit of our tree of public education is windfall in the sixth grade, and only one-twentieth ripens from the elementary school, and one-thirtieth from the high, and you get an entirely new conception. The waste, waste, waste! We simply don't educate, and can't be complacent with

either those who would perpetuate the present control, or methods.

### The Cost

The yearly expense is less than half that of the ordinary elementary school per pupil, running from \$7 to possibly \$20, rarely, perhaps \$30. There are today about 5,000 children in the continuation day industrial schools, and as many adults in the evening and day schools.

The difference between murder and neglect is only one of degree. Other cities can let their children suffer another twelve months, when they must yield to the Wisconsin demonstration. Can they not be moved to quicker action? Each twelve months is of vital consequence to 10,000,000 children, or more, and yet our school teachers prate and few dare to stand for the truth and complete justice and for action that is fully intelligent.

## TESTING THE EFFICIENCY OF THE PUBLIC SCHOOLS

Suppose you could make a dozen of your personal friends peer into a magic looking glass. Suppose each one could see in it just how he compares with the others in general calibre and usefulness. Wouldn't you be doing your level best to start self-improvement all around the circle?

Something like this has been done for forty-eight states with respect to their provision for public education, which is a pretty good test of their interest in the citizenship of the future. The looking glass in this case is a little book of facts put out by the Division of Education

of the Russell Sage Foundation, of which Leonard P. Ayres is director. It shows that if ten special tests of educational efficiency be applied to the different states, Washington takes first rank as a wise parent of childhood. Massachusetts is second, while South Carolina and Alabama bring up the foot of the list. The standing of all, and the tests applied, are shown in an accompanying diagram. While these tests were arbitrarily chosen, they are thought to be the ten most important features in estimating the service rendered by a given system of public schools.

### WHAT THEY HAVE AND WHAT THEY SPEND

Amount expended for schools for each \$100 of wealth (estimated total valuation of all real and personal property) in each state in 1910.

Now, a looking glass is useful only when it reflects, and it reflects only when you look into it. So the only way to make this pamphlet useful was to induce each state to see its own image in it. Therefore, 6,027 copies were sent to 6,027 members of state legislatures in about forty states whose law-makers are in session this winter. The governor of each state and each state superintendent of schools received a copy. Seven hundred and seventy city superintendents and 154 principals of normal schools found them in their mail, and in addition fifty-eight college departments of education were presented with copies.

This fairly took care of those immediately responsible for the conditions which the pamphlet described. But sometimes such people don't live up to their responsibility. So it became necessary to get the facts before the people of each

state. Five hundred and seventy newspapers and magazines were selected and to each was sent a copy of the pamphlet together with a press story. Four weeks later, while the clippings were still coming in, 418 papers had been heard from and the clippings averaged over a column to a paper. Many gave whole pages to the story, printing interviews with local school men as to its significance. These 418 papers reached a circulation of 10,818,978. No other study made by the foundation ever received such extensive publicity.

Legislators, school men and newspapers did not exhaust the range of those who wanted copies. Orders for various quantities at fifteen cents each began to come in from all sorts of sources. An official of the United States Brewers' Association wrote for fifty copies. A fire insurance exchange wanted several.

The vice-president of the Chicago City Railway Company telegraphed twice to have copies hurried to him. Government officials of England, France, Germany and Italy sent orders. A tutor of the Russian Crown Prince went personally to the office to secure a copy. And a Chinese student in one of our universities ordered a copy to take back to China with him.

Much of this interest may be explained on the score of timeliness. Hundreds of fresh, enthusiastic law-makers are entering this winter on their first experiences as representatives of the people. "Many of these," explained Mr. Ayres, "are going to their state capitols filled with the ambition to pass progressive legislation. In this frame of mind, almost their first thought is 'what can be done to better the schools?' The forty legislatures convening this year consider annually 1,000 bills on educational questions and enact 200 of them into law. So the time was ripe for making known the salient facts about school conditions in all the states."

But not all the interest apparently can be explained on that ground. Much of it is probably to be regarded as evidence of an increased belief, in this country and elsewhere, in the obligation of the state to lay sure the foundations of future citizenship.

THESE ARE THE TEN TESTS

Rank of states in each and all of ten educational features, 1910.

## INVESTMENT IN SCHOOL PLANT

161

So far as the clipping service reveals, the South gave a greater proportionate publication to the facts than any other section of the country. Virginia and Wisconsin, the former standing forty-first, the latter twenty-eighth, seemed to sustain the rudest shocks to their pride.

As a nation, the United States has a shorter school day, a shorter school week, and a shorter school year than any other highly civilized country in the world.

Our expenditures for public education have more than doubled in the past ten years. Today the United States spends nearly half a billion dollars a year on its public schools. The expenditure per child of school age ranges all the way from \$3 in South Carolina to \$32 in Washington.

In Mississippi the average investment per child in school buildings and property is \$4.00, while in Massachusetts it is nearly 29 times as much, or \$115.

The unequivocal comparison of one state with another proved a delight to the newspaper man's heart. Politicians and interested persons in nearly every state habitually delude the people with the assurance that their state leads the nation in the wisdom and bounty of its provision for education. Doubtless many persons sincerely believed that such was the case. Now came a rude shock. An Iowa editor, whose state ranked twenty-first, asked in a headline, "Is Our Boast Busted?" and papers in a dozen states

States where school attendance is compulsory throughout state in outline, those where it is compulsory in part of state in diagonal, and those where it is nowhere compulsory in solid black.

States having mandatory laws in outline, those having permissive laws in diagonal, and those having no laws in solid black.

As a nation, we allow our public schools to burn down at the rate of more than one for every school day in the year.

The per cent of attendance ranges from about 60 in Maryland and Mississippi to more than 80 in Oregon and Massachusetts.

In North Carolina, New Mexico, Arkansas and Alabama the attendance period is so short that the average pupil would need about 22 years to complete an elementary course of eight years of nine full school months each. If he were compelled to live up to this standard, he might enter school at the age of five and not get his eighth grade certificate until he was 27.

In eighteen of the forty-eight states the average annual wage of public school teachers amounts to less than one dollar a day. In just five states is it more than two dollars a day. The highest average salary paid in the United States is \$918, in California, and the lowest is \$200, in North Carolina.

According to this study, the average annual wage of carpenters in the United States is about \$802, of coal miners \$600, of factory workers \$550, of common laborers \$513, and of teachers \$485.

Throughout the southern states thousands of rural teachers earn less than \$150 a year. In one New England state hundreds of teachers earn less than six dollars per week. In one county in a Central Atlantic state the average for all teachers is \$129 per year. One southern state rents its convicts to contractors at a little more than \$400 per year, while it pays its public school teachers slightly over \$300.

#### VOCATIONAL GUIDANCE IN NEW YORK

For the purpose of "studying the field and furthering the work of vocational guidance," the Vocational Guidance Association of New York has just been formed. This is the outgrowth of suggestions made at the Second National Conference on Vocational Guidance, reported in *THE SURVEY* of November 23, 1912.

Among the teachers, social workers, business and professional men present at that meeting there was general acceptance of certain fundamental facts in regard to children who leave school at an early age to go to work. It was regarded as having been quite proved that they leave with little or no training which fits them to enter industry auspiciously; that, therefore, most of them spend a great part of the next year or two shifting from one line of work to another, without aim and without advantage to themselves; and, finally, that not more than a quarter of these children are driven into wage-earning occupations through economic necessity within their homes. The majority of them, it was believed, could be induced to take advantage of further education if such education could be made to appear to them to bear a real relation to their future life.

With these facts as a basis it was pointed out that there are two ways of attacking the problem. One is by finding the best jobs available for boys and girls of fourteen as they leave school. The other is by doing three things: studying the needs and opportunities of industry, and making these known to the children; changing the school curriculum so that it will more adequately fit for life; and discovering the vocational aptitudes of the children who leave.

The new association extends its scope to all of these methods. Its active work is to be carried on by the five following committees, though others may be added from time to time.

Committee on Study of Occupations; chairman, Alice P. Barrows, Vocational Education Survey.

Committee on Opportunities for Vocational Training; chairman, Charles S. Bernheimer, Hebrew Educational Society, Brooklyn.

Committee on Giving Vocational Information to Children; chairman, Henrietta Rodman, Wadleigh High School.

Committee on Vocational Analysis; chairman, James E. Lough, New York University.

Committee on Placement; chairman, Eli W. Weaver, Boys High School, Brooklyn. Placement of Boys, Gilbert J. Raynor, Commercial High School, Brooklyn. Placement of girls, Mrs. P. J. O'Connell, Alliance Employment Bureau.

It is contemplated that every person desiring to do active research or field work in vocational guidance shall attach himself to one of these committees. It is intended also to bring the association "into active touch with the world of affairs through an advisory board, consisting of representative employers, workers, and experts in various fields."

The officers are as follows: president, Frederick G. Bonser, Teachers College; first vice president, Edward L. Stevens, associate superintendent of schools; second vice president, Stephen P. Duggan, College of the City of New York; secretary, Benjamin C. Gruenberg, Commercial High School, Brooklyn; treasurer, Robert J. Leonard, secondary schools of Teachers College.

#### VOCATIONAL SCHOOLS IN WASHINGTON

A bill providing for vocational continuation schools has been introduced in the Washington legislature. It provides for compulsory continuation schooling for six hours weekly, three years for boys and two years for girls, after the age of fifteen. The plan is somewhat similar to the Cooley proposal in Illinois, but differs in empowering the local school board to appoint the board to have charge of vocational training. In this and other respects it resembles the Wisconsin law enacted in 1911.

# CHURCH AND COMMUNITY

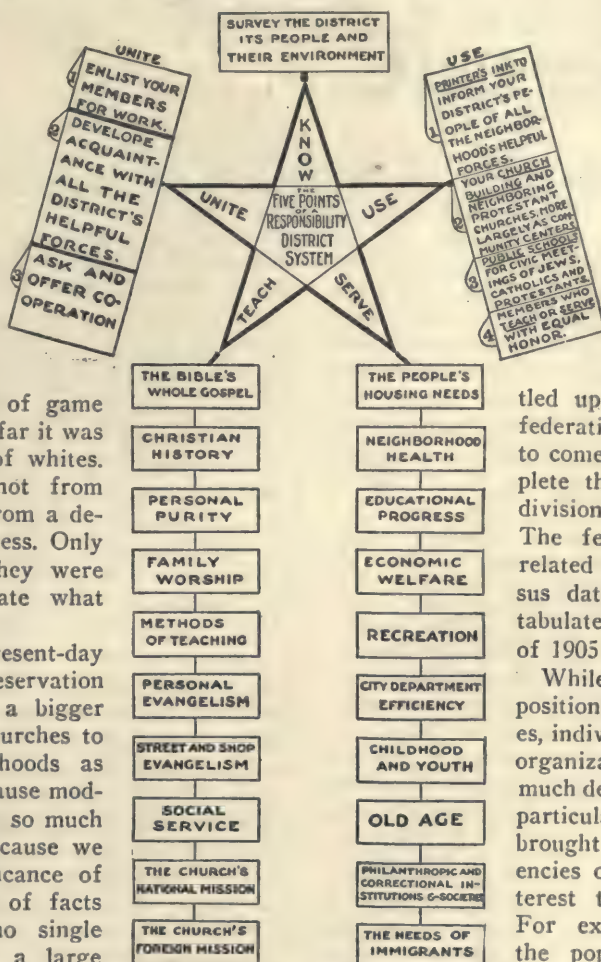

Edited by GRAHAM TAYLOR

## TELLING THE CHURCHES WHERE THEY ARE

The Puritans who settled in New England did so practically as congregations; put in modern terms, one of the earliest needs felt by these church communities was that of statistics of their neighborhoods. They wanted to know, for example, the density and tribe of nearby Indians, the quantity of game within reach and how far it was to other settlements of whites. Their need sprang not from fear alone, but also from a desire for larger usefulness. Only by knowing where they were could they demonstrate what they were.

It is so with present-day churches. Self-preservation and the hunger for a bigger service are leading churches to study their neighborhoods as never before. But because modern neighborhoods are so much more complex and because we understand the significance of so many more kinds of facts than we used to, no single church, especially in a large city, can adequately inform itself of all that it wants to know. The New York Federation of Churches has undertaken to supply the data with regard to New York for all who will use it. It has recently announced that it is now ready to furnish, through its Population Research Bureau, manifold demographic statistics for the Boroughs of Manhattan, Bronx, Queens and Richmond, and that it will be able to do the same for Brooklyn in a month.

Much of the material which the federation has at its disposal is the result of painstaking interpretation of the 1910 census returns. It was through the efforts of the Department for the Improvement of Social and Living Conditions of the Charity Organization Society and the federation that the tabulation of the city in

The Federation uses a star to illustrate the joint responsibility of the Protestant churches under a distinct system.

that census was done largely by forty acre tracts instead of by wards and assembly districts, which varied so in size and boundary as to be almost useless for the purposes of these two organizations. Even after the facts had been gathered they would have remained bot-

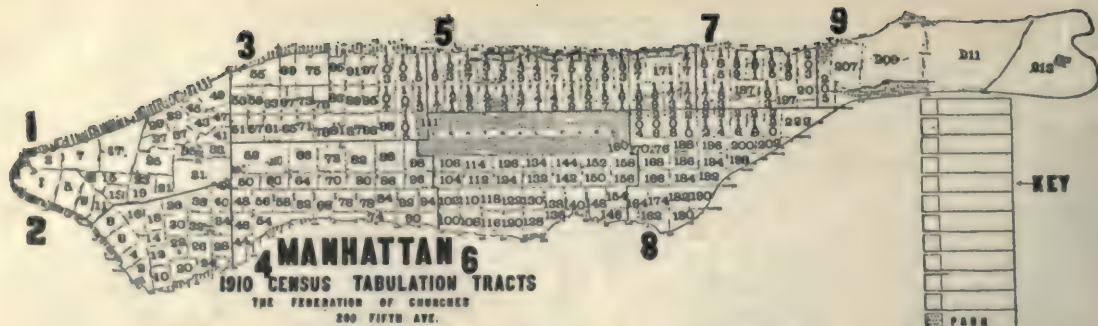

tled up in Washington if the federation had not been allowed to come to the rescue and complete the partially inaugurated division of the city into tracts. The federation has also correlated with the federal census data information specially tabulated from the state census of 1905 for the same tracts.

While the federation is in a position to supply to the churches, individuals and social service organizations of the greater city much detailed information about particular localities, it has also brought out some larger tendencies of the population of interest to the general reader. For example, the growth in the population of Manhattan through immigration has long been familiar. But while Manhattan was 47.36 per cent foreign white, 1910, against 42.31 per cent, 1900, or 5.05 per cent more foreign in 1910 than in 1900, Brooklyn became 4.63 per cent more foreign in the same decade, Bronx 3.99 per cent more foreign, Richmond 0.53 per cent, while Queens became 1.30 per cent less foreign.

Brooklyn now has nearly as many foreign-born whites as Chicago. Chicago has 585,420; Brooklyn, 571,356. Chicago has 35.7 per cent foreign-born whites; Brooklyn, 34.95 per cent. Chicago added to itself, 1900-1910, 195,797 foreign-born whites; Brooklyn added 217,606.

Buffalo has 423,715 people; the Bronx, 430,980. Buffalo has 118,444 foreign-born whites; the Bronx, 148,935. Buffalo has 28 per cent foreign-born; the Bronx, 34.6 per cent.

#### THE TABULATION TRACTS IN MANHATTAN

The cloth mounted original of this map, 72x21 inches, shows the tract populations, 1910; tract gains, 1905-1910; tract percentage gains; and gains or losses in nine tract groupings. This is the borough map supplied to churches, as described in text.

The officers of the federation hold that these figures controvert the position taken by some Protestants that a federation of Protestant churches may be necessary in Manhattan for the interpretation of evangelical Christianity to Jew and Roman Catholic—the present largest elements in the city's growth; but that such a federation should not cover Brooklyn and Bronx. Brooklyn, 1900-1910, gained over 48 per cent of the Russian growth of Greater New York.

From present tendencies the research bureau sets 9,600,627 as the maximum figures for Greater New York's population in 1940. Of this it assigns 2,158,221 to the Bronx, or over half a million more than to Manhattan in that year. The Bronx today, it is declared, is in about the same condition for church work problems as was Manhattan in 1860.

The federal census bureau is not allowed to classify the population by religions. Estimates by the research bureau for 1900 and 1910 are as follows:

	1900	1910
Roman Catholics .....	1,266,561	1,672,618
Protestants .....	1,572,629	1,785,366
Jews .....	598,012	1,252,135
Greek-Catholics .....		56,764

The *American Hebrew's* estimate of the number of Jews in New York today is about 900,000. This is said to be the figure commonly accepted among Jews. The federation's estimate is 300,000 more.

To return to the districts and the serviceability of the census data to the churches in them: For these districts in the four boroughs above named, information is now available dealing with such characteristics of the population as the percentage of foreign-born whites, of native whites of foreign parentage, of those speaking the various languages and dialects, of illiteracy, of children attending school, of foreign-born males of voting age, and with many other matters. This information, says the federation to individual ministers, constitutes "a

fundamental equipment for religious and social service in your district." It goes on:

"If, for instance, the survey shows your district in 1910 had a large foreign population of a given 'Nationality,' and you discover there is yet no neighboring religious work under way for it, it may be the duty of your church to institute an evangelizing movement for the nationality concerned. If you desire to co-operate in the anti-tuberculosis campaign by delivering throughout your district the health circular, 'Keep your Windows Open at Night!' the information as to the 'Number of Families' will, for this social service, inform you of the number of circulars you need, while the number of dwellings will inform you of the number of workers needed to distribute them, and country of birth of the various nationalities for which circulars should be procured.

"Other uses of this 1910 census population survey will occur to experienced workers.

"Churchless families, especially those with children, might be ascertained by a visitation of the district, and exchanges of like information could be made with churches assuming adjoining responsibility districts.

"Shops, factories, parks and institutions in the *responsibility district's* area, wherein teaching or social service might be carried on, should be ascertained.

"The helpful and harmful agencies in every block should be mapped. For this work the federation will make a list of forces for good and evil which should be noted, and suggest the best methods of locating them on block directories."

The "responsibility district" mentioned in this quotation is the unit of territory in which the federation urges each church to busy itself. For the greater part of the city these districts are forty acres in size, though in some sections they are much larger. Concerning the responsibility district system the federation says:

"It were too much to say that New York is

now entirely a home missionary field. It is not too much to say, however, that New York's Protestant churches cannot discharge their mission to the city without entering into a co-operative responsibility district system. For such a responsibility district system the tracts tabulated by the Federal Census, at the original suggestion of the Federation, are the best possible basis.

"In 1910 and 1925, if its plans are carried out, as well as in 1920 and in 1930, these tracts will be re-tabulated by the Federal Census Bureau, and if the Protestant churches have the vision and heroism now to begin to work for the city on a responsibility district basis, the Government Census will thus supply them, as well as other groups of religious and philanthropic workers and city and state authorities, with a quinquennial measurement of the changes of population. . . . The plan outlined, though not developed in full detail, cannot be carried out without an efficiency organization of the churches even greater than that called for in the Men and Religion Movement. To carry it out, the possession of the tract tabulations is a necessity for each church accepting a responsibility district. Even the churches which do not assume such districts will find, however, that a tract tabulation of their neighborhood is indispensable for their work."

The diagram on page 689 shows ten fields of social service activity,—in addition to the teaching suggested above, in which churches are bade to serve their communities. In respect to these the federation offers these suggestions:

**CO-OPERATE** with Tenement House Department to banish dark rooms. For method apply to the Federation. Co-operate in insisting on lighting of halls, and on sanitary conditions. For welfare of your own neighborhood, work for introduction of zone city-plan system of European cities throughout New York, which would reasonably restrict height of buildings and prevent private home neighborhoods from business and tenement house invasion.

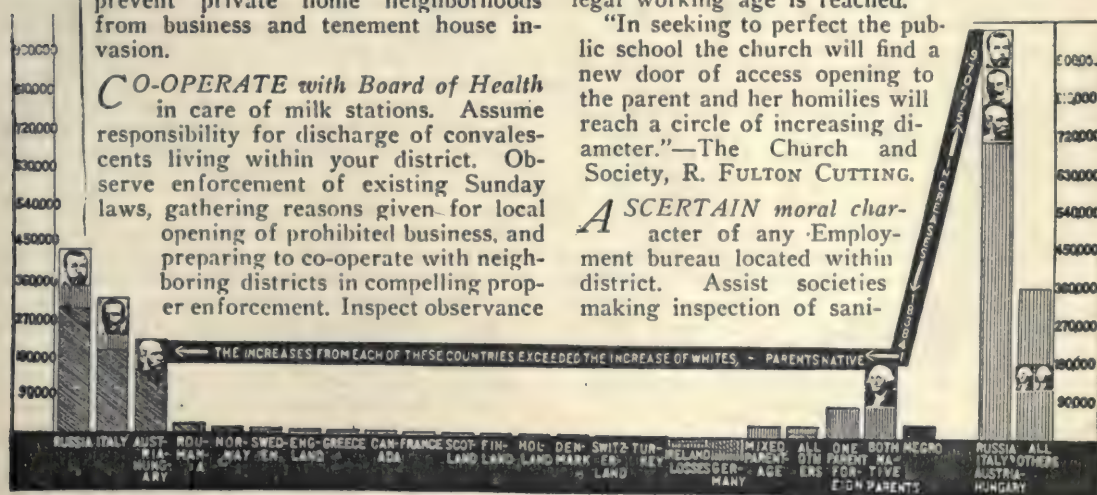

**CO-OPERATE** with Board of Health in care of milk stations. Assume responsibility for discharge of convalescents living within your district. Observe enforcement of existing Sunday laws, gathering reasons given for local opening of prohibited business, and preparing to co-operate with neighboring districts in compelling proper enforcement. Inspect observance

of ordinances prohibiting exposure of foods, and insist on enforcement. Observe enforcement of roller towels ordinance in public places and compel enforcement. Observe cleaning of streets and co-operate with street cleaning department. Inspect removal of garbage and co-operate in securing a scientific system of removal and disposal. Assist association of tuberculosis clinics in conducting nearest neighborhood clinic or day boat camp. Help summer mothers' classes. Organize children through public schools for periodic "spotless town" campaign in responsibility district. Unite physicians with offices in district to counsel things needed for banishment of all local disease, and to volunteer attention to necessitous families. Make an analysis of air of your church rooms to detect and remove excess of carbonic dioxide. Investigate hours of work in stores and factories of your district, and encourage employers to give, and the purchasing public to assist in securing a reasonable working day and Saturday half-holiday for classes of employes now overworked. Investigate in your neighborhood extent of seven-day work, and inform Federation or Churches of your discoveries to assist it in its legislative campaign for a compulsory one day's rest in seven.

**VISIT** public school in your district; form acquaintance of principals and teachers, and observe teaching methods. Attend opening exercises and judge of value of compulsory daily Bible reading in city's public schools. Ascertain causes of absence of district's children out of school, as tabulated by federal census in 1910 and any later survey of board of education. Investigate ventilation, seating, etc., of school buildings, in cooperation with public health association, and ascertain teachers' views of additional equipment needs. Organize a parents' association in your own church membership and from it organize a parents' association for your responsibility district, giving it headquarters in your church for its stated meeting. Investigate opportunities for education of defective children, and befriend families compelled to place their children in gainful occupations the moment the legal working age is reached.

"In seeking to perfect the public school the church will find a new door of access opening to the parent and her homilies will reach a circle of increasing diameter."—The Church and Society, R. FULTON CUTTING.

**ASCERTAIN** moral character of any Employment bureau located within district. Assist societies making inspection of sani-

tary and fire hazard conditions in shops and factories. Co-operate with campaign for honest weights and measures. Ascertain, as far as possible, number of industrial workers, living elsewhere, coming into district for their daily work, and if need appears, use your parish room for noonday rest and lunch for women workers. Investigate opportunities for securing vocational education in schools, factories, settlements, churches and other district social agencies. Secure, if needed, church rooms for meetings of district's labor union locals. Estimate district's economic waste from liquor traffic, and consult the Federation as to methods of reducing licensed drinking-places. Co-operate with state department of labor and organizations in a study of district loan agencies, and other forms of credit system.

**S***TUDY recreation conditions in parks in or near district and plans for further neighborhood park provision and equipment. Study need and supply of local outdoor playgrounds. Make periodic, simultaneous and systematic inspection of motion picture places and study sanitary and moral conditions and observance of laws regulating attendance of children. Organize simultaneous visits of volunteer inspectors to vaudeville shows and theatres, and work to prevent indecent performances. In church work regard recreation as a natural right and universal duty, and, if district dance-halls are dangerous, provide substitutes in parish rooms or elsewhere. Acquaint district's people with city's recreation resources by organizing visits to museums, zoological garden, parks, playgrounds—with special attention to boys.*

**V***SIT frequently every school, police station, fire hall, hospital, and every other city department with a district office, observing efficiency of management and unmet needs. Regard district's police as a most desirable and a possible ally for righteousness, and develop personal acquaintance with all inspectors, captains and patrolmen having local authority or duty.*

**S***TUDY recreational, educational and hygienic conditions and neighborhood habits of youth of your district, and institute district boy organizations. Study observance of child labor laws, and befriend families compelled to put children, prematurely, into gainful occupations. Assume responsibility to "big brother" all boys living within district, for whom children's courts have found no other friend, and ascertain from school teachers boys likely to reach court unless "big brothered" in advance. Study wages of working girls in neighborhood, and observance of law directing store-keepers to give them seats. As-*

certain number and nature of district's girls' boarding houses and boys' homes, and cooperate in meeting unsupplied needs.

**O***RGANIZE a committee to co-operate with any neighborhood home for the aged, and institute in district's churches simultaneous "old people's day," requisitioning automobiles owned by your church members or loaned for day.*

**O***RGANIZE neighborhood committee to co-operate with any local rescue mission. Form similar organization to co-operate with institutions and societies for relief, ministry to defectives and securing employment for out-of-works. Assure charity societies of willingness to care for any case of district distress having no other friend, and use confidential charity lists of such societies. Visit and inspect all philanthropic societies having district headquarters.*

**C***O-OPERATE with state bureau of industries and immigration, and aid Americanization of new immigrants on its request. Study 1910 Census population survey of your district, and teach English and civics to foreigners as shown to be necessary thereby, especially helping new immigrants to connect with public school classes in English for beginners.*

To any individual or church the federation advertises to furnish for \$10, a map of the borough in which the applicant lives, with its census data collated for three tracts—the one in which the applicant lives and two adjoining. To any settlement it will furnish for \$15, a similar map and information covering twelve tracts.

This last offer shows that the usefulness of the Population Research Bureau is not limited to churches. It has, in fact, already supplied to social service bodies data directly touching their work yet not obtainable in any other way. For example, the Public Recreation Commission of New York learned from the bureau that there are 770,037 children between six and fourteen years in Greater New York. These are, of course, the ones for whom certain types of amusement are especially needed. Seventy-two thousand of these, or 9.37 per cent, are not in school. The congested districts show the greatest percentage of absence from school. Ground maps for the commission's own interpretation of contributed data have been supplied it.

The secretary of the New York Federation of Churches, the Rev. Walter Laidlaw, believes that there is need for a similar service in every large city of America. St. Louis has arranged with the Census Bureau to secure much of the information about itself which the federation secured with regard to New York.

## THE ARMY CHAPLAINS' MEMORIAL

Not only the churches, but the general public, will do well to give prompt heed to a memorial which the chaplains of our army, navy and national guards have addressed to them. By invitation of the retired army chaplains a conference was held in Los Angeles "to consider the moral and religious needs of the various bodies serving their country in the military and naval forces of the United States."

Attention is called to the large proportion of young men among the 80,000 officers and men in the regular army, the 62,000 officers and men in the navy and the marine corps, and the 100,000 in the national guard. Just at the formative period of their manhood they are "crowded together in barracks and on ships, away from the restraining and elevating influences of home and churches, being forced to lives of celibacy and in the society of men alone."

These more or less unavoidable conditions of military and naval service are so perilous morally and spiritually as to demand extraordinary efforts to counteract and improve them. Less interest and means, however, are taken in providing for the religious needs of these 242,000 men, living at best under disadvantageous conditions, than are invested by the churches, the Young Men's Christian Association, and by public agencies of some cities and states to help and safeguard men living under conditions ordinarily more advantageous to the religious life.

These chaplains well state that their essentially difficult work is done under special disabilities. Chief among these is the prevalent assumption of the government's indifference to religion. This is supposed to be grounded in the constitutional provision forbidding any establishment of religion, which, however, was surely not intended to discredit religion. Nevertheless, it seems to have this effect in the indifferent attitude taken toward religion in the army and navy not only by superiors, subordinates and enlisted men, but by the public itself. The office of the chaplain is therefore regarded by officers and men "more as a sinecure than as a necessary part of the service and their work as unessential to the well being of the commands to which they are attached." Thus they are left not only without the moral support of administrative officials, but without any such church organization, advisory boards, church fellowship and direction, as sustain and strengthen the pastor and the missionary on their fields, however remote.

Not only is the number of chaplains inadequate to care for the battleships and army posts, training ships and stations which have an otherwise full complement of officers and men, but they are all most inadequately supplied with chapels or places for worship and instruction, with equipment of desks, tables, chairs, stationery, and libraries, reading rooms, moving pictures, or other forms of recreation.

The structure of the barracks is said by the chaplains to be "very unfavorable to morality

and religion, as it forces large numbers of men into each squad room." If this room were small enough for not more than a corporal's squad and liberty were given in the choice of squad rooms, "those who desire to cultivate decency might relieve themselves of offensive companionship."

While the general sentiment is said to prevail, both in the army and navy, against the excessive use of intoxicating liquors and in favor of temperance, "no systematic official encouragement is given chaplains to organize total abstinence societies nor to support and encourage young men to take pledges to overcome the temptations to drink," such as the British government extends to its chaplains.

And yet these handicapped ministers of religion unite in declaring that "no institution in the country, no college, no military boarding school, no reformatory, has the organization so admirably adapted to the purpose of molding its membership as the army and navy—and it does so mold it." But, they add, "The Christian public has not concerned itself whether the old sergeant has a contempt for the highest ideals or will build in the boy from Christian homes fiber of the good soldier."

THE SURVEY agrees with chaplains that "these counts must convince every fair-minded person that the present policy of our government toward that which is best in the soldiers and sailors, their moral and spiritual natures, is radically wrong and that the whole subject must have faithful consideration and prompt action." They have indeed "presented a national problem." For its solution we commend to the churches, and especially their social service commissions, the task of putting themselves immediately in co-operation with the field secretary of the Chaplains' Association, Chaplain Orville J. Nave, United States Army Retired, 2505 S. Grand Ave., Los Angeles, Cal.

### A RESPONSE TO THE CHAPLAINS' MEMORIAL

The San Francisco Preachers' Meeting was one of the first religious bodies to respond to the Chaplains' Memorial. Its resolutions covered all the points of need therein stated by requests to Congress, the War and Navy Departments for such standards, equipment and supervision as will insure for the religious work in the army and navy and its personnel the same consideration that is given to the other departments of the service. The most significant opinion expressed, however, was couched in these words:

"That while we commend most heartily the work which the Young Men's Christian Association has done in the army and navy, a work which under present conditions could not have been done if not done by the Y. M. C. A., we declare it as our opinion that the United States government should not continue to be an object of Christian charity,

but should support such work out of army and navy appropriations and under the care of its chaplains. If charitably disposed persons of means are so moved by conditions in our services that they are willing to contribute hundreds of thousands of dollars out of their own private purses for the amelioration of such conditions, it is high time that those in authority should take some adequate measures to meet these needs."

An army chaplain writes thus regarding the disposition in certain quarters to put the chaplaincy on a contract basis:

"I think it would be a serious mistake. The work of a chaplain is difficult and delicate, and we ought to have the very best men of the churches for the work. These men should make it a life work, and should be in position to study that work under all conditions, both in garrison and in the field, at home and abroad. Any man trying to do this work with less than the present commissioned status of chaplains would find himself very greatly handicapped.

"Two elements would favor degrading the chaplaincy: those who are clamoring for retrenchment in army expenditures and those in the service who fear that this spirit of economy may attack the retired list. These latter feel that probably sacrificing the chaplains might save others from the keen edge of the retrenching knife. This however, is not likely to affect the chaplains now in the service, but would be a great mistake for the future. We are now more anxious to secure proper equipment for our work and enough chaplains to do it. We beg the co-operation of all friends of the service."

From the *San Francisco Chronicle* of December 9 and 10, 1912, we take two statements which are in point:

"In treating of the morals of the army, Secretary of War Stimson recites the results of his inspection of forty-nine of the mobile army posts, where he found the military reservations adjoined by dives and ill resorts of the vilest character. These conditions he believes to be the ultimate causes 'which make the record of our army in this respect shameful beyond that of the army of any civilized nation.'"

This statement is made, however, by the secretary to support his belief that the so-called anti-canteen legislation has been responsible for much vice. The other excerpt sent us from the coast is a dispatch to the *Chronicle* from Sacramento stating that according to a report by the Board of Health from data prepared by Statistician George Leslie, "more soldiers and more nurses commit suicide in California than persons in any of the other occupations. Soldiers lead the men with 7.9 per cent, while nurses lead the women with 5.5 per cent." A correspondent adds: "As soldiers form a very small

per cent of the male population of California the above figures are significant."

## JOTTINGS

### DIGNIFYING THE CHAPLAINCY

Speaking of chaplains, here are the qualifications which the general superintendent of a state reformatory is seeking for that post in his institution:

"The kind of a man that I am seeking for is

(1) A Godly man that knows how to reach young men;

(2) One with sentiment well directed and controlled by common sense;

(3) One with ability to speak acceptably both to prisoners and the public;

(4) One with training in social work or in a school of philanthropy.

"While I want a good strong man, I also want a man with broad ideas of religion and who has had his sociological training four or five years ago, which would mean that he would have had an opportunity for some outside field experience since his college work or training. I want him to have reached an age that guarantees a degree of maturity of judgment. I want his religion to go through and through and clinch on the other side. I want a man who is willing to throw his whole soul into the work for the love of the good he can accomplish—a man with kindly magnetic personality, intellectual, scientific, with a correct conception of the broad humanism of the work. I am exceedingly anxious to build up an organization here along real scientific lines."

### INNER MISSIONS AS SOCIAL AGENCIES

The social work of the Lutheran churches is done chiefly through their Inner Missions. Established in Germany sixty-two years ago by Emanuel Wichern, the Lutheran apostle of modern missions, they have followed that great religious fellowship wherever it has spread over the world, thus fulfilling the prediction of their founder, that "the entire evangelical church must make the inner mission her work and demonstrate her faith by her love."

In Protestant deaconess mother-house work, which is the most distinctive feature of the mission, the Lutheran church is the pioneer. Nine such mother-houses have been established in the United States, and a tenth is in prospect. Their deaconesses are helpers not only in hospitals, orphanages, old people's homes, epileptic colonies and other charitable institutions, but they conduct Christian kindergartens and day nurseries, assist in settlement work and in parish ministries. The "Christian hospice" is another distinctive feature of this mission work. It is established in some instances for girls only, in others for general patronage, and is open not only for those who can pay a nominal rate, but for those who need free shelter. Meeting and caring for immigrants and a free employment bureau are parts of the same work.

The social instruction in many Lutheran theo-

logical seminaries is closely related to teaching the history and methods of the inner mission. Prof. George H. Gerberding of the Lutheran Theological Seminary at Chicago illustrates this connection in a pamphlet recently issued on the Relation of Inner Missions to Sociology.

#### "THE NEED OF NEW VISION"

Before the United Hebrew Congregation of St. Louis, Oscar Leonard, superintendent of the United Jewish Educational and Charitable Associations of that city, spoke of "the need of new vision" among his people. His diagnosis of a prevalent situation was bold, incisive, yet pervaded by intense loyalty to the fellowship. By his courtesy we reproduce some of the most striking sentences and paragraphs of this notable address:

"Our lack of vision disquiets us. Our growing generation has lost the vision which brought peace and contentment to the fathers. They have nothing in its stead. They are perishing for want of an ideal. As a result, pleasure has become their goal. In this the Jewish youth is like the American youth. These pleasures lead to indulgence of the kind never known among Jews before. We have reached a condition which probably cannot be paralleled in Jewish history.

"The Jewish family, which has been known through the centuries for its integrity, is disintegrating. The time has come for us to take heed. The danger in here—it is knocking at our door. The warning has been sounded from one end of the country to the other.

"This does not mean, however, that we must give up the fight, or our place as a people peculiar in our high moral standards. Even though our heads are bowed in shame, we must raise our eyes again and look for a new vision—take heart anew and plan for the future.

"We must therefore look for something that will fill the hearts and souls of our young men and women. The only thing I can see now is to give them social ideals, teach them to love justice and mercy, to work and fight for social justice, for the uplift of the downtrodden, to break the chains of the oppressed.

"The free synagogue is a demonstration of what the synagogue can do to give new vision to Jewish young men and women. It is ever in the forefront in the struggle for civic righteousness and social justice.

"The settlement has a work to do. I maintain that with very few exceptions no person without a European background can work successfully in a settlement. To work successfully with immigrants one must be an immigrant. A wholesome change is coming, however. The bulk of social workers who discussed the various problems at the last session of the conference of Jewish charities came from the ranks of the immi-

grants. The task of the settlement is to show that to seek happiness is to lose it. We must help our young people to find joy in their daily labors. We must make labor human. Our ancestors were wont to return blessings for the tasks of the day. Our young men and women need the same vision. We shall probably translate it into modern terms, but the vision will be the same. We shall not allow ourselves to perish because we have the power of renovating and revitalizing our vision."

#### PARISH SOCIAL SERVICE COMMITTEES IN CHICAGO

The Social Service Commission of the Episcopal Diocese of Chicago is perfecting its organization by securing the appointment of a social service committee in every parish, consisting of three men and two women. To the twenty parish committees already appointed the following suggestions of definite lines of work have been issued by the commission:

1. Hold monthly meetings if possible.
2. Distribute to the congregation from time to time such literature as shall be furnished by the Social Service Commission.
3. Ascertain certain social conditions in the parish or community, as suggested by the Diocesan Commission.

4. Arouse local opinion on the community's social needs as suggested from time to time by the commission or by the local committee itself. Additional activities will be outlined from time to time.

A field secretary of this commission is devoting his entire time to organizing and assisting the social work of the parishes in the diocese. His services have been generously extended to the community work of outside committees, and thus the church has valuably contributed its aid in public emergencies.

#### SOCIAL SERVICE AND DOMESTIC SERVICE

Surely the term social service loses none of its dignity in being used to dignify domestic service, as it was in one of a series of discourses by Rev. Willard Brown Thorp, delivered at San Diego:

"So long as the idea prevails that domestic service is unskilled labor, that it is drudgery, that it is menial and relegates the worker to a lower or servant caste, and so long as certain other disagreeable conditions prevail, it is not strange that it is hard to get first-class girls to do household work.

"A great change is coming, however, over our ideas of the status of household service. The feeling of both employer and employe about it is changing. The new idea is here.

"It is not a menial occupation. It is honorable work, and entitles the one who is doing it well to regard herself with pride and to be treated with respect. There was a time not long ago when to be a nurse was thought menial. Today it is a high and honorable profession to give skilled care to

## A Will

In the name of the Father and of the Son and of the Holy Ghost. Amen.

It is my will that my burying be as the burying of the poor. In this I wish to be identified with them and as in my life I have failed to manifest the sympathies of my heart in this regard, in the first place through my own fault, ignorance and perverted judgment of things, and lastly for want of means and health, I, in this last act would offer a public reparation for all that I have neglected to do that I might have done. I love the rich for the sake of their souls and the good deeds they can do with their riches. I love the poor for the sake of their souls and for their poverty because being poor more is demanded of them by society. They must be more patient, long-suffering, grateful and kind than the well-to-do or the well-to-do will condemn them. A trifling theft is a great crime in them because in their simplicity they are unable to conceal it and custom does not sanction their sin as it does the greater thefts of the rich in the payment of inadequate wages, delay of paying, etc. Ah, my soul, before God I am thankful that I have come to see their wrongs. I will then, to be buried with them in consecrated ground, my coffin to be like the coffin of the pauper, the vehicle in which it is taken to interment to be like the vehicle used for their interment. If any wish to follow my remains thus let them do so, praying for my poor soul and the conversion of all sinners to truth, justice and love. Rockford, Aug. 29, 1883.

Let a simple wooden cross mark the spot with the inscription "I am a beggar and poor—the Lord is careful of me. Of your charity pray for the repose of my poor soul."

And let no eulogy whatever be spoken over my remains. If anything be said say that I was a poor sinner but that through the great mercy of God I died in the hope of pardon.

I know no other means of expressing my constant understanding of the absolute equality of all flesh, therefore this my will is neither a love of eccentricity nor fanatical but rather an earnest desire to give my testimony to truth. Jan. 1884.

"The slumberer here confides in the mercy of God." The above inscription on the tomb of Emily Linder strikes me as beautiful and expressive of my heart. Aug. 6, 1880.

ELIZABETH A. ADAMS.

We are indebted to the Very Reverend P. J. Muldoon, bishop of Rockford, Ill., for a copy of a remarkable statement read by him at the funeral of Elizabeth A. Adams, an aged parishioner, and prepared by her as her last will and testament. A convert to the Catholic faith, she taught the first parochial school in Rockford, contributed many articles to Catholic periodicals and was enlisted in many good works. Her wishes regarding her obsequies were respected.

the sick. Why shall not the same be true of domestic service?

"It is skilled labor. The people who think anybody can do household work do not know what they are talking about. It is a mistake to suppose that every woman is by nature fitted to do housework, just because she is a woman. Some cannot even learn to do it well. The schools are recognizing the skilled nature of housework by teaching domestic science; and such instruction as is now given is only the beginning of what is to come in the future.

"It is not drudgery—or, rather, it is drudgery only when it is done poorly. To cook a meal well and serve it daintily; to keep a house in such order that everything is fresh and sweet and attractive from the bathroom to the kitchen porch—that is not drudgery. The girl who has the instinct, the gift, the art of doing that will take pride and satisfaction in her work. The construction of the modern house, with all its conveniences, is making possible and inviting a different type of household work. The standards of cleanliness and beauty in the home are being raised; and that in itself is elevating our conception of the work which achieves these results.

"It requires as much training to make a good house mistress as it does to make a

good domestic. Some women assume that because a girl works for them they have a right to exercise a supervision over her whole life. Some go to the other extreme, and take no personal interest at all in the girl, even when it would be welcomed. In an increasing number of homes, however, the relation is a very pleasant one. Maid and mistress become personal friends, often pupil and teacher. The idea that employment in domestic service will interfere with a girl's prospects is a great mistake. If a girl has fine quality in her, I believe it will be recognized quicker by those with whom she comes in contact in domestic service than almost anywhere else.

"A darker side of the picture is in the temptations to which the domestic servant is exposed. A large proportion of girls living an immoral life date their fall to a time when they were employed as domestics, and in many cases the man who was responsible for it was a member of the family.

"Perhaps the greatest need of the girls who are doing household work today is wholesome conditions of recreation. Like everybody else, they want a good time, friends, merriment, social life. In default of a home where they can invite their friends, the streets, the theatres, and the dance halls become their natural resorts."

February 15, 1913.

# INDUSTRY

## THE Y. M. C. A. AMONG IMMIGRANTS

PETER ROBERTS

IMMIGRATION SECRETARY, Y. M. C. A.

The "immigration problem" is ever with us. The sixty-third Congress, discussing the Dillingham bill largely based upon the recommendations of the Federal Immigration Commission, failed to pass it. We are not done with the question. The present session of Congress has another bill, which is now in the hands of the President. Legislation will doubtless help in the solution of some phases of immigration, but the question will never be solved in America until each community having a colony of foreigners takes practical and sane measures to help the immigrants to rise to the stature of men who believe in self-government and to teach them how to govern themselves. One of many agencies attempting to solve this problem is the Young Men's Christian Association.

The Y. M. C. A. is a world-wide organization, and young men are world-wide rovers. Possibly 200,000 young men leave Europe each year for foreign lands, and a vision of a world-wide agency to help them in their migrations is today something more than a dream. A young man, Albert Ross, started from Lancaster, England, to go to an uncle in Mexico. He was met in Liverpool by the Association's representative; his parents sent a letter with a post-office order to New York, requesting that an agent of the Association should meet him at the port of

landing. The Association immigration secretary on Ellis Island found the young man, gave him assistance with his baggage, guided him to the proper place to get the exchange of tickets necessary to travel by the boat going to Galveston, and saw him safely on the vessel. A letter was also sent on to Galveston and the Association secretary there met Mr. Ross and made his brief stay in the city pleasant. His uncle was telegraphed to as soon as he reached Galveston and arrangements were made for the young man to meet his relative. Word came back from both the uncle in Mexico and the secretary at Galveston that the immigrant arrived safely at his destination. This chain of services, last month, extended, in the case of a young man going from England to Honolulu, a distance of over 13,000 miles.

The representatives of the Association are not always able to render as satisfactory service as was given in the above cases, but in twelve European ports Association agents are stationed, to help, guide and advise young men coming to North America. They distribute among immigrants cards printed in thirty languages informing them of the services the Y. M. C. A. can render. They distribute literature in four tongues, which gives the immigrant useful information concerning America as well as the

A class in English for Italians at Rome, New York.

#### SINGING "AMERICA"

A gathering of many nationalities in classes in English in New York. The classes are led by college students. A screen in front shows the words of the song.

Association branches in the leading cities of North America, in which secretaries are found willing to serve the newcomers free of charge in every possible way. More than 55,000 men were thus touched last year at ports of embarkation, and many of them found the Association a Godsend, for by its aid they found work, friends and a good place to board.

Many strange coincidents occur in this work. A young German took his introduction card to the Association branch in Milwaukee, Wis. He could not speak English and the secretary knew no German. They could both smile and shake hands, and after the greeting, the hour being late, the secretary gave the newcomer his supper, then a bath and a room over night. The following morning the secretary took the newcomer to a German friend, but on their way the immigrant gave a shout, ran across the street and grasped a man's hand. The secretary stood wondering, but soon saw the men kissing each other vigorously. The immigrant had found an old teacher who had taught him in the homeland, and the question of his adjustment to a new environment was solved.

The Association has ten representatives working among immigrants in ports of landing on the Atlantic. They help the incoming foreigners in every possible way, by communicating with their friends, writing letters for them, visiting those who are in the hospital, assisting those in distress and comforting the disconsolate. They also give the aliens cards of introduction to Association secretaries inland, and the name of every man to whom a card is given is immedi-

ately sent to the secretary at point of destination, so that he may look up the newcomer and be of service to him.

A Greek, George Milos, was given a card in Ellis Island, and his name was sent on to the secretary of the branch in Oakland, Cal., his destination. The Greek had not been in the city three days before an officer of the branch called at the address given and asked for George Milos. The place was a Greek candy store and the proprietor was surprised to have an American gentleman come and ask by name for one of his countrymen who had been in the city barely three days. He was a broad-minded man, however, and kindly called the young Greek to meet the visitor. The Association representative bade him welcome to America, told him he was glad to see him, explained that he belonged to the same organization as gave him a card in Ellis Island, and invited him to a class in which he would find others of his countrymen who were learning the English language.

Sometimes the call made upon the services of the Association is beyond its capacity to fulfil. The card given the immigrants states that "all possible services will be rendered *free of charge*." Immigrants give these words a very literal interpretation. A good Dutch brother was given one of these cards and was settled for some time in Rochester, N. Y., before he thought of using it. He went, however, to the Association secretary, card in hand, and asked him if the organization was ready to serve him. "Yes," replied the secretary, "what can we do for you?" "Well," said he, "I'm alone here, will

you please loan me money to get my family from Europe?" "How large is your family?" asked the officer. "A wife and six children," was the reply.

Another young Armenian went to a secretary of one of the New York branches, requesting his services as per the card "free of charge." He wanted employment but felt that he could not afford to take anything that would pay him less than \$20 a week. Of course, he could not find work of that character and, his money getting low, he proposed that the secretary take him home, board and room him "free of charge," until such time as he would find a job to his taste.

The secretaries at the ports of landing touch each month between 2,500 and 3,000 young men, and 400 Association branches inland second their efforts by coming in touch with the men whose names are forwarded to them. Hundreds of young men are thus helped to get their feet under them in a new country and hundreds more are tied up to safe associates and surrounded by influences that are uplifting and wholesome. In this important work of safeguarding and serving young men leaving home, Association branches in Europe and North America join hands. Their aim is to make the voyage of each young man leaving the old for the new world as safe and pleasant as possible.

The three secretaries on Ellis Island have among them, command of twenty-one tongues in which they urge young men of various races to use the machinery of the Association to help them start life in the new country. Some of these men go to rural communities, but they are not lost to the organization. The County Department of the Y. M. C. A. has, in thousands of rural communities, corresponding members. If a young man settles in one of these the corresponding member is notified that a foreigner has settled in his village and that it offers him an opportunity to serve. In this way many a young man is helped by finding in the Association man a brother and counsellor. Hardly a week passes that parents, relatives and friends from Europe and America do not request the help of the immigration secretaries to smoothen the pathway of those enroute from Europe to some part of North America, while scores of letters of gratitude are received continually from young men who have been helped before and after they have reached their destination.

But this port work is only one part of the scheme planned and carefully carried out by the Y. M. C. A. in its efforts to serve foreigners. The larger and more comprehensive work is done by three hundred branches scattered throughout North America. These branches organize classes among foreigners to teach them the English language. They use the Roberts' system of English for Coming Americans which has three courses, the preparatory, first reader and second reader. These classes are sometimes carried on in rooms assigned for the work in the buildings, but the majority of the classes are con-

ducted in foreign colonies. The policy generally followed is to take the school to the immigrants, not to ask them to come to the branch buildings. The teaching is done largely by volunteers. Last year 1,179 young men, college students mostly, gave their time and talent free to this work. Some of these men traveled ten miles to the classes. In cities where students are not available, volunteer teachers are enlisted from Association members, civic clubs, church brotherhoods, etc. The teaching, as a rule, costs the foreigners nothing. All they do is find a place to meet and pay for necessary supplies. The latest statistics show that about 16,927 men are thus organized in classes, meeting on an average twice a week to study our language and learn our ways. Last month, the immigration secretary of Pittsburgh called on a Greek newcomer, and found a group of fifty Greeks who are now organized into classes to learn our language. The same opportunity was extended last year to men of forty-five different tongues.

Foreigners who attend evening school are ambitious and earnest. They almost invariably want to become Americans and are anxious to get their naturalization papers. Teachers keep this in mind while imparting instruction, and never let an opportunity pass to give helpful instruction to this end. Hence, scores of Associations have groups of young men studying the principles of government and looking forward to entering our national family. Special lessons have been prepared for this purpose and many young attorneys render excellent service by helping foreign-speaking men to qualify themselves for the examination in naturalization. Many Associations are pleased with the success they have attained in this respect, and the men who have been helped are very grateful.

After an examination of "coming Americans" in the United States District Court in Derby, Conn., Judge Platt said: "I have been listening to the examination of a great many aliens since the last naturalization law went into effect and do not remember any case which evidenced any better results." Then he complimented the Association secretary for the good work he was doing.

From among the alien students in the classes, are organized committees to look up new-comers, belonging to their respective nationalities. The members of the "cosmopolitan committee" welcome them to the city, introduce them to the Association, ask them to join the class in English and bring them in touch with men who improve the opportunities America offers immigrants. The Association branch in Chelsea, Mass., has such a committee and the last report for this month states that seventeen names were sent to the secretary. Three of the addresses were wrong; the other fourteen men were located: eight of them are members in English classes, while three of the remaining six moved on to other towns. Oakland, Cal., was sent fifteen names, all of whom, save one, were located, welcomed and helped.

In connection with the classes, lectures are

POLISH-AMERICAN CLUB AT NEW BEDFORD, MASS.

"Hundreds of young men are helped to get their feet under them in a new country and hundreds more are tied up to safe associations and surrounded by influences that are uplifting and wholesome."

projected for the enlightenment of the foreign-born. These talks are about America, its heroes, its institutions, the principles of health and social hygiene, geography, industries, etc. The lecturers usually are local men, while members of the Association draw upon state departments for visual instruction, private collections, stereopticon firms, etc., for slides to illustrate their talks. Last year, 76,150 men were reached in this way. If the men cannot understand English, an interpreter is employed to translate the lecture. In one of these lectures, three different groups were brought together and three different interpreters were used. They spoke simultaneously, each to his own group, and the men heard the lecture each in his own tongue.

Many associations also plan meetings to which men of all nationalities among whom work is done may come. These gatherings are for the purpose of bringing the various members of the community together, in order to develop their consciousness of community relationship and

common interests. In these meetings, both the native and the foreign-born meet. In one of these, held in Aurora, Ill., five different languages were spoken. The leaders of various nationalities do the talking, and they generally give wholesome advice to their countrymen. In these meetings the men sing their own songs, play their own games and use their mother tongue. All, however, join in singing "America," and feel that they are members of one great family. They are also pleased to meet sympathetic Americans who are their friends and are willing to help them in every possible way.

The aim of the work is to help the foreigner get on his feet in a new country, to teach him our language, to tell him something of the struggle and the sacrifice of the founders of this great nation, to help him to become an intelligent member of the community, the state and the nation; and to ask for the best that is in him so that he may help solve the problems not yet solved in state and national life.

# WELFARE WORK OF THE STEEL CORPORATION<sup>1</sup>

H. P. BOPE

VICE-PRESIDENT CARNEGIE STEEL COMPANY

"It is unquestionably true that the spirit of the times is tending toward humanitarianism. A proper recognition of this fact in its relation to the human side of labor will eliminate economic waste and will conserve human energy." This is a broad statement made in a recent discussion before the American Academy of Political and Social Science, and its truth will not be questioned by those who have recently taken an interest in this view of the modern consideration of capital and labor in their relations as employer and employe.

Before entering upon a statement of what has been done in these recent years toward the amelioration of the conditions under which labor is employed in such industries as the one I represent, it seems to me a brief statement as to the tremendous growth of the steel business will not be uninteresting and will serve to show why, up until within a comparatively few years, it has not been possible to reach such methods and measures sooner, although the underlying thought has been in the minds of the manufacturers for years, as evidenced by the somewhat crude yet helpful means employed to give in many mills the steel-worker some measure of assistance in sickness, and to his family some measure of relief at his death.

<sup>1</sup>An address delivered before the Rochester Chamber of Commerce.

SWITCHBOARD GUARD

Oliver Iron Company, Hibbing, Minn.

Out of these small beginnings have come the great pension fund and the other measures for the welfare of the employes of the United States Steel Corporation; as well as in other similar corporations. The steel industry of this country has differed somewhat in its growth from that of other great products in that its greatest demand has come in cycles. In the period from 1870 to 1880 its development was marked by the introduction of the steel rail. The discovery of the Bessemer process cheapened cost and increased production, so that railroads were enabled to relay their lines with a better and cheaper rail, and the demands for steel in this form became a permanent product of the steel business, and although Bessemer has been superseded by the open hearth process largely for rails, between extensions, additions and the use of heavier sections we are now on a basis of consumption of 3,600,000 tons annually, which bids fair to increase.

From 1880 to 1890 there was the introduction of the skeleton structure, caused by the designing of lighter and more graceful shapes in steel than were the old iron sections, with an equal or greater factor of safety, and by the development of the tin plate industry. You will remember, doubtless, the famous campaign of 1890 when it was claimed it was impossible to produce tin plate in this country; but substantial progress had already been made, and in 1911 this industry represented a production of 783,960 gross tons. The sneers and jeers of the politician in belittling a great interest are forgotten, as are the men who uttered them, but the industry is one of our greatest and most prosperous today.

In the period from 1890 to 1897, marked as it was by the great financial panic of 1893, the industry languished, but in 1897 came the steel car, the use of plates for large diameters of pipe and the beginnings of larger things on the Great Lakes whereby the shipbuilding industry was bettered and entered upon larger development. This constantly growing demand, arising out of the rapidly increasing population, the beginning of the scarcity of wood, the introduction of steel in many lines and for new uses, was, if you please, an evolution beyond the power of any one to foresee or control, so far as its magnitude was concerned. Where we had been accustomed to deal in tons, our multiple became thousands. The railroads, with increasing demands upon them, by reason of this development, went at once to heavier rails and to the steel car for greater carrying capacity, necessitating heavier bridges, greater terminal facilities, and in other ways, such as steel splice bars, bolts, tie plates, etc., added to the demand.

Words almost fail to depict the wonderful

SWIMMING POOL FOR EMPLOYEES.  
Frick Coke Company, Lelssening, Minn.

growth of the steel industry in this period. It is not the purpose of this address to describe it more than is necessary to show that by reason of this great and sudden growth and the efforts to meet the demand the problems of construction and production had to receive attention before those arising from the humanitarian consideration, though this was by no means lost sight of. But it was as if the genii of the bottle had been let loose, though instead of being an instrument of destruction to mankind he became a benevolent agent of civilization.

#### *The Steel Combine*

For a moment the manufacturers stood aghast at what they saw before them. Individual plants such as then existed, even the great Carnegie Steel Company, were not equipped with the proper facilities for the handling of this great demand. New plants, larger and better equipped, were needed. Greater capital, more efficient organization in both operating and selling were called for. These could not be obtained by the individual plant, and so the process of combination was resorted to, to obtain the best of each in every line and out of the demand of the people themselves for a larger production of the article which has done more to advance civilization and progress than any other one inanimate thing, came the Steel Corporation. Regardless of what has been said by way of criticism of organization, methods or treatment of its employees, I maintain, and the results will ultimately show that it was builded better even than its organizers knew, that it has exercised at

all times a beneficent influence in the trade; it has been courteous and conciliatory to its competitors, considerate beyond measure to its customers, and is now engaging in the great work of promoting the welfare of its employees as no other organization has ever done before.

Not the least of the means employed by the corporation to enlarge its business has been the treatment of the small consumer. Recognizing that in this wonderful age of progress and rapid growth a small purchaser may soon develop into a larger, and therefore more profitable one, special attention has been given to the welfare of such buyers. Their interests have at all times been carefully considered, their rights have been conserved equally with those of their larger brothers, and equal attention has been paid to their needs and requirements. No paternalism, either in this relation or in that pertaining to the welfare of the employe, has been exercised by the corporation, but rather a wholesome regard for the rights and privileges of the buyer and the individual.

Now the early years of the corporation under the stress of the tremendous demand upon its resources of production were years of construction, consolidation and organization. None of these things are yet completed, nor can they ever be, apparently, with the constantly growing demands of the country and the world for its many and varied products. Today the United States is producing at the rate of 30,000,000 tons annually, and in five years this enormous tonnage bids fair to reach 40,000,000. Under the conditions of manufacture with such press-

LOCKERS, BASINS AND LUNCH TABLES  
Carnegie Steel Company, Clairton, Pa.

ing demands, it is admitted that the strain on labor is great. A steel mill under the best possible conditions is not a parlor, nor are the men who work there parlor gentlemen. They are strong, sturdy, intelligent workmen, who are recognizing that which is being done for them, and are accepting in the same broad, generous spirit with which it is offered. They are giants in their toil, but the best of American citizens in their relation to home, the community and the state.

That we shall ever produce ideal conditions is perhaps doubtful, but no more are those prevailing in the cab of the locomotive or the engine room of the great ship. Whose voice is raised in behalf of the firemen in the engine room of the great liners? And yet the steel worker's labor is easy compared to theirs. Our men know that the officials of the corporation are thinking and planning in their interest, and appreciate it. If there are any complaints theirs is the voice to speak, not the muckraker and the would-be philanthropist, many of whom have never been inside a steel mill.

#### *Phases of Betterment work*

So much then by way of introduction. Let us now turn to the measures either already adopted or under consideration, which the great corporation has instituted or is about to put into effect for the benefit of its people.

The Steel Corporation is spending each year for the betterment of its workmen not less than \$5,000,000. It may challenge comparison in amount and method with any other corporation in any other line of business. I should like to go into detail with you as to how this vast sum is expended, but time will permit only the briefest statement, yet for any of you who may

be interested in any particular item fuller details can be forwarded on application.

First in order of time comes the employes' stock subscription plan. The corporation has made it possible for every employe to become an owner of its stock. Over 30,000 of the workmen are now so interested. It promotes thrift by saving in a small way what would otherwise be expended thoughtlessly and so lost. For five years a high return is made by the payment of a bonus and afterward a large interest on such a small investment. They are induced to take a direct interest in the business, remembering their own is tied up with it, and they are further encouraged to remain with the company, profiting by permanent employment, the corporation

benefitting by the maintenance of a faithful, skillful and efficient organization so produced.

#### *Accident Relief*

Even before there was any law in this country which required anything of the kind the Steel Corporation established a system of voluntary accident relief absolutely regardless of legal liability. Every man injured and the family of every man killed is taken care of without need of lawsuits or even of any claim against the constituent companies. To show how this plan is working, in the year 1911 we were sued in only 2/10 of 1 per cent of the cases. This provision costs the corporation each year \$2,000,000.

The adoption of workmen's compensation laws in place of the outworn system of liability based upon negligence is one of the greatest advances in the welfare work of our generation.

#### *Accident Prevention*

For over six years the corporation has been developing a system of preventing accidents which it is confidently believed is not surpassed anywhere in the United States or abroad. This system comprehends all manner of safety devices and other material safeguards. Above all it is based upon the development of an earnest, constant and determined effort to prevent work accident, from the president to the lowest workman. The watchword of this campaign among superintendents, foremen and workmen is "safety first."

In these six years the number of serious and fatal accidents among workmen employed by the corporation has been reduced 43 per cent; and the means employed have cost to date about \$2,500,000; \$750,000 per year is now employed

in the maintenance of these devices, and in the study of a larger prevention.

### *Surgical and Hospital Arrangements*

At all the mills, mines and plants of the corporation provision is made for the best surgical and hospital treatment obtainable for employes injured at work. In the mining regions those arrangements include medical attention for the men and for their families as well. From time to time prominent physicians and surgeons not connected with the companies are employed to make inspections of hospitals and surgical arrangements with instructions to criticise with absolute freedom and to recommend any changes they may deem advisable.

### *Pensions*

At the institution of the corporation, Andrew Carnegie donated \$4,000,000 as a pension fund for the employes of the old Carnegie Steel Company and its subsidiaries. The corporation is now adding \$8,000,000 to this fund, which has been extended to all companies of the corporation. The income of this fund is applied to the pension of superannuated employes who have remained twenty years in the service of the corporation. The smallest pension given is \$12 per month and the largest \$100. The annual cost of provision for this permanent fund and the payment of pensions is upwards of \$700,000.

### *Sanitation and General Welfare*

It would be difficult to cover under this head all the work which is being done in the direction of the general welfare of the employes of the corporation. The same general system is applied as in the matter of the use of safety devices, and naturally it is necessary to obtain the interest and co-operation of the workmen themselves. Although this work is only in process of organization and development its cost in the year 1911 amounted to \$1,250,000.

Among the objects is the sanitary disposal of sewage and fecal matter, provision for pure water in all plants and houses belonging to the companies, drainage of stagnant water, prevention of flies, cutting weeds, collecting garbage, fencing and painting and enforcing cleanliness and order generally.

Food supplies, particularly milk and meat, are protected from contamination wherever the several companies have any responsibility for providing such supplies. The installation of wash-rooms, shower-baths and lockers in the mills, and the institution of swimming-pools have cost much money.

A PRIZE GARDEN  
Frick Coke Company, Dearth, Pa.

Some of the companies have provided playgrounds for the children in the crowded districts. Another has provided land, furnished seeds and given prizes for the making of gardens by its workmen. All the companies are donors to hospitals, churches, clubs, libraries and other organizations established by the communities in which there are plants or by the workmen themselves.

The managers of plants are thoroughly interested in the development of this welfare system and are giving much time, thought and attention to work which will benefit the community at large, and thereby the individual workman.

### *Instruction for Employes*

In addition some of the companies have established schools for the better instruction of their salesmen, in which the young men are given a thorough knowledge of the operations employed in the manufacture of steel from the selection of the ore to the processes of inspection and testing of the finished material. One company is now carrying this system of instruction into its plants for the purpose of developing intelligent young men for assistant superintendents and foremen. In most plants the rule heretofore has been if a young man sought employment to put him anywhere there was need without regard to the fitness or taste of the employe for the particular work. Now he is watched, his particular bent is studied, and he is put to work where he can do the most good for his company under conditions which are congenial to the employe himself. In other words, there is no longer an attempt to do the impossible—fitting square pegs into round holes.

BURLAP SHIELD FOR BENCH CHIPPING  
National Tube Co.

One of the most difficult of all methods employed to promote the welfare of employes was the establishment of the six-day week. Around a blast furnace where operation is continuous this was a specially hard matter. Yet the officials of the corporation felt that once the great campaign was entered upon, no half measures should be employed and in the spirit of "six days shalt thou labor and do all thy work," this provision was extended to all plants alike. Except under conditions of extreme necessity as

in breakdowns or absolutely needed repairs, every employe is required to rest one day in seven, and hours of labor are so arranged that this has become a perfectly practical measure although it entailed a large curtailment of production, and met with opposition from many of the men themselves who preferred to labor to obtain the additional compensation. But the rule was made to apply to all.

Naturally all these things have taken time, and will take more time. Criticism is welcomed so long as it is along the lines of progress, but criticism merely for the purpose of injury without help in constructive work benefits no one.

As has been shown the development of this great industry has been so rapid that little opportunity has been given until within a comparatively few years to look at this side of the work. In the great upward movement of humanity, for better treatment, for better living, and for all the conditions which tend to a wider humanitarianism and broader civilization and a greater degree of progress the Steel Corporation has not been and will not be found lacking in interest and in support of such movements to the extent of its ability, and much greater progress can be expected in the future under the wise and humane supervision of the men who control its destinies.

## "THE CHILD THAT TOILETH NOT"

WILLIAM LEAVITT STODDARD

WASHINGTON CORRESPONDENT OF THE SURVEY

The Child That Toileth Not is the title of a book by Thomas Robinson Dawley, Jr., published late in 1912. It is the story of the writer's experience in looking into the conditions of labor in the southern cotton mills as a special investigator for the federal Bureau of Labor. This investigation was to be a part of the report on the condition of women and child wage-earners in the United States. Major Dawley's volume is dedicated in these words:

"To the Congress of the United States of America who by an appropriation of three hundred thousand dollars for the investigation of the conditions under which women and children are employed throughout the country, and in particular to those legislators who believe the economic laws of the universe can be upset and the people forming our great Republic made healthy, well and wise by legislation."

The author of this book, according to the 1910-1911 edition of Who's Who in America, was born in New York in 1862 and has had a varied career as printer, teacher, war correspondent, voluntary aide on the staff of General Miles in Cuba, newspaper editor, special agent making a report to the President on the political and sociological conditions in Santo Domingo, and later special agent of the Bureau of Labor. He has contributed many articles on Latin-American countries and Spain to magazines and Apple-

ton's Encyclopedia. His address is given as Washington, D. C.

Summarized, the principal points made by Mr. Dawley in his book appear to be these:

That the condition of the workers in the southern cotton mills is better than the condition of the people who work farms in the mountains, and who in many cases are brought down to the mill centers by the manufacturers.

That "hired reformers, investigators, and muck-rakers" have grossly exaggerated, if not actually misrepresented, the conditions of labor in the southern cotton mills.

That the National Child Labor Committee and the United States Bureau of Labor are guilty along with these reformers. Against the United States Bureau of Labor Mr. Dawley brings the specific charge that "the results of two years' work, paid for by the people, were suppressed."

It is not possible within the limits of this article to go into all the detailed miscellaneous charges which are brought by Mr. Dawley against both individuals and organizations. The book is full of accusations such as the following: Mr. Dawley quotes Dr. McKelway, secretary for the southern states of the National Child Labor Committee, as saying that 1,500 people had gone from one little village of Clyde to the cotton mills of South Carolina, and he then points out that the entire population of Clyde before the exodus was only 244! But Mr. Dawley fails to

<sup>1</sup>The Child That Toileth Not. By Thomas R. Dawley, Jr. Gracia Publishing Co. New York. Price \$2.00 postpaid.

include Dr. McKelway's statement that Clyde is the railroad station from which the farm people in the country around the village had gone to the mills. Charges like this, based on a half-statement or a perverted emphasis of the material published by the National Child Labor Committee look like a deliberate attempt to prejudice the reader and certainly obscure the truth. To the present writer it is evident that the fundamental *raison d'être* of Mr. Dawley's book is that he failed in a measure to understand the kind of work required of him by the Bureau of Labor, that he set about his task not only with a wrong method, but in a wrong spirit, and that, beginning thus his task, he could hardly fail to have crowned it as he has done with a biased and unjustly personal attack. I believe that Mr. Dawley convicts himself of these things out of his own mouth. Let us see.

In the first place, Mr. Dawley objects to the kind of information which he was required to collect. "These schedule blanks," he says, speaking of the blanks supplied to him by the Bureau of Labor, "seemed to me to be poorly adapted for the work in which I was engaged . . . and the same was true with the family schedules. They merely provided for showing the earnings of the individual members, with their supplementary incomes from a cow or a vegetable garden, if they had any, with some of the conditions under which they were living, but no provision was made to show whether their standard of living was inferior to what they had been accustomed to, whether any inadequacy was due to insufficient wages, or whether the fact of their dependency on the mill for support tended toward progress or retrogression."

These statements are made on page 50 of Mr. Dawley's book. They are here quoted because they indicate that the tendency of Mr. Dawley in his work was to turn from the study of cotton mills as such and of mountain whites as such to a study which should compare the respective conditions of each. Now, a study of this kind, properly made, would be of great social value, and the fact that the Bureau of Labor sent Mr. Dawley into the hilly regions shows that it was the purpose to investigate in this direction. The fault that the present writer finds is that the importance placed by Mr. Dawley upon this comparison leads him to an extravagant conclusion. Let us look at the way he arrived at it.

Briefly stated, his first conclusion is that the families which moved into cotton mill civilization from the semi-civilization of the mountains are much better off than they were before their change of base. From this observation he draws the further and logical conclusion that cotton mills have been a benefit to the race; and the still further and illogical conclusion that child labor in them is itself the most wholesome preparation for life.

"If I were a Carnegie," he writes, "or a Rockefeller seeking to improve the conditions of our poor mountain people, I would build them a cotton mill. I would gather their children in just as soon as they are big enough to doff and spin, and instead of feeding them on homilies and

panegyrics, I would pay them a stipend that would get them more than 'bread and meat.' I would teach them with real money what real money brings, and while my cotton mill might not pay dividends in dollars and cents, it would at least turn out workers capable of making a living for themselves when grown."

From this quotation, as from many passages of similar import and from the dedication of his book, it will be seen that Mr. Dawley does not discuss the conditions under which women and children work in the cotton mills except incidentally or comparatively. Yet this was the prime subject for investigation; not whether those conditions were worse or better than something else, but were they good or bad for human beings? He assumes without sufficient proof that child labor is necessary to the existence of the cotton mill; and when he does treat of the cotton mill labor problem he makes such points as these:

(1) That there is welfare work in certain mill communities, and that therefore the cotton mill is a blessing to humanity.

(2) That child spinners are the exception, not the rule.

(3) That the children play about the aisles in the mills, but do little or no work.

(4) That the social workers interested in the problems of the child care nothing about the child.

Any one who is acquainted with the statistics can easily discount these charges. For example, the fact that some mills are doing welfare work does not answer the criticism that the cotton industry is one of the chief exploiters of child labor in the country. The number of cotton mill operatives, between the ages and ten and fifteen in the United States, according to the census of 1900, was 44,427, 28,023 of whom were in the southern states.

The only other single occupation in the census classification<sup>1</sup> that employed more than 27,000 children—the figures for the southern mills alone—was "messenger and office boys."

If child spinners are "exceptional," then it is odd that the census of 1900 reported about 5,000 girls of from ten to twelve years of age in the cotton mills, and the Federal Report on Woman and Child Wage-Earners (1907-08) showed that 75.8 per cent of the 4,585 girls under sixteen employed in the southern mills investigated were spinners or spoolers.

The answer to the objection that the children play about the aisles and do little work may be put in the form of a question: If this is true, why are cotton manufacturers almost always consistently opposed to laws which would compel the children to leave the mills and play elsewhere?

As for the criticism that the National Child Labor Committee cares nothing about the child and does not appreciate welfare work, it can be authoritatively stated that the National Child Labor Committee has repeatedly given credit,

<sup>1</sup>"Agriculture," "laborers" (not specified) and "servants and waiters," are the only general classifications larger than this figure.

for example, to certain cotton manufacturers for building private schools to educate children of mill villages, but it has always urged that this example of feudalism can not take the place of a system of public education.

These are only haphazard illustrations of the kind of controversy which Mr. Dawley's book has stirred up. In a letter to the editor of the *State*, a newspaper published in Columbia, S. C., written December 8, 1912, A. J. McKelway, secretary of the National Child Labor Committee for the southern states, has answered in detail many of these criticisms, and anyone who is desirous of digging into the debate further is referred to that issue. In conclusion Dr. McKelway says:

"The animus of Mr. Dawley's book is only too plain. The National Child Labor Committee and the state committees organized in co-operation with it are attempting to raise the standard of legislative protection for the children. In five southern states, South Carolina among them, it is lower than it is in the rest of the Union and in the civilized countries of Europe. The facts available for information to legislators are to be found almost exclusively in the reports of the agents of the National Child Labor Committee, with an abundance of photographic evidence, and in the reports of the agents of the Bureau of Labor, employed in this investigation, most of whom, by the way, so far as the investigation of the cotton mills is concerned, were southern men and women. If the agents and secretaries of the National Child Labor Committee can be discredited, and the agents of the Bureau of Labor likewise, there are no facts remaining of authority. . . .

"But, finally, what does the whole contention amount to? What has this matter to do with child labor? Suppose we grant that all which Mr. Dawley asserts about the miserable conditions of rural life in the mountains is true, does that condone child labor in the factories? Does it shorten the eleven-hour day for children and women? . . . The question is not was the cotton mill family worse off on the farm, or the immigrant family worse off in Europe, but rather, are the children of either as well off now as we have a right to demand that they should be?"

Mr. Dawley's charges against the Bureau of Labor are serious and are made in apparent good faith. He believes that the bureau is biased against the manufacturers, and goes so far as to say that the commissioner (Mr. Neill) "himself referred to certain business men as pirates and declared in my presence that one manufact-

Mr. Dawley, moreover, appears to have a personal animus against not only the commissioner of labor and several other prominent people, but against several of the employees of the bureau, whom he lists as "a German professional uplifter, a partially paralyzed doctor of philosophy, and a Russian doctor of something." His plain implication, from a page or two of entertaining description of the work in the Washington office, and the prompt manner in which everyone ran for the door when closing time arrived, is that these gentlemen were not worth their salt. It is therefore instructive to note that each of these three has since left the Bureau of Labor in order to accept elsewhere higher salaries than the bureau was able to pay them.

urer who had attempted to convince him that the employment of the poor children in the cotton mills of the South had proved beneficial to them, was a liar." Both of these statements may be absolutely true without any reflection upon Mr. Neill. Also, when Mr. Dawley says: "He instructed his agents at the mills to seek the very worst conditions," it is plain that those orders—supposing they were given—were nothing more than orders to get the facts, no matter whom they hurt. But when Mr. Dawley continues: "And every effort was made to gather data that would support the representations of those special interests whose very existence is dependent upon misrepresentations" he is merely interpreting the order according to his prejudices. And when he charges specifically that "the results of two years work, paid for by the people, were suppressed," it need not disturb the reader who has believed in the integrity of the Bureau of Labor that an unfortunate but established policy (true of all federal departments) prevents the bureau from making a categorical denial of charges brought against it by an individual. Anyone familiar with the work of such an investigation knows that in the course of it many facts are necessarily collected by individual agents which are not included in the final report. Some of these facts have served their purpose to those who wrote the report: some, of course, are valueless. In the case of Mr. Dawley, it would appear on his own confession that he collected much information which was not asked for, and, if we are to judge by his book, he gathered much information which, while interesting in itself, is very plainly not the kind of evidence which a competent statistician could admit to a statistical study; I refer to anecdotes, hearsay facts, unverified except by word of mouth, personal impressions, and the like. It is safe to say that every government investigator has collected, at one time or another, matter which has been rejected, and that to term such rejection "suppression" is unjust not only to the government, but often to the investigator. On this point Mr. McKelway says,

"Senator Overman [of North Carolina] made a speech in the Senate last winter, in which he denounced the Bureau of Labor for having sent its agent into the mountains to obtain these reports. He said: 'Some of these reports were so obscene and scandalous and outrageous that the Secretary of Commerce and Labor refused to print them. . . . Some of the reports were so obscene that it would be indictable to send them through the mails.' And so on, in even less parliamentary language, and Senator Overman has authorized me to say that he was referring to Mr. Dawley. So we have Mr. Dawley and his supporters complaining that his reports were suppressed, and Senator Overman complaining because the bureau ever hired Mr. Dawley at all."

In all fairness to Mr. Dawley, it must be said that his book is an interesting contribution to the literature of the social problems of the South. It

is thoroughly readable, and it bristles with "human interest" stories concerning the natives and their ways. One cannot, nevertheless, help having the feeling that scientific accuracy has been sacrificed for the sake of a good yarn.

The Gracia Publishing Company is the name under which Mr. Dawley prints and circulates his book. In its pages he states that upon being discharged from the Bureau of Labor he approached "the manufacturer whom the commissioner of labor had declared a liar." This manufacturer refused to give him financial assistance, fearing that the charge would be made that he, Dawley, was working in their interests for their pay. For addressing a southern cotton mill association Mr. Dawley states that he was not even paid traveling expenses, but he adds that he "should have willingly accepted such financial aid as the association might have seen fit to give me to place my story before the people."

His appeal to such backing lies in the underlying thesis of his book that the real business interests of the country are practically without representation because the government is the tool of hired reformers, investigators, and muck-rakers. In proving this thesis, he starts from an admittedly biased angle, intersperses his argument with general accusations, and in most cases, as a careful examination and checking up proves, does not squarely and definitely meet the statements he challenges. His contention that the children of the mills are better off than those of the mountains should prove a spur to such sani-

tary and other reforms in the South as the Rockefeller Hookworm Commission has shown to be possible in the rural districts; but it does not carry conviction that we should on that account tolerate mill conditions unless they are positively good any more than he would have us tolerate mountain conditions. There are indications of a growing and constructive public opinion in the South with respect to both. It is when he attempts to demonstrate that child labor is a positive good in itself that his argument drops through. In order to defend it, he reviews, in the words of one social worker, "all the arguments of a past age. Child labor teaches habits of industry. It is needed for the support of widowed mothers and orphans. It lays the surest foundations of a career. It furnishes the best possible education. One typical contradiction occurs in this connection. In one chapter the author would show that mill children are better off than children on the farms because they do not lead such a lazy listless life; in another, because the mill children do not have the heavy work to do that is required of children on the farms."

Personally, the writer welcomes Mr. Dawley's book as a healthy sign of the times: the arguments which he presents against child labor legislation are the stock arguments of the cotton manufacturers—he has added no new ammunition to an already powerfully armed interest. If this is the worst that can be done, then there is great hope for the future.

## INDUSTRIAL BOARD FOR NEW YORK

### LARGE SCALE RECONSTRUCTION OF THE LABOR DEPARTMENT RECOMMENDED BY THE FACTORY INVESTIGATING COMMISSION

Wednesday, February 19, will be a field day for labor legislation in New York state. At 12:30 in the Senate chamber at Albany a public hearing will be given on the thirty-two bills which have been drawn up by the Factory Investigating Commission to embody the recommendations growing out of their two years' inquiry. If they become law not only will many practical and long needed reforms be given legal sanction, but a new system of administering labor laws will be inaugurated.

The commission was appointed after the Asch Building fire two years ago, and five of the thirty-two bills deal with fire hazard. Six are concerned with administration, and the balance deal with problems of woman and child labor, safety and sanitation. One extends the child labor law to cover cannery sheds. The protection of the law is also extended to women in canneries which heretofore have been exempted from the nine-hour law. The protection however still falls short of that thrown over factory workers as the bill provides that in certain seasons of the year a maximum of twelve hours a day and sixty-six hours a week may be permitted. Night work of women in

factories is prohibited between 10 P. M. and 6 A. M., and the law requiring seats for female employees is given increased effectiveness. The law requiring the maintenance of safe conditions in factories is greatly improved, employment of children in dangerous trades is further prohibited and a restriction is placed upon the employment of women in the core rooms of foundries. Another bill not strictly a labor measure requires that containers of wood alcohol must be plainly marked as such.

Important as are some of these reforms, it is the series of bills reorganizing the Department of Labor which are of most far-reaching consequence, for upon that administrative body depends the effectiveness of every labor law.

The proposed changes are many and detailed. The inspection work would be consolidated into one bureau under an inspector general, and the state divided into two inspection districts—roughly, New York city and the balance of the state—with a chief inspector in each district. Nine subdistricts would have a supervising inspector in charge of each. The present law provides for "not more than" 125 inspectors; this phraseology is changed to read "not less than."

While the attention of the commission has been

directed most particularly at law enforcement an important reorganization is proposed also for the Bureau of Labor Statistics. Its title would become the Bureau of Statistics and Information and it would include five divisions, each of which would have its own chief:

General Labor Statistics.

Industrial Directory.

Industrial Accidents and Diseases,

Investigations,

Printing and Publication.

The changes would not only systematize the work of the bureau but give it additional powers.

Entirely aside from these provisions, the commission has made two signal proposals. They would provide a division of hygiene in the Bureau of Inspection. This division is to be made up of a physician who is to be chief medical inspector, a chemist, a mechanical engineer who is an expert in ventilation and accident prevention, and a civil engineer who is an expert in fire prevention and building construction. The bill calls, also, for three medical inspectors, one of whom must be a woman and all three of whom must be licensed physicians. One of the first four officials named is to be designated as director of the division and the chief medical inspector is to have charge of the three deputy medical inspectors. The engineers, chemist and chief medical inspector are to make special investigations with a view to improving factory conditions from the standpoint of construction, ventilation, sanitation and safety. They are to make recommendations which it is proposed will be adopted by the department as definite rules which will have the force of law. The three medical inspectors will be constantly employed in looking after the health conditions of factories with a view to learning what are the present industrial hazards coming within the field of hygiene, and what are the methods of eliminating those hazards.

The most marked departure from previous legislation is the provision for an Industrial Board of which the commissioner of labor is to be chairman and which is to consist of four members, each to serve for a term of four years, so arranged that the term of one member will expire each year. It is the expectation of the commission that one member of the board shall represent employers, another employes, a third to be a woman and the fourth a scientist. It is expected that the board will meet at least once a month and that it will direct the Division of Hygiene or other bureaus to make special investigations or will itself conduct independent investigations. It may employ experts for longer or shorter periods of time, and can take up and study every problem that presents itself in industrial life from that of friction between employer and employe to hours of labor and guarding of dangerous machinery.

But the feature of the powers of this board that is of constructive significance is not alone its power of investigation but its power of making rules and setting standards. In this provision, the commission would give the state of

New York an agency possibly as powerful as the Industrial Commission of Wisconsin, one certainly charged with responsibilities of equal grade. Problems that have heretofore been for the commissioner of labor alone to decide, and which have been too numerous and too important for any one man, would be passed upon by a body of five and while the commissioner of labor personally will be responsible for the carrying into effect of the rules and regulations agreed upon, he would have support that he does not now have in the knowledge that instead of a personal ruling, he would be carrying into effect the combined judgment of the board.

Particular groups of bills will be reviewed later in *THE SURVEY*. In general it can be noted at this time that they are on the whole not only acceptable to social workers but of a calibre that is stimulating to enthusiasm. There is a general feeling that the commission deserves commendation for the painstaking manner in which large branches of its work have been carried on, for the great publicity it has secured for the bills by its frequent public hearings, and for the fairness with which it has accepted criticism from all quarters.

Whether its working program proves effective or not, is passed or not—and as Democratic measures under a Democratic administration there is good chance that the bulk of them will be enacted—it stands out as the first large scale, constructive plan put forward to place the labor administration of the first industrial state of the Union on a basis commensurate with its vital importance to the people. Moreover the data collected by the commission's investigators is of lasting value. There is general recognition that as yet unestimated public service has been performed by these investigators, by the commission as a body and especially by its counsel Abram I. Elkus and his assistant Bernard L. Shientag.

## THE LABOR MARKET IN WISCONSIN

WILLIAM LEISERSON

Staff Wisconsin Industrial Commission

For the first time in the history of this country reports relating to the demand and supply of labor are now published by the state of Wisconsin. Strange that our newspapers should devote whole pages to market transactions in hogs, wheat, stocks and bonds, while the markets where labor is bought and sold, which affects us all so much more closely, should be so completely ignored! Now that a beginning has been made, however, we may hope that the time will soon come when no market page of a newspaper will be complete without reports of the transactions of the labor markets of the country.

The labor markets which the Wisconsin reports cover are the four free employment offices conducted by the Industrial Commission of that state. The offices are located in Milwaukee, Superior, Oshkosh and La Crosse, each covering a distinct section of the state. While the operations of these employment offices show

but a small part of the total labor bargains made in the state, they are as representative of all these bargains as are the transactions of a stock or produce exchange of the buying and selling of stocks and produce.

The idea of labor market reports is not a new one. Ohio, which created the first public employment offices in this country in 1890, as well as several other states which copied its law, has for a long time been printing weekly reports of the operations of their offices. Their methods of compiling statistics, however, are unscientific and unreliable, and little use has been made of the weekly bulletins, some states even abandoning them entirely.

A step forward was taken by the superintendent of the state employment office in Boston, when he began to issue to the press every month a bulletin describing the conditions of the labor market as viewed from the free employment office. But while the records kept at the Boston office are more reliable than those of most states they make no scientific classification of occupations and no distinction between casual and other employments, both of which are necessary for a true understanding of conditions in the labor market.

This is the work that has now been begun by the Wisconsin Free Employment Offices. Each office sends in a daily report of its business to the central office in Madison. The report blank contains a printed list of occupations grouped in industries following the United States Census classification of occupations, but adapted and boiled down to the needs of the offices in Wisconsin. Opposite each occupation are four columns for showing respectively the number of "applications for work," "help wanted," "referred to positions," and "positions secured." These daily reports are tabulated by the statistical force of the Industrial Commission of Wisconsin, and they show, besides the supply of labor and the demand and something of the character of each occupation, what industry it belongs to, whether it is skilled, semi-skilled or unskilled and whether it is permanent or temporary. From the location of the offices the conditions in different sections of the state can also be told.

#### EFFICIENCY SOCIETY MEETING

Organization, management, hygiene and industrial relations were the things taken up by the Efficiency Society at its recent annual meeting in New York.

At the session devoted to the subject of organization, Harrington Emerson took up the subject with special reference to personnel. Dr. Katherine Blackford followed with a paper on Scientific Selection and Assignment of Men in the Creation of an Organization, and John Calder spoke on Divisional and Departmental Organization. The very titles of these papers suggest what the experts mean when they speak of a "new science of organization."

The discussion of management began with a paper by William Lodge of the Lodge & Shipley Machine Company, Cincinnati, outlining the

duties of each man in a typical manufacturing organization, from the general manager down to the yard laborer and the night gateman.

With lantern slides and moving pictures J. G. Aldrich showed the latest methods of micro-motion studies for analyzing operations in order to get rid of useless motions.

Mrs. Harriet F. Andrew, who owns and manages an anvil works at Trenton, N. J., gave her experiences in handling draftsmen, pattern-makers, cupola men, moulders, and machinists to the number of sixty. She took charge of the works fourteen years ago on the death of her husband, and was proud to have maintained the factory's record which began under her husband's father. Under her management the plant has never shut down except for funerals or holidays and has never passed a pay roll. Men have been in the employ of the anvil works sixty-five years. Sons have followed fathers in the service.

Two other women gave their experience in industrial management: Mrs. J. Russell Selfridge, widow of Admiral Selfridge, who has run a model laundry in Bedford, N. Y., and Mrs. Nelson H. Henry, the organizer and manager of the Women's Industrial Exhibition, now an annual affair at the Grand Central Palace.

One session was devoted to a symposium on industrial relations, Samuel McCune Lindsay presiding.

Out of the experience of the Consumers League, Mrs. Frederick Nathan declared that the greatest obstacles to efficiency in business and in factory life are long hours and low wages. Jane Seymour Klink, welfare worker in the Pilgrim Steam Laundry of Brooklyn, spoke on conditions in that industry. F. S. Tomlin, secretary of the Central Federated Union of Brooklyn, declared that as a union official, he had sometimes had much greater difficulty with members of his union than he had with the employers. That lack of proper co-operation between employer and employee is a great bar to efficiency was a point brought out by H. C. Hunter of the National Metal Trades Association. He declared, however, that collective bargaining had proved a lamentable failure in his trade, and hoped that the Industrial Relations Commission would investigate this field.

Industrial Hygiene was the topic at the closing session, with Dr. Winthrop Talbot of Cleveland, in the chair. The program opened with a description of the medical service of the Norton Company of Worcester, Mass., by Dr. S. Irving Clark, followed by a discussion of industrial diseases and their prevention by Frederick L. Hoffman of the Prudential Life Insurance Company. Prof. Charles L. Parsons of the United States Bureau of Mines, read a paper on the work of its division of mineral technology, looking to the prevention of disease. Dr. George M. Price, medical inspector of the New York Factory Investigating Commission, discussed industrial inefficiency.

That not all of the burden for the improvement of hygienic conditions among employees should be put upon the employer, was insisted by Dr. Graham Rogers, medical inspector of the New York State Department of Labor. He

pointed out that unhygienic conditions in the home might have as much to do with the ill-health of a workman as any condition he might encounter in the factory, and he urged that the state should authorize the factory medical inspector to inspect houses and tenements where working people live. Dr. William J. Manning, medical officer of the Government Printing Office, described the methods that have been worked out there for the elimination of contagious diseases. Dr. C. E. A. Winslow of New York, pointed out that the seemingly insignificant things are often of greater consequence than more spectacular defects. For example, he declared that more damage is done by overheated factories than by acute poisons. Dr. Thomas Darlington gave an illustrated lecture on welfare work under the American Iron and Steel Institute. The feature of this meeting was the resolution introduced by Dr. Talbot urging the medical schools to introduce courses in industrial hygiene, an account of which was given in *THE SURVEY* of February 8.

### THE CIVIC FEDERATION MEETING

The National Civic Federation gathered in New York recently for its thirteenth annual meeting. The number proved unlucky for the Socialist Party and the Industrial Workers of the World, whom President Seth Low in his annual report criticised severely. He characterized their efforts as destructive in contradistinction to the American Federation of Labor which, he declared, was a constructive and reasonable labor body designed to improve the condition of the workers without destroying industry. He urged employers to recognize the conservative force of this body and the wisdom of dealing with it in order to check what he considered the undesirable and revolutionary policies of the Socialists and industrialists.

One day's sessions were given up to arbitration. Marcus M. Marks pointed out defects in the Erdmann Act and urged that it be strengthened and enlarged in its scope. He called attention to the fact that under that law the mediators are two public officials whose principal duties are along other lines. While he recognized that signal success has attended the efforts of Commissioner Neill and Judge Knapp of the commerce court, he pointed out that the system is weak when it depends in its entirety upon the ability of two men to put aside their other work and enter into a strike problem when it may arise. These two men, he went on, who have gained experience in the work and are able so admirably to discharge their duties will at some time necessarily have to lay down these duties and no one else is gaining the experience or knowledge of the work necessary to fit them to fill the places. He urged that the time is now ripe for a special government bureau of arbitration and mediation which shall have more than two members. He urged also that the scope of the act be so broadened as to include all employees who have anything to do with interstate commerce instead of train men alone.

A feature of the discussion of this topic was an address by Samuel Gompers, in which he declared that organized labor would never consent to compulsory arbitration such as was recently proposed by the arbitrators in the railway engineers' case. He characteristically attacked "dilettantes who go on sociological mental slumming expeditions."

In the afternoon, William J. Schieffelin described the protocol in the New York garment trades. The minimum wage was attacked spiritedly by Edward F. McSweeney, member of the Industrial Accident Board of Massachusetts, who repeated the charge he made before the economists at Boston that the minimum wage is a pagan proposal. No other than Prof. John A. Ryan of St. Paul's Seminary turned up at the meeting and put in a rebuttal. There are intellectual grounds on which a person can consistently oppose the minimum wage, he said. Perhaps there are pagans who believe in it. He had not met them. But this talk that it is anti-Christian, state socialism and the like is, said Father Ryan, in effect, all buncomb.

### JOINTINGS

#### MEDALS FOR SAVING LIVES

Four gold medals for saving lives were awarded on January 23 at the United Engineering Societies Building, New York city, by the American Museum of Safety.

The *Scientific American* medal for the most efficient safety device exhibited in the museum and invented within the last three years was awarded to the Draeger Oxygen Apparatus Company for the invention of the Pulmotor which has been used so effectively for the resuscitation of victims of electric shock.

The Travelers' Insurance Medal was awarded to the New York Edison Company. This medal is given annually to the company which in the opinion of the Museum of Safety has done the most in the way of protective devices and methods of operation to safeguard their employees.

The Louis Livingston Seaman medal, awarded this year to the National Cash Register Company, is in recognition of efforts along the lines of sanitation and hygiene and the lessening of industrial disease.

Thomas A. Edison received the Rathenau medal which was awarded for the first time in America. This medal was placed at the disposal of the Museum of Safety by the Allgemeine Electricitaets Gesellschaft of Berlin, and is to be awarded each year in recognition of the best invention calculated to promote safety among electrical workers. This award to Mr. Edison was in recognition "of his application of his storage battery in new forms with special adjuncts in relation to safety in mines, tunnels, work under way in factories where explosives are made, powder magazines and where explosive magazines are generated or in use. General application of the storage battery in this field has reduced the hazard to workers fully 100 per cent."

## SOCIAL AGENCIES

### THE MOTHERS' COMPENSATION LAW OF COLORADO

BEN B. LINDSEY  
JUDGE OF THE JUVENILE COURT, DENVER

*[Judge Lindsey is an active champion of the mothers' pension idea, and in this paper he interprets the Colorado plan which he sponsored, and which was passed last fall by a referendum to the people. The new law covers various other matters with respect to dependent children, and is the subject of vigorous controversy.—Ed.]*

An amendment to the dependent child statute, popularly known as the Mothers' Compensation Law,<sup>1</sup> was adopted by the people of Colorado at the November election. In making this amendment a number of needed additions were included, all relating to the same subject.

When children were committed to the state home for dependent children under the former Colorado law, there were no legal rights given or retained to parents for their reclamation. The statute (Sec. 574 General Laws 1908 Session Laws 1895) merely provided that "whenever one or both the parents of any ward of said board, who is not indentured, have become able to support the child and educate it, the child may by resolution adopted by said board be restored to its parents."

This amounted to nothing at all in many cases. If the parents did afterward become able to support the child, as the law contemplated they might, they often found the child indentured or adopted out. If not, the board claimed the right to refuse to return it.

Sometimes it operated as a great hardship. For example, children are often declared dependent and sent to the state home when the chief cause, directly or indirectly, may be poverty. At the hearing of such a case it might appear from the evidence in court that within a reasonable time the conditions making for poverty could be overcome. But the statute made no provision that would enable such parents to make such a showing at the hearing, or the court to make such a conditional order. The old law provided that a child committed to the State Home for Dependent and Neglected Children "should, as to its care and disposition, be subject to the law establishing said home." (Sec. 558, Gen. Laws 1908). This left the state home with the right to adopt out or indenture a child at any time after it was received from the court.

The first change made, then, through the Mother's Compensation Act was to provide that "any dependent child committed to the state home should, as to its care and disposition, be subject to any special order of the court making such commitment, provided such order be made at the time of such commitment." This at least softened the rather harsh law that formerly existed, and it seemed fair both to the parent of the child and to the state home. It enabled the parent to show poverty as a

cause at the hearing, and permitted the court, in a proper case, to make a special order at the time of such commitment, safeguarding the right of the parent to reclaim the child. The state home would thus know the status of the child from the beginning. It answered the other objection that in proper cases children might be indentured and adopted out by the home and then afterward interfered with through the whim or caprice of a judge or a court, who might change the order. Of course, there are other rules of law that safeguard against such a danger. And experience shows that it is in any event largely imaginary. The facts show that judges are not in the habit of resorting to such whims or caprices in these cases.

The law establishing the State Home for Dependents specifically provides that children shall be placed in family homes. It was thus intended primarily as a mere clearing house or state detention home until the children could be placed in family homes. The amendment therefore giving the real and natural home a reasonable chance in the proper and exceptional case to reclaim the child not only does not alter but strengthens the purpose and good effects of the act.

The next provision of the law concerns what is more generally known as "mothers' pensions," "funds for parents," or, as we in Colorado prefer to call it, "mothers' compensation." It provides as follows:

"If the parent or parents of such dependent or neglected child are poor and unable to properly care for such child, but otherwise are proper guardians, and it is for the welfare of such child to remain at home, the court may enter an order finding such facts and fixing the amount of money necessary to enable the parent or parents to properly care for such child, and thereupon it shall be the duty of the Board of County Commissioners . . . to pay such parent or parents, or, if it seems for the best interest of the child, to some other person designated by the court for that purpose, at such times as said order may designate, the amount so specified, or when so ordered by the court, its equivalent in supplies and assistance, for the care of such dependent or neglected child until the further order of the court."

This provision is substantially the same as that of the Illinois act, with two changes: (1) The provision that permits the court to pay the sum to some other person for the parent; (2) or the equivalent in supplies or assistance. The

<sup>1</sup>The vote for the amendment was: for 82,337; against 37,870; majority for 44,467.

rather inelastic provision of the Illinois law in this regard seemed to us to be less adapted to its practical administration.

It does not permit such sum to be paid to keep the child in any other home. That is to say *the judge or the court cannot board children out in other family homes out of this fund.* The pension or compensation can only be paid to the parent direct, *or to some other person for the parent,* to permit the parent (not some other person) *to keep the child in its own home—the parent's home.*

The Illinois law provided for payment of a lump sum of cash to the parent in every case. But suppose the trouble with the home is, for example, periodic intemperance, or some other cause that the evidence may show may be corrected, but which for the time being would make it unsafe to pay a lump cash sum? Surely, this elastic provision is helpful as permitting the Board of County Commissioners (or if in Denver the Board of Charities and Corrections) to provide the home with rent, groceries, clothing or supplies in a sum equivalent to the cash until it is safe to pay the cash.

The objection that the judge is given some discretion after hearing the evidence, as to whether or not it is a proper case, and from the evidence determining what is necessary to help the home, etc., is hardly a fair objection. For nearly twenty years, under the same act, no child could be sent to the State Home for Dependents except upon the discretion of a court. The judge's order compelled the state home to receive the child and compelled the state, through its agent, the state home, to spend a per capita cost of \$15 to \$20 per month to care for the child—not in its own home, but in an institution or state home until it was placed in a private home. The power had to be lodged somewhere. In every state, so far as I know, it has been lodged in a court. In Colorado, out of thousands of cases, I have never heard of one where any abuse of this power was charged. It has certainly never been charged in Denver. Yet, under this new law, giving a new alternative for the first time in this state, the power is now for the first time divided with the Board of County Commissioners. Yet it has met with objection. Not because of the division of power, but because those who have read the law appear not to have understood that it was divided. They are assuming that it was left, as it has always been, entirely with the judge—as in Illinois for example. But in Colorado the judge may be powerless to use the new alternative. He can do nothing toward ordering money to care for the child in its own home unless an estimate is first made of the annual sum that is necessary to do the work and unless the county commissioners make the appropriation.

The law next provides: "The juvenile court in counties of over 100,000 population, and the county court in all other counties, shall appoint proper persons for the purpose of investigation, visitation, the keeping of records and the making of reports in cases requiring relief under this act."

Then follows a provision limiting the numbers of such investigators and salaries paid to

those of probation officers in such juvenile and county courts. This means, under our Colorado laws, that the city of Denver, with 225,000 people, cannot have over three such investigators; in cities and counties of over 25,000 not over two, and that their salaries cannot exceed \$100 per month. No extra help for this purpose can be had by the court unless it is first approved and allowed by the county commissioners. It thus fixes a limit. In Denver and in the large outside counties of the state not to exceed one such investigator will be employed. In some jurisdictions, as in Denver, the assistance of other agencies will be such that the employment of a special investigator, permitted by the law, may be entirely dispensed with. None has been appointed in Denver. The Board of Charities and Corrections does the investigating and, as provided by the law, pays out the money. The court merely orders it—if the commissioners have allowed anything to pay. Under the old law, county commissioners are not limited in authority as to the number of charity and relief investigators they may employ or salary paid.

The next provision is intended to give publicity to the actual work done and money paid out—not to the names or identity of the individuals receiving relief. Juvenile and county courts are required on or before the first day of July of each year to submit to the Board of County Commissioners a report of all cases receiving relief under the act, "and an estimate of the sum necessary to be placed at its disposal for complying with the provisions of this act. A copy of such report shall be filed with the State Board of Charities and Corrections."

The courts enforcing the law are given the usual powers that courts have in mandamus proceedings against ministerial officers by the right to proceed as for contempt of court against officials who "wilfully refuse to comply with its orders directing their compliance with the provisions hereof; *provided, the sums paid out under this act shall not exceed in any year the amount appropriated for such purpose by the county, city and county, or state authorities respectively.*"

Judge Pinckney of the Juvenile Court of Chicago in speaking of the unlimited power given to judges under the Illinois Mothers' Pension Law said: "The law is unparalleled because, on an order of the Juvenile Court, a million dollars could be ordered paid to families in this community within the next year, and nobody could stop the courts from doing it if the parents made application." As shown, this is not true of the Colorado law.

The laws concerning dependent and neglected children in Colorado have shown scant respect for the religion of the parents. There are no mandatory provisions in this regard. But the new act compensates the parents with the consolation at least that consideration must be had for their religion if their children go into foster homes. Here is the proviso: "Petitions and commitments under this act shall state the religious belief of parents, if known, and if not

known the court shall endeavor to ascertain such fact, and family homes to which children are committed shall, as far as practicable, conform to such religious belief."

The next provisions of the law concern the boarding out of children in family homes. Our present law since 1895 has provided (Sec. 573, Laws 1908) "that it shall be the duty of the board to use special diligence in placing the children admitted to such home in suitable family homes," etc. But there was no provision of our law permitting the state through the home to pay families to take the children in family homes. The new law adds a provision permitting this to be done. The only legal alternative the state home formerly had was to keep the child in the institution or permit its indenture or adoption. The result was that there were on an average of from 200 to 250 dependent children constantly in the state institution.

The provisions of the new act merely give this new alternative to the State Home for Dependent Children. In any number of cases, however limited, if they believe it is possible and "for the best interests of the child," they may board such children in a family home. They are not compelled to do it. If the State Home refuses to avail itself of this new privilege there will never be any occasion for any appropriation from the legislature that the law provides shall be made for such purpose.

The final provision of the act concerns the employment of men convicted for non-support of women and children. The act provides that in counties of over 20,000 population the authorities "shall establish and maintain workhouses or proper facilities for the detention and employment of men convicted of non-support of women and children. Any sums of money earned by them or collected for their labor by the authorities in charge of such workhouses or facilities shall be used for the maintenance of the fund necessary to be expended by the county or city and county in carrying out the provisions of this act." In Colorado, where wife and child desertion is growing with alarming rapidly, the deserters are generally sent to a very comfortable county jail, where they are fed up, and the wife and children starve outside. The detail as to the payment of the earnings for the support of the cases mentioned in the act was intended to put a premium on motherhood—in favor of the woman who bears children. But it is a small detail that can be changed if necessary after the law has had a chance.

It is experience that points out any necessary changes that ought to be made and no doubt will be made.

The opposition to the law in Denver was so bitter that it has not yet subsided.

The reactionary and corporation daily papers in Denver were crowded with anonymous articles bitterly attacking it. The principal objections were that it would bankrupt the county; that it would encourage an influx of pauper parents into the state; that it gave the judges of the courts too much authority over county funds; that it would cost Denver \$100,000 to build an expensive workhouse; that the children

were to be "farmed out" and horribly maltreated; that it did not refer to mothers at all, but to parents. The answers to these objections were that they were largely imaginary; that the law was safeguarded by so much detail that it could not be abused; that it was contrary to the experience in Illinois, where the law was perhaps open to many more of these objections, but where, even without any such safeguards as surround the Colorado law, the scare about the influx of paupers had proved groundless. That under the Colorado law no judge would have to consider paupers if they did flock to the state; that such charges need alarm no one.

Neither the Illinois law nor the Colorado law employs the word "mothers" except as it is included in the word "parents." The term is necessarily employed for many reasons; one was to avoid attacks against the constitutionality of the law, as class legislation, or the mere dispensation of charity and the use of public funds for private purposes in aiding a privileged class. Since fathers are subject to imprisonment for refusing to support their children, and since judges are at least assumed to have some good sense and discretion, and can do little without the consent of the county commissioners, it followed in actual practice under the law that where the word "parents" is employed that only mothers get the pension or compensation, and that the very exceptional case to the contrary must be a very proper case. That the law did not make it mandatory to establish expensive workhouses, but was designed to avoid encouraging wife and child desertion by making it mandatory on the authorities to at least maintain "proper facilities for their employment."

The final provision of the act is, to my mind, one of its best: "This act shall be liberally construed for the protection of the child, the home and the state, and in the interest of public morals, and for the prevention of poverty and crime." It is a recognition by the state that the aid is rendered, not as a charity, but as a right—as justice due mothers whose work in rearing their children is a work for the state as much as that of the soldier who is paid by the state for his services on the battlefield; it is a recognition for the first time by society that the state is responsible in a measure for the plight of the mother, and acknowledges its responsibility by sharing the burden of her poverty that is created largely by the conditions that the state permits to exist.

Acknowledging its part in misfortune, for the first time in history by law society through this act literally "bears one another's burdens," quits "the devourers of widows' houses," and "lifts one little finger" in behalf of justice. It will prove at least a good entering wedge for those social and industrial insurance laws that must come in time as the public is educated to their necessity. The amount allowed by the county commissioners for the next year for the operation of the law in Denver is \$4,800. It must be (under the law) paid out by the City Board of Charities and Corrections to such cases as the court orders; provided, the total amount for all cases cannot exceed this appropriation.

## BENEVOLENT INSTITUTIONS OF THE UNITED STATES

A special report on benevolent institutions in continental United States is in course of preparation by the Bureau of the Census, in connection with the thirteenth census. Preliminary figures, showing the number of institutions reported, together with certain data relating to inmates of these institutions have just been issued by order of Director E. Dana Durand. These figures are subject to revision, but are given out as substantially correct.

The total number of institutions reported is 5,397. In these institutions, or under their care, there were at the close of the year 380,337 persons. As compared with the previous report, that for 1904, the number of institutions reported shows an increase of 1,346 (day nurseries, of which 166 were reported in 1904, were not included in 1910); inmates of institutions at close of year, an increase of 95,975; children received into institutions during the year, an increase of 11,186; patients treated in hospitals, an increase of 911,326; and in dispensaries, of 827,408. There was a decrease of 109,319 in the number of persons received into institutions for adults or adults and children, and of 4,471 in the number received into institutions for the blind and deaf. The Census Bureau's comment is:

"Whether the increase indicates greater need, or greater care and more complete provision is a question which must await a more careful study of the situation; as also the question as to

the decrease. Two items are of special interest: the collection for the first time of data in regard to the placing-out of children in families, and the notably increased interest manifested in the treatment of tuberculosis, which accounts to a very considerable degree for the increase in the number of dispensaries and to some degree of hospitals and sanatoriums. Thus the net number of dispensaries added to the list is 420, and of these nearly 200 are county dispensaries established in the state of Pennsylvania by the Department of Health for the treatment of tuberculosis. The decrease of 109,319 in the number of persons received into institutions for the care of adults or adults and children is chiefly confined to institutions for the temporary care of men who are destitute.

"Noting the distribution of institutions in the states, it appears that New York leads with 797, an increase of 200 over the figures in 1904; Pennsylvania has 692, an increase of 301; Massachusetts, 359, an increase of 104; Illinois, 324, an increase of 39; Ohio, 311, an increase of 52; and New Jersey, 207, an increase of 58. Almost all the states show an increase (generally in about the same proportion), which would indicate that the interest in public provision for those who are regarded as "wards of the state," is by no means limited to the centers of population, but is growing throughout the entire country."

### JOTTINGS

#### HOUSING REFORM IN CINCINNATI

As a result of the Darkest Cincinnati campaign of the Civic Anti-Tuberculosis League, steps have been taken to establish as a distinct branch of the city government a tenement house department, with full power to inspect and enforce adequate housing regulations. Darkest Cincinnati is a motion picture showing bad housing conditions in that city. One result of the campaign is the discovery that a large percentage of the tumble-down and unsanitary tenements are owned by a single man.

Another result of the campaign is a movement for legislation to put the city tuberculosis sanatorium on a firmer basis with a salaried medical director and resident physician.

#### BREAD MUST BE WRAPPED

Senator McCumber of North Dakota has introduced into the Senate a bill requiring all bread sold in the District of Columbia to be wrapped. The loaves must be enclosed in a "suitable sanitary wrapper or package that will protect it from dust, insects, or other contamination" before it leaves the bakery. It is also made unlawful for dealers to sell or deliver bread not properly wrapped.

#### CORRECT DATE OF NATIONAL CONFERENCE

After *Bulletin No. 59* of the National Conference of Charities and Correction had been published giving the date of the fortieth meeting at Seattle, the date was changed. This has led to many incorrect statements of the time. The right date was published in *THE SURVEY* of November 23.

#### COST OF FEDERAL HEALTH WORK

With a view to ascertaining the total expense to the federal government, for the year 1912, of all its health activities, Senator Works of California, who is a Christian Scientist, has secured the passage through the Senate of a resolution directing the secretary of the treasury to compile statistics of cost, maintenance, and personnel of the following: public health and national quarantine, Public Health Service, medical departments of the Department of War, Navy and other departments, hospitals, hygienic laboratories, medical schools, attending surgeons' staffs, surgeon general's office, Bureau of Medicine and Surgery, boards of examination of officers, Board of Medical Examiners, Children's Bureau, medical service in the Bureau of Immigration, and all other bureaus or branches of the health and medical service of the government.

## HEALTH

(Continued from page 681.)

"It is intended that the medical department shall have wide range in its activities. In addition to the usual functions of such a department, it will devise and carry out various methods of health protection known as preventive measures. So far as practicable we shall seek the early detection of diseases, particularly those that are communicable, notably tuberculosis, and arrange for their prompt removal, care and treatment. This not only offers a far better chance for the patients' recovery, but also protects other employees."

## AMERICAN SOCIETY OF MEDICAL ECONOMICS

For the purpose of bettering the economic condition of the medical profession, the American Society of Medical Economics has been incorporated in New York state. The organizers of the new association plan to make this one of the most influential organizations of medical men in the country.

By the provisions of the constitution all registered physicians, without regard to their school, may become members. Dr. E. Eliot Harris, chairman of the committee on legislation of the New York County Medical Society, who is the president, has announced that already one thousand have pledged themselves to become members. Although the organization as yet is largely confined to New York state, it is planned to include every section of the country.

The founders of the new organization believe that a scientific society is not the proper body to consider the need of economic reform, a subject on which it is possible to unite all schools of medicine. The society has standing committees on general economics, professional conduct, medical charities, education and statistics, legislation and food, drugs and sanitation.

The officers include five vice-presidents, Dr. Algernon T. Bristow, professor of surgery at the Long Island Medical College; Dr. W. F. Campbell, vice-president of the State Medical Association; Dr. Smith Ely Jelliffe, the specialist; Dr. T. K. Tuthill, a former coroner, and Dr. T. F. Rally of Fordham College. Dr. S. Dana Hubbard, chief of the Bureau of Contagious Diseases of the Board of Health, is secretary, and Dr. Royal S. Copeland, dean of the Homeopathic Medical College, treasurer.

## TYPHUS FEVER FOUND IN U. S.

That typhus fever and Brill's Disease are identical has been demonstrated by the hygiene laboratory of the United States Public Health Service recently. This discovery is considered important because it has been thought for years that typhus fever did not exist in the United States. But Drs. Anderson and Goldmeyer of the Public Health Service have shown not only that typhus fever does exist under another name, but that it is transmitted by means of the head louse and the body louse. Thus sanitary authorities are now equipped with definite knowledge with which to combat the disease and to prevent its spread.

# Fresh Air

## And

# How to Use It

By Thomas Spees Carrington, M. D.

## A New Book for Everybody

Containing information on ventilation; window tents; wall houses; iron frame porches; and roof bungalows for city use; temporary fresh air porches and permanent sleeping porches and loggias for country homes; tents and tent houses, open air bungalows and cottages; methods of protecting and screening porches; clothing, bedding and furniture for outdoor life, and a host of other subjects.

**E**IGHT hours for a day's work for women in the District of Columbia is one step nearer realization. The Senate committee, before which this proposal has been pending, has agreed to report the bill favorably. The measure is now included among those favored by the Republican caucus.

**A**RBITRATION under the Erdmann Act is to prevent the threatened strike of the firemen on eastern railroads. Thus the firemen win their contention for an arbitration board of three under the law instead of the proposal of the railroads for a board of seven such as made the award in the recent engineers' controversy.

**A** MINIMUM wage of six dollars a week for all employed women is provided in a bill which has just passed the Kansas house of representatives. Domestic servants and others who are furnished with meals and lodging may be charged for these not to exceed three dollars a week or fifteen cents for each meal or lodging.

**T**HE New York legislature faces a confused tangle of constitutional amendments and compensation bills. Although somewhat embarrassed by conflicting suggestions, the justice of the compensation principle is apparently admitted by the law makers without much question. Edward T. Devine explains the principles back of the three main compensation bills now pending at Albany. P. 722.

**T**HE New York State Factory Investigating Commission has submitted thirty-two bills for reorganizing the Labor Department of the state and regulating factory conditions. The document is the focus point of the attention of social workers throughout the state, who are interested in the purposes of these bills. Page 725.

**T**HE National Cotton Garment Manufacturers' Association in New York has conceded full recognition of the union and 8,000 girl strikers in the white goods trades are returning to work. By the terms of the agreement the workers obtain increases in wages amounting to from \$1 to \$2 and receive a fifty-hour week schedule. A permanent wage board is provided for which is expected to arrange an average wage of \$10 a week.

**G**OVERNOR SULZER'S special health commission has reported its recommendations for changes in the laws and in their administration. The commission recommends an increase of from six to ten thousand dollars a year for the state commissioner of health, the practical abolition of town and village boards of health and the granting of their powers to the local boards of trustees, and the appointment of twenty district sanitary superintendents in the territory outside New York city.

## IMMIGRATION BILL VETOED

President Taft's veto of the immigration bill, just before it would have become a law without his signature, was based upon objections to the literacy test.<sup>1</sup> These were presented to the President in a letter from Secretary of Commerce and Labor Nagel, which was sent to Congress along with the brief veto message. The secretary's objections did not carry conviction in the Senate which has passed the bill over the President's veto. In the House, however, the attempt to re-pass the bill failed by a small margin.

Both the President and Secretary Nagel wished that many of the provisions of the bill might be added to the present immigration laws. Both, however, felt that the literacy test was of controlling importance in that it violated, in their judgment, fundamental principles in a sound immigration policy. Secretary Nagel thought that this feature admitted of no compromise. In stating his objections he said in part:

"The effect seems to be that a qualified alien may bring in members of his family who may themselves be disqualified, whereas a disqualified member would exclude all dependent members of his family, no matter how well qualified they might otherwise be. In other words, a father who can read a dialect might bring in an entire family of absolutely illiterate people, barring his sons over sixteen years of age, whereas, a father who can not read a dialect would bring about the exclusion of his entire family, although every one of them can read and write. Furthermore, the distinction in favor of the female members of the family as against the male members, does not seem to me to rest upon sound reasons. Sentimentally, of course, it appeals, but industrially considered, it does not appear to me that the distinction is sound. Furthermore, there is no provision for the admission of aliens who have been domiciled here and who have simply gone abroad for a visit. The test would absolutely exclude them upon return."

He argued, relying on the judgment of immigration officials, that the literacy test would cause delay and friction at ports and on the Canadian and Mexican borders; that \$1,000,000 more

would be required for the administration of the law than at present; and that many interpreters would be needed over whom it would be impossible to have adequate supervision. He further declared that the literacy provision -

"was originally urged as a selective test. The older argument is now abandoned, and in the later conference, at least, the ground is taken that the provision is to be defended as a practical measure to exclude a large proportion of undesirable immigrants from certain countries. . . .

"I cannot accept this argument. No doubt the law would exclude a considerable percentage of immigration from southern Italy, among the Poles, the Mexicans and the Greeks. The exclusion would embrace probably in large part undesirable but also a great many desirable people, and the embarrassment, expense, and distress to those who seek to enter would be out of all proportion to any good that can possibly be promised for this measure. . . .

"So far as the industrial conditions are concerned, I think the question has been superficially considered. We need labor in this country, and the natives are unwilling to do the work which the aliens come over to do. It is perfectly true that in a few cities and localities there are congested conditions. It is equally true that in very much larger areas we are practically without help."

While Secretary Nagel recognized that many newly arrived immigrants live in deplorable conditions, he held that the same is true in certain sections of the country inhabited for a century by natives, and that such conditions are exceptional. He continued:

"The census will disclose that with rapid strides the foreign-born citizen is acquiring the farm lands of this country. Even if the foreign-born alone is considered, the percentage of his ownership is assuming a proportion that ought to attract the attention of the native citizens. If the second generation is included it is safe to say that in the Middle West and West a majority of the farms are to-day owned by foreign-born people or they are descendants of the first generation. This does not embrace only the Germans and the Scandinavians, but is true in large measure, for illustration, of the Bohemians and the Poles. It is true in surprising measure of the Italians, not only of the northern Italians, but of the southern.

"Again, an examination of the aliens who come to stay is of great significance. During the last fiscal year 838,172 aliens came to our shores, al-

<sup>1</sup>By an oversight, the age limit affected by the literacy test stated in the article on the immigration bill in *THE SURVEY* for February 8, page 645, was eighteen years. It should have been stated sixteen years.

THE MAN ABOVE: "YOU CREATE IT, BUT  
YOU CANNOT HAVE IT."

Mayor Gaynor opened a "Lower Rents" exhibit in New York on Monday. The exhibit is the work of the Committee on Congestion, and its purpose, to convince New Yorkers that it would be socially desirable to halve the tax rate on buildings. A bill before the legislature would submit the proposal to a city referendum.

though the net immigration of the year was only a trifle above 400,000. But, while we received of skilled labor 127,016, and only 35,896 returned, we received servants, 116,529, and only 13,499 returned; we received farm laborers, 184,154, and only 3,978 returned, it appears that laborers came in the number, 135,726, while 209,279 returned. These figures ought to demonstrate that we get substantially what we most need, and what we cannot ourselves supply, and that we get rid of what we least need and what seems to furnish, in the minds of many, the chief justification for the bill now under consideration."

Mr. Nagel was persuaded, he said in conclusion, that the provision was based upon a fallacy in undertaking to apply a test which was not calculated to reach the truth and to find relief from a danger which really did not exist. He made minor objections with respect to the inclusion of Hawaii within the terms of the bill; the vague language of the provisions excluding aliens capable of assuming citizenship; the provision whereby the secretary of commerce and labor's decision, admitting skilled labor under contract, may be submitted to a review by the

courts in advance of affirmative action; the provision for detailing matrons and inspectors on immigrant vessels, and the drastic power in the hands of the secretary for penalizing ship companies that solicit immigrants.

#### A SHAM BATTLE AS A MENTAL RESTORATIVE

The Agnews State Hospital in California, of which Dr. Leonard Stocking is medical superintendent, is carrying on an interesting experiment in the so-called moral treatment of the men patients. With a view to evolving a restorative system of mental treatment based upon exercises calculated to call into play the disconnected mental forces of insane men, Dr. Stocking has organized a system of military drill. Employees of the hospital with military training were detailed to this service a few months ago and in a few weeks had two well-organized companies of militia, to which later was added artillery, a Red Cross hospital corps, etc. The patients seemed to take to this novel method of occupation and entertainment and threw themselves into it with such enthusiasm and ability that a sham battle was arranged for and very successfully carried out. The model was the battle of San Juan. A Spanish fort was built, camps were established, and the details of the battle were closely followed. During the summer two companies went off on a ten days' camping trip to the mountains.

This experiment is said to be unique and to deserve trial in other institutions. For some years the Central Islip State Hospital in New York has carried on an informal drill of men patients, which is said to have greatly improved their gait and carriage. A more complete organization of such methods of occupying the men patients might be especially advantageous during the winter months when there is so little opportunity for outdoor work and recreation. A vigorous march to the strain of the hospital band would, it is thought, be a great improvement over the sluggish daily walk forced upon unwilling patients at most of the institutions for the insane.

#### PROGRESS IN THE PLANS FOR LETCHWORTH VILLAGE

The need for effective handling of the feeble-minded in institutions in case of fire was shown recently by a loss of life at Amityville, Long Island, N. Y., when the Brunswick home was destroyed. An attempt to solve the problem is being made at Letchworth Village, New York state's new 2,000 acre home for the feeble-minded and epileptic. Plans for the buildings have progressed, so that contracts can be let for the first ten structures. Not only will the buildings be of "slow burning" construction, but

DORMITORIES PLANNED FOR LETCHWORTH VILLAGE

there will be no intricate passages, making it possible to empty them with the greatest ease. Doors opening directly outside will be provided for each apartment occupied as sleeping quarters.

The architectural character of the structures is notable. The portico and dome of Monticello, Thomas Jefferson's home, have been chosen to relieve the barn-like monotony of the usual institution of this sort. This type of construction is said to be particularly fit for the village's environment of low hills and valleys.

That the dormitories for girls are to be separated from those for boys by a stream running through the middle of the grounds has already been stated in a previous article in *THE SURVEY*; also that there will be six groups of buildings, each complete in itself.<sup>1</sup> Each group will consist of eight dormitories, an industrial building for hand work, an attendants' home, and, with the exception of those for the infirm, a dining hall. There will also be schoolhouses in the groups for children. Three of the groups will be for boys and men and three for girls and women. The inmates will be grouped in three classes: improvable children, able-bodied adults and infirm adults.

The administration group will consist of an office building, cottages for men and women officers and a library fire station. Hospitals, a laboratory, observation buildings, a club house and other buildings will make up other groups.

At the last session of the legislature, \$457,000 was appropriated for the ten buildings which it is expected will be started this spring. These in-

<sup>1</sup>See *THE SURVEY* for March 2, 1912, page 1869.

clude four dormitories, an attendants' room, a dining hall, a laundry, a shop, a power plant and a store house. The last four will serve the entire village.

It is realized that the village will offer an opportunity to demonstrate how economically the policy of segregating mental defectives may be conducted.

In speaking of the methods and aims of Letchworth Village, Dr. Little, its superintendent, said recently:

"The farm colony provides the most economical way in which to segregate the feeble-minded. It costs less to feed and house the inmates. It furnishes a healthful occupation for mind and body. It provides a most favorable environment for their happiness and comfort. It gives them a range of movement that permits the development of whatever individuality they may possess, for it separates them from contact with other colonies."

#### SAGE FOUNDATION LOSES DR. GULICK

Coincident with the resignation of Dr. Luther H. Gulick as director of the Department of Child Hygiene, the Russell Sage Foundation announces that the department under this name will be discontinued. Most of its activities will be carried on by two new departments which will be developed from the present Divisions of Recreation and Education. These will be under the directorships, respectively, of Lee F. Hammer and Leonard P. Ayres.

In 1907 Dr. Gulick, then president of the Playground Association of America, was made

ONE OF THE DINING HALLS

chairman of the Playground Extension Committee and the Backward Children Investigation of the Russell Sage Foundation. These were merged in 1909 into the Department of Child Hygiene.

Ever since his connection with the Boy Scouts of America as a member of their Committee on Organization Dr. Gulick has believed that a similar organization for girls was needed. In accordance with this idea, the Camp Fire Girls was organized in 1911, and Dr. Gulick now gives up the directorship of the Department of Child Hygiene to devote his whole time to this movement. His resignation to take up a new work affords an opportunity for reviewing the record the department has made in forwarding movements for better social conditions in schools.

When the Playground Extension Committee first co-operated with the Playground Association of America in 1907, ninety cities had playground facilities. The number had jumped to 531 in 1910, when the Foundation dropped this work as one of its main activities, and turned over most of its playground interests to the Playground Association. It has since then, however, continued to work along other lines to further the interests of public recreation, such as the development of the use of public buildings and grounds for evening recreation centers, summer playgrounds, vacation schools, social center work, public lectures and meetings, and school gardening. Dr. Gulick was responsible, for example, for the interesting and picturesque experiment of having several hurdy-gurdies equipped with folk dance music.

The Division of Recreation has been active, also, in the sane Fourth campaign; has helped work out many plans for May Day observances; has backed the endeavors of the New York Public School Athletic League for the control of school athletics; aided in organizing the Boy Scout movement in this country; has conducted dance hall investigations; and has been a general clearing house of information for questions on the subject of recreational facilities.

It is this division and that of education which are to be continued as separate departments of the Foundation.

The findings of the Backward Children Investigation (afterward the Division of Education) that a large number of children were retarded in their school work because of removable physical defects aroused strong interest among school men and lent impetus to the movement in behalf of medical inspection of school children. After the report was published the number of cities having systems of medical inspection in schools jumped from 135 in 1908 to over 700 in 1912.

The division has co-operated with school men by giving them material on the causes of re-

tardation and non-promotion among school children, the relation of physical defects to school progress, and like problems. The published reports of the division have served to help socially minded educators who are trying to fit the school to the needs of the child and to fit the child for present day demands. Some of the reports which have attracted most attention are: Why 250,000 Children Quit School; What American Cities are Doing for the Health of School Children; A Scale for Measuring the Quality of Handwriting; Reports of the Age and Progress Study, and A Comparative Study of the School Systems in the 48 States.

One exhibition conducted by the division, which showed school conditions and school needs in Greenwich, Conn., cost \$2,500. It resulted in the raising of a bond issue of \$250,000 for school improvement in that town—a return of 1,000 per cent.

### COMPENSATION BILLS AT ALBANY

EDWARD T. DEVINE

In the confused tangle of constitutional amendments and compensation bills now pending in the New York legislature, we may distinguish certain clear issues on which the average citizen should have no difficulty in making up his mind.

The first of these is as to whether, in view of the probability of the adoption of the amendment conferring upon the legislature the power to enact a compulsory law, like that which in the Ives case was declared to be unconstitutional, the legislature should enact any so-called voluntary compensation scheme at all. The three bills known respectively as the Jackson or Federation of Labor bill, the Foley or administration bill, and the McClelland or Civic Federation bill, all agree in setting up plans which within six months of the time when they go into effect will be antiquated, if, as is surely to be taken for granted, the amendment is approved by the present legislature and by the voters in November. The obvious suggestion would be to wait until the constitution has been amended and then pass the kind of law which public opinion really demands.

There are two objections to this course. One is the uncertainty which always attends delay. Through some wholly unforeseen political development the amendment might fail. The courts might discover some irregularity in the process of amendment. There is now an aroused and enlightened public sentiment on the question. Now, therefore, is the time for action.

The other conclusive argument in favor of immediate action is that every day of delay means more uncompensated, or inadequately compensated, injuries. Every day there are deaths and crippling which a better law would tend to prevent; and the economic burdens still fall on widows, orphans, and disabled workmen, instead of being distributed widely through insurance and prices.

In this situation, the suggestion has been made that a compulsory law, such as is ultimately to be enacted, should be enacted now, but with the proviso that it should go into effect after the constitutional amendment has been approved. No doubt the legislature can pass a law which is to go into effect contingently upon some specified future event. Whether it would be constitutional for the legislature to do this when the particular contingency is a constitutional amendment conferring upon the legislature the power to pass the act in question is a very nice point. As the proposed statute would not be identical with or even very much resemble the one which was found to be unconstitutional, and as the court in any event would have had ample time to change its mind, it is possible that the validity of the new law would not have to depend solely upon the amendment. The advantages of passing immediately an ideal compulsory statute are that, if upheld, it would end at the earliest possible moment the present unsatisfactory condition; and that it would give to voters when the constitutional amendment is before them, a clear and definite idea of the system which the adoption of the amendment would permit.

The second issue involved is as to whether the insurance of the risks created by the new law shall be undertaken by the state exclusively, as the Jackson bill contemplates; or by the commercial and mutual companies, as the Foley bill provides; or by these companies with the state insurance department as an alternative, as the McClelland bill permits.

It must be admitted that commercial accident insurance has no very creditable record in this country. However necessary some such system may have been under our old plans of compensation it has as a whole been expensive, cruel, and anti-social. It has fought claims, just and unjust, remorselessly and has eliminated the human element in industrial relations so far as they relate to compensation for injuries. Miss Eastman, after scrutinizing minutely the Pennsylvania method of settling for work accidents, reached the conclusion that if injured employees had had no legal claim whatever and had been dependent entirely on the good will of their employers they would have fared better than under the Pennsylvania law. That is the curse of the liability chaos under which we have lived, that it destroys good will.

In one case of which the writer has personal knowledge, a man was injured and after a few weeks died from the illness of which his injuries had been at least a contributing cause. His employer could not "afford" to allow the visitor who came on the family's behalf to see the loom at which he had worked, or to talk with his foreman. He could not help them lest it should be taken as evidence of "liability." But after much interviewing and correspondence, he wrote a letter in which he said that, if the injured man, who was at that time still alive in the hospital, would sign a release from all legal obligations, merely as an expression of his sympathy and regret he would send a check for any amount which the society considered reasonable, up to—*twenty-five dollars*. As an expression of sympathy this may seem inadequate, but it was twenty-five dollars more, as it turned out, than the legal claim was worth. The employer was insured.

There is something to be said for the plan of mutual insurance, and possibly corporations or other large employers that can satisfactorily guarantee their solvency should be allowed to carry their own risks. But the safest, simplest, least expensive, and most democratic plan would seem to be that of a state insurance fund, administered not by the Insurance Department but by a distinct compensation insurance commission, levying premiums on various industries and within the industries on various establishments, according to the actual risks as shown by inspection and experience. If by the side of this normal and authorized system there are allowed the alternatives of self insurance and mutual insurance under the regulation and oversight of the state commission, this would seem to afford all the latitude which is called for. One consideration in favor of the continued use of the casualty companies also is that there are some industries which are so limited in certain states that the broader basis of experience throughout the nation is almost indispensable. Generally speaking, however, the one type of middleman which among all the superfluous middlemen could be eliminated with the most cheerful acquiescence of everybody concerned is precisely the liability insurance company which, in its obnoxious methods and enormous administrative expenses, made necessary by the legal system of which it is a part, has most completely represented all that is bad in the old order of things.

The third issue involved relates to the scale of compensation. The Jackson bill proposes as a general unit of compensation two-thirds of the average wages at the time of death or disability, with a maximum period of ten years, a maximum amount of \$5,000 in case of death, and of \$15 a week for disability. The Foley bill

and the McClelland bill propose one-half of the average wages at the time of death or injury as a maximum, the period for which payments are to be made varying according to the character of the injury. The period during which compensation is given in case of death is six years in the latter bill and about seven years in the former. Ten dollars is fixed as the maximum weekly payment in both bills. There are many details to be considered in comparing the provisions of the different measures, but the typical figures cited show fairly the different points of view.

The Association for Labor Legislation has by resolution endorsed the Foley bill on condition that certain amendments should be incorporated, among them the more liberal scale of compensation proposed in the Jackson bill, i. e., two-thirds rather than one-half of the average wage. The association also insists that the period of payment be made even longer than in the Jackson bill as, for example, during the continuance of disability, during the continuance of widowhood, and until dependent children reach the age of sixteen. In insisting on these amendments the association is well advised. The scale of the Foley bill is clearly inadequate as it stands and it illustrates the inevitable weakness of any optional bill. In order to induce employers to elect to come under it, the scale must offer substantial advantages to them. The theory of the so-called voluntary system which has been making such headway is that it is to be made as nearly compulsory as possible by the financial inducement of a low scale of compensation on the one hand, and on the other hand by removing the common law defenses of assumption of risk, fellow servant, and contributory negligence from employers who do not elect to come under the law.

There is something inherently obnoxious about all such bargaining. It is, as Mr. Freund said in Washington a year ago, in effect bartering justice. Litigants in a damage suit are not treated with that uniform impartiality which our traditions require, but according as they have or have not decided at some previous time a question of policy on which there may be room for differences of opinion. Optional schemes therefore are bound up with the two grave evils of unequal treatment of employers and inadequate compensation to injured workmen.

To increase the scale of compensation after a law is once enacted has been found in practice to be exceedingly difficult, if not impossible. To be sure workmen are better off with a very moderate payment which is assured and is prompt than with a vague prospect of some large sum after long delay and anxious uncertainty. But why should the sums to be paid be reduced in

amount merely because payment is to be certain and delays eliminated? What public opinion demands is that the one should be done and the other not left undone. That is to say, delays and uncertainties and unnecessary expenses are to be ended, and also the amounts to be paid are to be just and reasonable. What is proposed is that industry shall squarely shoulder the costs of its deaths and injuries. If prices go up, let them. This is one item in the cost of living which will cause no grumbling worth taking into account. If some employers fail, let them fail. This is one cause of bankruptcy upon which society can look with comparative equanimity. If some industries are no longer as profitable as they were, let the dividends shrink. The social ledger will still show a favorable balance in wage-earners spared to their families or, if they must be killed and maimed, at least in a means of livelihood for the bereaved and dependent families. With no less justice than Captain Scott, our industrial workers who die at their post leave us everywhere their farewell message: *Surely a great rich country like ours will see that those who depend on us are properly provided for.*

## THE EIGHT-HOUR DAY AND WORKING CHILDREN

FLORENCE KELLEY

Secretary National Consumers' League

Congress seems to be on the eve of enacting an eight-hour law applying to women employed in all industries except household work and trained nursing in the District of Columbia. Three states have enacted eight-hour laws for women. In Washington and California the state supreme courts have already sustained these laws, and the most recent statute, that of Colorado, was adopted by a popular vote under the initiative and referendum.

These familiar facts are rehearsed here because they raise the question why no New England state has established the eight-hour day even for children—and why no southern state except Mississippi? In sixteen states working children have the eight-hour day. In Ohio it applies to girls until their eighteenth birthday. In New York it assures to all boys and girls under sixteen, employed in manufacture, a working day ending at 5 P. M. sharp. In Utah and certain other states boys share with men the eight-hour day in the mining industry.

With forty-two legislatures in session it seems reasonable to hope that New England and the South may awaken, and begin during the present year to adopt the eight-hour day at least for the children.

# THE NEW YORK FACTORY BILLS

THIRTY-TWO BILLS have been recommended by the New York Factory Investigating Commission (See THE SURVEY for February 15, p. 659). Among these are bills to abolish child labor in canneries and in tenements, to end night work for women in factories, to minimize fire hazards, to reorganize the Labor Department, and to create an industrial board.

 PAULINE GOLDMARK, secretary New York Consumers' League.

## THE REORGANIZATION BILL. BY A. F. WEBER,<sup>1</sup> STATISTICIAN PUBLIC SERVICE COMMISSION, FIRST DISTRICT.

JUST THIRTY YEARS ago the state of New York, through the establishment of a bureau of labor statistics, gave official recognition to the modern demand for governmental regulation of such conditions of employment as are beyond the control of individual wage-earners.

The bureau brought to light and stamped with its official guarantee the facts that established the need of state interference to control and elevate the plane of competition among employers in such wise as to safeguard the health and welfare of employes. But progress has been slow both on account of the reluctance of the judiciary to abandon the notion that "freedom of contract" had been written into the constitution and on account of defective civil service regulations that left the enforcement of protective labor laws to an untrained and inexperienced body of officials. The factory laws embodied the practice of the best and most enlightened employers, but they existed more as an ideal than as a minimum requirement to be met by every manufacturer. Whenever complaint was made of the non-enforcement of statutory provisions, the responsible official almost invariably pleaded the inadequacy of his force, and the legislature would from time to time respond with additional appropriations.

While additions to the staff of officials are required to keep pace with the rapid growth of population and industry in this state, such additions have not sufficed and will not suffice to secure the protection of the wage-earner that the law intends to afford, unless the officials are prop-

erly trained and supervised. Such training and expert supervision have heretofore been largely wanting. Each inspector has had to work out from his own experience some standard of adequate protection of the health and safety of employes, as the supervising officials have been too busy with the disposition of cases of appeal from aggrieved proprietors to formulate detailed instructions for the field workers.

This situation the Factory Investigating Commission proposes to remedy in part, by the creation of an industrial board of five persons (including the commissioner of labor as chairman), endowed with authority to formulate and establish an industrial code and industrial rules and regulations supplementing the statutory regulations. It is proper and necessary that the exercise of these quasi-legislative functions should be confided in a board rather than an individual because legislation presumes deliberation and consultation of all interests involved. A board that is freed of all administrative duties will have time for deliberation, and if it is properly constituted will listen to and weigh the facts and arguments of every interest involved in a determination of standards that are designed to safeguard the public welfare. This board will require the assistance of expert advisers and investigators, which has been provided for in the Wagner bills by the addition to the staff of the Labor Department of a division of industrial hygiene, comprising a licensed physician to act as chief medical inspector, a chemical engineer, a mechanical engineer expert in ventilation and accident prevention, and a civil engineer expert in fire prevention and building construction.

The commissioner of labor, with a salary of \$8,000 a year, is made responsible for the enforcement of the factory laws, industrial code

<sup>1</sup>From 1901 to 1907, chief statistician, New York Department of Labor.

and regulations of the industrial board, so that any failure in the execution and administration of the law can be brought home to an individual. Under his supervision the first deputy commissioner, as inspector general (salary \$5,000), will have charge of the bureau of inspection, which will consist of at least four divisions—factory inspection, home-work inspection, mercantile inspection and industrial hygiene (the last mentioned division, however, to be in the immediate charge of the commissioner). There are to be two factory inspection districts (one consisting of New York city and Long Island and the other of the remaining counties of the state), each in charge of a chief factory inspector at \$4,000 a year, and there are to be not less (instead of not more) than 125 inspectors. The \$1,000 grade of inspectors has been eliminated; \$1,200 is certainly small enough compensation for a man qualified to assume the responsibilities of a factory inspector.

The bureau of mediation and arbitration and the bureau of industries and immigration will remain unchanged in the reorganized department, but the important bureau of labor statistics is to be greatly enlarged in accordance with the enlightened judgment of social workers here and elsewhere. Within the new bureau of statistics and information, separate divisions are established for the industrial directory, industrial accidents and diseases, investigations (including all research work), and printing and publications. This expansion is urgently needed, as the force of the bureau since it was made a part of the Department of Labor in 1901 has been sufficiently large to keep up only the absolutely essential records of wages, unemployment, manufactures, industrial disputes, etc. This class of information will hereafter be prepared by the division of general labor statistics (and the industrial directory division).

The general scheme of reorganization commends itself on the whole to the great body of disinterested citizens and experts. It concentrates responsibility, and while differences of opinion, as might be expected, exist as to certain features, no one will deny that the bill represents a most important advance step. The only anxiety now felt is on the question of the method of selecting the officials in the new department. Shall the office seek the best qualified man, or, as too frequently in the past, shall a poorly qualified man seek and obtain the office? The answer will depend less upon the legislature than upon the governor and the Civil Service Commission.

## THE PERSONAL EQUATION. BY F. S. TOMLIN, SECRETARY-TREASURER JOINT LABOR LEGISLATIVE CONFERENCE.

IN CONSIDERING REORGANIZATION of the department of labor as proposed by the Factory Investigating Commission, it is necessary to make some reference to the causes which make reorganization advisable. The chief of these causes may be summarized as follows: Active hostility

to the work of the department on the part of employers; indifference and lack of co-operation on the part of employees; half hearted and inefficient inspection; failure of the general public to appreciate the importance of the object of the department; the pernicious effect of political influence on the executive and administrative force.

No mere change or improvement in organization will of itself remedy these evils. The proposed system, or any system, will prove abortive unless the attitude of all who are responsible for the present shortcomings of the department can be changed and is changed. The industrial board as proposed by the commission provides effective machinery for accomplishing this result, provided the board is made up of people possessing the right kind of ability.

It is not important that the members of the board should be executive or administrative geniuses; nor need they be trained experts. The commission has (very wisely in my opinion) invested the industrial board with the power to obtain information of all kinds from any source which will aid them in the performance of their duties. The members should have a fair amount of common sense, some knowledge of machinery, an acquaintance with industrial processes and business methods, and a well balanced idea of justice. They should have in addition ability to use the knowledge they possess and the information they may acquire to make sane, practical rules and regulations for carrying out the policy and intention of the commission as stated in paragraph 51-4C of their bill providing for the board.

There is some difference of opinion as to whether the commissioner should be a member of the board or not. I do not think this is very important. I do, however, consider it essential that the commissioner should be a broad gauge, first class man who is capable of inspiring the force, from deputies down to first grade inspectors, with loyalty and devotion, enthusiasm for their work, and the ambition to make the Department of Labor a model of efficient service. Given capable efficient people as members of the industrial board and with the powers proposed by the commission there is hardly any limit to the beneficent work the Department of Labor can accomplish. Given incompetent, indifferent or unfit people in these positions and the department will be no more efficient than it is now.

## FACTORY REGULATION. BY E. E. PRATT, MANAGER INDUSTRIAL BUREAU, MERCHANTS' ASSOCIATION.

THE SUCCESS of recent English factory legislation, especially in regard to occupational diseases and industrial hygiene, has been largely dependent on two essential factors:

1. The careful investigation by a board of experts which has always preceded any action looking to the improvement of factory conditions.
2. The power vested in the Department of

Factory Inspection to draw up special rules for certain industries. These rules and regulations when approved by the home office have the force of law.

These same methods seem to have been sought in the legislation which has been proposed by the New York State Factory Investigation Commission.

One of the laws' suggested creates an industrial board which, under the proposed law, is given not only general and supervisory administrative duties, but is also clothed with the power to make investigations and to lay down regulations which shall have the force of law. It is specifically provided in the bill that these regulations shall be different for different industries and even for different factories. For the first time in the history of factory legislation in New York the essential differences between industries are recognized, and it is proposed to have varying regulations applicable to industries with varying conditions and dangers.

In its general nature the reorganization of the Department of Labor which is proposed is not unlike that of the Public Service Commission. This is true with two important exceptions: (a) The members of the industrial board are not so well paid and there are fewer of them; (b) the members of the board, except the chairman, give to this work only a part of their time and attention. The obvious danger in this is that the members of the board will have too much power with too little acquaintance with the actual conditions over which they have jurisdiction.

The importance of the industrial board as proposed can scarcely be overrated. In comparing the extent of its jurisdiction with that of the Public Service Commission, it is interesting to note that the latter is concerned with approximately 1,000 companies, having about 100,000 employees, while the Industrial Board will have jurisdiction over some 45,000 establishments, employing more than 1,250,000 workers. If there is anything to choose between the complexity of conditions confronting these two bodies, it is likely that the greater variety and complexity of conditions confront the industrial board.

On the whole, these bills proposed by the Factory Commission represent a great advance over the system now in operation. In the field of industrial hygiene alone they will make it possible to eliminate many of the preventable diseases which menace factory workers. Among other things the board is empowered to carry on a campaign of education—not that it could not be done at the present time, but that it has not—which will probably prove extremely useful. In the field of industrial hygiene what is most needed is education—education of the employer concerning the dangers in his factory and consequent lowered efficiency of his employees; education of the workers to the danger of the work in which they are engaged and to the use of

safety appliances and preventive measures; education of the public to a realization of the seriousness to the community of unhygienic and unhealthful conditions in industries.

These laws are aimed in the right direction, but, like so many other improvements, their success will depend more upon the personnel of the industrial board and its administrative staff than on the phraseology or the content of the law. If the industrial board does not carry weight alike to employers and employees, only another piece of cumbersome machinery will have been added to our already heavy-going state administration. With a personnel which commands the confidence of the community, a great benefit will accrue to the industries of the state. With such an industrial board it will be possible for manufacturers to co-operate not only in improving conditions in their plants, but also in raising the efficiency of their organizations and improving the whole tone of their industries.

## THE REORGANIZATION BILL. BY PAUL KENNADAY, AMERICAN ASSOCIATION FOR LABOR LEGISLATION.

THE FACTORY INVESTIGATING COMMISSION has provided for better enforcement of labor law by substituting, in place of the old theory underlying so much of the labor law in this country, general principles to be enunciated by the legislature and to be specifically applied to particular problems by an industrial board. Better enforcement of these general principles and of the board's industrial code will also come through the proposed improved organization of the department's force, through the small increase in the number of the regular inspecting force, and through the relatively considerable increase in the force of qualified experts.

But the commission's own strictures upon the failure of present methods are too sweeping to permit us to hope that this proposed curtailing of the legislature's duties and enlargement of the department's functions will bring about genuine enforcement of labor law until we have within the Department of Labor and without it a new conception of the relation of the department to the people of the state. Too long the idea has gained currency in the ranks of organized labor that because this department was created in answer to their demands it should be manned and operated only as organized labor chooses. Too long, on the other hand, have employers looked upon the department as a meddlesome policeman, understanding none too well his job. Too long have politics and other peculiar influences held more than even their fair American share of influence in the department, according to widely prevalent public opinion.

The commission makes the excellent recommendation that oral examinations be given inspectors in addition to the required written civil service examinations, and this no doubt will serve better to test the real qualifications of candidates. The suggestion that pensions be provided for inspectors will materially help, when

<sup>1</sup>Bill No. 1, to be Article 3, Section A, of Chapter 30 of the laws of 1909.

carried out, to place inspection work on a better and more efficient basis.

But in spite of better laws and more laws we shall make but little genuine progress until the general public and politicians of all parties take the view of Senator Wagner and his fellow commissioners, that "no government is properly performing its functions when it permits the working people within its bounds to be employed under unsanitary conditions, when it fails to protect them from preventable disease and accident, when it permits the premature employment of its young children, and the excessive toil of its women."

The gulf is great between "the little attention" which the commission finds "has been paid to the preservation of the state's most precious asset, the workers within its bounds," and the attention which justice demands should be paid by the people's representatives to the people's rights. Fearlessness of the politicians, the grit to do the right thing regardless of the discreet thing, determination to enforce the law, inspiration and vision to comprehend the tremendous opportunity for public service in its grasp; these are the qualities needed within the department, and without, to turn the new Department of Labor, with its new laws and new machinery, into an effective instrument for the prevention of that "annual waste of human life in our industrial establishments" reported by the Wagner-Smith commission as now resulting "from unsanitary conditions and *preventable* accidents and diseases."

## INDUSTRIAL BOARD. BY HENRY MOSKOWITZ, BOARD OF SANITARY CONTROL CLOAK, SKIRT AND SUIT TRADE.

THE SUCCESS of the Joint Board of Sanitary Control in the Cloak and Suit Industry is largely due to a thorough investigation of the actual sanitary conditions which exist in the hundreds of shops in this industry. These conditions are carefully recorded through a card system which was devised with the assistance of a number of labor experts and sanitarians. Upon the basis of the facts thus ascertained, sanitary standards were formulated which were adapted to existing conditions, and therefore enforceable. These standards were higher than those embodied in the labor law, but the board, knowing the actual conditions, could fix reliable standards. The facts served to correct any attempt to impose upon the industry standards which were not enforceable.

The members of this board are convinced that such a method, if generally applied throughout the industries of the state, will result in a more effective enforcement of the labor laws and an improvement in the condition of the workers. It is difficult to enforce general labor laws. Aside from the inadequacy of the inspectorial force, there are so many exceptional conditions of which a department must take cognizance and to which the laws may be intelligently adapted and effectively realized.

This is the purpose, as I understand it, of the industrial board in the reorganization of the Department of Labor contemplated by the Factory Commission. It is not intended that the industrial board should lower the standards; on the contrary, it will make the standards work by drafting a code of practical rules founded upon the specific studies of the actual conditions which the board discovered in the industry. It is an effective method of preventing the laws from becoming dead letters. The successful experience of European labor bureaus with such procedure encourages the innovation. Incidentally, the board will secure the co-operation not only of the workers, but of enlightened employers in the industry who are eager to conform to decent rules in the industrial game. It will not be necessary to resort to frequent amendments of the labor law; and whatever changes must be made will be based upon the experience and the study of such an industrial board.

The responsibilities of the board are great. It is therefore incumbent upon the governor to appoint as members of it those who are qualified by their training and knowledge of labor conditions to perform this important service. The revolutionary changes made in the machinery of the Department of Labor can be justified only if the state authorities will put behind it men and women who are qualified by their experience, knowledge, and character to make it work. The test of the present administration's attitude toward labor and its welfare will soon be made. By the men and women appointed to the new positions created through these desirable laws we shall know whether the Department of Labor is to become a grove of juicy plum trees for the hungry office seeker or an opportunity for genuine service. This is the challenge of the new administration.

## THE INDUSTRIAL BOARD. BY IRENE OSGOOD ANDREWS, AMERICAN ASSOCIATION FOR LABOR LEGISLATION.

BILL No. 1 of the Factory Investigating Commission creates in the New York Department of Labor an industrial board of five members, with the commissioner of labor as chairman. It is the duty of the board to see that "all factories, factory buildings and mercantile establishments shall be so constructed, equipped, arranged, operated and conducted in all respects as to provide reasonable and adequate protection to the lives, health and safety of all persons employed therein, and that said board shall from time to time make such rules and regulations as will effectuate the said policy and intention."

The board has power to appoint a secretary and determine his salary; to make investigations; inspect factories; compel the attendance and testimony of witnesses and the production of books and papers; to employ experts for special and occasional services; to utilize the employees of the department; and to make rules and regulations which may be adopted only after public hearings. In contrast to the plan adopted

both in Massachusetts and in Wisconsin, the New York board has no voice in staff appointments nor in the administration of department affairs.

The power to make investigations is also given to the Bureau of Statistics and Information, and to the division of industrial hygiene, both of which are under the supervision of the commissioner of labor alone. But recommendations for rules and regulations must be submitted to the board before they can be embodied in the industrial code. The board thus becomes a legislative agent to carry out the more general directions and intention of the legislature.

The effective use of the power given to the industrial board will mean much to the factory workers of New York. The present New York law, as in most other states, is too indefinite to permit of effective enforcement, and it fails to cover many of the most important danger points in industry. By the specific rules and regulations which the board is authorized to make both employers and inspectors will know exactly what is required of them, and enforcement should be greatly simplified.

In Wisconsin this method of work has resulted, according to the former commissioner of labor, in the installation of more safeguards in the last six months than were installed in the preceding six years under the old method; at the same time there has been a decrease in the needed inspection force. The Massachusetts board, created in 1912, will begin work in March of this year.

The reorganized department in New York has almost unlimited possibilities and can become a powerful agent in the prevention of industrial accidents and diseases in this state. Although the Factory Investigating Commission has for the present finished its work, the crucial time is yet to come. Unless the right kind of appointments are made the purpose of the industrial board and the reorganized department will be defeated, and the factory workers of New York will receive but little benefit from the \$70,000 and more spent by the investigating commission. The work of the commission must now be taken up by the interested public.

## POWERS OF PROPOSED BOARD. BY RAYMOND V. INGERSOLL, CHAIR- MAN CONGESTION COMMITTEE.

THERE IS MUCH that is excellent in the bills recommended by the Factory Investigating Commission. Of all the measures, none is more constructive and far-reaching than the one providing for the creation, within the Department of Labor, of an industrial board with broad discretionary powers of administration. If we can have this board, and if it can be made up of men of integrity and ability, we shall be abreast of the most enlightened methods.

It will be the underlying function of this board to make from time to time specific rules and regulations to the end that: "All factories, factory buildings and mercantile establishments shall be so constructed, equipped, arranged, op-

erated and conducted in all respects as to provide reasonable and adequate protection to the lives, health and safety of all persons employed therein."

Under the proposed plan, public supervision and regulation of the conditions of industrial health and safety can be made much more flexible and intimate and correspondingly more effective than at present. For the legislature itself to attempt to make the rules and regulations, as under the theory of the present law, is necessarily cumbersome. Needed amendments are obtained too slowly. Rules designed to apply to all industries throughout the state inevitably tend to such vagueness as to make enforcement extremely difficult. If the legislature were to make such rules definite they would be too severe for some industries or some communities and too lax for others. This has been the past experience. The industrial board, on the other hand, will be expected to make a first hand study of the special processes and needs of separate industries. It can subpoena witnesses, and will have the right of access to all manufacturing establishments. It can take into consideration the peculiar problems of different localities. Perhaps business housed in a high loft building in Manhattan will not call for precisely the same provisions which would be most suitable for a similar industry located in the open country.

Through direct contact between the industrial plants and the regulating authority, relations of helpful advice can be established. The board can make suggestions which will often be welcomed and can instruct the managers of backward establishments in the more enlightened methods of safeguarding employes which may already prevail elsewhere. At present the Labor Department must proceed by an irregular succession of prosecutions. Even these prosecutions often fail because the law is unfair in its rigidity and in its failure to discriminate between conditions which are widely varying.

The board will be made up of the commissioner of labor, who will act as chairman, and four associate members to be appointed by the governor. The term of one commissioner will expire each year. In addition to its powers to make investigations and publish reports, the chief functions of the board are thus expressed in the bill:

"(4) To make, alter, amend or repeal rules and regulations for guarding against and minimizing fire hazards, personal injuries and disease with respect to (a) the construction, alteration, equipment and maintenance of factories and factory buildings; (b) factory buildings and mercantile establishments and the limitation of the number of persons who may occupy the same or any part thereof; (c) the arrangement and guarding of machinery and the keeping of property and articles in factories, factory buildings and mercantile establishments; (d) the places where and the methods and operations by which trades and occupations may be conducted and the conduct of employers, employes, and other persons in and about the factories, factory buildings and mercantile establishments."

# THE FIRE BILLS. BY H. F. J. PORTER, FORMERLY FIRE EXPERT FACTORY INVESTIGATING COMMISSION.

TWENTY-SEVEN LIVES were lost on November 26, 1910, in the Highland avenue fire in Newark, N. J. Knowing of the campaign which I had been carrying on for some years to secure legislation to better the construction of factory buildings, and for tests of facilities for emergency egress from them, you asked me to report to you upon that fire and compare conditions as I found them there with those existing in New York factory buildings. I reported that there were many hundreds of buildings in this city where such a disaster, or even a worse one, could occur at any time, and I designated the loft buildings.<sup>1</sup>

On March 25, 1911, the Asch building fire occurred, where 142 lives were lost, and the press of the next day printed my letter of earlier date to the Triangle Waist Company, which was burned out, telling them of their dangerous conditions and advising them to put in an exit drill.

At the next monthly meeting of the Fifth Avenue Association I spoke of the danger existing in the loft buildings in its district, and at a Sunday evening meeting of the People's Forum in the Church of the Ascension I gave a lantern slide talk, showing the abnormal conditions existing in these buildings. A few days afterward I was able to bring together a group of men from these two associations. Under the leadership of Joseph S. Auerbach, the eminent attorney, they secured the co-operation of the Committee on Safety which had been formed at the mass meeting called just after the Asch building fire. They also went to Albany to ask for the appointment of a commission to draft legislation to change the conditions I had depicted.

A hearing was granted by the governor in the executive chamber. Among those who attended and addressed this meeting were the Rev. Percy S. Grant, rector of the Church of the Ascension; Robert Grier Cooke, president Fifth Avenue Association; C. Grant La Farge, president New York Chapter American Institute of Architects; Arnold W. Brunner, architect and chairman of the McAneny City Planning Commission; William M. Kendall, member of the firm of McKim, Mead & White, architects; George T. Mortimer, vice-president United States Realty Company; Reginald Pelham Bolton, consulting engineer, expert in loft building construction; Peter J. Brady, vice-president United Printing Trades Council; Charles H. Keyes, executive secretary Committee on Safety.

In Mr. Auerbach's address to the governor he said:

"Of course, you do not need to be reminded, any more than the others in this room, of the appalling disaster from fire that recently took place in the city of New York, where the alternative, and the only alternative, to the people who were entrapped in the burning building was either to jump to their death or to be burned

to death. I do not need to characterize, as the Grand Jury has characterized, the kind of negligence responsible for that disaster.

"I think, however, it would probably be news to you, as it was to me when I was invited to take part in the present movement, to know that today, while we are talking about the matter at this hearing, scores of thousands—and I speak well within the figure—that scores of thousands of operatives are exposed to similar peril. Not only that, but while we are here, foundations are being laid, and structural iron and brick and stone put into place for new buildings where such intolerable conditions will be reproduced and multiplied. . . .

"I hope you will permit me to add a word in conclusion, your excellency. I should like you to know what Mr. Porter, the prominent industrial engineer, has authorized me to say to you, and he will be very glad to answer any questions you may ask him upon the subject, that by the inauguration of no kind of fire drills with which he is peculiarly familiar, however efficient they might be, would it be possible in case of fire to empty the operatives out of these buildings now existing and those which are being constructed. So that there are no means, outside of comprehensive legislation, that can remove the peril to operatives and to the community."

Shortly after this hearing the Factory Investigating Commission came into existence. It worked for six months and put in a preliminary report, which was followed by a series of bills for proposed legislative enactment. Some of these bills were vetoed on account of inherent defects, and those that were passed amounted to practically nothing. The term of the commission was extended for another year, and the thirty-two bills now before the legislature, and which you have asked me to criticize, are the result of its year and a half of work. Only five of these bills pertain to the fire hazard situation; all the rest are concerned with the improvement of sanitary conditions in factories and the conditions of wages and hours under which men, women and children work.

During the almost two years since the Asch building fire, conditions have remained exactly as Mr. Auerbach depicted them at the time of his address, nor will the recommendations in the legislation proposed by the commission in the five bills above referred to affect this condition materially. In other words, the commission has failed to fulfil the chief object of its creation.

The loft factory and other crowded conditions are abnormal. Measures are required to cure these conditions and to prevent their future recurrence. A law should be drafted requiring architects and builders to design buildings so that they may be emptied within a reasonable time, say three minutes. Before being accepted by the proper authorities the law should require these buildings to pass an emergency exit test and should provide for periodical exit tests to insure the maintenance of safe conditions.<sup>2</sup>

I do not wish to withhold from the commission

<sup>1</sup>See Warding off the Factory Fire Panic, THE SURVEY, January 7, 1911.

<sup>2</sup>See Fire Wall an Essential, THE SURVEY, July 15, 1911.

any meed of praise for the work which it has done in co-ordinating the forces which for many years have been urging reforms in sanitation and in the working conditions of men, women and children in the factories of the state. It has marshalled these forces and drafted legislation recommended by them which will undoubtedly be of tremendous value to the working people of the state at large. The work for which the Fifth Avenue Association and Committee on Safety went to Albany to have accomplished has scarcely been touched, however, and I feel that it is due to the people of the state that the special work for which this commission was created should be performed, otherwise there is imminent danger of another factory fire or a department store holocaust which will put all past horrors in the shade. There is still time for the commission to draft such a measure as I have outlined. It should not take many days for a group of experts such as the commission can readily secure to frame a comprehensive bill.

If the commission will not do this then that special work should be taken from its hands and placed in those of another commission, with specific instructions that the problems which Mr. Auerbach so graphically depicted shall be solved for all time for the protection of the lives of the thousands of operatives and the public who have been and are still in jeopardy.

## ORGANIZING FOR EFFICIENCY. BY JOHN R. SHILLADY, BUFFALO TUBERCULOSIS ASSOCIATION.

THE NEW YORK state factory bills, as a whole, make one "sit up and take notice." Social workers may well be enthusiastic in commendation of the work of the commission. The so-called organization bill is certainly the most effective piece of bill drafting affecting the Labor Department that we have yet seen in this state. The machinery is high grade and has "punch." In the first place the salaries are reasonable and adequate, and ought to appeal to socially minded and intelligent workers who wish to serve the state and its thousands of working people.

Significant is the increase in the number of factory inspectors from not more than 125 to not less than 125 and the change in minimum salaries to \$1,200 for the first grade up to \$3,500 for the seventh grade. Factory inspection has for too long in this country been merely a "job." Now there seems to be provided an opening for a career in this field.

The reorganization bills are notable in that they do not deal in glittering generalities but provide effective methods for carrying out the intent of the labor law. Dividing the state into two districts, with a deputy commissioner of labor designated as inspector general, provides a working area that can be advantageously handled.

The four bureaus provided for follow lines similar to those now in vogue—inspection, statistics and information, mediation and arbitration, and industries and immigration. An im-

portant division of the bureau of statistics and information is that of industrial accidents and diseases specifically provided for and not left to be looked after incidentally by a division already overburdened with detail.

The division of industrial hygiene is a distinct advance step and will receive the cordial approval of all readers of THE SURVEY. This division has the power to make special inspections of factories and other places of employment and to investigate industrial processes and conditions. One very important function of the division is that it shall propose rules and regulations and standards to the industrial board as provided for in another section of the bills. One great trouble with our present factory inspection system is that we have heretofore had no standards of sanitation, ventilation, lighting and safety which were recognized either by employers, employees, or factory inspectors. All social workers will look forward with great expectancy to the work of this bureau. One great possibility for this division is its educational campaign, through leaflets, bulletins and special printed matter affecting health and safety.

The first three grades of inspectors designated in the reorganization bill are allowed salaries of \$1,200, \$1,500 and \$1,800, respectively. These may be called factory inspectors *per se*. The inspectors of the fourth grade, with salaries of \$2,000, are investigators. Inspectors of the fifth grade, of whom one shall be able to speak five European languages in addition to English, are to act as supervising inspectors at a salary of \$2,500. Of these there shall not be more than nine. The inspectors of the sixth grade (of whom there shall not be less than three duly licensed physicians, one a woman), at \$2,500 salaries, are to be medical inspectors in the division of industrial hygiene. In addition to inspecting mercantile establishments and factories, the bills provide that they shall have charge of the physical examination and medical supervision of all children. It is to be regretted that the Factory Commission did not use the word "minor." I take it that "children" means persons sixteen years old and under. In many occupations medical social workers recognize grave dangers to the adolescent youth. Medical inspection of those over sixteen and under twenty-one would prevent many being thrown early in life on the human scrap heap.

Bill No. 28, in relation to dangerous trades, gives the industrial board power of requiring medical inspection of persons of all ages employed in any industry which, as a result of an investigation, shall have been found to be dangerous.

Inspectors of the seventh grade, of whom there shall be not less than four, at salaries of \$3,500, constitute the division of industrial hygiene. One, a physician, shall be designated the director, and receive \$500 additional compensation. Seventh-grade inspectors must include one physician, one chemical engineer, one mechanical engineer, and one expert in ventilation and accident prevention, a civil engineer, and an

expert in fire prevention and building construction.

The organization bill wisely provides for the assigning and transferring of factory inspectors from one district to another. This will permit the department to throw an effective working force into any community or to concentrate its force on any point for effective and prompt action.

The new division of home-work inspection will remove from our state the disgrace of the exploitation and degradation of workers that has been exposed by consumers' leagues, child labor committees, and *THE SURVEY*.

One provision of the bills that may be opposed is that allowing special counsel to advise with the labor commission and take charge of prosecutions. In factory matters I am convinced that the department should handle its own prosecutions to avoid delay and for effective work.

## THE FIRE BILLS. BY FRANCES PERKINS, EXECUTIVE SECRETARY, NEW YORK COMMITTEE ON SAFETY.

FIVE OF THE BILLS recommended for passage by the New York State Factory Investigating Commission deal with the problem of preventing fire in factories and protecting human life against fire. These five bills come from the commission as an answer to the question which was put by the horrified people of New York after the Asch building fire—"What can we do to prevent the recurrence of such a disaster and what can we do to protect from fire the lives of the workers in our factories?"

Two important principles are embodied in the bills: (1) That every possible precaution should be taken to prevent fire in factories; (2) That every person in a factory building should have adequate opportunity to escape to a place of safety in case of fire. Carrying out the first of these principles, the commission recommends certain obvious preventive measures such as the storing of inflammable waste in fireproof receptacles; the guarding of all gas jets; the prohibition of smoking; the enclosure in fireproof material of vertical openings between floors, and the installation of automatic sprinklers in buildings over seven stories in height.

Recognizing that, in spite of all measures for prevention, a fire or other disaster may make necessary the sudden escape of every person in a factory building to a place of safety, the commission recommends three specific methods of making this escape possible and of preventing loss of life in such emergencies:

1. That the number of persons who may occupy any factory or floor thereof shall be limited to such a number as can safely escape from the building by means of the exits provided. The rule for determining such number is specifically stated and we have here proposed a new and most important principle of building construction; namely, that the number of exits in a building should not depend upon the area or the height of the structure but upon the number of persons

who must use the exits. In new buildings, exit facilities will be provided by architects and builders for all the people who are to be employed therein; in existing buildings the effect of this regulation will be either to reduce the number of persons who can be employed to such a number as can escape by the present exit facilities or to force the provision of additional means of egress.

2. That the means of exit from all factory buildings shall be so safeguarded as to assure to the persons who, because of the existence of this means of exit, are allowed to be employed in the factory complete safety from fire during their passage from the building. This is largely a matter of building construction and consequently Bill No. 10 reads like a building code. It requires fireproof enclosure of stairways; provides for the proper construction, opening and size of doorways connecting with such stairways and with the street; requires in new buildings that the means of egress shall be of the best type, that is, either interior enclosed fireproof stairways, or smokeproof towers, or horizontal exits; prohibits the future building of winding stairways as means of egress; requires the proper safeguarding of fire escapes when allowed on existing buildings by the industrial board as a means of exit; requires that all rear stairways and exterior means of egress shall have direct connection with the street and shall no longer be allowed to empty into enclosed courts; provides that all factory buildings have at least two means of egress remote from each other; and requires the maintenance of free and unobstructed access to all means of egress and the plain marking of all such exits.

3. To prevent the loss of life which often ensues because panic-stricken people do not make the most effective use of the exit facilities provided, the commission recommends the installation in all factory buildings of fire alarm signal systems and fire drills, which shall be so arranged as to conduct all the occupants of a building to a place of safety and in which all the occupants shall participate simultaneously.

These fire bills submitted to the legislature by the commission present the skeleton of a complete program of fire prevention and fire protection for factory workers. The whole subject of fire prevention is in its infancy and no one recognizes more clearly than do the members of the commission that the specific regulations embodied in these bills may not in all cases provide adequate safety against special dangers. Realizing this and also the fact that from year to year and even from month to month new and improved methods of fire protection may be suggested by experts, the commission wisely recommends that the Industrial Board of the Department of Labor be given power to make special regulations to cover special cases and to make additional regulations for safeguarding the lives of the workers against fire.

The outline for this program of fire prevention and protection is so intelligent and the specific provisions recommended are so essential that

these bills merit the support of all thinking citizens who hope to see in the future as a part of our labor law a complete and adequate program of fire protection.

## CANNERY REGULATIONS. BY ZENAS L. POTTER, DEPARTMENT OF SURVEYS, RUSSELL SAGE FOUNDATION.

THE NEW YORK STATE Factory Investigating Commission's bills applying to the canneries, if passed and as law enforced, should effectively remedy every bad condition existing in the canning industry of the state, save only that of low wages. They would successfully terminate the ten years' fight for reasonable regulation of labor conditions in the canneries of the state.

The first bill is designed to abolish child labor. The state law prohibits the employment of children under fourteen years of age "in or in connection with any factory," but a former attorney-general held that work in canning factory "sheds," where fruits and vegetables are prepared, was neither work "in or in connection with any factory." The result has been that in many canneries grave abuses have been perpetrated and children from four to fourteen years of age have been frequently employed for very long hours. The bill is designed to prevent this exploitation. Objection has been raised to the form in which the bill was originally drawn, and it has been accordingly amended. It is a bill, however, with whose intent no good citizen can disagree. It is noteworthy in this regard that more than half the canners of the state have, without duress of law, already abolished child labor in their factories, and many of them will welcome its elimination from the industry. The passage of this bill will be a triumph for justice and progress.

The second bill regulates the hours of women's work. Last year, as a sacrifice to secure the passage of the fifty-four-hour law, the canneries were left entirely exempt from restriction of women's hours. The cannery investigation last summer revealed the fact that during the rush weeks last summer women worked in some factories as much as 110 and even 119¾ hours in a week. It also revealed the fact that in other canneries much more reasonable hours prevailed. The bill is designed to protect the vitality of women by establishing a standard of competition which will force all canneries to observe reasonable hours.

Heretofore, American legislatures have either placed canneries in the same class as other industries or have totally exempted them from the law fixing women's hours. The Factory Commission bill does neither. It recognizes the fact that in the canning industry periods of rush are followed by slack periods, so that the maximum hours per week worked in any factory are reached only in scattered weeks throughout the season. On the other hand it recognizes that women in the canneries are just as perishable as crops and more important, and limits the maximum number of hours they may work to

sixty per week from June 15 to October 15, and sixty-six per week from June 25 to August 5. It further wisely provides that to work women over sixty hours a factory must secure a permit from the industrial board of the reorganized Labor Department. This will give the board the power to require that any factory working women over sixty hours per week shall maintain the best of working conditions. Nearly all these features are taken from the English law.

The bill, in the opinion of the writer, protects the vitality of women workers and meets the peculiar conditions of the canning industry. It is not drafted in support of the principles of labor legislation regardless of the facts, but to support those principles intelligently applied to the facts; it also proves the value of just such investigations as the Factory Commission has conducted.

The third bill makes it illegal to falsify factory time books. One canner's books showed women working sixty hours in a week who actually worked, upon the confession of the employer under oath, 119¾ hours. This bill can have no opposition.

The cannery investigation showed that many of the labor camps connected with the canneries provide no proper sanitary conveniences, insufficient privacy for families, and that they are kept in a filthy condition. The fourth bill gives the Labor Department power to require proper sanitary conditions in all factory labor camps. It is a reasonable extension of the Labor Department's authority and can hardly meet objection.

If the Factory Commission can secure the enactment of these bills alone, its existence will be fully justified.

## DEPARTMENT OF INDUSTRIAL HYGIENE, LILLIAN D. WALD, NURSES' SETTLEMENT.

THE ESTABLISHMENT of a department of industrial hygiene is perhaps the most interesting proposal in the budget of bills presented to the legislature by the Factory Commission. The appointment of a board of scientific experts to investigate conditions, with a view to the creation of higher standards of sanitation, ventilation and safety, and with authority to make definite proposals for attaining these standards, is socially important. It promises the substitution of constructive suggestions for the merely negative police work, which, hitherto, has been largely the function of the Department of Labor. It is a provision which should, on this account, be welcomed by the community, and particularly by the manufacturer.

The average employer of labor does not wilfully create bad conditions in his factory. He, as well as the general public, is often ignorant of the fact that they are bad, not because he is indifferent, but because frequently the evil that exists and the effect of it upon the workingman can be discovered only by experts. Even when the evil is more obvious and is reported by the ordinary inspector, the employer is often uncon-

vinced or genuinely at a loss as to how to remedy it. The advantage in having a body of experts to investigate conditions with authority, not only to report the evil, but to suggest immediate and practical steps for correcting it, is obvious. It is a reversal of the relationship of the state to the employer as well as to the employe, placing upon the state the responsibility for improvement of its labor conditions.

We can hope that with the creation of this bureau, new industries will be investigated as they develop, and regulated before they reach such proportions as make regulation more difficult. The program of the proposed legislation requires expert knowledge, and can not be carried out by inspectors who have not had scientific, technical training.

The section of medical inspection in this division, with a staff of three doctors and a medical director, gives promise of excellent and much-needed work in the continuous investigations of occupational diseases and the effects of different occupations on the health of employes, and will ensure the medical supervision of children at work. It is a step toward intelligent, scientific supervision of industrial conditions.

## SAFEGUARDING WORKERS. BY STEPHEN S. WISE, RABBI OF THE FREE SYNAGOGUE, NEW YORK.

THE REPORT of the New York State Factory Investigating Commission is a telling document and sets a standard for future state commissions. The well-balanced group comprising the commission have been greatly furthered in the work by the co-operation within their ranks of their counsel, Abram I. Elkus, and his aide, Mr. Shientag, and the co-operation without of a goodly number of effective social workers.

For one thing, the commission has clearly aimed to elicit the facts; it has honestly sought to set them down; and, finally, it has dared to draw inferences, unlike Leslie Stephen's friend who said that he saw no reason for adding two and two as long as they persisted in making four when added.

The spirit and the purpose, alike, of the commission are set forth in the concluding words of the summary of the contents: "Whether this be true or not, we believe that human life is sacred and must be placed above monetary considerations. The broad aim of government is the happiness and well-being of the governed. No government is properly performing its function when it permits the working people within its bounds to be employed under unsanitary conditions, when it fails to protect them from preventable disease and accident, when it permits the premature employment of its young children, and the excessive toil of its women. Short-sighted, indeed, is the policy of any state that permits the waste of its human assets."

The most significant feature of the report is to be found in those recommendations which bear upon the labor law and its administration. Here, in the judgment of the commission, as

embodied in the legislation proposed by it, there is to be no tinkering, but a fundamental attempt to re-create the entire Department of Labor. The report puts the question concisely. The Department of Labor should be one of the great departments of the state. A great department it has not been. A great department it may become, and more effective it is almost sure to become if the recommendations of the commission be carried out with respect to reorganization and the creation of an industrial board. This board, I take it, is designed to lift up the entire Department of Labor above the low level of mere law enforcement. In other words, it is to investigate, it is to recommend, it is to initiate, it is to prescribe. The department, as the result of the co-operation of an industrial board—assuming of course that the industrial board will be properly manned—is to take its place as one of the important and significant bureaus of the state government, charged with important duties and dowered with wide powers.

The question of tenement manufacture is vigorously handled. The commission frankly acknowledges the intolerable evils of the system, declaring that manufacturing in tenement houses is a serious evil, that it is, in fact, a blot on our industrial system. The commission virtually assumes that regulation of tenement manufacturing is impossible, and that what it calls necessary control over unsanitary and unhealthful conditions of work in tenement houses cannot be secured by inspection and supervision. None the less, it is ready to tolerate the continuance of tenement work under conditions which, in its judgment, would make for more careful inspection and for the abatement of the most obvious evils of the system. The commission hopes, too, that the industrial board may abate some of the gravest of the evils of tenement work, but it significantly concludes, "It is probable, however, that in the future more radical action will be necessary." Why the commission, quoting it literally, did not feel justified in recommending that the whole system be rooted out at once, it is difficult to understand. Why put off for two or three years the attempt to grapple with the evil of tenement work, since it is virtually admitted in advance that nothing less than elimination will avail. There are some industrial evils which no measure of regulation or inspection will suffice to remedy. Of all such evils, tenement work is the most serious in its hurtful effects upon the body politic.

The fourth section of the report, bearing on the canneries, gives us some of the most vigorous passages in the entire document. The evil results of exemption from the provisions of the factory law with regard to the work of women are clearly shown. The commission rightly names the canning industry an entirely unregulated one—since, as the commission puts it, the exemption was directly opposed to the best interests of the state and was granted because of misapprehension of the true conditions in the industry. It is regrettable to find that the commission yet urges that it would be unfair and

unreasonable to the workers to apply the fifty-four hour law to the canneries during the busy season. The injury which it is fancied would result from the application of the fifty-four hour law to canneries would not compare in gravity with the injury which would continue to result from the exemption, legally partial, but almost certain to become wide-open and unregulated. We do not believe that the hours of labor of women during the canning season—for four months in the year—should be permitted to be sixty hours per week.

The most significant recommendation of the commission with regard to child labor is that which would empower the industrial board to cancel work certificates in the case of children who are physically unfitted to remain at work, and the further recommendation which would look to the measurably accurate standardizing of educational requirements in the case of child workers.

The commission expresses itself most vigorously and directly in recommending that night work of women in factories and workshops of the city be at once prohibited, and rightly holding that such work is unnecessary from an economic point of view and indefensible from the standpoint of public welfare, for it is dangerous to health, inimical to good morals and destructive of the vitality of women as wives and mothers. The commission touches the crux of the situation in its insistence that in order that the enforcement of the inhibition of night work by women may be made possible, there must be legal closing and opening hours and that unless definite hours are set, before and after which work is illegal, it becomes almost impossible completely to prevent the evil of night work.

Perhaps no section of the report is more significant than that which deals with the employment of women and children in mercantile establishments. The findings with respect to hours of work and wages are indeed woeful. It seems incredible that there should be no limitation whatever upon the hours of work of women over twenty-one, and that New York, as the commission expresses it, alone of all the large industrial states, fails to protect adult women employed in stores. The distinction as to wages and hours of work with respect to employment in stores and shops imposes a grievous burden upon a multitude of women workers in the state. It rests upon the wrong assumption that work in stores is easy as compared with factory work, and the evil has been perpetuated up to this time as a result of the persistence of a well-organized and too powerful department-store lobby.

It now rests with the legislature to embody the recommendations of the commission into law, and there should be no mutilating of the proposed bills. The commission admittedly asks for a minimum of legislation and its minimum proposals cannot be modified without being mutilated and rendered virtually valueless. The legislature of New York faces a great task and, irrespective of partisan sympathies, it may be wished that to this task the legislature may

prove itself equal to the end that the Empire State may be imperial not only in its wealth and power but first among the states of the Union in its care for the workers, in its safeguarding of the rights of the men and women employed in its industries.

## HOME WORK, BY PAULINE GOLD-MARK, SECRETARY NEW YORK CONSUMERS LEAGUE.

IN RECOMMENDING the abolition of certain forms of Tenement House Work. The Factory Commission has taken a step of far-reaching significance. For twenty-eight years, since the Court of Appeals in the Jacobs case in 1885 declared unconstitutional the law prohibiting the manufacture of cigars in tenement houses, no attempt has been made to prohibit home work in the tenements, though the evils have been widely known and condemned.

Now at last in the home work bill, together with the investigation and report upon which it is based, the commission has fairly faced the issue. It has performed a service of such signal value that this alone would insure lasting recognition of the high quality of the commission's work. Its recent investigations have clearly revealed that home work is an unmitigated evil: that it is carried on in unclean and unsanitary surroundings; in homes where there is disease, and that because the work of young children is permitted, it nullifies the child labor and compulsory education laws. These reasons clearly justify the sweeping prohibition of the work of children under fourteen years of age.

Surely no one who reads the forty odd pages of the commission's report devoted to the discussion of home work can have any reasonable doubt that the proposed measures are needed on grounds of health. The arguments are marshalled with convincing clearness.

The recommendations include the immediate prohibition of the manufacture of food products since they are more "liable to contamination than any others and their preparation under entirely sanitary and hygienic conditions is a matter absolutely necessary to the public health."

Besides proposing to remove food preparation from the tenements, the commission has opened up a new method of attack upon home work, so long entrenched behind the Jacobs decision. On grounds of health, the commission would prohibit the manufacture in tenements of all articles to be worn and of certain toys handled by children on the express ground that children are more susceptible than adults to contagious diseases liable to be transmitted by these articles. "It is intolerable," says the report of the commission in no uncertain terms, "that the manufacture of garments and other articles to be worn by them, or which they play with, should be permitted under circumstances that may tend to spread disease." The articles to be prohibited include children's and infants' wearing apparel of all kinds, and dolls and dolls' clothing.

The classification of prohibited articles, the

commission argues, is "reasonable and one that may, under the decisions, properly be made by the legislature." The decision in the Jacobs case need not be held as authority to the contrary. For the decision in that case was based on the assumption that the act was not a health measure, and that it was not enacted in the interests of public health. But if the public health is shown to be involved in the manufacture of the newly prohibited articles the reasoning in the Jacobs case falls to the ground.

If, then, the proposed bill passes, an entering wedge will be driven home: Certain forms of tenement work, clearly detrimental to health, will at last be legally abolished with good reason to expect the concurrence of the courts.

The commission goes even further in its findings, and points to the possibility of further action, which in the opinion of many experts, is the ultimate solution of this complex problem—namely, the total prohibition of home work in the tenements. With the frank acceptance of facts which it has shown throughout, the commission concludes with the clear-sighted statement: "If the necessary control over unsanitary and unhealthy conditions of work cannot be secured by inspection and supervision, then all manufacturing in tenement houses should be prohibited in the interest of the home workers, of the dwellers in tenement houses and of the public at large."

### THE WIDOWS' PENSION CONTROVERSY

TO THE EDITOR:

Mr. Carstens' report on widows' pensions, if we are to judge by that part of it which appeared in *THE SURVEY* of January 4, shows a painstaking study and fair-minded presentation of facts. But can it be said that his conclusions are fairly drawn from these facts?

That the Illinois law does not provide for adequate administration is evident; it is also evident that such success as it has had is due first to Judge Pinckney and second to the group of volunteers who constitute the case committee. Mr. Carstens also makes it plain that neither the probation officers nor the county agents were fitted to their task; but none of these drawbacks is inherent in the principle of widows' pensions. What evidence do we find then, in the facts so clearly set forth, of the inherent dangers feared by opponents of this principle?

We find that of the 100 cases studied, in 72 the school attendance was satisfactory; in 86 the mother was with her children a reasonable amount of time; in 74 there was no evidence of undue dependence in the attitude of mothers and children; in 81 the standards of the family are such that the home should be maintained for both mother and children; in 58 improvements are noted over the care that the family had previous to the pension period. We find that "in

a large majority of the cases visited there was no evidence of wanton recklessness, extravagance or foolishness in the expenditures," and that "there are many in the total number who have a large measure of family life and whose care of the children is most excellent."

Do not these results compare well with the records of most private relief agencies, especially when it is borne in mind that the administration of the pension has not been safeguarded by a carefully chosen group of agents, but has been in the hands of "a corps of visitors who are largely unfit for such serious responsibilities?"

Of this last fact Mr. Carstens gives us evidence in his statement that in 64 of the cases the investigation was not satisfactory; in 89 the supervision was not sufficient to affect the family in the health, training and diet of the children, and that "in only 7 instances did there seem to be any looking ahead on the part of the probation officer or family to a period of self-support or to a better plan for the family life; while 88 families seemed to be living on without the development of any plan for the future."

An unfit body of administrators is not an argument against the principle involved in the question. When the placing-out plan for the care of dependent children was under discussion a generation ago its opponents might have found many instances of placing-out work in the hands of untrustworthy town and county officials; but who today would go back to institutional care for our state minor wards in Massachusetts?

There are two other facts which Mr. Carstens' table brings out. One is that in 34 instances "the application was due to the existence of a pension plan from public funds;" the other, that in 51 instances "the church, relatives, employers or private societies have become less interested or ceased their interest altogether since the pension began."

The first of these facts seems to show that there is a class of the needy whose self-respect will not permit them to apply for private charity, but who are willing to accept help from the state in the form of such a pension. Is this class rightly called a "newly-created group of dependents?" Is it not rather a newly-created group of employes of the state? It would be interesting to inquire further into this group of 34 families, to find out what, without the existence of the pension plan, their plan of life would have been. Would these mothers have gone out to work by the day, leaving the children to shift for themselves until such time as the usual percentage of them drifted into the Juvenile Court or the Children's Society, and the homes were then broken up not for "reasons of poverty" but because of the waywardness or delinquency of the children?

As to the lessening interest, in 51 instances, on the part of church, relatives, employers and private societies, the statement is too inclusive to be significant. A lessening interest on the part of private societies would indicate that the pension was doing its work adequately. A lessening interest on the part of church, relatives and employers might indicate the same thing and might

be accompanied by a growth in a finer relationship. May not a consciousness of indebtedness to church, relatives and employes be a more demoralizing influence on the widow than a consciousness of temporary indebtedness to the state, which is to be paid off by the proper upbringing of her children as its citizens?

Mr. Carstens speaks of "the payment of a lump sum from the public treasury as a substitute for family and neighborhood responsibility." Is not the principle of widows' pensions rather an extension of neighborhood responsibility than a substitute for it? In the present vast and intricate plan of society is not the real responsibility with the state rather than with the neighborhood?

Yesterday a man died of tuberculosis in a crowded tenement. Does the responsibility for his children lie with his brother, who lives next door and who is struggling against the same conditions, or does it lie with all of us who constitute the state and who permit these conditions to go on?

When we seek for a rigid enforcement of responsibilities let us first of all find where the responsibilities rest. Let us reflect whether a rigid enforcement of responsibility, where the responsibility is not real, may not do more to undo the ties of kinship than the dreaded state pension.

Let us go ahead with measures that look toward the prevention of accident, disease and death; let us have compensation for occupational diseases as well as accidents; let us have a plan of social insurance, but let us make sure that it is not simply a plan of chaining the burden to the back too weak to hold it; let us find where the responsibility lies and then let us rigidly enforce it; but even so will there not still be premature deaths for which no one person or group of persons is responsible? Is not then the state responsible, and is it not a responsibility which calls for "rigid and intelligent enforcement?" Such enforcement should produce a tie, a sense of reciprocal responsibility between the family and the state which ought to result in a constantly improving citizenship.

Let us read Mr. Carstens' conclusions in the light of his figures; let us not read his figures in the gloom of his conclusions.

M. L. HALE.

Boston.

#### TO THE EDITOR:

I have read the above letter with much interest. The writer has voiced the sentiment of a considerable number of people in each one of our communities, and I have no doubt that we shall all benefit from a frank discussion of our differences.

In a few particulars the writer has clearly drawn a different conclusion from my own. For instance, the letter is inclined to interpret the fact that in thirty-four instances where the application was due to the existence of a pension plan from public funds as an indication that the mothers in these instances would have continued to go out to work and to leave the children to shift for

themselves until they drifted into the Juvenile Court or the Children's Society, when the homes would have been broken up, not for "reasons of poverty" but "because of waywardness or delinquency." A considerable number of these thirty-four, however, were aided, without apparent objection, by relatives or friends, employers or others until the public pension was brought to the attention of that family and its friends, who thereupon seemed to have become less charitable because of its existence. It does not follow therefore that all of these children would have starved without the pension fund, or that the mothers would have neglected their children or have been deprived of them.

I wonder also whether the writer, in comparing the home conditions of the one hundred families visited with those of the average families of private relief agencies, has kept in mind that both the case committee and the court had very carefully selected a group of pensionable widows, and that these were not the average beneficiaries who had applied to the court for help or to be compared with any hundred relief cases under the care of a society. The results in this specially selected group were under discussion, and most of them had been under the supervision of probation officers so short a time as to show neither good nor bad results.

I fear, however, that the principal reason that the writer and I have reached a different conclusion is because we have started with a different major premise. If we start with the assumption that the state has married the parents and therefore endows them and their offspring, we may very well argue from the standpoint of making the mother, by the fact of her motherhood, an "employee of the state." But if so, why are not the fathers also such employees, and the children, at least, potential employees? This also raises the question whether motherhood may reasonably be thought of as endowed when the offspring in so many cases is either illegitimate, misshapen, undernourished or diseased, a constant care and menace, or an expense to the state rather than an asset or a blessing.

If, on the other hand, we expect the state to protect the life of its members, to train them for good citizenship, to help them make the most of themselves, to stimulate initiative and responsibility and not to deaden them, and to work in behalf of its members always only so far as it is for its own protection and best interests, we are apt to reach a different conclusion.

But whether we assume that every widow by the fact of her widowhood, or only those who cannot be taken care of in other natural and reasonable ways, are eligible, the granting of pensions to mothers with dependent children from public funds has some inherent difficulties. A pension from public funds will be more readily sought, more easily granted, and less easily stopped when the time of need has passed than if it comes from private sources.

These difficulties, serious as they are, are, however, not insurmountable. But when by law it is recognized that widows are a group that re-

quire special legislation, to be placed in the care of a special department of government or special commission, then the widows of our communities become a special dependent class whose demands the public authorities will oppose with increasing difficulty and hesitation and whom politicians will use for their own purposes as was done in the recent election in Chicago.

C. C. CARSTENS.

[Secretary and General Agent Massachusetts Society for the Prevention of Cruelty to Children.]  
Boston.

## MUSCATINE

### TO THE EDITOR:

It is alleged in editorial comments appended to my communication in your issue of November 30 that my means of obtaining information did not qualify me to speak as I did of conditions in Muscatine, Iowa. This I emphatically deny, and had I opportunity I could point out to your informant, whoever he may be, where he is in error in each particular given by him. It is also assumed in your editorial that I made criticism of a report submitted by a committee of THE SURVEY and approved by it. I made no reference whatever to such report but confined myself to statements made by Mr. Ward and Mr. Batten, separately, in your issue of June 1.

On only one point does your editorial note take issue with statements made by me, and that is wherein you say "the courts have not sustained Mr. Mahin's contention concerning acts of strikers," etc. No honorable person acquainted with the facts will deny that there were acts of violence. This fact does not depend on my statement. A similar statement signed by the ministerial association of Muscatine before I wrote to you on the subject was published in a Chicago paper in refutation of misrepresentations by H. F. Ward. Besides, the court in Muscatine sent a man to the penitentiary for malicious mischief on the premises of a non-union worker and would have punished others on similar charges had they not absconded. Just before writing my communication to you I spent nearly a week in Muscatine. I mention this to show that I was not lacking in opportunity to obtain correct information as to the matters referred to.

But you give as the first and therefore presumably the chief reason why my testimony should be discredited that I am "a man of advanced age." This is a broad charge, as it includes all men of advanced age. It will strike many as a queer discovery. It sets at naught Longfellow's soothing saying that "age is opportunity not less than youth" and also the familiar adage which speaks of "old men for counsel and young men for war." When he

who penned this uncalled-for insult to me shall have become "a man of advanced age," I am sure that neither one of my two noble sons will be so lacking in common courtesy and sense of justice (saying nothing of respect due to the aged) to seek to reproach him on account of it, or use it as a reason why his testimony should be discarded or his opinion derided.

JOHN MAHIN.

Evanston, Ill.

[There is one point in Mr. Mahin's letter in which THE SURVEY note was clearly in error; namely, his week's visit to Muscatine. But for the rest, the reader is referred to the report of the special investigating committee of the Commission on Social Service of the Federal Council of Churches of Christ in America.

Mr. Mahin inadvertently refers to this body as a "Committee of THE SURVEY," and he, of course, wholly misconstrues the reference to his advanced age in our editorial note. The point was offered as a partial explanation of the break between the conclusions of this old-time resident of Muscatine and those of the committee of inquiry.—Ed.]

## THE AIM AND THE NAME

### TO THE EDITOR:

Anent Dr. Patten's letter of January 3—Is it not well within the possibilities that the time of the two-thirds who are convinced has come?

How is it possible to tell without banding for a trial at coercing that other third?

And shall we quibble over a name for this new consciousness, this bigness in men's hearts, this swelling hurt which portends the agony and exaltation of birth—God send the birth of a universal conscience.

It is written that the great Teacher was called by many names, both true and false, and that some were afraid to follow by reason of this, but not till men were a long way from his spirit did divisions and schools arise.

It has, even within our own ken, been maintained, and hotly, that his teachings would lose their power to save and heal were his generation merely the stupendous marvel of creation by which we all enter into life, and even this contention made breach between brothers.

There is that before us to do, which gives a new and startling meaning to the constitutional right to life, liberty and the pursuit of happiness. For this is the first time in the history of civilization when even the most unthinking men and women believe that not only has every man such a right but every woman also and that every child, born and unborn, has a further right to demand at our hands a chance for this life and happiness.

In the face of this demand is there time to speak of schools and divisions or to hint at the possibility of the making of schools and divisions. May we not leave this to the theologians?

Shall a man desert his captain in the heat of the march because the words of his mouth are displeasing to his refinement?

We are convinced that we have one goal. Why jostle and shoulder each other? It hinders.

DAVID CHURCHILL.

Northampton, Mass.

# THE COMMON WELFARE

## CHICAGO'S ADIEU TO JANE ADDAMS

The head resident of Hull House sailed last week for a four months' trip to Egypt and Italy—the only respite from her incessant work which Miss Addams has taken in winter time for many a year. Her last fortnight at home was filled with daily addresses. Although she is to be absent only four months, every good cause and special occasion which could possibly lay claim to a last word from her did so, and they all got it.

A great outpouring of good fellowship occurred on Miss Addams' last evening in the city, when, at the call of the Progressive Club of Chicago, over 1,200 guests gathered at a farewell dinner which filled and overflowed the largest banquet halls of the Hotel La Salle.

When, by the removal of the tables, all were gathered together, story tellers, singers, cartoonists, legislators and settlement associates vied with each other in paying tribute. After George Fitch, John T. McCutcheon, Bert Leston Taylor, Mary E. McDowell and Richard Henry Little had done their best, Bainbridge Colby of New York the last speaker tried "to do them one better" by saying:

"At a gathering of Polish patriots held years ago, to voice their undying sense of nationality and defy their oppressors, one patriot proposed a toast in these words, 'Where liberty is, there is my country.' He was followed by a younger man of equal fervor but sounder philosophy, who proposed as his sentiment, 'Where liberty is not, there is my country.'

"The guest of honor, your distinguished fellow citizen, Miss Addams, has built her life upon this latter thought—where liberty is not, liberty of opportunity, equality of chance, of outlook, of promise, of circumstance, there has been her country.

"What an extraordinary mission in life is hers, and how wondrously her life has preached the sermon of the deed! Refusing to lull her conscience by a dreamer's scheme, unbeguiled by paper reforms, she set out early in life—and I use her words—'to make social intercourse express the growing sense of the economic unity of society and to add the social function to democracy.' Proceeding upon the sober theory that the dependence of classes upon each other is reciprocal, she determined to deal directly with the simplest human wants.

"It is Miss Addams who has finely said that 'a tumult of feeling is always produced by con-

tact with a conscience,' and I confess that in approaching the record of her life so steadily and serenely conscience-governed, I feel the tumult of which she speaks.

"Abounding in achievement as her life has been, I venture the assertion that the year just closed is the richest and most fruitful of her life thus far. This year she has sown broadcast the seeds of ripened purpose, of experience and deep reflection. She has scattered wide the accumulations of the past. To a waiting and famished people, who hungered and thirsted after righteousness, she has thrown the rich spoils of her life.

"She has espoused a party which seeks to make humanity an article of our national faith. She has built, she has sustained, she has inspired—she is a leader of that party. As such we hail her. We make our grateful acknowledgment of her services. We pledge our admiring respect."

The chairman interspersed the speeches with valentine verses. He also claimed to have received messages from the Khedive of Egypt, the King of Greece and Premier Asquith—somewhat timidly expressing greetings, but with strange unanimity telling Miss Addams not to stay too long and to stir up the women of their respective lands as little as possible.

With no trace of the manner of "the guest of honor," Miss Addams rose to strike one note of hope in bringing men and women together in the united effort to secure recognition for the human issues of industry, childhood, womanhood, and family in our political policies and legislative programs.

To the air *My Bonnie Lies Over the Ocean* everybody sang:

Jane Addams sails over the ocean,  
Jane Addams sails over the sea,  
We're glad she's to have a vacation,  
But bring back Jane Addams to me.

We'll lend her to Greece and to Egypt,  
Jerusalem, Athens and Rome,  
We'll lend her to Europe and Asia,  
So long as we get her back home.

The Peace Dove will perch on her shoulder,  
All Europe will dwell in accord,  
The Turks will go back to rug-making,  
The Balkans will put up the sword.

In the *Chicago Daily News* the day of her departure Graham Taylor paid this editorial tribute to his colleague and friend, under the title *In the Light of Lincoln's Life*:

"Today Jane Addams—Chicago's foremost citizen—leaves us for a well-earned respite abroad from her work with us all. Last evening as many of her friends as could crowd into two of the largest banquet halls in one of our greatest hotels vied with each other in bidding her Godspeed.

"But an even greater host of her fellow citizens, of every race and residence, in every condition and status, are whispering in their hearts, 'Good-by and God bless you.' No one could be more missed from Chicago than she. Every good cause, especially the hardest to promote, will lack something of strength and courage while she is gone. She has humanized, idealized, united, fraternalized, put to work and set forward so many of us. No one among us is so Lincoln-like in spirit. Perhaps it is because her father was Lincoln's personal friend—the Addams with the two D's—he called him. Like Lincoln, she is as all-human as she is all-American. America accounts for her, but humanity claims her. She is ours, yet belongs to every one else. Back to us may she come to work with us all more than ever. 'It was that word *with* from Jane Addams,' said a working woman, 'that took the bitterness out of my life. For if she wanted to work with me and I could work with her, it gave my life new meaning and hope.' The hope of democracy roots in that word '*with*.'"

#### ARIZONA'S PROGRAM FOR CHILD WELFARE

Youthful but ambitious Arizona, the newest and last of the continental states to be admitted into the Union, proudly asserts that she has already established an enviable record for social betterment legislation. The new commonwealth made an especial effort to put upon its statute books the best child labor law in the United States. At the same time Francis H. McLean, whose article *The City of Life and Death* (Phoenix, Ariz.), appears on page 754, declares that neither Phoenix nor Tucson, the two largest towns, have awakened sufficiently to the need of supporting the volunteer social organizations whose day-to-day work means much to the childhood of the state.

Phoenix, the capital, leads the state in the number of its social agencies and in its influence upon welfare legislation. In this ambitious city of 18,000 people is the largest associated charities society, the headquarters of the anti-tuberculosis league, the only public tubercu-

losis sanatorium, a juvenile court, a detention home for children and a Florence Crittenden Home.

These agencies have been urged to rally and prevent the establishment of a permanent home for dependent children. There is at present no such institution and it is possible, Mr. McLean says, "to go the entire limit in placing out from temporary homes, subject, of course, to strong supervision." The organization of a state home-finding society to take charge of all placing out work has been recommended as the first step for systematizing this service. Other needs according to Mr. McLean "are an institution for the feeble-minded, and insistence upon a strict civil service system in the state's institutions. This insistence should be accompanied by the power to bring the best people from anywhere in the country to serve in the responsible positions."

A measure granting to the juvenile courts power to require a physical examination of all delinquent children arraigned before them, has been urged as a step toward placing these tribunals on a par with the best in the country. Among the bills which failed to pass the legislature at its last session, but which will probably be reintroduced, was one requiring children whether minors or adults to support their parents to the limit of their ability in view of their own family responsibilities. An attempt will also be made to extend the juvenile court statutes so as to include within their scope all minors and to take away the somewhat large discretion still left to the courts and probation officers to place children in families of a different religious belief from that of their parents.

This extensive program for child welfare as well as the legislation regulating child labor and the labor of women, which was passed at the first regular and the first special sessions of the legislature, is an indication, says Mr. McLean, that the citizens of Arizona "wish to have their state grow up to a fine and clean womanhood." But he also asserts that:

"here, as in the Northwest, one sees a strange paradox, a people above all things, virile and individual, imagining that the ideal state will come through legislation alone, without individual quickening of conscience and perception through the light of education furnished by voluntary organizations. . . . But a few leaders have arisen and there is a genuine spirit of comradeship abroad. While the task of developing increased interest will be painfully long, it cannot but come."

## MECHANICAL SHORT CUTS USED IN CENSUS WORK

Every ten years the United States takes a trial balance and publishes the results in a series of bulky volumes. The decennial census returns in a very true sense constitute our national balance sheets. On page 757 Miss Claghorn tells what the first complete instalment of this balance sheet, the "Abstracts of the Thirteenth Census," shows and the classes of facts which it presents.

But in striking his balance the census expert, like the modern banker or corporation official, was greatly aided by ingenious mechanical devices. The population statistics for 1910, like those for 1890 and 1900, were tabulated by a punch card system.

The machines used for the eleventh and twelfth censuses were rented from a private concern, but those for the thirteenth, while based in part upon the principles employed in the previous machines, were constructed from designs made in the Census Bureau and are owned by the government.

Under this system a card is prepared for each person, upon which the facts as to sex, race, age, marital condition and place of birth are indicated by the punching of appropriate holes. The cards were punched, for the most part, by machines which contained 240 keys or one for every item to be recorded. Each key is set by the operator in the same way as those of an adding-machine, but no hole is punched until all of the keys are depressed, so that errors can be corrected. By touching a hand bar, holes corresponding to the keys pushed down are made by means of electric power and the next card is brought into place for punching.

The cards after being punched are systematically verified, in part by reading back to the schedule but mainly by the use of electric tabulating machines which reject automatically any card lacking the required number of holes or any card containing holes apparently inconsistent with one another, as, for example, one indicating that a person, though less than ten years of age, is married.

All the cards are then sorted according to main classes by special machines. Electric contacts made through the punched holes determine the groups into which the cards are sorted. After sorting, the cards of each group are passed through the tabulating machines in order to record numerous facts regarding the characteristics of the persons in the given group. As many as eighty counters are sometimes operated at one time. The results for any given group of cards as recorded on the counters are automatically printed.

On account of the complexity of the statistics required, each card must be run through the tab-

CARD TABULATING MACHINES IN USE

Partial view of room in census building

ulating machines several times. The different operations necessary for the complete tabulation of the scheduled facts concerning more than 90,000,000 people made the work equivalent to handling over 700,000,000 cards on the sorting and tabulating machines.

By the old hand-tally methods in vogue before the introduction of the punch-card system it would have cost several times as much to obtain the same results. In fact, according to the census officials it would not have been considered worth while to tabulate the statistics in such a complex manner by hand methods, and the public would have been without much of the information which can now be derived from the census.

## STAVING OFF THE FIREMEN'S STRIKE

On the morning of February 18 it looked as if there would be a strike of firemen on the railroads of the eastern district, since these workers had been unable to secure a settlement of their demands or to agree upon a plan of arbitration with the railroads. This district is practically the same as that involved in the wage controversy of the engineers which, according to report of the arbitration board in that case, includes a population of over 38,000,000 people with nearly 67,000 miles of main track which handle from 42 to 47 per cent of the traffic of the United States.

Before noon, however, an agreement was

reached with the railroads to submit the matter to three arbitrators under the terms of the Erdman act. This was a concession on the part of the railroads which had been standing out against arbitration under that law. They proposed a board of seven similar to the one which last summer arbitrated the demands of the engineers in line with a voluntary agreement between the engineers and the railroads.

Both railroads and firemen had up to this point stubbornly refused to recede from their positions, each calling the public to witness that if a strike ensued, it would be the fault of the other.

Since the first of the year there have been really two controversies between the firemen and the railroads, one as to wages and the other over the manner of arbitration. At the last the second controversy so overshadowed the first that the wage difficulty was all but forgotten.

The wage controversy goes back to April, 1912, when the firemen first made demands. The engineers had previously asked for higher wages, and both groups of workers understood that upon the settlement of their claim would to a certain extent, depend the settlement of the claims of firemen and other railway employees. In the case of the firemen, as was true of the engineers of the eastern district, their wages have long been somewhat below those paid by the railroads of the western district.

The board of arbitration in the engineers' case compiled from the statistics of the Interstate Commerce Commission tables of wages paid in the various districts, not only for engineers but for other railway employees.

These figures would indicate that the firemen in the western district were receiving in 1911 about 10 per cent more than those of the east. The eastern firemen in statements that they have given out to the public claim to be making a demand for an advance that will average 15 per cent, and that this advance will equalize wages between the east and west. The railroads, on the other hand, claim that the demands of the firemen will amount to a 35 per cent increase, and they are not willing to say, without reference to data not yet compiled, that a 35 per cent increase would be greatly in excess of the wages now paid in the west.

It has been the contention of the firemen that the Interstate Commerce Commission's statistics are inaccurate; that they are merely the statements of the railroad companies assembled and published by the government; that they are not compiled on the same basis, take no account of the differences in the length of working day in the different territories covered, and fail to distinguish overtime from the earnings of the normal working day. It is conceded by both

sides that the wages of the firemen in the east are considerably below those of the west.

The firemen's original demand as to wages included the payment of time and one-half rates for overtime after ten hours. In support of this claim they declared that the federal sixteen-hour law

"has practically created a sixteen-hour day for men employed in freight train service. . . . As workers in other industries have found relief from excessive hours of labor by securing an excessive rate of pay for overtime, so the firemen sought relief from conditions of employment that are unbearable."

On becoming convinced that it would be impractical to press this demand, however, the firemen eliminated it, and it will not go before the arbitration board.

Outside of wages, the most important demand was for the employment of two firemen on the larger engines on account of the severe strain involved in stoking. The original demand of April, 1912, called for the granting of an additional fireman on 13,500 engines in the eastern district. In a conference held December 2, 1912, this claim was modified to include about 5,000 engines, and on December 18, it was further modified until it includes only about 2,000. With regard to this claim the railroad managers insist that it is but the entering wedge preparatory to a demand for placing two firemen on all engines. Consequently, they have absolutely refused to grant the request. The matter will probably be thoroughly thrashed out before the arbitration board.

#### BACK TO THE ERDMAN ACT

The issue that is clearest at the present time, and one upon which it is possible to be more fully informed, is with regard to the facilities at hand for adjusting or arbitrating disputes upon railroads. From the point of view of the public this may well be considered the most important aspect of the situation. When it became evident that negotiations between the railroads and the firemen would amount to nothing, the question of arbitration was broached, with the result that the two methods mentioned above were proposed. The opposition of the firemen to departing from the Erdman act grew partly out of the experience of the engineers with the different form of arbitration.

One point was the length of time consumed by the board in the engineers' case. The engineers' claims date, as do those of the firemen, from April, 1912. The arbitration board began to hold hearings in July, and it was November before its award was announced to take effect from the previous April. But as late as February 17

last, while the firemen's strike was hanging in the balance, Warren S. Stone, chief of the Brotherhood of Locomotive Engineers, stated that only one railroad had put the settlement into effect, and there was so much difference of opinion over the exact meaning of the award that a meeting had been called at Chicago by Chairman Van Hise for February 20 to "decide what the award really means."

Again, the engineers' arbitrators entered into the general question of the settlement of disputes upon railroads and recommended a scheme which seemed to involve compulsory arbitration. In a statement given to the public, President Carter of the Brotherhood of Firemen intimated that it was the purpose of the railroads "to mold public sentiment to the end that legislation will be enacted forbidding railway strikes."

The more concrete objections of the firemen, however, were, first, that if arbitration were resorted to, other than as prescribed by the Erdman act, it would be impossible to punish witnesses for perjured testimony even if they should be sworn, and, second, that there would be no legal procedure laid down which the arbitrators would have to follow. Hence, they would be free, as were the arbitrators in the engineers' case, to seek evidence wherever they might find it. It was charged that this board got much new evidence of its own after the hearings had been closed and based its award upon this new evidence without either side having an opportunity to protest against its admission. Much of this evidence, particularly wage statistics, was from the reports of the Interstate Commerce Commission, which the firemen claimed are faulty and inaccurate.

Their objections to arbitration under the Erdman act were summed up by the committee of railroad managers in a letter addressed to Judge Knapp and G. W. W. Hanger, acting commissioner of labor, announcing their final acceptance of such arbitration in order to avoid a strike:

"At the urgent request of you as representatives of the government, and under the strongest protest we are able to voice, the managers' committee agree to arbitrate the firemen controversy under the Erdman act. The managers also desire to give notice at this time that they shall earnestly request that the hearings in this arbitration be open to the public.

"As the managers have stood out to the limit against arbitration under the Erdman act, and as the government—or the public—is responsible for whatever the consequences may be, the managers reiterate their principal objections to the Erdman act. These were pointed out by the board of arbitration in the engineers' case:

"The responsibility which would ultimately rest upon a third member of an Erdman arbitration board was too great to impose on any one man.

"The operation of the act is to settle a dispute rather than to adjudicate a controversy.

"The arbitrators are three in number. Each side is represented by one arbitrator. It rests, therefore, upon the third arbitrator to bring the other two arbitrators as nearly as possible together, and if he cannot do so he must decide between them. This is accomplished by splitting differences, and the case may be adjusted without adequate investigation of the facts involved, and the award may not rest upon a basis of equity.

"But the most fundamental defect of the Erdman act is that the interests of the public are not guarded by it."

"The managers feel that the public will not tolerate a strike, and realizing their threetold responsibility to the public, their men, and their shareholders, they only agreed to arbitration under the Erdman act when it seemed the only way to avert the calamity of a strike.

"The Firemen's Brotherhood has no responsibility except to its members.

"The question the public should seriously consider is whether, in compelling the railroads to arbitrate under a defective and inadequate law, and in thus securing temporary convenience and accommodation, they are not sacrificing their permanent welfare.

"The managers' committee wishes to warn the public at this time of another and similar demand for increased wages made by the conductors and trainmen. We desire to put the public on notice as to the crisis that will confront them when these demands are considered by the railroads.

"We also desire to call attention to the serious public danger of these recurring demands, backed up by repeated demands that the railroads arbitrate under the law.

"The whole situation is now in the hands of the government and the people. They have taken it out of the hands of the managers at a time when the latter hoped to make a stand for the public good."

#### BELIEF THAT ERDMAN ACT NEEDS REVISION

Meanwhile at another point the machinery of the Erdman act has broken down in the very way that has been feared by all who have recently given consideration to the terms of this law, calling as it does for mediation by the presiding judge of the Commerce Court and the commissioner of labor, the only two men in training for dealing with railway strikes. At this juncture, when there was imminent danger of the most populous section of the United States being deprived of railway service, the United States Bureau of Labor was without its official head. The name of Charles P. Neill, who had been commissioner of labor ever since the passage of the Erdman act, was sent to the Senate by President Taft for reappointment, his term having expired on February 1. This appointment, along with hundreds of others that have

been submitted by the President, has been held up in the Senate, and consequently one of the two men who has gained the confidence of the railroads and the workers alike and whose experience would have been invaluable at this time, was unable to be present in his official capacity. The difficulty reaches deeper, however. Judge Knapp and Commissioner Neill have been carrying a double load for six years. Whatever amendments may be made in the Erdman act as to the constitution of boards of arbitration, etc., there is growing sentiment among railroads and railway men that the work should be separated from the administrative work of the Bureau of Labor and developed along lines commensurate with its importance.

#### "DAMAGED GOODS" IS TO BE PLAYED IN NEW YORK

With the purpose of arousing interest in the propaganda for a law prohibiting marriage except on the presentation by both parties of a physician's certificate of health, Eugene Brioux's *Damaged Goods* (*Les Avariés*) is to be presented this month in New York. It is to be given under the auspices of the Sociological Fund of the *Medical Review of Reviews*. The Fund was started recently to co-operate with that periodical in a program which includes the dissemination of instruction through books, lectures and plays dealing with sociological subjects.

*Damaged Goods* was written in 1901. Its presentation was forbidden on account of its medical details, but it was read privately by the author at the Théâtre Antoine, Paris. The author's position, and that of the sponsors of the play, is expressed through the part of an enlightened physician who is brought into consultation with a prosperous family, every member of which, in his or her individual way, is suffering from the consequences of the irresponsible misdeeds of the son of the house before his marriage. The resulting tragedy is made the basis for the physician's plea for the spread of sociological education, the elimination of ignorance and false modesty, and the substitution of preventive measures through the sympathetic instruction of the youth of the present generation. He concludes with the hope that an awakened judiciary may be counted upon for a more enlightened viewpoint in applying social control to this evil.

An "all star" cast is to present the play on the afternoon of March 10, at the Thirty-ninth Street Theater. It is the hope of those who arranged for the play that this may be merely the first of a series of dramatic presentations to further the special work of the Sociological Fund of the *Review*.

#### A PRECEDENT FOR THE BOOHER BILL

The passage by the United States House and Senate of the Webb-Kenyon bill, which aims to prevent the shipment of liquor in interstate commerce into states whose laws forbid its sale, has given friends of the Booher convict-made goods bill hope that this precedent will aid the passage of the latter measure. The principle involved in the two pieces of legislation is declared to be the same. The Booher measure permits states to prohibit the bringing of convict-made goods across their borders.

A study of the debates on the Webb-Kenyon bill shows that the division which it caused in Congress was not along party but rather along constitutional lines. Democrats and Republicans alike divided into two camps with respect to the principle of the measure. In the Senate, for example, Mr. Root of New York, Republican; Mr. Paynter of Kentucky, Democrat; Mr. Pomerehne of Ohio, Democrat, and Mr. Sutherland of Utah, Republican, voted against the bill on the ground that it violated states rights.

Notwithstanding this serious opposition and notwithstanding the possibility that the courts will declare the law unconstitutional, it is asserted by many congressmen that the recent action of Congress has advanced the day when the federal government will exert its power to uphold state laws whose violators have so long lurked in Mr. Bryan's picturesquely termed "twilight zone."

#### A NATIONAL EIGHT-HOUR BILL FOR WOMEN WORKERS

Senator Kenyon of Iowa, who has shown an active interest in the District of Columbia eight-hour bill for women, has introduced a measure to establish, through the federal control of interstate commerce, the eight-hour day for women in all the states.

The bill would prohibit interstate carriers from transporting products offered for shipment by any mill or factory in which women work more than eight hours a day or six days a week. Affidavits must be filed by the mill or factory declaring that no women are employed longer than the hours specified before the carrier can accept goods for shipment. The form of the affidavit is to be left to the secretary of commerce and labor.

A fine of not more than \$10,000 or less than \$1,000, or imprisonment from one to six months, or both, may be imposed on the officers or agents or carriers who violate the law. Failure to file the statement as to the hours women work and false affidavits the bill makes punishable by a fine of from \$5,000 to \$20,000, prison terms of from three months to a year, or both.

## EDITORIAL GRIST

### EXVILLE AND 533 OTHER CITIES

CHARLES F. WELLER

Associate Secretary Playground and Recreation  
Association of America

In a city of 130,000 inhabitants I saw recently an example of American needs and opportunities which are important but little understood.

Four years ago the city council appropriated \$7,000 for playgrounds. But there was so little understanding of what constitutes a real playground that it became a "recreation movement" backward, growing weaker year by year. Finally, the original friends of the movement said, a year ago: "The latest appropriation (only \$2,500) is the last that Exville will ever make for playgrounds; we have tried them and found them unsatisfactory."

How many Exvilles are there? Altogether 533 American cities were active in playground or recreation movements last year. But only 285 had supervised playgrounds. The other 248, at least, are in danger of auto-vaccination—of having such inadequate, unsatisfactory playgrounds that the people will become discouraged and the development of effective recreational facilities will be prevented or postponed.

What is the answer? Exactly what saved Exville. A field secretary of the Playground and Recreation Association of America gave ten weeks of competent service. This cost, for salary and all expenses, \$1,000. It gave Exville first, an understanding of her own needs; second, a vision of what a modern recreation movement means in the most successful cities; third, a program—practicable, progressive, irresistible.

This \$1,000 will bring to Exville's children at least \$7,500 this year and, within a few years, from \$100,000 to \$500,000. The very first expenditure will be for a commissioner or director of recreation to select and train play leaders, to exercise a growing influence over all forms of recreation; in short, to do for leisure time what the superintendent of schools does for the hours of formal education.

Like a great but growing tide, the playground movement is sweeping over America. It is too rapid, may be said. Yes, but why? Because it is timely. Because it meets needs of which people are becoming keenly conscious. Because it answers some of the strongest social instincts in men's minds and hearts.

From thirty to forty cities are new recruits each year. Over 5,300 play leaders were employed last year, an increase of 22 per cent over

the previous season. More than \$4,000,000 were expended last year, in addition to bond issues of over \$3,700,000.

This tide can not be checked. It can be guided. Such guidance is one of America's gravest needs and largest opportunities.

### STATE FUNDS TO MOTHERS

EDWARD T. DEVINE

Two illuminating articles<sup>1</sup> in this number of *THE SURVEY* are very likely to be cited a generation hence as embodying in extraordinary perfection the two fundamentally contrasting social points of view of our perplexed generation.

Neither article is a reply to the other; neither writer had seen the other's in advance. Even the editor did not know that it was a debate which was forthcoming, for the reason that although both articles are contributed by request, one of them—no matter which one—has, through a fortunate misunderstanding, turned out to be something quite different from what was expected. The result is the clear-cut, refreshing, and instructive contrast which the reader finds.

Mr. Hard's paragraphs are short, epigrammatic, and oracular. One whole paragraph, for example, is to the effect that:

Even the best of us have principles.

Miss Richmond's paragraphs are longer, more formal, more balanced, conceding many things, and requiring attentive reading. Mr. Hard is writing a political platform and commenting on a study which he evidently finds irritating. Miss Richmond is developing an impersonal argument which requires deliberate historical excursions and a patient, even if not altogether sympathetic, examination of her opponents' positions.

Mr. Hard eschews "facts," especially "immediate facts" and "practical propositions," and soars at once into the realm of principles, of feelings, of moral and esthetic perceptions. He "writhes in mind" over certain phrases in current use and regards them as giving the precise "direction of the mental attitude" of "charity agents." He swings the "whole movement" of which he is speaking on a "moral pivot" from its "existence in human aspiration to its existence in human fact," hanging it meanwhile "before the vision in a paragraph."

Miss Richmond on the other hand will have nothing to do with "arguments that will not bear critical examination." She is all for "facts," precise, verified, analyzed and interpreted facts. She insists that legislation should be based on experience; that we should not be carried away by enthusiasm. No one better than Miss Rich-

<sup>1</sup> See *Motherhood and Pensions* by Mary E. Richmond on page 774, and the *Moral Necessity of "State Funds to Mothers,"* by William Hard, page 769.

mond sees the peril in a catch phrase; no one has so little faith in "any one remedy applied wholesale by statute" to a "ganglion of evils."

Mr. Hard, appeals to instinct, like a Bergsonian; Miss Richmond to intellect, like a Spencerian. Mr. Hard has faith in the political democracy; Miss Richmond in free trade, thrift, family solidarity, individual self-help, and unconstrained personal service. Mr. Hard gleefully proposes to go after the taxpayer. Miss Richmond sees in unnecessary soldiers' pensions the chief source, the only one she discusses, of the funds which might have been used to fight tuberculosis and feeble-mindedness.

To the one, taxation is an unlimited, virtually untapped resource. To the other, it is a fixed and limited sum like the old "wage fund" of the economists, which if used for pensions is not available for other public uses, however beneficial. The one apparently holds to the investment theory of taxation and to the most broadly social conception of the state; the other would seem to regard taxation, if not government itself, as a necessary evil, and to think of society as an organism acting through many other and better instruments than those supplied by the political mechanism of the state.

Both statements are invaluable; but their value is of very different kinds. Mr. Hard's instinctive insurgency, his warm—not to say hot—human sympathy, and his contemptuous disregard for what he believes to be irrelevant facts, even his own, are characteristic of a national, of an international movement which social workers must increasingly take into account. They are in fact doing so and are everywhere taking their part in it.

The report by Mr. Carstens, against which Mr. Hard lodges his protest, does not really deserve the adverse criticism which Mr. Hard gives it. It is not a narrow, reactionary, or partizan document. On the contrary, it is a very fair, open-minded presentation of an actual situation. It deals, and pretends to deal, only with "immediate facts" and "practical propositions." Whether such considerations are to be controlling or are to be disregarded in favor of abstract principles and ideals is for each man to decide for himself; but even the most ardently progressive idealist, even the most instinctive Bergsonian, should not object to such inquiries and reports. There is a place for observation, and analysis, and interpretation of facts, even if, in the end, we are to be pushed by the very principle of life itself, blindly, instinctively, and irresistibly, into policies which seem to have little relation to the results of our investigations.

It must be admitted that Miss Richmond is on impregnable ground in insisting that experience does count for something, and that any cause is weak whose advocates close their minds

to the lessons of experience; that along with increased material relief, whether public or private, there should go more individualized, more skillful, more thorough treatment of the widely diversified causes of dependence.

Mr. Hard's feeling about the use of the word "dependent" does him credit and though he may not think it, his feeling in this respect is not in the least different from that of Mr. Carstens or Miss Richmond. But "dependence" is not merely a disagreeable idea; it is an ugly fact. No esthetic revolt will of itself change the fact. It is not true—history clearly teaches the contrary—that by translating the relation of dependence to the public domain we win the only possible chance of transforming it into independence and self-respect. By that change alone you gain a legal definition. You gain neither strength of character, nor a fighting opportunity. There may be some fields in which a state monopoly is justified; but that of "caring for the widow and the fatherless" is not among them.

We "charity people" are reproached because we do not give a clear-eyed affirmative answer to the question as to whether "relief is adequate," or else join with those who advocate "state pensions." But the fallacy lies in the inquiry. Is education now adequate? Is religion adequate? Is justice adequate? Those who "distinctly evade" a question which is in itself fundamentally absurd are the only ones who give it the correct answer.

The desirability of state pensions does not turn upon the adequacy or inadequacy of voluntary relief, but upon the prospective results of the state pensions. Will they prevent commitments to institutions or increase them? Will they increase or diminish the actual amount of neglected poverty in the community? Will they increase or diminish the number of independent, self-supporting, self-respecting citizens? Will they strengthen or undermine character? Will they operate beneficially or injuriously upon the relation between the individual and the state and upon the relations of citizens to one another? Will they socialize or pauperize the nation?

Upon such issues as these the decision should rest. All the evidence pertinent to such issues should be diligently gathered and fairly considered. The burden of proof rests upon the advocates of "state funds to parents." It may be that the endowment of motherhood will come, as Mr. Hard anticipates, merely because it is involved in an irresistible social movement, as a result of esthetic perception, of accepting a principle. Some things, like the burning of witches, and the French Revolution, have come about in that way. Possibly those who are opposing state pensions to mothers should seriously consider whether they are confronting a similar phenomenon.

## LEBANON TRUST: AN EXPERIMENT IN SMALL PARKS FOR SMALL CITIES

[Midway between Cincinnati and Dayton, Ohio, on a ridge of fertile farming and grazing land between the great and little Miami rivers, lies the pleasant village of Lebanon. Besides being a marketplace for the farming country back from it, Lebanon is the site of one or two canning factories, a bridge works and an old but small university. The institution which distinguishes it, however, from hundreds of other middle western towns is the Civic Trust, which has kindled civic spirit in what was a dormant community and revived a variety of social and co-operative activities.

William E. Harmon of New York is an Ohio man. It is his belief, Andrew Carnegie's well-known predilections to the contrary, that the surest and most permanent basis for a public benefaction is land. In April, 1911, he decided to "try it on" his native town. He sounded a group of representative men by offering for an indefinite period to give the sum of \$3,000 per year for a community welfare campaign. A few months later he made a formal offer to buy land for park and playground purposes and to build a gymnasium. The next step was the purchase of an eighty-acre farm. Last summer work was started on a gymnasium in the center of the town. Because the nearest river was four or five miles away, a dam was built across a stream in the park, so that the boys should have a place for water sports.

An endowment yielding \$3,000 per year has been provided and seems to be sufficient. The management is lodged in a board of seven trustees acting under the name of the Civic Trust of Lebanon on the William E. Harmon Foundation.

While the work is but just under way, many forms of local co-operation have grown about it. The example has struck root, and others have made gifts to the town for various purposes.

The results of his initial experiment have been so encouraging that Mr. Harmon is keen to induce other towns to establish similar trusts, and makes an offer through THE SURVEY (see page 753). The story of the Lebanon Foundation in land and goodwill is told in the following pages by the people who have had a hand in it. First, the donor tells how he came to make the offer to his home town. Then the president of the university speaks for the trustees who are handling the money. Next the executive officer of the trust describes what has actually been set on foot, and, finally, an outsider, the editor of the Lebanon Western Star, gives a private citizen's views on the undertaking.—Ed.]

### ORIGIN OF THE HARMON FOUNDATION. BY WILLIAM E. HARMON, WOOD, HARMON & COMPANY.

SPEEDING TOWARD New York on the Twentieth Century, three of us dropped into a discussion of gifts in perpetuity. By that we meant such gifts to the public as combine the greatest degree of permanence with a fair degree of usefulness. Most donors like to feel certain that there is an element of permanence in their contributions—that is, the power of self-renewal or continuous growth. But the obvious facts are that many so-called permanent gifts return a low rate in satisfaction and become practically useless after a time.

We considered endowments, permanent buildings as adjuncts to colleges and hospitals, founda-

tions for education, and, finally, land—naked land. Most trusts that require oversight are ever subject to tempest, fire, earthquake, dishonesty, or unwisdom. After a time they seem to shrink in importance. Land only is forever prepared to fulfil a function at the moment of need. Land only is independent of oversight when not in use. Rome has parks 2,000 years old which in 1913 give breathing space to tired lungs just as they did in the year one. London has parks that, speaking in a general way, have constantly increased in usefulness since medieval times. One could cite instance after instance where vacant and apparently valueless land has brought the people a rich and increasing return as the years rolled on. But often the most reverently bestowed treasures of devoted, and perhaps as enlightened, people have disappeared

from the face of the earth and been forgotten.

It did not take us long to conclude that land as a gift to a community that needed it was a reliable form of benefaction.

The conversation then turned to parks and playgrounds. It seemed to us that private and public benefactions, reinforced by calculating grafters and genuine civic leaders, were largely meeting the needs of the big cities. There is a tremendous movement to provide parks and playgrounds. The work so far, however, has been mostly confined to cities. In them there is a bright outlook for the future.

While we were talking it suddenly came over me that thirty years ago as a boy in a village of 3,000 people I had had no place to play a game of ball. Surrounded by rich agricultural land, there wasn't an acre in that town where the boys had real rights as distinguished from revocable privileges granted by word of mouth.

We three had all come from the West, and, strange to say, each, it proved, had suffered the same restrictions in his youth.

Since then I have made a canvass of a number of interior towns. Everywhere I found a somewhat similar state of affairs: Plenty of land; good-natured owners; casual ball, marbles and hockey. But if any concerted effort arises to secure a permanent tenure to justify fixture and apparatus and perhaps a clubhouse, then up go prices to the sky. In a word, the whole thing is squelched.

Among a richer class who may desire playgrounds, exactly reverse conditions are encountered. A, B, C, D, and E form a playground association, but they call it a country club, and they get what they want on their own terms. Why? Because any shrewd owner of real estate knows that nothing will add as much value to land as a country club. This, with the social features offered by a country club, takes care of the needs of the more fortunate class of people.

After an extended investigation, I became convinced that among the youth of the typical small town there is really serious need for playground space, but before assuming that my remedy would solve the problem, I determined to "try it on the dog"—my native town. A tract

of eighty acres, reaching close into the town, was purchased, and on a nearby lot a suitable gymnasium is being constructed. We engaged the services of a director who, so far, has been fully occupied in the preliminary work of organizing clubs and teams for various youthful activities. Less than two years have passed since the idea was developed. A completely new spirit has arisen in the village, and the outlook has seemed so favorable that I believe some fairly definite conclusions can be formed.

## A ADMINISTERING THE HARMON TRUST. BY WALLACE E. MILLER, PRESIDENT LEBANON UNIVERSITY.

THE DUTY of the trustee is to carry out the intention of the founder of the Civic Trust. While this might seem to be an easy task, it is really somewhat difficult to interpret accurately the wishes of the donor. All conditions and dilemmas cannot be foreseen. Like a judge, the trustee must often apply a general principle to a specific instance. But his greatest anxiety is to understand the need before him so that the remedy adopted may be neither a waste of money nor an aggravation of the trouble.

The necessity for the trustee is quite obvious, because the founder planned an institution to

last beyond his own lifetime and beyond that of any of the trustees now chosen. Residence in a distant city, likewise, makes it impracticable for the donor himself to direct the work. As nearly as possible, every trust of this character should be conducted with great fundamental ideas as their base. The trustee, serving as a sort of go-between, is interested neither as a giver nor as a recipient. His decisions are dictated only by impartial and impersonal considerations.

Probably a greater responsibility rests upon the trustee than upon any one else connected with this Civic Trust. The benefactor has to a large degree parted company with his money, and in a sense with the idea. Both are in the keeping of others. A conscientious trustee, particularly where future generations are largely in view, wishes to build wisely and well so as to get reasonable returns now and not to impair success fifty or a hundred years hence.

The Harmon Foundation is seeking to develop the highest types of manhood and womanhood. It has not chosen a mould into which all characters are to be cast. It proposes to take young people as it finds them and encourage inborn tendencies. Many types of efficient character are bound to result from this elastic policy.

This development can be brought about only in the case of those whose characters are forming. Older persons with fixed ideas of life and

manners cannot be affected to any great extent. Their characters may be called into expression, but little or nothing can be added to them. A homely adage says that as the twig is bent so is the tree inclined. Growing boys and girls may have a profound tendency imparted to their lives through the trust. It is to give this predilection that we exist. We propose to furnish a richness to the content of life that would not be there but for us. The founder, I am sure, will be satisfied if this result is accomplished.

A rural environment need not be a handicap to one born and reared in it. It is often so regarded by those who take but a superficial view, in the face of the fact that much of the most virile energy of our urban centers was stored up in the countryside. The Harmon Foundation proposes to aid rural environment to do its best work.

There is a time in the life of every young person when the building up of a sound nervous system has reached its maximum. To cut short this period prematurely means a sacrifice of power in after years. By making country life interesting and attractive, we hope to retard a too early exodus from country to city on the part of our present population. Also, this same power in later life is impaired if incorrect ideas are incorporated into the life of a youth. It should not be necessary for the country boy going to the city to win his way to unlearn anything. His ideas should be substantially correct. They may be made so if the proper influences are at work in the country. Immaturity of thought and unfamiliarity with the true meaning of life handicap one for success. To do away with these will be a very definite result of the work of this trust.

Not so long ago, drudgery was the most prominent aspect of country life. Science and invention have tended to change this. Country life is becoming more and more attractive, and we are learning that the best life is that which is spent close to nature. It would be regrettable if the youth of the future were to disrespect his early rural environment. On the contrary, he will be so proud of it that he will be unwilling to change it for another, no matter how alluring it seems

#### THE LEBANON CITY BUILDING

The other important public buildings are a county jail and court house and Lebanon University.

#### THE "KIDS' DAM" IN HARMON PARK

The dam was partially constructed by the Boy Scouts and provides almost the only place for swimming and skating.

to be. To keep as much as possible of our population from being drained away into the cities will be our constant aim.

All things are not good merely because they are found in a country environment. We hope to minimize the influence of undesirable elements and ideas. Many conditions need to be corrected, many things need to be emphasized in order to make the surroundings of rural life better.

It has been the practice until lately to permit the hidden and unharnessed forces of our social organization blindly to work out their will. Now this is not thought to be the best way. Social workers are convinced that social forces need guidance. Students of social conditions in rural communities are sure that some of the finest constructive social work is waiting to be done in thousands of sections like the one of which Lebanon, Ohio, is the center.

A trustee of this foundation may therefore be pardoned for feeling that he is doing a pioneer work, the results of which must appear little by little, and make themselves far more apparent to his grandchildren than they are to him.

**WHAT THE CIVIC TRUST IS DOING.** BY S. C. BRITTON, DIRECTOR OF THE HARMON FOUNDATION.

A CERTAIN old lady, so the story runs, upon returning from a visit to the farm remarked, "I wonder why they didn't build the big cities out in the country?" Perhaps one might ask with equal grace, after a visit to the city, with its parks, playgrounds, operas, and other recreations, "Why didn't they place the country within the big cities?" Therein lies a problem. The country boy, longing for excitement, is going to the city. Probably his departure is to be lamented, but a more serious feature of the situation is that he is lifting a curtain which reveals new scenes—scenes for which he is not prepared. To assist the growing generation to appreciate the real happiness that may be found in the country and to acquaint them with the environment of the city is the work of the Civic Trust of Lebanon.

For this reason the trust is establishing in Warren county some of the worthwhile attractions of the city. An eighty-acre field has been secured. Some may doubt the need of a recreation field in the country. Let them ask Farmer Jones for permission to play a game of ball in his pasture. Let them explain the popularity of Harmon Park in the village of Lebanon. Country boys as well as their city cousins enjoy American games, and appreciate a public playground. This park is used much. It is not uncommon to see the park alive with several hundred boys and girls from six to twenty—yes, some from twenty to sixty, for all are young here. Formerly the boys went "swimmin'" in "Mulford's Hole," which resembled a crowd on election night. Now they go swimming in the "Kids' Dam," where

they have more fun and less mud. Skating was a neglected art. But with the new water course "as slick as glass," many are the plans and boasts, and often is proved the proverb "Pride goeth before a fall." Many of the outdoor activities will be transferred to the gymnasium and clubhouse which is now under construction. This will be a social center.

The social side has been disintegrating. An occasional "belling" is all that breaks the monotony now. But a generation ago the beaux and belles had the husking bee, barn dance, quilting party, spelling bee, and debating society. Man is a social being, even in the country, and needs social meetings. To fill this need a series of lectures by local talent has been developed which is offered to any school, church or other organization in the country. Eight places have arranged courses. The Presbyterian Boys' Club of Morrow are saving the surplus made from their course for a library and club room. Union and Ridgeville expect to raise some funds in this manner to beautify their school. The other communities are content to "break even." Although the lecture venture is young, it is serving as a potent magnet in drawing the people, especially the young men and women, into social groups. An orchestra of boys, under a boy director, is to give one of the numbers. A revival of the old-time spelling bee promises encouraging results. Overflowing crowds have twice journeyed to the Union School to see who was the best speller in the "deestrick."

To promote any movement thoroughly worth while until it can stand alone, and to foster any that cannot, is the purpose of the trust. This makes possible a broad field of activity. A corn-growing contest, in which forty-one boys and two girls were enrolled, has just been concluded. Three of the boys and one girl won prize trips to Washington, where they will meet the President. One farmer declared, "It has done more for our township than all our farm magazines." A garden guild, enrolling 10 per cent of the youngsters of Lebanon, closed with an exhibit and lecture. Reforestation has been materially encouraged in Lebanon. Although this village is in a veritable grove, yet three railroad cars of trees were imported in 1912. And the School House Beautification Contest has been responsible for much rivalry. One school this Fall on a single afternoon planted fifteen hard maples. Birds and their protection is now the thought of many little bird police who are members of the Audubon Society. A snowbird photo contest, athletic contests and the Boy Scouts, who assisted in building the "Kids' Dam," are all helping to bring the city to the country boy.

"Remember we are here to help you help yourself," is a familiar sentence in the correspondence. The trust will not force its way, but will win it. In fact, one of its useful deeds is getting the people of each community to carry on their own work. Although the trust is still new, its present use and the increasing demands for its assistance is evidence of its need and value.

**W**HY THE CITIZEN APPROVES.  
BY JOHN M. MULFORD, EDITOR  
LEBANON WESTERN STAR.

LEBANON is as beautiful a village of 3,500 souls as can be found in Ohio. It is a substantial settlement, which dates back over a hundred years and enjoys more than average educational facilities. During the bigger half of its life it has had institutions of higher education. Today the town furnishes free tuition from the kindergarten through the college. It never had a park, however, until William Elmer Harmon of New York, who was born and reared in Lebanon, presented us with eighty acres about a year ago.

When it became known that Mr. Harmon had given us a park, there were some of our citizens who couldn't understand why he had not donated his money to some "worthy purpose," as, for instance, the endowment of the college or the erection of a small hospital. It was argued by others that they had grown up without any place for play, save the street or over in the "pasture field" of some neighboring farmer. They thought it was unnecessary to have parks for the children of the present generation. One man even remarked that "Elmer Harmon is a pretty big man, and he hadn't any park to play in when he was a boy." These criticisms were from those who cannot see any good in a project unless it pays 6 per cent in the coin of the realm. Others, and they were the more numerous, welcomed the park—because of its possibilities, even though they acknowledged that they didn't know what these were. Among the boys and girls, however, there was not a dissenting voice. They were not worried about the relative value of the bequest. It meant to them a great big playground, bigger than the largest yard, bigger than the generous school grounds, and even bigger than any pasture in which they could play. Yet the children were as far from realizing the possibilities as were friendly adults.

With the park came a young man to teach the children how to play. He was not considered by the youngsters when they grew enthusiastic over their playground, because they knew nothing about his appointment, but today he is loved and respected by all of them. He is their scout master, and leads them on long hikes or camps

with them in veritable wigwams in the park; he is their football coach; he is their teacher of agriculture, conducting a garden contest among the boys and girls; he is their forester, teaching them to know trees and how to plant them. Ever alert, he keeps a watchful eye over the youngsters, tactfully giving them great freedom with the least possible show of restraint, which is the secret of all government. The Civic Trust of Lebanon, which is in charge of the park, decided to dam a beautiful meandering creek and thus make a swimming pool in summer and a skating surface in winter. At once the director interested a band of boys from fourteen to sixteen years of age in the work. They camped in the park, cooked their suppers and breakfasts in the open, listened to stories around the camp fire, and at 4:30 in the morning were out along the creek gathering stone to be crushed for the concrete work of the dam. This was thoroughly enjoyed, and it was a physical, mental and moral education. Today, December 14, there is a beautiful expanse of ice, affording room for hundreds of skaters.

The playground apparatus, which affords hours of enjoyment to all ages of children, is a novelty to them. After school they hasten to the park and enjoy wholesome athletic sport. At supper time, thoroughly tired out, they go home ready for a night of sound sleep. What is true of the small children applies equally to those who play on the tennis courts, on the baseball diamonds, at basketball or at football.

In the park children gather in little self-chosen cliques for play. Here they spend hours and, even if unwatched, behave better than in their own "back yards." I know that the camp fire stories have inspired the reading of history and biography. The work in the gardens has led to a desire for books on agriculture. In fact, so great has become the demand at the Public Library for elementary books on science that one of the fraternities of the town is preparing an entertainment for the benefit of the Children's Department of the library.

Harmon Park is a blessing to Lebanon. If no other proof were at hand, the plea of my sturdy six-year-old lad at this very moment for a pair of ice skates because "I want to go to Harmon Park" to me would be convincing.

#### A FINAL WORD FROM THE DONOR.

*I will give \$5,000, in sums of \$1,000 each, to any five towns in the state of Ohio having a population of less than 7,000 that will inaugurate and carry through a movement similar to the one we are working out in Lebanon, namely, to provide a permanent playground and gymnasium adequate to the needs of the community involving an investment of not less than \$10,000. This offer is limited to such movements as begin after, or take their incentive from, these articles, and to a period of two years from the date of this publication.*

WILLIAM E. HARMON.

THE VISTA OF BLUE MOUNTAINS FROM PHOENIX  
An irrigated orchard in the foreground

## THE CITY OF LIFE AND DEATH

FRANCIS H. McLEAN

SECRETARY AMERICAN ASSOCIATION OF SOCIETIES FOR ORGANIZING CHARITY

THE contrast came to me grimly, irresistibly, when my guide pointed to a shabby house. It was a very ordinary oblong wooden building, two stories high. "I suppose more people have died of tuberculosis in that house," she remarked, "than in any house in Phoenix."

Yet only a few feet away across the yard was a great ditch which ran high with the promise of abounding life—one of the secondary irrigation streams on its way to wreath the desert with fragrance and plenty.

In a valley of marvelous richness, needing only the water which has thus been brought to it, lies the capital of our youngest state. Strange to say, though the most important city in Arizona, Phoenix is not on the main line of any railroad. The Santa Fe reaches across two hundred miles of wild mountain ranges and desert from its main line at Ash Fork on the north, and the Southern Pacific pushes up some thirty miles of branch line from Maricopa on the south to a point where the two roads almost, but not quite, touch each other. Only a narrow street separates the two termini but it has been enough to block the scheme for a union station.

Nevertheless this is the only place in Arizona where the two great railroad systems come together. Before the Santa Fe built its branch line from Ash Fork, travel by rail from south to north Arizona, or *vice versa*, could be accomplished only via Los Angeles. So in a

pretty real sense Phoenix is the heart of Arizona.

As a capital city Phoenix ranks among the comparatively few which, taking advantage of their political importance and other natural and acquired advantages, assume leadership among cities. The population in 1910 was only 18,000, but staunchly the city holds the vision of a fair and beautiful metropolis, veritably pacing its way across the valley.

Phoenix is a city of beautiful vistas—blue mountains not many miles away, broken, jagged hills of the desert, jutting back from one section of the city. Italian skies and sunshine, fragrant air, a dare-devil soil once it has drunk, fairly squandering its richness in unbelievable exuberance of plants and flowers, transforming nothingness into magic gardens—all this has the capital city of Arizona.

Such advantages of climate and altitude have brought the cities of southern Arizona a great social problem, the problem of imported tuberculosis. Northern Arizona is generally higher in altitude and reacts unfavorably upon the disease. Not so southern Arizona, and its reputation has diverted the stream of the tuberculous which in earlier days wended its way to California or Colorado. Phoenix and Tucson, the largest cities, have naturally felt this problem most keenly, and I found a far greater degree of sympathy for the incoming sick in Phoenix than in either Texas or southern California. The rea-

son is not hard to find. Texas was a state of many large cities and had reached its second stage of development long before the tuberculosis invasion. Southern California took its first start as a health resort, but soon its great productive possibilities and its manifold attractions as a winter resort for the well and well-to-do brought in a population which in numbers tremendously exceeded those who came simply in search of health.

In Phoenix, on the other hand, quite a large proportion of the population is made up of families who sought residence here on account of the health of some of their members, and having found health for the sick ones have deemed it necessary to remain in order to conserve that health. Bronchial diseases and similar troubles bring others here, so in Phoenix sympathy comes largely from this fellow feeling.

This is something fine to build upon. Indeed, one cannot but be impressed with the fact that the possibilities of social development in many lines in Phoenix, when once men relax a bit in the wild scramble for wealth, are greater by reason of this sympathy. I recall the remarks made to me by social workers in Los Angeles in contrast. The Californians told me in sorrow and some little bitterness of spirit how little support could be obtained from many people who make a winter playground of their city. In very many ways social development in Los Angeles is stunted because vast numbers of its wealth-holding population, especially the temporarily resident, feel little social responsibility.

If the people of Arizona can be aroused to the meaning of a social program, the community will be able, I believe, to surpass even California. But the very first step, of course, is for them to realize that their fellow sympathy for the tuberculous has not yet gone far enough. For it is true that hundreds have died of tuberculosis in Phoenix; many have died on the way to the city and many have died on the way home. Not a

THE HOLLAND HOUSE

Sixty-five consumptives within five years died in this house. Scarcely one was a resident of the state. Five lived but a week after arriving from the East penniless. Rooms were sometimes relet within six hours after a death. During the past year, however, no consumptives have been lodged in the building.

few are struggling along in the city with insufficient funds for their support—their doom sealed. And it is true that of those who died some might have been saved if in their own homes, in the incipient stages of the disease, they had sought local sanatoria. Therefore, fellow sympathy becomes a hard and cruel thing if it does not link heart with heart and throw all its influence in such ways that, whether they go to Phoenix or are kept from going to Phoenix, more shall live.

What can Phoenix do? It can take advantage of the very exigencies of its situation as a haven of refuge for the sick to give what might be called health leadership to those sick and to the regions from which they come. This is one of two alternatives in the large scale public control of the tuberculosis problem. The other was suggested in an editorial in *Harper's Weekly* recently. In criticizing most unjustly a statement of the governor of Texas, this article indicated that the tuberculosis problem should be handled by national and not local agencies. If this means anything at all it means that to the few states having a favoring climate there shall be transplanted all the tuberculous with small means in the United States, in most cases with their families. Furthermore the experience of many people in Phoenix and elsewhere goes to show that an arrest of the disease in Arizona holds good only as long as the patient remains in the beneficial climate. Therefore the transplanting would in a great many cases be permanent and there would be obligation on the national government to see to it that this great population was absorbed industrially each year into the natural population of each state. If such a plan were possible from a practical standpoint it would play ducks and drakes with one of

AN IRRIGATION CANAL

March 1, 1913.

THE CITY HALL OF PHOENIX

the foundations of the present campaign of education, viz.—voluntary early examination of suspected cases and the early use of sanatoria. Early examination would become less frequent, instead of more so, if the patient felt that it inevitably meant that he must pull up stakes and cut himself off from old connections. And the states would scarcely make provision for their own sick at home if federal transportation to the Southwest offered an easy escape from the burden. No, “sanatoria everywhere” is the only safe hope for diminution and it is the local sanatoria which encourage early examinations.

The first of the two alternatives—state action—is the one which I offered in a report to the social agencies of Phoenix. My recommendation was that the Southwest should make covenant with the rest of the country as follows:

First, we, the people of Arizona, recognize that the only real way of making headway against the mass of tuberculosis is through local treatment all over the country; nevertheless we hold our favoring climate free to all.

Second, we will provide through private and public agencies, physicians and citizens, the necessary supervision of all tuberculous cases within the borders of the state, and thus guard against increased contagion in this region of health giving. This in itself is a pretty large and expensive job and has scarcely been touched as yet. Not even is registration of cases required and the neglect of fumigation is simply shocking. Rooms and houses in Phoenix are let to new patients and their families after old ones have moved out, without a word said about fumigation.

How much indigenous tuberculosis there is is a bone of contention, but waving this aside it is preposterous to imagine that a badly infected room will not unfavorably affect a patient or other delicate members of a family, no matter how good the climate may be.

Then there is need of medical advice. The physicians in Phoenix and doubtless elsewhere are giving a considerable amount of free service. It may be best for all concerned for Phoenix and Tucson to have tuberculous dispensaries on a

free basis. We have said that even the question of the geographical inception of present cases is an unsettled question. This is but one indication of the need that the state board of health be given by law such facilities as will not only enable it to lash municipal authorities into taking proper precautions but also in maintaining a pathological and social record of every case in the state. It is very important to know not only reactions upon various conditions but accurately what indigenous cases there are and how far the climate will from year to year, with increasing centers of infection, continue to strengthen the resistance of the inhabitants to this infection.

As one physician quaintly put it “We’ve got to watch out that by a process of elimination we do not breed here a sturdier bacillus which will defy even our climate’s killing powers.”

Third, having accepted these heavy burdens, public and private, the people of Arizona demand that others provide the living expenses of every one who seeks its climate. We cannot do everything. Therefore, to the patient who is sent here without means or who is stranded here, the only merciful thing to do is to return him to his home unless persons or public or private agencies in his home city or state provide for his support. Such returns have already been arranged by private agencies, such as the Associated Charities in Phoenix, and by public agencies, such as the Board of Supervisors of Maricopa County in which Phoenix is situated.

Now we propose to ask the state legislature to pass a law providing for the transportation by the state of non-resident dependents to their place of legal residence. This will be a general law which of course will have special application to the tuberculous. Such a state law would attract country-wide attention to Arizona’s attitude—the only merciful one. Phoenix would then be no longer a city of awful misery for scores of human souls.

We would, if we could, support those in the incipient stage of the disease, but we cannot bear the burdens of a whole country and others must help. The whole country should be warned that many; many die of tuberculosis in Arizona, and that it is criminal to urge those in the advanced stages of the disease to seek benefit here.

Only the most superficial and crassly ignorant critics could characterize this policy as any except the most righteous, the most humane, the most sympathetic. It remains for the social agencies of the state and of Phoenix particularly, to urge upon the legislature the first steps in the carrying out of this policy in the Southwest. It remains for the rest of the country to take to heart the fact that early examinations and universally present local sanatoria—not removal to Arizona or Texas—are what must be counted upon to force down the tuberculosis death rate.

# OUR NATIONAL TRIAL BALANCE

KATE HOLLADAY CLAGHORN

NEW YORK SCHOOL OF PHILANTHROPY

CENSUS CARD PUNCHING  
MACHINE<sup>1</sup>

NOT a little disappointment and impatience have been felt by students of social progress at the tardy publication of the facts gathered in the federal census of 1910. For the first completed volume has only just appeared, nearly three years after collection of the material. Prior to this a few printed bulletins and certain announcements of interesting general results made through the press are all

the information that has been given out. One reason for this is an improvement in method of presentation which made it necessary to wait until all the main classes of figures were tabulated before presenting any in extended form.

Another is that in the preparation of the census results for the public the director of the census had laid upon him the highly unsatisfactory task of making bricks without the requisite quantity of straw. For the ruling powers, in a praiseworthy but unenlightened desire for economy, have cut down the appropriations for this great enterprise to about half the amount stated by the director to be imperatively needed and to much less than half the amount required to make a thoroughly full and satisfactory presentation of the census facts. Every lover of efficiency should enter an urgent protest against such a short-sighted policy. What would be thought of the business manager whose first act of economy was to discharge the bookkeeper and throw away the ledger? Yet that is precisely what is done in so far as our government curtails its activities in keeping proper account of that most important element of our national resources—our population.

It is unfortunate that supplies are always begrudged to statistical work of any description,

<sup>1</sup>The extent to which the use of machinery has displaced the old hand tally methods is explained in the forepart of the magazine.

due largely to the general prejudice against statistics. The average man is repelled by long, dry columns of figures, and will not try to understand them. Consequently he thinks them useless, and their preparation merely an excuse for drawing fat salaries. And it is the average man, to a great extent, who controls the purse-strings.

But, after all, these dry "statistics" of our census give the basal facts by which any effective direction of social and political forces must be guided. Indeed, there is hardly a scrap of information in the many bulky volumes of the twelfth census which has not been used to practical purpose and found invaluable by some worker along some line of social advance, and there has been crying need for more—much more information than that census afforded.

Peculiarly short-sighted, too, is the special disinclination to allow money for the proper working up and presentation of results after the facts are collected. Such economy simply means a waste of money already expended. If the public cannot have the results, why collect the facts? In the New York state census of 1905 were gathered numerous items with regard to population on the same basis as the federal census, and under the direction of one of its officers. But the only results published were the bare numbers of the population in different districts.

All classes of social workers consider it most desirable to have statistics of the larger cities given by smaller units, as far as possible by single blocks. In point of numbers and variety of population the large cities are surely entitled to this. The city of New York alone has a larger population than any single state in the Union excepting the one in which it is situated and the two which contain the two remaining cities of over a million population. Its single blocks range in number of residents from the ordinary small town, which is tabulated separately as a matter of course in the census, to the fairly good sized city. And within the city's boundaries there is greater variety in the characteristics and composition of population in the different blocks than would be found in all the counties of some of the farming states of the Middle West.

In the large cities arise some of our most acute social problems, and to deal with them adequately we must know, not simply their general extent, but just where they are localized.

CARD TABULATING MACHINE—FRONT VIEW

In measuring our success in improving health conditions, for example, we may be positively misled by a low average death rate for an entire city. Statistics by small districts might show that the low average concealed plague-spots of disease in certain quarters which should be made the center of attack, and that while progress had been made in reducing diseases peculiar to certain occupations and age-groups, those characteristic of other classes were gaining headway. The proper placing of the various remedial agencies in social work,—social settlements, playgrounds, schools and parks—depends on a knowledge of the distribution of the different elements of population. This the federal census ought to give us.

This need has been so deeply felt that before the taking of the present census a committee of social workers in New York, called together by Lawrence Veiller, urged the director of the census to undertake the preparation of statistics for New York city by blocks for the more crowded sections and by forty-acre districts for the entire territory.

Other large cities were invited to join in such a request, and did so. The director of the census was entirely favorable to the plan, and took the necessary steps for its adoption. But, owing to the lack of funds, the nearest approach to block statistics for New York city was given in a publication by enumeration districts—some covering less than and some much more than a block—of statistics of total population, without subdivision by nationality, sex or age. And now we understand that the results by forty-acre districts are to lie unpublished until the city or some private organization is ready to pay the expense of issuing them.

This is entirely wrong; it should not be left to any one community or organization to decide what facts should be published. A city govern-

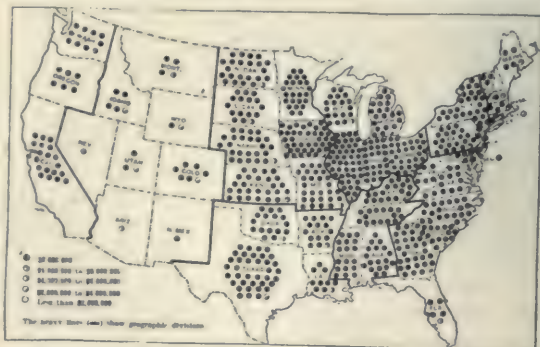

ment might be the last to desire the publication of detailed facts about the territory under its jurisdiction. A private organization which had expended its money for these results might be unwilling to share its knowledge with others, might, in fact, use this in a money-making enterprise, and in any case, the private organization should not be asked to divert its funds from the urgent business of social betterment to that of discovery of conditions. The facts regarding any one of our great cities are the concern of the nation, and the nation should give them out.

It is not too late even now to secure the publication of these statistics. The material is collected. The Census Bureau is a permanent organization. All that is needed is a small additional appropriation. The additional cost for New York city is estimated at only about five thousand dollars, including printing. Could not our social workers try again to get this?

### *The First Volume for 1910*

Turning to the first complete volume before us, we find it issued under the title *Abstract of the Census*, but containing something entirely different from what we are accustomed to see under that name.

The "abstract" of former censuses was a compact little book, giving in the most condensed form possible the main statistical tables relating to the United States as a whole, to the states and to the principal cities. No explanatory text accompanied these. Little space was assigned to comparisons with any former census, and no attempt was made to show the real significance of the facts by maps or diagrams or by computation of percentages or averages. For all interpretation of the figures the reader had to turn to the brief introductory sections of one volume after another of the main series of the census, and for detailed information about any one locality or any one subject of special interest had to search through many scattered pages besides.

VALUE OF FARM CROPS, 1909

The total for each state is obtained by adding the values of the dots and circles

This method of presentation put the government to the heavy expense of sending every one of its great books to everybody who needed to use the census at all, and put the recipient to the embarrassment of finding storage room for the long line of blue-backed elephants which kept coming and coming.

The purpose of the new arrangement is to give the majority of the users of the census all they are liable to need in one volume, and, so far as possible, all they are likely to need at one time in one place in it.

The present "abstract" is intended to be this one volume. It is divided into two sections, the first and longest being the abstract proper. This covers the four principal branches of inquiry taken up by the census—population, agriculture, manufactures, and mines and quarries—and is complete as to all the subjects under these four branches except for occupations and one or two minor inquiries of the population schedule, the data for which have not been fully tabulated.

The "abstract" appears at first glance to be simply a collection of the various explanatory texts formerly given as prefaces to the separate volumes. Here are the diagrams, the maps, the computations, the comparisons, and the discussion of the meaning of all these and of the tables that characterized those introductions. But it is more than this. Here also are all the general tables which the present census will give, in close connection with the text explaining them.

### *The State Supplements*

The second section consists of a state supplement, giving in greater detail than is afforded in the abstract the statistics for that state. This combination of an "abstract" of the kind here found and a detailed state supplement is the most novel and interesting change in method of presentation in the new census, and is the device by which the output on the general mailing list can be reduced to one volume from the dozen or more of the former census.

It is presumed that beyond the general facts every one wants to know, the interest of any

CARD TABULATING MACHINE—REAR VIEW

one person in local details (which bulk so largely in the older censuses) will not as a rule extend beyond the state in which he resides. For distribution in each state, then, a different edition of the "abstract" is issued, with a supplement for that state, the matter of the abstract proper being identical in each edition.

The new volume is attractive in make-up, but in some details betrays the prevailing economic stringency. A cheaper grade of paper, apparently, has been used, which makes the book agreeably light to handle, but allows the imprint to strike through a little and gives a limp handful of pages to turn. Some of the tabulations are so badly crowded that their use makes patience a virtue and spectacles a necessity.

The maps and diagrams are on too small a scale to be entirely satisfactory and printed as they are on the ordinary page paper are less distinct than we should like. We hoped that to supplement these there was still to be issued a statistical atlas of as fine workmanship as that embodied in the census report of 1900. Such an atlas places directly under the eye the very process of growth of the different elements treated in a way that no tabulation or description and no roughly worked out diagram can effect.

But we regret to learn that it is by no means likely that such an atlas can be published, also owing to insufficient appropriation. The most that can be hoped for is the assembling of all the present black and white maps and diagrams in one volume printed on somewhat better paper than is used in the ordinary text volumes.

The method of draughting the maps is good, and we note an ingenious new device for indicating amount of product, shown in the accompanying diagrams of the value of manufactures and farm crops.

In general, the changes in arrangement and presentation are admirable. They are all along the line of the general purpose of the new plan

VALUE OF MANUFACTURES, 1909

The white circles and black dots range in value from \$37,500,000 each to \$150,000,000.

of getting together in one place what will be needed at one time. The most noticeable change is the closer connection of text and tables. In the presentation of any subject, text and tables have been treated as a unit, the tables being either inserted in the text or placed immediately after it. The maps and diagrams also have, as far as possible, been printed in immediate connection with the subject referred to.

#### *The Handling of Details*

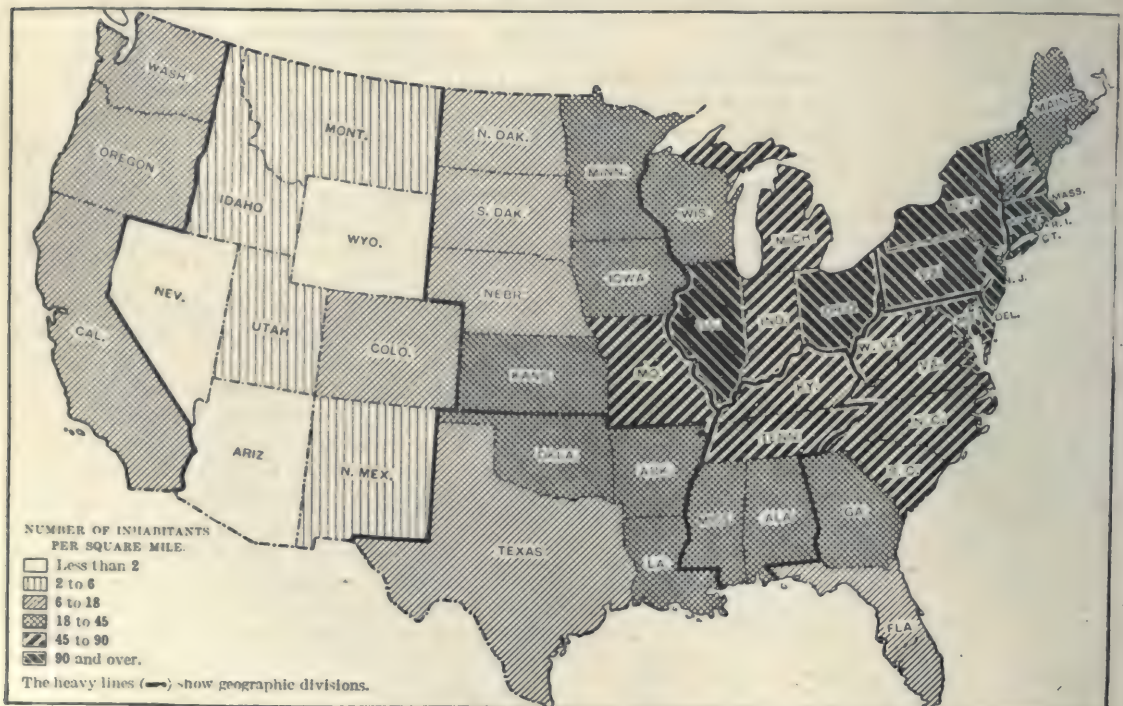

The five geographic divisions of the twelfth census have been subdivided, to correspond with the growth and diversification of our population, into nine, each covering a group of states fairly alike in physical character as well as in the characteristics of their population and their economic and social conditions, while each differs sharply from most others in these respects. Again, these nine subdivisions are regrouped in certain tables into three great sections—the North, the South and the West.

In the principal state tables the alphabetic order of the last census has been replaced by a geographic order, leaving the state under the heading of its own geographic division, which makes it easier to compare conditions in contiguous states, or to summarize facts for like units.

The state supplement, which is in itself the greatest innovation, shows the greatest inno-

vations in arrangement. This, like the abstract, covers statistics of population (exclusive of occupation statistics), agriculture, manufacture and mining, and embraces all of the census results to be published concerning that state. The supplement now before us is for Maine, and gives all the facts in the brief compass of eighty pages. Apparently nothing essential is left out. In fact, there is more detail than was formerly given. Here are given summary tables relating to the state as a whole, detailed tables for counties, and for cities, and, finally, for subdivisions of the larger cities. Accompanying these is a full explanatory text, a feature never before attempted for the separate states.

The facts about population, agriculture, manufactures and mining are given in different chapters, but for any one subject the arrangement is such that all data pertaining to one locality are grouped together, with the exception of some repetitions in summary tables. When we see given in a single page for the city of Portland, for example, the total population at successive censuses from 1870 to date, the percentages of increase worked out for the last two decades; the color and nativity of the population, with comparisons for 1900, and percentage of the total population at both censuses; sex, subdivided by color, country of birth of the foreign-born, males of voting age by nativity and color, with comparisons and percentages; illiteracy and school

POPULATION PER SQUARE MILE, BY STATES, 1910

The original of this map appears on page 29 of the Abstract of the Thirteenth Census of the United States

attendance by age, color and nativity, practically each figure of which would have had to be extracted from a different page of the old census, and from a different volume in many cases, we realize how much labor has been saved us, and how much more freely the census facts are likely to be used when given in so convenient a form.

It also makes us long for a similar supplement for New York city. If Maine, with her three-quarters of a million population, can have eighty pages of detailed analysis, why not New York city, with her five millions? What an interesting book it would be! So, too, would be the book for Chicago, and Philadelphia and St. Louis, and San Francisco and Boston. Cannot the principal cities ask for them and get them?

#### *Complete Editions for Special Students*

This combination of abstract and one state supplement in one volume is an admirable plan to meet the needs of most uses of the census. There are a few people, however, who have no occasion for the state supplements, and for their use a separate edition of the abstract, apart from any state supplement, is in preparation.

On the other hand, a comparatively large class—special students of social and economic conditions or the many national societies devoted to social betterment of various kinds, for example, are interested in details from all the states. To meet their needs a full set of reports will be issued comprising the abstract volume above mentioned, the contents of all the state supplements, and analytical discussions of special topics relating to population, agriculture and manufactures. Those parts of the various state supplements relating to population will be bound together to form two volumes on population, two more volumes will contain the state sections on agriculture, and one, the sections on manufactures. The volumes dealing with special topics will contain all the data regarding states and large cities which appear in the various state supplements, the order being rearranged so as to assemble all the information about any given subject in one place.

There will also be issued a series of pamphlets, each containing an entire state supplement—population, agriculture, manufactures and mining combined, chiefly for the use of libraries which have special state collections. It is hard to imagine a more ingenious plan to give maximum service at minimum expense.

Most of the general results of the census given in the abstract volume before us have already been given to the public by piecemeal. But marshalled here for the first time, they make a more definite impression.

In the decade ending in 1910 nearly 16,000,000 persons were added to the population—an increase of 21 per cent—which is the first gain in

CARD PUNCHING MACHINES IN OPERATION  
Partial view of one room in census building

rate since 1860. The gain is slight, and may be merely an accidental variation. It may, however, be the first indication of a shifting of economic base from agriculture to manufacture that will have far-reaching social results. This seems to be suggested by the fact that while the less densely settled agricultural divisions of the far West showed the highest rates of increase, their absolute gain amounted to less than 3,000,000 of the total 16,000,000 for the whole country, while the strongly industrial states of New York, New Jersey and Pennsylvania, making up the Middle Atlantic group, with a low rate of increase (higher, however, than the average for the country), gained nearly 4,000,000 inhabitants.

#### *Some Grand Groups of Facts*

Notwithstanding the great increase in immigration of the last two decades, the foreign-born have maintained about the same relative proportion to the general population since 1860. In 1910 they constituted 14.5 per cent of the whole, and their absolute increase is a little over 3,000,000. Second generation foreigners made up 20.5 per cent. This element in the population, unlike the foreign-born, has been steadily increasing in relative importance since 1870, and

the actual additions between 1900 and 1910 were about 3,250,000. The Negro population, on the other hand, has dropped from 15.7 per cent of the total population in 1850 to only 10.7 per cent in 1910. Less than a million of the total increase for the last decade was furnished by them.

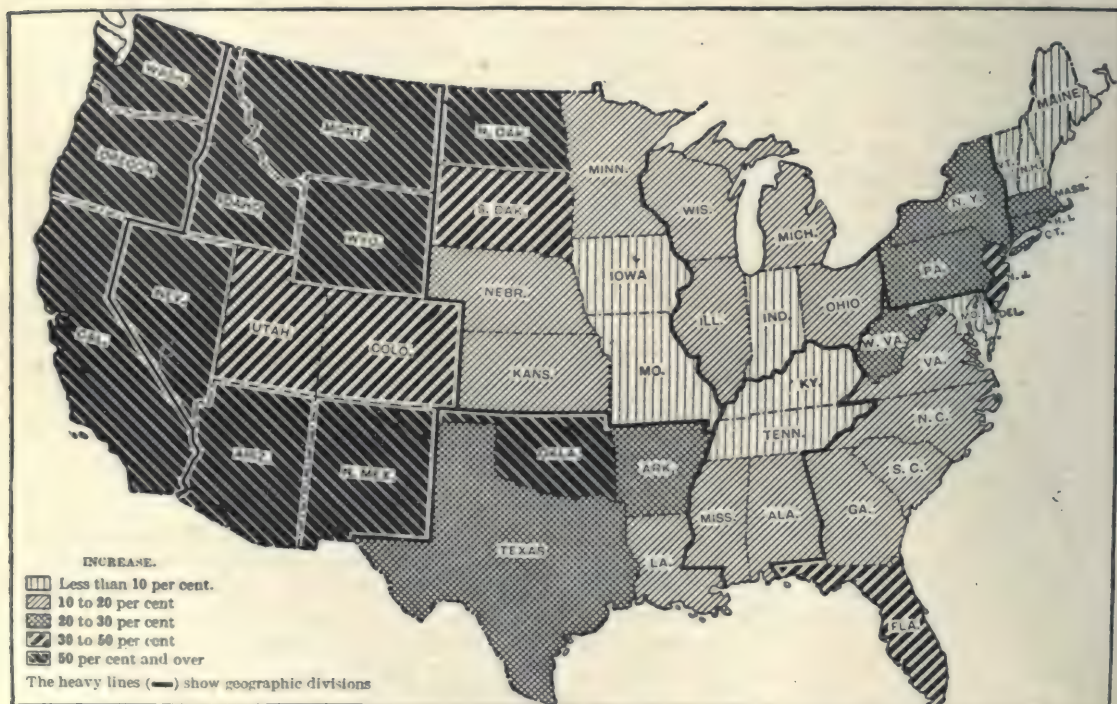

In the southern divisions, where they make up from one-fourth to one-third of the population, their relative statistical importance has declined materially since 1900. And they are being supplanted, not by foreigners of the first or second generation, but by native white people of native parentage. On the other hand, this purely native element has dropped from 50 per cent to 40 per cent of the population in New England, and from 48 to 44 per cent in the Middle Atlantic States, with a corresponding gain in foreigners of the first and second generation. This reflects the growing part played by the foreign-born in our industrial life. For of the 4,000,000 total increase in the Middle Atlantic States, over a million and a half were foreign born. The net result of the racial changes in the United States has been a constantly decreasing proportion of the native whites of native parentage from 1860, when they constituted nearly 60 per cent of the total population, to 1910, when they were just short of 54 per cent, a little over one-half.

The present census takes account of the change

in character of immigration within the last two decades by grouping separately the foreign-born from northwestern and from southern and eastern Europe. In 1900 67.8 per cent of all the foreign-born were from northwestern Europe; in 1910 only 50 per cent. In 1900 only 17.7 per cent were from the South and East; in 1910 the proportion had mounted to 37.4 per cent—still considerably short of the northerners. Of the 5,000,000 southern and eastern Europeans in the country in 1910, over 1,700,000 were from Russia, 1,670,000 from Austria, and 1,343,000 from Italy.

### *New Classifications*

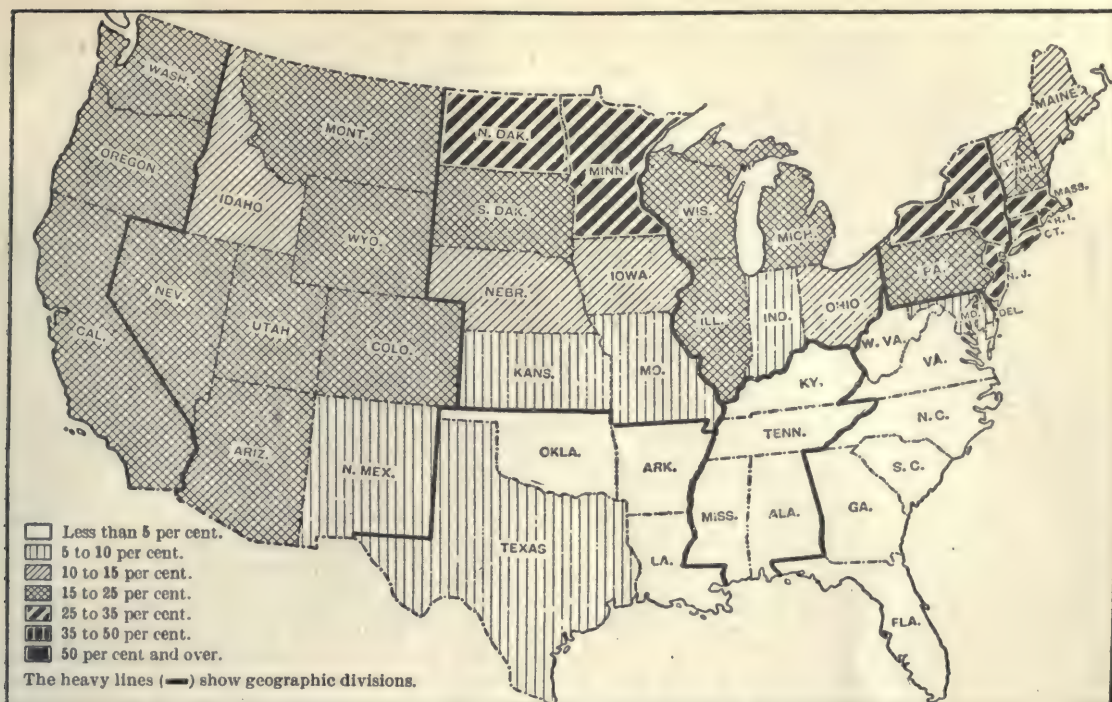

The material afforded in this abstract tempts to endless quotation and combination in following up only a few of the highly significant facts it reveals. For the first time the foreign-born are classified according to mother tongue, which allows us to see the actual racial divergence under a common nationality. The foreign-born are also classified according to the date of immigration as a means of determining what proportion of the immigrants of each year or period of years had remained in this country and were still living. A study of the growth of cities is helped by the present census grouping of large cities with their suburbs and natural dependencies, in metropolitan districts, and by grouping of cities

PER CENT OF INCREASE IN TOTAL POPULATION, BY STATES, 1900-1910

This map appears on page 23 of the Abstract

PERCENTAGE OF FOREIGN BORN WHITES IN TOTAL POPULATION, 1910

"For the first time the foreign-born are classified according to mother tongue. The foreign-born are also classified according to the date of immigration as a means of determining what proportion of the immigrants of each year or period had remained in the country."

according to size with their rates of increase. The chapters on age and marital condition are scholarly studies of population facts which have little popular interest, but are basal to any thorough understanding of the other subjects. We could wish, however, that statistics for divorced persons had been kept entirely separate from the married and widowed, as at present we are not able to work out in detail a matter which is of interest to many.

The statistics of state of birth of the native population enable us to trace the extent of interstate migration, which in 1900 had resulted in 20.6 per cent of the population being found living outside the state in which they were born, and in 1910 in 21.7 per cent of the population out of their native boundaries.

The chapters on illiteracy and school attendance give a comforting or discomfoting impression of progress, according to the way the figures are looked at. It is cheering to note that the percentage of illiteracy in the population of ten years of age and over has decreased from 17 in 1880 to 7.7 in 1910; that the rate for natives of native parentage has dropped from 7.5 in 1890 to 3.7; that the second generation of foreigners show the phenomenally low rate of 1.1 per cent, and that, notwithstanding the great in-

crease of immigration from countries in which the rate of illiteracy is high, foreign-born whites show an actual decrease in illiteracy from 13.1 per cent in 1890 to 12.7 in 1910.

On the other hand, it seems inexcusable that in the year 1910 there should be over 295,000 native white persons of native parentage, ten years of age, in the northern states who can not read and write; 46,294 in the far western states, and 1,118,573 in the southern states. And that the total number of illiterates of native white birth and parentage is exactly four-fifths of the total number of illiterate foreign whites.

All the above topics are taken up in the section of the abstract devoted to population alone. The sections on agriculture and manufacture afford just as significant indices of our national growth, and are as carefully prepared.

It is to be hoped that no changes in governmental policy will disturb the present careful organization of the Census Bureau, but, rather, that more ample financial support will be given to enable it to carry out with full effectiveness the excellent plans that have been conceived and inaugurated, and that we may expect, year by year, a series of special studies as full and as interesting as those made for the twelfth census.

# THE CANAL BUILDERS

EDWARD T. DEVINE

**T**HIS is not a survey but only a snapshot of the Canal Zone. The impressions were gained during a week in January of the seventh year since the zone was actually occupied by the builders, though it is nearly nine since the concession to build was obtained from the newly fledged government of Panama, the rights of the French company secured and the building of the canal undertaken.

Now is the best time of the seven years for the layman to visit the canal, for the huge locks, although nearly finished, are still empty; the lake, although fully impounded, still leaves uncovered much of the 164 square miles of swamp and jungle which it will cover; the great cut through the continental divide at Culebra is within a few feet of the bottom, in some places actually at the bottom, and yet the unconquered—though not unconquerable—slides still push their toes menacingly into the canal, as if the angry earth gods would show the puny engineers that they must not be too confident, at any rate of the precise date of their final triumph. The end is in sight. Water will go into the canal, whether it is ready or not, when the rains come, and dry excavation will have to be replaced by wet dredging if digging is still necessary, so the engineer of the Atlantic Division, who holds the dam and spillway and is responsible for the great lake, declares. And the engineer at Culebra still says, "Let it come," although at the very moment he is postponing for three months the date, which for two years and a half he had kept unchanged, for the completion of his task. This was made necessary because the Cucurache slide, having slept for a year, recently awoke and began to push again, to push harder than at any time since 1907 when it first troubled the American diggers, to push more angrily, more expensively; for after all it is mainly a matter of cubic yards, of weeks, and of dollars, and the division engineer has saved enough in other ways to be even yet within his estimates.

The end is in sight. Shops are concentrating, houses are being demolished where they are no longer needed, purchases of materials are made cautiously, army officers are speculating about future details, the Federation of Women's Clubs has held its last annual meeting. And yet, notwithstanding the unmistakable signs of an early end, there are at the moment more

men actually employed on the canal zone than at any previous time—over 40,000. The whole organization is working at its maximum capacity. Long after the recruiting of labor was stopped as being no longer necessary, 500 Negroes are again on their way from the Barbadoes. Steam shovelers at Culebra and lock gate mechanics at Gatun are engaged in a display of well-directed competitive energy—each determined not to be the limiting factor that will delay the completion of the great enterprise. And up at Culebra, in the operating headquarters, the chairman of the commission and his engineers and aids are no doubt keeping an eye on the distribution of money, men, and materials with a view to a symmetrical and well-timed rounding out of all parts of the work, so as to satisfy the just expectations of the nation whose trusted agents they are.

Yes, this is the time to see the canal. The hospitals and the penitentiary are in smooth working order. The quarters supplied by the authorities are fully occupied—congested at some places, the official reports say—and besides, whole villages of unofficial commercial tenements are crowded, really congested, with "silver" laborers and their families. Congestion of population and extortionate rents are among the sights of the canal zone which may be less in evidence next year than this. The "red light" districts of Panama and Colon will no doubt remain, at least for a while, and the lottery (for these are not on the canal zone); and the overcrowding in those two cities will continue unless the United States, through its new civil government in the canal zone, decides to extend its sanitary regulations and police surveillance, as the treaty with Panama gives it the right to do if it deems it expedient. At present residents of Colon and Panama are required to install a sanitary toilet and to supply their dwellings with running water. Sewers, drains, and paving are also constructed under sanitary direction. Otherwise there is no interference with domestic arrangements, and the local regulations do not insure safety against any such dangers as those from fire, congestion, or the greed of landlords. Whether the Chinamen, the canal zone employes, and others who build the flimsy tenements and rent them at \$10 in gold a month for each room are all making a big return on their investment, may, of course, be

a question. Building materials are expensive and the harvest time is short. Not all speculative builders get rich, even in the cities of the North. But it seems a safe guess that the income from rentals should balance the cost of construction in about six months.

No doubt many people suppose that all the laborers and their families are housed by the government, just as they are fed, at fixed prices, from the official messes and commissary. But that is not the case. What the commission undertook to do was to furnish "bachelor quarters," i. e., for laborers, bunks in large dormitories, and, for more highly paid white employes, comfortable rooms, each shared by several men, with adjoining shower baths, screened verandas, etc. It was also expected that "so far as practicable" married men in the more responsible positions who wished to bring their families would be provided with "married quarters." Reduced rates on the New York steamers are secured for wife and children only after "married quarters" are actually assigned. At present there are over 700 applications for such accommodations on file which cannot be considered favorably, for lack of the necessary buildings. Those who choose to bring their families or to establish new households without having obtained the privilege of "married quarters" must therefore pay rent or build for themselves. Many of the Negroes do the latter, and their shacks in the brush are a feature of the landscape all along the line of the canal. They are the aristocrats of the zone, free from landlord's extortion, free to work as much or as little as they please, cultivating a little ground, buying what they like from the commissary, untroubled for the most part even by the sanitary authorities. They are about as healthy and vigorous as their more industrious and better fed neighbors, although they have some malaria most of the time, and die quickly of tuberculosis or pneumonia, if either attacks them.

The larger number, however, of the Spanish and West Indian laborers who depart from the free "bachelor quarters" do so to take up their residence in the commercial tenements of the speculative builders. These tenants represent the more industrious, more dependable, better paid, and it must be confessed, so far as rent is concerned, more exploited part of the population. Their dwellings are often unscreened, the children are bitten unmercifully by insects, their death rate is high, co-habitation is not always preceded by marriage, as it is supposed to be in "quarters," though the clergymen try to bring this about whenever possible. Private physicians of no great learning or capacity drive a flourishing practice, easily persuading the gullible Negroes that, because of their

higher price, their remedies must be worth more than those furnished free or at a nominal charge by the authorities. Even the lawyer hangs out his card unblushingly and finds plenty of clients—notwithstanding the chairman's Sunday morning court in which justice is "dispensed" without fee or technicality.

Among the ingenious inventions to which social conditions on the isthmus have given rise, first place must be given to the broad distinction between "gold employes", who are mainly white citizens of the United States, and "silver employes," who are divided among common laborers recruited in Spain, frequently referred to for brevity as Europeans, and black West Indians, who make up the bulk of the unskilled, and much of the skilled, laboring force on the Isthmus. To be sure the line is not strictly speaking either geographical or racial. A capable colored mechanic may be put on the "gold" pay roll and a Spaniard may now and then have that distinction; but speaking broadly the social problem is solved by the arbitrary classification into those who are paid in gold and those who are paid in the silver coin of Panama, the parity of which at a fixed ratio with the American gold dollar as a token currency is guaranteed by the government. There is no "Jim Crow car" on the Panama Railway; but there is a first and second class with separate coaches, and on work trains there are separate cars for "gold" employes. The patent subterfuge might make "trouble" in some parts of the country; but on the zone, with Negroes who are mainly British subjects, and "Europeans" who are accustomed to the idea of social classes, the plan seems to work satisfactorily.

The laborers on the zone are all well paid and well treated. They respond as might be expected. The Negroes especially, whether because of the superior education at home on the islands, or because of the discipline, the abundant food, and favorable health conditions on the isthmus, have amply justified their selection. The police force consists largely of Jamaicans and other West Indian Negroes who have previously served as soldiers in the British army. As teamsters they have shown extraordinary capacity for improvement and are now generally as trustworthy as any who could be found to manage the army mules. As pitmen around the feet of the almost human steam shovels they may aspire to count their wages proudly in gold, and even in the strong rooms of the treasurer and disbursing officer they are employed in places requiring intelligence and character.

Best of all, they do not threaten the safety of women, or furnish a marked disproportion of criminals. Of course, much of the crime with which the local courts deal does appear among them for the same reason that it appears among

the immigrants in the cities, because they are relatively "the poor," the part of the population which is paid least, has least at stake in the community, has least of opportunity and of outlook. Drinking, gambling, and other vices flourish as might unfortunately be expected. A devoted missionary who worked on the Isthmus long before the Americans came and who has seen all the revolutions and developments of more than a dozen years there, thinks that the Negroes have advanced in nearly every way under the influence of the conditions which have prevailed, though he thinks it not to their advantage that they have learned "American" ways of spending their Sundays in dissipation, or at best in pleasure excursions, instead of in the more quiet and orderly religious observances to which they had been accustomed in their West Indian homes. It would be easy to collect stories of the ignorance and childishness of many of these West Indians, as it is even easier to hear of their precocity and extraordinary imitative teachableness. One little youngster gravely informed a tourist that "the London policeman is most discriminating in the world, able to tell by looking at a man whether he is a law-breaking or a law-abiding citizen." "Were you ever in London?" asked the tourist. "No," said the lad, "except in my mind."

Another young man, who had been employed for a year or two as attendant in a dispensary "along the line," found himself alone at the noon hour when the doctor on duty was taking his siesta. When the doctor appeared he heard his colored aid say, "I did not want to disturb you, doctor, and so I sewed this man up myself." The patient was a Spaniard who had a four inch cut in his back. The operation seemed to have been perfectly performed and the closest questioning revealed that the amateur surgeon had used the right instruments, had disinfected his hands and the wound properly, had, in short, done the work just as he had often seen it done. Unfortunately, however, infection developed which made it necessary for the doctor afterwards to undo the work and deal with the consequences. Such things no doubt happen sometimes in the most correct operations, but the boy was instructed not to assume again so much responsibility.

The three departments of the canal zone administration which have greatest interest for the social worker are those of the quartermaster, which includes the recruiting of labor and the erection and management of "quarters"; sanitation, which includes not only preventive sanitation but also the management of hospitals and dispensaries; and civil administration, under which come the schools, the post office the courts and police, the jails and the penitentiary.

The chief quartermaster is Col. C. A. Devol,

U. S. A., who in San Francisco in 1906 made friends for the United States Army in every direction by the efficiency, sound judgment, and good sense with which he handled the relief supplies. This service was highly commended by General Greeley in his official report and was recognized by the American Red Cross in the award of one of the first gold medals conferred under its present charter. On the canal zone, as his friends in the army and in the Red Cross would naturally expect, he is showing the same unostentatious but efficient capacity, and there, as in the emergency relief work in San Francisco, the real importance of his functions is far greater than the uninitiated might suppose.

The sanitary department, for example, decides upon health policies, but whether the houses and settlements shall really be sanitary depends, of course, upon the way in which they are kept, the removal of night soil and garbage, the cutting of grass and digging of drains, and other services the actual performance of which devolves upon the quartermaster's department. Again, the policy as to what labor shall be employed may be determined by the commission, that is to say by the chairman, or by the secretary of war, or even by the President, but the actual recruiting of the labor, the transportation of laborers, the supply of quarters, the cleaning of their beds and the supply of their drinking water, all come within the province of the quartermaster.

By a coincidence in which the writer takes special pleasure, Chief Quartermaster Devol—who was a major when we were working side by side in San Francisco seven years ago and a colonel in Panama during the brief visit of which this is but an imperfect record—received by cable in that week the notice of his nomination to the rank of brigadier general. The promotion is somewhat tardy as he has served thirty-three years in the army and has on many occasions deserved well of his country. President Taft is said to have been especially desirous of promoting him before the expiration of his own term of office because he has been a good loser on previous occasions and borne no ill will against those whose rewards have come more promptly.

Of the chief sanitary officer there is not less to be said but perhaps even less occasion to say it. Colonel Gorgas had won international renown by his extraordinary achievements in Cuba, and it is enough to say that the luster of that renown has grown brighter by the success which has followed him through the entire history of the canal zone. He was fortunate in Havana in having General Wood as governor, and he has been fortunate on the isthmus in having to report to Colonel Goethals. But he richly deserves his good fortune in both instances, and the advantage has certainly been mutual. The story is summed up in the fact

that yellow fever is banished and malaria controlled. There are, of course, many deaths from accidents, from pneumonia, from tuberculosis, and some from malaria. The death rate on the zone for the last fiscal year, including the cities of Colon and Panama, was 19.82 per thousand. In 1906-7 it had been 42.08. The next year, with an increase of more than 25 per cent in the population, the actual number of deaths fell by 570 and the death rate to 27.67. The death rate among employes last year was 10.16 per thousand, but these are, of course, of selected age and resistance; and this must also be considered in comparing the death rate of the zone as a whole with that of normal communities. Colonel Gorgas was not assigned to the task of making a health resort though he has very nearly done so. What was expected of him was that he should make it possible for men to work on the canal with reasonable safety from preventable disease in the light of modern knowledge. This he did promptly and continues to do at the cost of eternal vigilance. We have no reason to cease to take pride in the brief typical announcement in the official report for December, 1912: "No case of yellow fever, small pox or plague originated on or was brought to the isthmus during the month."

The general index for health conditions on the isthmus, however, is the morbidity rate of malaria. Since 1904 this has been year by year per thousand as follows:

1904-5. . . . .	162
1905-6. . . . .	727
1906-7. . . . .	625
1907-8. . . . .	287
1908-9. . . . .	312
1909-10. . . . .	183
1910-11. . . . .	202
1911-12. . . . .	143

There is a high infant death rate: 1,212 deaths out of 3,163 last year being of children under five years of age, and 956 of these under one year. Pulmonary tuberculosis in all ages accounted for 293 deaths; malaria and malarial fever for 256, diarrhea and enteritis for 394, and Bright's disease for 146. There were 22 suicides.

School attendance is not compulsory, but is general and reasonably regular. In December, for example, the net enrollment in the white schools was 1,241, the average number belonging 1,095, and the average daily attendance 1,025. In the colored schools the enrollment was about the same, but the average daily attendance only about three-fourths as good. There is an efficient corps of teachers, most of whom have had professional training and experience. Five pupils were graduated from high

school last year. One colored school boasts a school garden. As might be expected, there is a system of medical inspection. Notwithstanding the transitory nature of the population, and the shifting conditions, as a result of which, for example, the high school is this year conducted at Ancon while last year it was at Gatun, the educational needs of the children may be said to be fairly met.

There is no law against child labor in the canal zone and the official regulations distinctly recognize Boy A and Boy B rates of pay, which are five and seven cents an hour respectively. The boys are mainly water carriers and messengers. On June 30, 1912, there were only three employes receiving the five cent rate and 351 the seven cent rate. Among the latter, however, there may have been some men who had been injured in the service of the commission or the railway and were capable of performing only light work.

It would be refreshing to review the work of the district, circuit and supreme courts, to discover to what extent they have been able to create new precedents and to escape from the useless formulae and traditions which impede the development of the law in more stable communities, but something more than the slight and superficial observations for a snap shot would be required for this purpose. The ordinary civil law is that of Panama, modified by specific acts of Congress, ordinances of the commission, and executive orders from the President and secretary of war. For the criminal courts there is a penal code not substantially different from those of the various states. But the courts have had to deal with conditions as they are, and we venture to think that a capable law student would find an interesting theme for a dissertation in the examination of the decisions and opinions of the current decade in the canal zone. In one sense it will soon be a completed chapter, as the higher courts will be abolished under the new civil government which is to succeed the commission, and justice will be represented thereafter in the person of a single magistrate. If there is to be an appeal from his decision, or if a writ of habeas corpus is to be secured to set at liberty any one who is confined in pursuance of his judgment, it will be necessary to make a long and expensive journey to the nearest regular circuit judge in Louisiana for the purpose.

There is no juvenile court in the canal zone, no probation system, and virtually no resources for dealing adequately with the by no means infrequent cases of genuine juvenile delinquency which occur. Dismissal with ineffectual reprimand or commitment to the penitentiary are the unwelcome horns of the dilemma which the district judge faces. Thanks to the women's clubs,

a separate part of the district jail is set apart for women offenders, but the segregation in practice is apparently not always effective, as in the Colon jail the only woman, a young West Indian awaiting deportation as a disorderly person, was holding animated converse with a convicted felon across the corridor. Probably, however, the attention of the efficient chief of police, who is responsible for the jails and penitentiary, has already long since been called to this oversight, and its recurrence prevented.

Capital punishment by hanging is practiced on occasion, although juries are slow to convict of the degree of murder which has that result. There are some 150 convicts in the penitentiary on an average, and they are employed largely in road building and other outdoor work. They wear the striped clothing of the state's prison tradition. Also, alas! for the first three months, while at work, they wear the *ball and chain*, which saves guards, and as the chief of police thinks, some lives, for if the convicts were not chained the guards would have to shoot more freely when escape is attempted. The ball and chain and the striped clothes are a rough means of classification, but it seems a little hard on a man sentenced for three months that the most exemplary conduct secures graduation from the lowest grade only on the expiration of his term.

An army officer was once conveying some military convicts from Fort Snelling to Fort Leavenworth, all of whom were heavily encumbered with the ball and chain. They came to a place in changing trains where it was necessary either to cross a trestle, which the prisoners could not do in their chains, or make a long and tedious detour. The officer did not relish the prospect and said as much, whereupon the leading spirit among the prisoners, after a look of free masonry among his comrades, said: "Captain, if you don't mind, just to accommodate you, we will take these things off." Without further permission or assistance, they sat down and pulled off their boots and the irons, carried them across the trestle and then all in good humor and patience put them on again. They had some misgivings as to whether other Fort Snelling prisoners might not lose the advantage of the arrangement which they had had with the the accommodating black-

smith. The canal authorities might possibly find that if they would let their convicts slip off the chain they would not only build more road, but would also get more safely over the difficult bit of road which separates the life of a criminal from that of a law-abiding citizen.

There is no space left to tell of a bit of infant life saving by two trained nurses among the passengers on the Panama railway and of the way in which the other passengers showed their appreciation and congratulations; or of a horse-back ride into the jungle where a rubber plantation, a little gold mining, and some cocoa bean curing punctuated the long sweep of brilliant flowers and luxuriant vegetation.

Nor is this the place to try to appreciate the services of Colonel Goethals and his assistants, Colonel Hodges and Mr. Rousseau, to tell the story of the achievements of Colonel Sibert at the Atlantic end, of Colonel Gaillard in the central division, of Mr. Williamson on the Pacific, of Mr. Goldmark's lock gates, of Colonel Wilson's hotels and commissary stores, of the excellent railway service, of the work which Mrs. Brown, Miss Beattie and their associates have done in the women's clubs, or even of Mr. Dickson's Y. M. C. A. club houses, the centers of the social life of the isthmus. Of these last I have naturally the most vivid and appreciative recollection, for it was in them mainly—at Cristobal, Gatun, Gorgona, Empire, and Culebra—that I had opportunity to meet the builders, from members of the commission down to messenger boys, and a superb lot of men and boys they are. All honor to them; for this that they are doing, unlike some of the misty and mythical marvels of antiquity, is a real wonder of the world. Every one who has a part in it is to be envied. Every one who has a chance even to see it is to be congratulated.

The social and sanitary problems of the canal zone are expected to disappear with the completion of the canal. For the word is that, except for the army and the few necessary canal employes, the zone is to be depopulated. This is now said to be the easiest means of defense against both armies and aeroplanes. Whether that is so or not, it is no doubt the easiest means of preventing yellow fever, malaria, congestion, illiteracy and immorality. If there is no life on the zone then the problems of life will be utterly simple.

A Y. M. C. A. CLUB HOUSE  
This building is at Empire, on the Canal Zone.

# THE MORAL NECESSITY OF "STATE FUNDS TO MOTHERS"

WILLIAM HARD

AUTHOR OF THE WOMEN OF TOMORROW

[Mr. Hard has been conducting a department in *The Delineator* for the last eighteen months on the subject of legislation affecting women and children in their homes. In the course of this work he has made inquiries into such topics as the property rights of married women, the joint guardianship of children, the rights of the widow in the property left by her husband, and the enforcement of non-support and desertion statutes. He printed one of the first magazine accounts of the "state funds to mothers" movement and has taken a favorable attitude toward it in the material sent from his office to newspapers and individuals now actively forwarding "state funds to mothers" legislation in various states.—Ed.]

**I**F we discuss "state funds for mothers" as a mere immediate "practical" proposition, we shall never be finished.

For instance, Mr. Carstens alleges a certain local transitory fact about "commitments" of children to institutions in Chicago. We are not thereby advanced. For I immediately set up the local transitory explanation of the fact.

The fact is (and Mr. Carstens places it first among his statistical offerings in his *SURVEY* article<sup>1</sup>) that in the first six months of 1912, with the new State Funds to Parents Law in operation, there were 125 more "dependent" children committed to institutions by the Chicago Juvenile Court than in the first six months of the previous year, 1911, when there was no such law being enforced.

The explanation lay ready to Mr. Carstens' hand.<sup>2</sup>

Certain "homes" and "asylums," in the first six months of the year 1911, were "private enterprises" in the full sense of the phrase. They were receiving children; but they were not receiving public pay for receiving children. Consequently the children were received, large numbers of them, without being "committed."

By the first of January, 1912, the racial-religious groups maintaining several of these "homes" and "asylums" had re-organized themselves, either in their old buildings or in new ones, under the training-school and industrial-school acts of the state of Illinois; had become competent to receive public pay for receiving children; and had begun to have children "committed" to them by the Juvenile Court, regularly and officially.

In addition to re-organizations there were certain totally new openings. In the first six months of 1911, for instance, there had been no institution

<sup>1</sup>See *Public Pensions to Widows with Children*, *The Survey*, January 4, 1913.

<sup>2</sup>He makes what may be, or what may not be, an allusion to this explanation when he concludes his paragraph on commitments by saying that "It is not reasonable to suppose that the granting of pensions has had the effect of increasing the number of children in institutions," and that the increase in question was due to "other causes." This relegation of unspecified "other causes" to the last sentence in a paragraph which specifically and prominently stated the effects of those causes has done an injustice and an injury to the "state funds to mothers" movement in the United States. I have heard the fact of that increase repeated time and again without the explanation. I want to give the explanation in full.

to which to "commit" dependent colored Catholic girls. In the first six months of 1912 there was the "Illinois Technical," established in the interim for that sole purpose.

Reorganizations and openings together brought into the "commitment" records a large number of children who previously would either have made their way to institutions privately without passing through the court or else would have been thrown back into the community, though deserving "commitment," because of the absence of institutions operated by persons of their own nationality and creed.

Accordingly, the "Polish Manual," "St. Hedwig's," the "Kinderheim," and the "Illinois Technical," which had no "commitments" at all in the first six months of 1911, had 143 in the first six months of 1912.

This increase of 143 overlaps Mr. Carstens' increase of 125 by a margin of 18; and it is mainly nothing but the recorded exhibit of certain racial and religious classes of minor dependency which had previously existed unrecorded. It means an increase not of cases deserving "commitment" but of facilities for receiving such cases and for receiving them at public expense and, therefore, under public scrutiny.

When we turn away from new institutions created to meet old unsatisfied needs and also from old institutions re-made to merit public pay for a continuance of work already being done, and when we confine our attention to institutions and to agencies which were having children "committed" to them in the first six months of both years with no shift of policy, we arrive at different results; for we find that the "commitments" to such institutions and agencies suffered a decline of 85.

I submit, therefore, that Mr. Carstens' fact is worthless.

I also claim that my explanation is equally worthless. It shows, at best, the probability of a small loss, rather than a small gain, in the number of "commitments" ordered out of comparable sections of the population in the two compared periods. Meanwhile, behind both fact and explanation, there stretches, answerless, the dreary query as to what standards, right or

wrong, varying or identical, were used in deciding on the commitments of individual children, case by case.

We can set our teeth to such tasks forever without gaining any nourishment. They are not food, but a sort of intellectual chewing-gum, producing much interesting factitious mastication but no important alimentary consequences.

The question of "state funds to mothers," like all other questions which have moral as well as technical implications, will be settled not mainly on the basis of immediate facts and results, but mainly on the basis of principle.

Even the best of us have principles.

When I observe Mr. Carstens' success in displaying the increase of commitments in Chicago and his failure to display, or perhaps to discover, the reason for that increase, I suspect him of adhering, even as I do, though oppositely, to a principle, a theory, a philosophy, on the whole subject of the State and the Individual.

My suspicion deepens as I proceed farther into his article and observe both his assumption that private charity can, and will, give adequate "relief" to the widow with dependent children and his conviction that private administration is, and must be, superior to public.

As an illustration of the assumed adequacy of the "relief" now furnished to such cases by existing agencies, I observe that the Commission on the Support of the Dependent Minor Children of Widowed Mothers in Mr. Carstens' own state of Massachusetts found, in studying 757 separations of children from widowed mothers, that 429 of them involved no unworthiness of either mother or child and that "in a clear majority of the 429 cases economic causes determined the separation."

In New York I challenge any charity expert to deny that a few days' work in the Children's Bureau will reveal hundreds of cases containing the following elements:

1. The mother is known (has been reported) to a private charity society.
2. She has one or more of her children in her home.
3. One or more of her children are in an institution.

Are these mothers "worthy" or "unworthy"? If "unworthy," the children with them are being injured. If "worthy," the children not with them are being outraged.

To the question "Is relief to widowed mothers now adequate?" the answer returned by charity people is either distinctly evasive or, as in the case of Patrick Mallon of the Brooklyn St. Vincent de Paul Society, deliberately negative. I never yet have encountered a clear-eyed affirmative.

In the 1911 report of the New York State

Board of Charities, at page 39, in the course of comment on the number of children in institutions in New York, the opinion is expressed that "there is practically every reason to believe that many [broken] family homes should be kept together" and that "this is particularly true in the city of New York where public outdoor relief has been long discontinued and where the private relief-giving agencies admit, practically with one accord, that their present means are inadequate to the task they have voluntarily assumed."

In Chicago, as Mr. Carstens says, "state funds to mothers" may next year cost \$200,000.

In only 10 per cent of the cases studied by him did Mr. Carstens find that the homes were such as should not be maintained. In 9 per cent of the cases he was in doubt. Let that 9 per cent be deprived of the benefit of the doubt. Let 10 plus 9 per cent of the \$200,000 be regarded as waste. There remains \$162,000 to go into homes of social value.

Few homes will be excessively subsidized.

To be sure, Mr. Carstens says: "It must be conceded that where an average of \$23.28 (a month) is provided for each family, temptations come to spend money recklessly and foolishly, even in some of the better families."

I do not envy Mr. Carstens the multitudinous concern with which he must gaze at the masses of women to whom their husbands or their husbands' wills or their husbands' insurance policies each month deliver a sum considerably in excess of \$23.28 to be expended in all manner of indiscreet living utterly unregulated by the agents of any of our private charities.

I find, however, when I come to Mr. Carstens' tabulation of his inquiries that in answering the question "Is the relief given by the court adequate?" he says "Yes" for only sixty-one of his hundred cases, while for thirty-nine of them he says "No."

I find, further, that certain types of cases are now being recommended back to the private charities by the court because the rules of administration adopted by the court do not permit, for these cases, a "pension" large enough to provide for the needs of the family. The judge wishes to confide such cases, exceptionally, to the particular attention of the private charities rather than break a set of rules which at the present time seem to him to be demanded by the novelty of the "state funds to mothers" system.

In Chicago, as in Kansas City, the policy of the court, during this experimental period, errs (by intention) toward parsimony. The system is untried and the merit of it must be demonstrated to the tax-payers on a scale small enough not to arouse uninformed hostility.

Do I then admit an element of inadequacy in the Chicago and Kansas City "state funds to mothers" systems? Most frankly. I admit it

for the public systems, just as I charge it against the private. But I note the reason why the public systems have come into existence and I note the relative prospects of private and public enterprise in this country.

The public systems came into existence with the approval and assistance and sometimes through the spontaneous personal exertions of Juvenile Court judges who, in cities plentifully supplied with charity societies, had observed, with their own eyes, children suffering for necessities or committed to institutions through no fault whatsoever of their own or of their mother's. If private charity was adequate, its sphere of influence did not extend to the court rooms of Judge Wilbur of Los Angeles, Judge Porterfield of Kansas City, Judge Pinckney of Chicago, Judge Neely of Milwaukee, and Judge Lindsey of Denver.

The public system in Chicago, devoting itself almost exclusively to that one phase of child poverty which is caused by the death of the father, discovers, even under a rigorous and parsimonious set of rules, an appropriate scene for the expenditure of \$162,000.

The private societies, with all other phases of child poverty, to say nothing of adult poverty, crying to them, are, in turn, crying to the benevolent for subscriptions, just as before, and most rightly and meritoriously. They are not complaining either of lack of work or of surpluses in their treasuries.

What chance then do they think they would have had of raising, for next year, on behalf principally of just one type of case, "the widowed mother with dependent children," the sum of \$162,000 in excess of their present budgets? And if they think they could have raised it, why did they fail to raise it last year and the year before last?

To these questions there is no answer except the one currently given, namely, that the private societies, though not giving "adequate relief," were, and are, moving toward the giving of it, rapidly.

A typically "private-enterprise-individual-initiative" position is taken in this matter by many of the opponents of "state funds to mothers." They say that the private charities can rise to the level of adequacy and that the public systems are much less likely to do so, because, as one of the leaders of one of the largest charities in Chicago expressed it to me the other day, the resources of private charity are "virtually unlimited," while the resources of the public treasury are "fixed."

May I be pardoned for saying, in the midst of an otherwise moderately good-natured argument, that this is what I have been hearing for years from traction people and real-estate exchanges and bond-holders' committees and all the other

elements in society which seem to believe that there is money enough in the world for all luxuries except taxation?

The advocates of "state funds to mothers," on the contrary, are among those who believe that if the money is there to be contributed to the private societies it is there to be coerced into the public treasury, and that the coercion is going to happen.

Here, again, I am convinced, we split not on facts but on principles, policies. Mr. Carstens would improve the situation by whipping up the business man in his capacity as philanthropist. I would whip up that same man in his capacity as tax-payer. From his own standpoint, incidentally, and for the good of his own soul, since he has to pay the bill anyway, and ought to pay it, I would have him do so in the manner least calculated to tempt him toward thinking that he is performing an act of moral grandeur when he is really performing an act of elementary civic routine.

We split once more on principles when we come to the matter of the supervision of the families receiving stipends from "state funds to mothers."

I concede the basis which exists for severe criticism of the character of the work done by certain of the supervisory probation officers of the Chicago Juvenile Court.

It would, of course, have been generous in Mr. Carstens if he had taken pains to point out the fact that those officers were engaged in a work still new to all of them; that the Juvenile Court was in the midst of passing through political troubles unprecedented for violence; that the unique (and I use the word advisedly, for there can never be more than one Bartzén) temperament of the president of the County Board, happening upon a moment when the very method of appointing probation officers was in litigation, resulted in the presence of many sixty-day temporary appointees among the probation officers; and that at no previous time in the history of the court could an investigator have found so propitious an occasion for criticism of a hostile sort.

It was a period now coming to an end. The courts have lodged the appointive power in the hands of the judiciary, and new examinations for chief probation officer and for deputy probation officers numerous enough to form a majority of the probationary force have been held by a committee, the members of which (Mrs. Joseph T. Bowen, Sherman C. Kingsley, Dr. Emil G. Hirsch, Rev. C. J. Quill and Leonora Meder) are certainly not likely to be suspected, as a body, of a failure to understand and to appreciate both "civil service" and "social service" ideals.

I believe that an improvement in the public service may reasonably be expected. Such must be the hope of every person who believes that the

future is worth encountering. If there is any person who thinks that the public service cannot learn how even to administer a "pension fund" to widows, he has cast aside his heritage in democracy. He has despaired of the republic. He may be right, in the end; but the game of trying to render this planet tolerable will go on without him.

I observe that the public service does improve. And I observe that it improves especially in communities such as Wisconsin in which the functions of the state are farthest extended and in which ambitious men incline toward going into public life rather than into the service of reform organizations. The way to get reformers into public life is to have a public life for them to go into.

Even with an improvement in public service, however, the supervision given to widows with dependent children by public officials will be different, we may not only admit but hope, from the supervision given to them by the agents of private charity societies.

If we incline toward the gradual recognition of the principle of the endowment of motherhood, we shall devote special attention to the development of those policies which will give, not supervision, but instruction, possibly compulsory, to all mothers,—not merely to some of them, but to all. The public school nurses, the public visiting housekeepers, the public district doctors, the public health inspectors will carry their lessons down every street and will maintain principally by precept but in appropriate cases by ordinance, certain standards of child life in households in which the father is alive as well as in households in which the father is dead.

We can see the beginnings of such processes already in the educational activities of municipal milk stations and in the punitive activities of truant officers. In neither of these cases is there any of that "I-am-responsible-for-your-general-development-as-a-human-being" supervision which is bestowed on a dependent. The milk and the instruction about milk are given. The child who has failed to come to school is made to come. The contact is without favor on the one side and without obligation on the other. And it involves the wife as well as the widow.

In the case of the widow, if the state agents administering "state funds to mothers" establish the fact that the husband is dead and that the widow is no worse now than she was before his death, when she had the children, we shall cause her to be able financially to continue to have them and we ultimately shall not regard her as deserving any superior amount of supervision merely because her husband has died.

Mr. Carstens himself looks forward to a state of this kind. He speaks favorably of the principle of social insurance.

What sort of supervision, we may ask, will follow the principle of social insurance? The widow is in receipt of a monthly or weekly income from the insurance fund. That fund is established by coercion. The dead husband and father had a certain amount of money taken out of his wages each pay-day and retained by his employer forcibly to go into a treasury private perhaps but clearly owing its existence to public enactment and regulation. The formal state treasury itself, fed by taxation, could not be more impersonal. The money that comes to the widow will not have been earned by her. To her it will be money that comes without effort. It ought, if such money implies supervision, to be supervised. But what scheme of social insurance, existing or proposed, in this or in any other country, ever provided that supervision should be extended to its beneficiaries by the skilled social-service experts in the employ of private charity societies or even by public officers? The widow will spend her insurance stipends as she pleases and will maintain her family on them in her own way as long as she does not fall below those general standards of morality and efficiency to which every mother, without exception, must rise if she is not to be deprived of her children by general operation of juvenile court law.

I cannot but regard it as incautious of Mr. Carstens to conclude an article the principal point of which is the need of an expert private supervision, technical and intimate, with an advocacy of a system under which no such supervision will be in vogue.

The advent of universal compulsory insurance would be welcomed, so far as I know, by advocates of "state funds to mothers." It occurs to us, however, that several years will pass before we are able to welcome it throughout this country in any even partial form and that many years will pass before we are able to welcome it perfected. In the interim our view of the sort of supervision necessary in the case of the widowed mother makes it possible for us agreeably to accept the probation officer as a temporary substitute for that still less supervisory person, the distributing agent of the insurance fund.

We accept him and we propose to provide him with sufficient funds for his duties. We also propose to build up about him a system so large finally that it will compete on equal terms with the private charity societies for the services of especially intelligent and forceful young men and women.

Somewhere,—and wherever we can,—we must break the stalemate which threatens to keep the public charities department inferior because the efficient men and women are in the private charities, and which threatens to keep the efficient men and women in the private charities because the public charities department is inferior.

The case of the widow with dependent children is an excellent place at which to begin to break it, for two reasons. First, the administration of such cases is much easier than that of cases in which elements like unemployment and sickness of the husband are present. Second, the widow with dependent children is the most undeniable embodiment of the principle that the mother who needs aid for the single purpose of bringing up children is not properly an object of private charity, is not properly a "dependent."

Let me quote here from a man from whom Jane Addams has recently quoted in *THE SURVEY*.

L. T. Hobhouse, professor of sociology in London University, in his book on Liberalism, in the chapter on Economic Liberalism, which, by the way, begins with an attack on both the historical and the economic theory underlying Socialism, says:

"A third [way of attacking destitution] may be illustrated by the method by which the minority of the poor law commissioners would deal with the case, at present so often full of tragic import, of the widowed or deserted mother of young children. Hitherto she has been regarded as an object of charity. It has been a matter for the benevolent to help her to retain her home, while it has been regarded as her duty to keep 'off the rates' at the cost of no matter what expenditure of labour away from home. The newer conception of rights and duties comes out clearly in the argument of the commissioners, that if we take in earnest all that we say of the duties and responsibilities of motherhood, we shall recognize that the mother of young children is doing better service to the community and one more worthy of pecuniary remuneration when she stays at home and minds her children than when she goes out charring and leaves them to the chances of the street or to the care of a neighbour. In proportion as we realize the force of this argument, we reverse our view as to the nature of public assistance in such a case. We no longer consider it desirable to drive the mother out to her charring work if we possibly can, *nor do we consider her degraded by receiving public money. We cease, in fact, to regard the public money as a dole; we treat it as a payment for a civic service; and the condition that we are inclined to exact is precisely that she should not endeavour to add to it by earning wages, but rather that she should keep her home respectable and bring up her children in health and happiness.*"

Here we come to the pivot, the moral pivot, on which the whole movement of which we are speaking swings from its existence in human aspiration to its existence in human fact. It can be hung before the vision in a paragraph. But its validity must merely be felt or not felt. It cannot be proved or disproved.

It is a matter of moral, or, speaking even more broadly, of esthetic, perception.

I cannot prove to a man that a certain picture is beautiful nor can he prove to me that it is ugly. What determines our judgment is within us, under layers of customs and theories, unreachable by immediate argument.

I cannot even prove to a man that a self-governing community is nobler than a despotically governed one, unless the prospect of freedom strikes to a flame against the conception of freedom is in his own soul.

I cannot make Mr. Carstens understand why I writhe in mind when he speaks in his article of the creation of a new class of "dependents" under the operation of "state funds to mothers," unless he already has, rightly or wrongly, in his own mind a certain conception,—that is, my conception,—of motherhood and of the state.

Mr. Carstens clearly sees a "dependent" and properly wishes her to be supervised by expert private charity visitors. I see an independent citizen kept from self-support only by the presence or future citizens at her knees and requiring, in order that as she fulfils her instinctive duty to them she may also fulfill her indirect civic duty to the state, the means of support really for them and only incidentally for herself.

Her true position is determined not by her poverty but by her duty; for her stipend stops when her duty has reached fulfillment, when the future citizens in her charge are at the age of entrance into the self-supporting world.

To call such a person a "dependent" is to me as monstrous as to call the librarian of Congress a "dependent." He is paid for his work; she for hers. And she should be paid by those for whom she does it,—all the citizens of the state, not the subscribers to the charities.

When Mr. Carstens calls her a "dependent," he gives us the precise direction of the mental attitude taken toward her by the charity agents, an attitude which infuses all their daily intercourse with her.

The only chance that exists,—not a sure chance, but still a chance—of winning her an environment in which she can maintain a home for herself and for her children as self-respecting as the home next door is to annex that home of hers to the public domain.

In the public domain it can possibly be self-respecting, if we develop our plans manfully for making it so. In the private domain, self-respect is, for her and for those whom she is training to democratic citizenship, permanently impossible.

In the one case, we are sailing on the right sea on the right tack and may reach haven. In the other case, no matter how skilful our present skippers may be, and no matter how well they may sail, there is no haven. There is only more sailing.

# MOTHERHOOD AND PENSIONS

MARY E. RICHMOND

**A**RGUMENTS that will not bear critical examination are being advanced on both sides of the mothers' pension question. Wholesale claims that every need is now adequately provided for by this agency or by that; solemn general warnings about the dangers of pauperism; harrowing instances of hardship with most of the facts pertinent to the subject under discussion omitted; statistics from sources unknown or discredited; startling discoveries that pension plans lean to Socialism, or that their opponents conspire to reduce women's wages, or to increase the prestige of social workers—all this claptrap should be brushed aside. Until both sides have had a chance to be heard, until both have brought forward their evidence, the case is not settled, and the effort to settle it by stampeding our state legislatures can only cause delay. If, for instance, bills are passed as a means of emptying the children's institutions, but are so framed as only to increase their population in the long run, it is better to hear what competent witnesses have to say about this before than after legislating. Competent witnesses are often wrong, it is true, but only by witnesses more competent, with facts still more pertinent and unassailable, can they be so proven. And if we legislate that mothers shall remain at home with their children, as we are now doing, in some states, without giving so much as a thought to the experience of those who know most about home work, and the probable industrial effect upon it of a state subsidy, we may be vindicating our principles and "standing up for motherhood," but we are doing it at the expense of the very group we aim to help.

Decidedly the time to look about us, to compare experiences and reason together, is now, and the time to legislate is after we have done this. Many social workers, though not nearly all, have no faith in any one remedy applied wholesale by statute to the ganglion of evils that mother's pensions are supposed to do away with. As campaigners, this places them at a disadvantage. A single remedy, easily explained and picturesquely defended, makes an appeal that they cannot hope to make. But, as has been shown in more than one legislative hearing on this subject already, the people who live close to the facts and are in the habit of thinking about them constructively have nothing to lose by conference and by discussion. The Illinois

Funds to Parents Act was passed in 1911 without discussion; and now, when all its friends, from Judge Pinckney down, are striving to amend it, some other states, also without discussion, are adopting it verbatim in its unamended form. This is a wasteful way of getting forward. Surely experience counts for something, and that cause is weak whose advocates close their minds to the lessons of experience.

On what central facts are we all agreed and on which do we differ? We are all agreed, I think, that families are being broken up which should be kept together; that mothers are being overworked with disastrous results to themselves and to their children; and that inadequate food and clothing, together with overcrowding in the home, are physically and morally handicapping the children there. We are further agreed that it is far more important to remedy these conditions, and to remedy them in a way that will prevent their recurrence, than to vindicate our preference for private initiative or public initiative, for the word "relief" or the word "pension." Thus far we should be able to go along together without disagreement.

We are going to differ about the causes of these bad conditions inevitably, and to differ also about the series of remedies that must be inaugurated promptly while we continue to hammer at causes—to push the death-rate lower, to punish exploitation in all its forms, to segregate those who should not propagate their kind. Nevertheless, frank discussion helps—discussion, that is, which leaves our opponent some standing ground and does not impugn his motives.

Without further preamble, let me attempt to give, as my tentative contribution to such a conferring together, some of the arguments that seem to me to be related to this question.

## *The Institution Argument*

The claim is freely made that mothers' pensions would empty the institutions, but if, in cities giving pensions to mothers on a large scale, the children's institution population should continue to increase, then, whatever the cause, some other remedy will have to be found for this evil, in so far as it is an evil. If the per capita subsidy system prove to be one of the causes, can a per capita subsidy to the family be the remedy?

Analysis of institution populations would reveal, I believe, the following reasons besides "pov-

erty only" for commitment: Death of mother, illness of mother or child, moral disabilities of mother, desire of both parents to be relieved of care until child can earn, need of specialized care of child which the home cannot supply. A certain proportion of the children, a proportion varying greatly in different places, come from homes that should never have been established. As we know more of what it means to a child to be not only well cared for but well born—to have, that is, physically and morally sound parents—the more carefully we feel like scrutinizing any scheme which involves the possibility of making children (by means direct or indirect), a financial asset to parents of unsound stock.

The foregoing statements do not mean that we should not immediately take steps to see that all children are kept in their own homes that they can become good citizens there. I believe that the number now being removed is grossly overestimated, however, and that an equally important if not more important next step, as regards the number of children involved, would be the adoption of much better standards of care for the children that are in institutions and in charge of placing out agencies at public expense.

#### *The Overwork Argument*

The women upon whom work conditions press the hardest today will not be reached by the pensions now proposed. The widow or the wife whose husband is away or permanently disabled is at least relieved of the double burden of wage-earning and child-bearing. In helping that widow and that wife, we must be careful to put no further barriers in the way of the social workers who are striving to give all women a more dignified, better organized, and better safeguarded industrial status. But six of the mothers' pension bills on my desk would put up such a barrier, though quite unintentionally, for they prohibit the beneficiary from work outside the home altogether or for more than one day each week, but do not provide complete support. In discussing this aspect of pension legislation with one of the best authorities on women's work, I pointed out that these provisions might tend to subsidize the sweated industries in the large cities. But I was told that the measures would be equally dangerous in less populous places; that no home was remote enough from the freight office and the parcels post to be safe from such exploitation.

It will be suggested that the remedy for this is complete support by the state, and the prohibition of all work for wages, whether in the home or outside. This would be better than the present proposals, but in some of our cities, especially in their foreign quarters, the mothers who have always been wage-earners resent enforced home-keeping and grow very restless under the nerv-

ous strain of it. Glasgow tried the experiment in its "special roll" for the relief of widows with young children, and it records that "so many of the women are devoid of domestic and other interests that work for wages is a positive safeguard." But they should be taught, it may be suggested. Here we have the idea of personal service and individual care from which our pension friends are so eager to get away.

#### *Pensions as Relief and as Reward*

I have said that our preference for the words "relief" or "pension" should not permanently divide us, but the ideas behind those words, as I pointed out in a recent SURVEY,<sup>1</sup> are quite distinct. It was impossible then and will be impossible now to take up all the arguments for and against new pension measures, but at the risk of seeming to digress unduly, I should like to make myself clear on this one aspect of the question, for it has a very important bearing, I think, upon this year's legislative campaign. In so far as the words "relief" and "charity" have undemocratic connotations, I regret it, and would welcome substitutes for them, but the word "pension," to Americans especially, implies three things that destroy its usefulness as a substitute: First, it implies payment for a service rendered *in the past*; second, it implies, without any reference to the needs or the characteristics of the individual receiving it, a fixed rate of payment; third, it implies no responsibility for what happens. Pension advocates are now claiming, quite logically as it seems to me, that "one hundred cents out of every dollar" should go to the mother, thus cutting away at one stroke all careful choice of pensioners in the first place, and all personal service to the children of the household later on.

A case could be made out for a service pension to all mothers, rich and poor, at fixed rates, and a case could be made out for the further development of the relief measures that are now inadequate, whether public or private. But the mixture and confusion of the two ideas of service pensions and relief grants will make nothing but trouble. It is a confusion that has cost our country dear already. The same mixture of motive appears again and again in the records of soldiers' pension legislation—now it is payment of a debt, and again it is charity; now the pension roll is a "roll of honor," and again it is a thing that must be kept private because the veterans are sensitive about its publication. It will not be time wasted to turn aside long enough to see what has been happening to United States pensions. It is true that most of the mothers' compensation acts are only proposing to substitute state for local funds, but federal pensions to mothers have already been suggested, though not very seriously as yet.

<sup>1</sup>See The Survey, February 15, 1913, p. 665.

### *Soldiers' Pensions*

The basal principle of earlier pension legislation, as explained by Glasson in his careful study,<sup>1</sup> was the granting of pensions for "injuries received or disease contracted" in the line of duty, or on account of death directly resulting. No American can quarrel with that or with the desire to provide for the old age of actual veterans; but what are we to say of the piecemeal legislation, ever widening the scope and breaking down the safeguards of these conservative provisions, which has saddled us with the burden pictured on the next page? Now, in this year of grace 1913, when three-fourths of the soldiers of the Civil War are in their graves, we are spending more than we ever spent before; we are spending annually on an army mustered out of service nearly fifty years ago three-fourths as much as Germany spends on the second largest standing army in the world. Exclusive of administrative expense, our pension appropriation for the current year is \$164,500,000.

When Garfield reported to Congress thirty-five years ago a pension budget nearly *one-fifth* the size of the present one, he did so with the apology that this would be the maximum, and that in the natural order of things the sum would gradually decrease. What accounts for the quintupled increase since Garfield's budget was adopted? Not the Spanish-American War, whose pensioners are even now less than three and a half per cent of the total. Not bad administration at Washington, for the figures have mounted during good and during bad pension administrations alike. Not deliberate fraud, for though there has been much of this, especially during the years '66 to '78 when pension attorneys were most shameless, the number of pensioners actually decreased in those years nevertheless. Not even selfish special interests that played upon the country's generous feeling for the soldier account for the increase, though it is true that the situation has been used by these. On the whole, it has been honest people who have been betrayed into this unprecedented raid upon the people's treasury, and it has been the honest sentiment of the country that has betrayed them. Many of the young men who came out of the War of the Rebellion able and anxious to make their own way had no thought of seeking a government pension until it came to them fourteen years after the war in the overwhelmingly tempting guise of a large check for arrears.

This was by the act of 1879. An act of 1890 still further extended these arrear payments to all discharged soldiers, whether disabled or not, provided they were incapable of earning a living by manual labor. But the newer legislation did

not develop instead into "a dignified form of relief" for the indigent, "for it made no inquiry regarding the soldier's property or income." In fact, after the demand for pensions had been artificially stimulated, the cost of sifting the just demand from the unjust was almost prohibitive, and the process, moreover, became increasingly unpopular. Some of the later laws put a direct premium upon perjury, and perjury there was in plenty.

Eloquence—floods of it—addressed to the warm sentiment of the country toward the old soldier filled the pages of our Congressional Record. These pages read very like the reports now coming to us from legislatures and mothers' congresses, as the following examples will show:

From an address on mothers' pensions before the Congress of Mothers at Washington, D. C., quoted from the *Texas Motherhood Magazine*, November, 1912: "The state is a parent, and as a wise and gentle and kind and loving parent should beam down upon each child alike. At the knee of this great, just, loving mother or father, no child should beg in vain. The bounties of opportunity and reward should flow therefrom freely and gladly into each life upon this fair continent. It is not for you and me to struggle and travail under the masks of institutions of charity and benevolent organization, that the children of this parent may have light and love. From the fountain head—THE STATE—all benefits should issue. We, the mothers of the land, should go in a body and make the appeal for what we wish, then stand aside and rejoice as we see our desires expressed—just gifts given by a loving father, received equally by the children."

From a speech in favor of mothers' pensions before the Indiana legislature by one of its number, quoted from the *Indianapolis Star* for January 28, 1913: "We make an awful mistake when we assume, as often we do, that we can add to or take away from a mother's love, because a mother's love is a part of the mechanism of the soul, and it receives no abridgement from any known condition. It is a jeweled diadem placed upon the brow of a finite creature that the world may honor and obey. We know it to be imperishable, because it bears the impress of an undying perfection, and it is cherished as life's chiefest beatitude, wielding empire over the domain of human tenderness."

From a speech on the "dollar a day" pension bill in the House of Representatives, quoted from the Congressional Record, December 12, 1911. (Pension disbursements for that year \$157,325,-160): "Mr. Chairman, section 3, in my opinion, is a load upon this bill. (Applause.) It closes the door of hope to the old war veteran whose frugality and industry since the war have given him an annual income of a thousand dollars or more. In effect, it is a punishment to him because of his thrift since the war, rather than a reward because of his faithful servitude to his country

<sup>1</sup>See *History of Military Pension Legislation in the United States*. By William Henry Glasson. Columbia University Press, 1900. See also Publication No. 331 of the American Academy of Political and Social Science

during the dark days of the Civil War. It is an unjust discrimination which ought not to be made, and one which this House can not afford to sanction. . . .

"Mr. Chairman, . . . the true friend of the soldiers is the man who stands for the framing of a meritorious bill upon the broad basis of relief to the men whose services blotted out the

Mason and Dixon line, made certain the Union of these States, and sealed forever the destiny of this Republic, and after such a bill is drafted, works industriously for its early passage. Mr. Chairman, I am glad to say that this House bristles with such men on both sides of this Chamber—men whose hearts are earnestly enlisted in a most noble cause."

#### THE LADDER UPON WHICH SOLDIERS' PENSIONS HAVE CLIMBED

The Congress still sitting as this magazine goes to press has reported out of committee pension bills which would send this ladder up to the \$180,000,000 mark if the estimates published are correct.

Side by side with the development of general pension legislation there had grown up a system of special pension acts. Congressmen pleaded for more liberal legislation in order that they might be relieved of the intolerable pressure of these private pension bills, of which nearly 36,000 had been passed. But they sought a remedy that only increased the evil. In the closing days of the Sixty-first Congress, in February, 1911, these personal bills were being introduced "at the rate of two hundred per day."

The size of our pension expenditures, which have amounted to more than \$4,129,000,000 for Civil War pensions alone, is not, in itself, an indictment of the system, if it is clear that the money has been and is being well spent, and that it is bringing better returns to all the people of the United States than any substitute expenditures could bring. No one who has lived in America during these fifty years can fail to know of many cases in which a Civil War pension has been a great blessing, and has been of such definite benefit to the families as to benefit the community also; but the more kinds of people we know and the more intimately we know them, the more certain we are to have also encountered cases of degeneracy either induced or fostered by pensions. The rolls are secret, and no study has ever been made of the effects of soldiers' pensions upon family life, of their relation to social efficiency on the one hand or to social inefficiency on the other.

As to the positive evils that are matters of public knowledge, I do not quote William Bayard Hale or Charles Francis Adams, for, irrefutable as many of their items of evidence are, these authorities may be regarded as taking an extreme view—I turn again to Glasson, who is most moderate in all of his conclusions. He recognizes fully our obligation to all who have been handicapped by actual military service, and to those directly dependent upon them; he might also, in a country without old age pensions, concede the justice of provision for the aged veteran. But he finds that we have lowered the standard of morality and patriotism among our volunteer soldiers; that we have fostered fraud; that we have led honest people to imagine disabilities; that we have pensioned the affluent on account of disabilities in no way connected with military service; and that youth has been wedded to old age for the sake of the widow's allowance. "The investigator," he adds, "must, at times, turn from the record in disgust."

Glasson is a hopeful man. In his first pension study, the one of 1900, he expresses the belief that pension legislation will cease to be a question of party advantage, as the voting strength of the Grand Army decreases. That was thirteen years ago, and more than a hundred and

thirty-three thousand pensioners have dropped from the rolls since. But what is Congress still doing? If this too extended summary of pension administration is regarded as irrelevant and as an appeal to the history of other times and other manners, let us turn to the Congress which is still sitting as I write. It passed in 1912 a new law that sends our pension expenditures to a higher point than they have ever reached before, and is now engaged in sending them, by more bills, still higher.

One of the difficulties encountered by the advocates of universal peace is that every large expenditure in preparation for war helps to create a class in the nation who are specially interested in making these expenditures still larger. Give any considerable group a capitalized interest in one kind of legislation, let that interest find and join hands with a generous public sentiment, and then see all the seekers of special privilege of whatever kind rally to the aid of both. This is why the tide of pensions is always at flood.

There is another aspect of the pension question, however. Veterans are a diminishing class unless we have another big war; not so with mothers. The point of this comparison between mothers' and soldiers' pensions—a comparison which did not originate with me—is that grants to voters, or to those who may, perhaps, soon become such, tend to mount up and up, without any assurance to the state of an adequate return. The phrases "endowment of motherhood," "funds to parents," "mothers' compensation," are already being taken up by shrewd politicians who may give them a significance and a power of popular attraction that their originators never intended. These latter are rubbing the lamp industriously without any conception of the temper of the genie soon to appear.

#### *Constructive Statesmanship Is Delayed*

Let us ask ourselves what constructive policies now well thought out could easily be postponed indefinitely by a new flood of pension eloquence and a new series of pension grants. Far as we are from any immediate prospect of a general pension for mothers, we are no farther than the legislators of '62 and '66 and the years succeeding were from spending, as in some years since we have, 97.9 per cent of our total internal revenue upon pensions.

The heaviest cost may be in the further postponement of constructive health measures. Take, for example, the costliest disease and the costliest defect that afflict society today—take tuberculosis and feeble-mindedness. We know what to do about both of them, but we are not doing it. We have decreased the tuberculosis death-rate in New York city, but we are very

far indeed from having the disease under social control. We have known for a long time that the segregation of advanced cases is indispensable, for instance, but we still follow the line of least resistance by treating them at home instead. If the most careful estimates available mean anything, the only way to secure social control of tuberculosis in the United States is to increase five times over our present rate of expenditure upon care outside the home. The bearing of this upon pension problems is shown by the percentage of dependent widows who lost their husbands from this particular preventable disease. Out of 985 records of such widows recently studied by the Russell Sage Foundation, 799 gave the cause of the husband's death. In 29 per cent of these it was tuberculosis.

Very conservative estimates place the number of feeble-minded in the United States at 200,000, but recent students of the subject believe that 300,000 would be nearer the real number. Here is another group for whom home care is a failure, but only 20,000 are in institutions for the feeble-minded. The segregation for life, or at least during the child-bearing age, of a whole generation of the feeble-minded would bring this terrible curse under social control.

The interesting fact is that we apparently have already wasted enough money on soldiers' pensions to do both of these things—not to eradicate every case of tuberculosis or feeble-mindedness, for that is not going to be possible, but to bring both of these scourges under subjection and make them almost negligible quantities. We could do this, I believe (provided the custodial and supervisory powers granted were made commensurate with the expenditure) for a billion dollars less than has been unwisely spent for pensions.

The basis of this estimate, which is only of the roughest and most tentative kind, of course, is as follows: If the natural decline in soldiers' pensions shown for the years 1871 to 1879 is projected to the present year, we get an estimated pension disbursement of \$11,890,000 for the fiscal year 1913, and proportionate amounts for the intervening years. These may be regarded as the normal Civil War pensions. Taken together, they amount to \$680,590,000. Add to this the pensions granted on account of the war with Spain and in the Philippines, \$38,114,000. We may then assume that pensions to soldiers not otherwise provided for, beyond the age of sixty-five, are legitimate, purely as old age pensions, and for such payments add a billion dollars more. If we now deduct the sum of all of these items, \$1,718,704,000, from the \$4,106,585,000 actually spent on pensions during these years, we have still a total unnecessary expenditure of \$2,387,881,000.

Only a small part of this money actually could have been spent on either of the preventive campaigns named, because science had not discovered and social workers had not fully worked out the details of care or of prevention. But if the same rate of unnecessary pension expenditure were to continue (there were 508,812 applications for United States pensions or for increases in the same in the year ending June 30, 1912), or if our plans for cure and prevention had been ready earlier, a portion of this money could have been spent in a ten years' campaign for the control of tuberculosis, and another portion for a thirty years' campaign for the control of feeble-mindedness.

The highest estimate available (Easton's) places the cost of control of tuberculosis in New York city, where control is peculiarly difficult, at less than \$50,000,000. Let us say, then, \$45,000,000 in New York city, with its 10,000 deaths from tuberculosis per year, and multiply that by 15.5 for the country, which has 155,000 deaths per year from the same cause, according to Irving Fisher's estimate, and we have a total cost for social control of approximately \$700,000,000. This is probably an estimate which could be much lowered by good social and medical engineering.

The feeble-minded must be cared for longer—for thirty years, but their care is not so costly, and the most important single factor is the uncared-for woman of child-bearing age. Assuming that one-third of the total 300,000 of both sexes do not need custodial care, and estimating school care, exclusive of buildings, at \$175 per year for seven years, and adult care at \$100 per year (according to Johnson's plan for partial self-support) for twenty-three years, we have the enormous total of \$705,000,000. But from this it is fair to deduct the cost of caring for the 20,000 already in institutions for the feeble-minded, and the cost for the estimated number of 47,000 feeble-minded now in almshouses, insane asylums and prisons and reformatories. This leaves an estimated cost of \$408,750,000 for care, to which should be added \$133,000,000 for buildings. This gives a total estimated cost for the social control of feeble-mindedness of \$541,750,000.

Deducting the estimated cost of both tuberculosis and feeble-mindedness controlled from the estimated unnecessary payments in pensions, we still find \$1,146,000,000 remaining for the social control of other preventable diseases, and of such other social maladjustments as can be attacked from many sides at once by government activities.

In all our social planning nothing must be done which will deprive us of this power of

attack on many sides. It is useless to spend large sums in an unrelated, piecemeal way. We need a combination of high administrative standards and of deeply social motives; of competent technique and ample volunteer service. The advocates of mothers' pensions have no such carefully thought out program, or, if they have, they have not yet stopped to realize the demoralization that must come to social plans and social results from government per capita grants that are open to all the objections ever made against our present pension system.

### *Relief and Child Welfare*

No attempt has been made to keep to widows' pensions in this discussion, because the legislation already proposed in many states goes far beyond this. One publicist has said that these new pensions should be called children's pensions, and this title is the one, probably, which most accurately describes their purpose. If the pension bills introduced are passed, most of them will permit the present public relief officials to relieve families in which there are children, and the pensioning authority newly created will be expected to do the same. Now, the relief and oversight of children in those families which have a male breadwinner does not demand skill that is essentially different from the skill needed for the relief and oversight of families that have no male head. Family problems and child-helping problems are involved in both tasks, and both should be undertaken, whether at public or at private expense, by that agency in each community which is best able to secure good results.

It is true that there are many neglected children in their own homes today, and both the service and the relief that they are receiving are pitifully inadequate to their needs. The claim is made that it is only more income which is needed; that personal service, supervision, continuous oversight and care are not only superfluous but even impertinent. If individualized care is not necessary at this point, if "case work" has no place, then we are confronted here with the solitary exception in the whole range of social endeavor, in so far as such endeavor touches individuals. Human beings are different, and to get socially helpful results we have to do different things for different people. The dispensaries and hospitals are discovering this and are trying to socialize their work; the public schools are finding it out, in connection with their truancy work, their home and school visiting, their vocational guidance, and other activities. A list of the departments of human endeavor that are just waking up to the fact that they must individualize their clients would fill this page. None of them has the requisite skill

as yet—our agencies for family rehabilitation certainly have not, but their workers cannot acquire even a modicum of the technique necessary for this particular task without becoming immediately in demand far beyond the boundaries formerly given to social work. We social workers would welcome being put out of business by the general adoption of our program, but we want it adopted in full, and not in fragments.

I have said that no one remedy can meet the need or even relieve it. By those who are willing to accept this view and to agree to a plan of campaign in which more adequate material relief shall be made a part of more individualized, more skilful and more thorough treatment, what immediate further steps might be taken to advance child welfare in families?

1. Community by community, we must know what is happening. This is not the place in which to present a bill of particulars, but the experience of the best child-helping and family workers should be utilized in drawing up and making available a series of questionnaires that would help to bring out the salient facts as to relief and family dependency in each city, town, and rural neighborhood.

2. The relation between the conditions discovered and the campaigns of cure and prevention already launched in this country should be made very clear indeed, in order that relief administration and its accompanying work for individual families may no longer be regarded as an unimportant matter by a considerable group of social reformers.

3. Whatever undeveloped resources for service exist in each community, let us develop them. If the public agencies are carrying the chief burden already, and carrying it with any degree of responsibility and efficiency, strengthen them, aid them in every way, work to secure for them more adequate resources in relief and in service. If the private agencies are the chief burden bearers, do as much for them.

4. Some places will show very inefficient public and very inefficient private care of families, and an unaroused public sentiment as to their needs. Bombard the public with facts. Be sure that you have them first; devise a reasonable program based upon them, and then make these known by every engine of publicity, every graphic means.

5. Untiring work must follow. People and not surveys or exhibits must make things different by hard and steady pulling together. And to the solution of one family's difficult problem, to the safeguarding of one child's right to health and a fair chance, might well be brought, in contribution, everything that human ingenuity has devised or human sympathy has longed for.

## V GARY<sup>1</sup>

**"I**F YOU'LL give us the colors we want, Sophie will do the painting herself." This, broken up into foreign sounding English, ended the parley with the company decorator. He was putting a new coat on the interiors of houses provided for the cheapest immigrant labor of the steel mill.

But "Hunkyville," as this section is dubbed by the rest of the town, had a little school girl who, unabashed, challenged the United States Steel Corporation's scheme of art. And in the "box" occupied by her family she had her way. Outside it remained like all the rest in the row, but indoors, with stencil designs, such as she had learned to make at school, she painted the walls with borders at the top and panels running down to the floor.

This episode tells the human story of Gary—wholesale provision for community life, and that life itself surging in to cut its own channel for expression.

Gary is probably the greatest single calculated achievement of America's master industry. A score of steel towns have slowly grown from small beginnings. But the creators of Gary planned *de novo* a city which in five years attained a size that required thirty years of growth at Homestead and which is not unlikely to become the second city in Indiana before many decades pass.

Industrial power has perhaps never before had a simpler civic opportunity than when in 1906 it brought vast resources to an uninhabited wild-

erness at Lake Michigan's southern end. How did industrial power meet its civic responsibility, when there was nothing but a sand flat to gain-say its will, and how are the citizens meeting theirs now that the sand flat is a town? What of the relations between the two?

THE SURVEY<sup>1</sup> has already presented the main facts of Gary's development during the first three years which saw a square mile of steel plant, a made-to-order harbor for the great ore freighters and a substantial, well-appointed city of 12,000 people spring into being. The federal census of April, 1910, found a population of 16,802. In November, 1912, there were more than 30,000. According to the last published report of the city officials, for the year 1910, the building operations for that year involved \$4,000,000. In 1911, property valuation of the town reached \$19,000,000, and taxes \$229,638.60.

The inhabitants are mainly, of course, the working force of the steel mill and the subsidiary plants—officials, foremen, American and foreign skilled workmen, and the unskilled laborers, nearly all foreign. But civic affairs have been influenced quite as much by the smaller number of men not identified with the steel corporation. One of them, in fact, has been mayor ever since the beginning. To this element—real estate operators, tradesmen, and all sorts of foot-loose incomers, anxious to try their fortune in a place that offers quick development—is attributable much of the pioneer spirit that reminds one of the far West. The earlier days witnessed a scramble for "ground floor" advantages which the future might magnify. Like a

<sup>1</sup>Previous articles in the Satellite Cities series were: I. The Outer Rings of Industry (Introductory), October 5; II. Pullman, November 2; III. Norwood and Oakley, December 7; IV. Granite City, February 1.

<sup>2</sup>See THE SURVEY for April 3, 1909, page 20.

new mining camp, Gary attracted adventurers whose "pasts," even if known, mattered little to a community absorbed in the here and now.

With such a mixture of people it is not surprising that the civic history of Gary has packed into six short years all the political intrigue and struggle, the "gang rule," the "graft exposures" and "reform movements" which usually occupy a generation. Her mayor, owing to the bitterness of the strife, has been arrested no less than fourteen times in two years without having a charge proved against him in court. But her citizenship has shown an independent spirit especially in relation to the industrial power.

The average citizen scorns the thought that Gary is a "satellite" of Chicago if that implies dependence. This happens to be the spot, he points out, where raw material can most economically be assembled and finished steel distributed to the great middle West markets. But it would appear that this advantage has been bound up in large part in Chicago's great railway facilities, all at Gary's service, in the Chicago labor market and in the housing accommodations of Chicago's southern suburbs. Furthermore the president and other principal officers of the subsidiary companies which have developed Gary are to be found in the heart of Chicago's business and financial district.

The tract of land the company bought across the Indiana state line, stretching eight miles along the shore of Lake Michigan, and averaging two miles in width was in a sense but a great addition to the corporation's already

large holdings at South Chicago. All the plants except two occupy a strip between the Lake Michigan shore and the Grand Calumet river, which parallels it a mile or more to the south. The residential subdivisions laid out and developed by the Steel Corporation through its subsidiary, the Gary Land Company, occupy a strip flanking the south bank of the river. Still further south are the subdivisions which outside real estate promoters are "booming." Thus in general the Grand Calumet river separates the plants from the town.

From east to west the industrial strip is given up to the 560 coke ovens which supply all the gas needed in the operation of the steel mills; the possible site for a plant of the National Tube Company; the artificial harbor and the square mile of steel mills which flank it; the plant of the American Sheet and Tin Plate Company; the site for the proposed plant of the American Steel & Wire Company; the switch yards and repair shops of the Elgin, Joliet & Eastern, the steel company's railroad; the site on which the American Car & Foundry Company will build and the plant of the American Bridge Company. This last is already second only to the Ambridge plant of the same company and when completed will be the largest structural steel plant in the world.

That rank has already been obtained by another of the Gary group. Two miles farther west along the lake shore is the plant of the Universal Portland Cement Company, another subsidiary of the United States Steel Corporation. It uses immense quantities of blast furnace slag from the steel mills, and is operated by electrical power generated by the waste gases of the blast furnaces. Thus the whole scheme of industries is bound together with great adroitness and efficiency. South of the Grand Calumet river and just east of the original subdivision laid out by the Gary Land Company is the site for the American Locomotive Company

- P. P. Parks.

plant which will probably employ 3,500 men and have a capacity of fifty finished locomotives per month. Nearby is the only one among all the plants not a direct subsidiary of the United States Steel Corporation—the Gary Bolt and Screw Company, owned principally by Pittsburgh capital.

Gary's industry thus consists of the great mill and the group of plants which use the steel it manufactures.

### *City Planning*

The contrast between the arrangement and team work of these great plants and the rule-of-thumb planning of Gary, the city, has already been pointed out in *THE SURVEY*<sup>1</sup>. The street plan is the old-fashioned rectangular gridiron the steel corporation's subdivision being no ex-

ception to those promoted by local real estate men. To anyone who has glanced even cursorily over a few of the forty-odd city plan reports which have been made for American cities in the last decade, nothing is more evident than the effort to break up such rectangular street arrangement by diagonal direct routes. These can cut cross-town travel in two and add beauty and variety to the scheme of thoroughfares. It does not take much of a stretch of the imagination to see the future Gary employing a city planner whose report will propose belated diagonal streets cut at great expense through built-up sections. This situation, pointed out in these pages two years ago, is even clearer now. Take only one of the many obvious instances. To go from Broadway and Fifth avenue, where important public buildings have been grouped, to the southwestern annexed part of Gary, one must travel

<sup>1</sup>See *THE SURVEY*, October 5, 1912, page 16.

approximately two miles covering two sides of a right angle. A direct diagonal would measure scarcely more than a mile and a half.

Many radical improvements could still be achieved at a cost very little greater than that involved in present haphazard lines of growth. The cost may be prohibitive later on. The city has not as yet made good the corporation's short sightedness. Present requirements are merely that new streets shall be continuations of present streets and bear the same names. Indeed the town has fallen back from some of the standards set by the industrial leaders. The uniform building line which the steel corporation wisely stipulated in the subdivisions under its control has not been extended to other parts of the city. In no way could the municipal officials of Gary render a more important service to their community, and incidentally go the steel corporation one better in making an orderly and beautiful city, than by bringing in expert city planners while the place is still plastic. The Commercial Club of Gary has made a start in this direction by the appointment of a committee on city planning to work for boulevards, diagonal streets in outlying sections and the proposed lake front park. But the opportunity to grapple with a big situation in its formative stages should command ability of the first order.

It has already been pointed out that the plants occupy a strip along the lake front and that the steel companies set apart the strip adjoining it, on the inland side, for residential purposes. It was evidently their notion that the workmen in each plant would live back from it in a subdivision within walking distance of their work. A principal thoroughfare was laid out parallel to the lake to connect all these subdivisions. This is Fifth avenue, eighty feet in width, with a grouping of public buildings on it at the point where Broadway, running south and inland from the main mill entrance, intersects it at right angles. The growth of the town has, however, expanded quite as much to the south as along the flanks of the mills. Broadway is the main street today and has now been laid out six miles south from the mill entrance, and for well over three miles it is built up more or less continuously. Frequent street car service for this distance has doubtless had much to do with its rapid development. City officials assert that this

growth south of the steel company's residential strip was both unexpected and undesired by the company. The latter flatly denies this and says that it has consistently welcomed any growth or development of the city.

The expansion to the south not only calls for a reconsideration of the city structure but involves a situation both extraordinary and amusing. Gary's annexation experiences rival the most complicated matrimonial career that ever found its way into a divorce court. It seems that Indiana has a law permitting any town or city, by action of its board or council, to annex contiguous outside territory at any time. If it would avoid being summarily kidnapped, the contiguous territory must file in the proper court within thirty days a petition signed by two thirds of all its voters. The burden of the situation is thus put, not on those who do the annexing, but on those who want to stay independent.

The "game" was started in the spring of 1910 when the city of East Chicago, Ind., immediately west of Gary, suddenly embraced the larger city of Hammond which adjoins it on the far side. The councilmen of Gary, fearing that East Chicago in her thirst for dominion might without warning turn about and swallow up the future citadel of steel, decided as one city father declared to "beat her to it." Accordingly the mayor and the nine councilmen hastily met before daylight the very next morning and officially annexed the newly enlarged East Chicago. Once started Gary annexed the town of Tolleston, just to the southwest, and later the town of Miller just to the east. When these various places began to wake up to the situation a number of by no means uninteresting parleys resulted in a family understanding. East Chicago said she had not thought of wanting Gary and Gary acknowledged that the only reason she had annexed East Chicago was to prevent the reverse happening. Hammond put in her plea for single blessedness. So they all went to the superior court and agreed to dis-annex. Gary wanted to keep Tolleston and Miller, so they did not figure in these proceedings. Miller gained enough signatures to her petition to be allowed to go her own way. But Tolleston failed to do so and thus became a part of Gary which thereby swelled to an area of thirty-two square miles.

Gary's first railroad depot six years ago and her present Union Station for the Lake Shore and the Baltimore & Ohio.

A final point remains to be noted in the layout of Gary. While it may fall short in its community features, there are those who see in it an extraordinary degree of industrial strategy. They spread before you a map of the region and point out that the plants, with Lake Michigan on the north, are separated from the people on the south by the Grand Calumet river which would thus serve as a veritable

moat against possible mob violence in times of stress. With the lake front so extensively controlled by the company, strike breakers and supplies by the boat load from numerous ports on the Great Lakes could be brought directly to the plants without risk. It is pointed out that under such conditions, a repetition of the Homestead strike would be impossible, and that possibly no great industrial plant or series of plants occupies a position so impregnable to mob attack and so calculated to withstand a prolonged industrial siege.

### Housing

The housing provided by the corporation shows considerable diversity of architecture and little of the monotony ordinarily characteristic of "company housing." Solid rows of brick dwellings such as are to be found at Pullman have been avoided. The 506' dwellings originally built for steel mill employes and the new ones for the employes of the American Bridge Company and the American Sheet and Tin Plate Company, each of which have made their own designs, are handled by the one land company.

Gary's significant new development in company housing is an extensive experiment in the use of concrete. It is especially interesting in view of Mr. Edison's enthusiastic predictions and the general impression that this is the coming method of supplying good housing at low cost

The original 506 houses and their rentals were described in THE SURVEY for April 3, 1909. Two miles west of Broadway is the new subdivision for the American Bridge Company houses. These include:

1	nine room house
9	seven " houses
30	six " "
30	five " "
40	four " "
72	five " flats
112	four " "

Each house or apartment has a bath room additional. The company's experience in housing its employes at Ambridge, Pa., convinced it that such facilities were well used. It should be mentioned, however, that common laborers constitute not more than 30 per cent of the working force.

STEEL COMPANY'S OFFICE  
Grand Calumet River at Broadway.

for working people, especially when large numbers of houses are built at the same time and place. With the largest cement works in the country at Gary, operated as a subsidiary of the steel corporation, it may seem strange that concrete construction was not attempted at the beginning of the town. The reason put forward is that the need for houses was so pressing as not to warrant the risk involved in experimentation.

The Sheet and Tin Plate Company decided to take the risk. Should its houses and flats fulfil all the hopes for them, an important contribution will have been made toward the solution of the housing problem in America. The results of this experiment should be watched by every industrial leader and every housing reformer in the country.

Concrete houses have many points of superiority. They are indestructible, thus reducing fire risk to the minimum. They are sanitary, to an extent impossible to obtain in the ordinary frame or brick house. Deterioration is so slight as to reduce repair bills and maintenance costs to the lowest figure. And the cost, according to those responsible for the development at Gary, is not expected to exceed the cost of fairly well built frame houses.

From the capitalist's point of view a concrete house is a far better investment at 8 per cent than a frame house is at 10 per cent.

Curiously enough the actual decision to use concrete construction came when the Sheet and Tin Plate Company's engineer found excessively high building costs at Gary, due to high wage scales established by the building trade unions. It became necessary to devise a construction scheme which, by the use of machinery, would reduce the labor factor to the smallest proportions. This led in turn to the design and construction of special machinery and adaptable

CONCRETE HOUSES AND APARTMENTS FOR WORKINGMEN

molds. With this initial cost out of the way, the company can build additional houses at a still lower cost.

The first group of houses, already occupied, consists of:

24 apartments, some of 3 rooms at \$12.50 a month but mostly of 4 rooms	"	16.00	"	"
40 five room houses	"	17.50	"	"
30 six " "	"	20.00	"	"
10 nine " " (3 stories)	"	27.50	"	"
6 detached houses.				

Most of these houses are in terrace construction in groups of six or ten. Each house or apartment has a bathroom, pantry and a coal bunker under the front porch.

Sheet and Tin Plate Company employes eagerly rented the whole supply, finding the rentals considerably cheaper than corresponding accommodations elsewhere in the town. The tenants are all skilled workmen, mainly American. The undertaking thus far has proved encouraging, both to the engineer in charge and to the Gary Land Company officials and there seems to be a reasonable hope that it may point the way to a hitherto unattained type of concrete house for low paid unskilled workingmen.

Under the Gary Land Company's terms of sale<sup>1</sup> according to the statement of the superintendent, the sale price covers the actual cost of the land, the cost of the complete improvements—street paving, sidewalks, sewers, etc., and the cost of the house plus 5 per cent per year. The total amount may be paid in ten annual installments, with 5 per cent interest on deferred payments. This amounts to very little more than rent. If the householder is discharged, or voluntarily quits work, or for any reason wants to anticipate his payments, he can do so. Or if he wants to turn back his house, the amount he had paid in will be refunded, minus 9 per cent a year as rent. In case of his death similar terms are open to his heirs. American Bridge Company officials declare that such a scheme has proved satisfactory at Ambridge. By distribu-

tion of seeds and free water for garden purposes, the Gary Land Company has made efforts to encourage tenants to keep their premises attractive. It has offered prizes for the best lawns and has planted several thousand trees.

#### *Lodgers and Overcrowding*

Company provision for construction gangs of immigrant labor has been far from good. When the American Bridge Company was erecting its plant the huts which were provided bunked thirty or forty men in a room not only too small but poorly ventilated and lighted. The men were left to do their own cooking, with no facilities except crude fireplaces, which they built of stones and pieces of corrugated iron around the hut entrances. Construction workers have been known to pack themselves to the number of thirty-five in a one-room shanty 30 by 15 feet, half of them sleeping by day and half by night. Each man merely had a blanket in which he rolled up on his allotted floor space. The windows were never open and a Gary physician states that among the thirty-five men he found six cases of tuberculosis.

The company's provision for the low paid immigrant laborers who make a large and permanent part of the mill force has been slight—chiefly in Kirkville in the northwestern corner and in "Hunkyville" in the northeastern corner of the first subdivision. Its experience has been somewhat dismal with the problems of dirt and rural habits among those foreigners who take in an indefinite number of boarders. Miss Byington's study of the boarding boss establishments in Homestead and Mr. Lauck's analysis of wages, rents and overcrowding at Granite City,<sup>2</sup> show that the unskilled laborer with a family looks to the lodger as the often necessary means for supplementing wages. In the midst of these conditions there were evidences of a desire for better things, such as the little girl who wanted to "mind the paint" herself and another young-

<sup>1</sup>See Homestead: The Households of a Mill Town. By Margaret F. Byington. Survey Associates. Price \$1.50; by mail \$1.70.

<sup>2</sup>See THE SURVEY for Feb. 1, 1913, p. 593.

ster who asked for some white enamel to fix the pantry in her home like the "domestic science place" at school. There were, on the other hand, many flagrant abuses of the property by the tenants; the company despaired of its efforts and rather than be responsible as owners for the miserably insanitary conditions which prevailed, ordered the tenants of "Hunkyville" to move out. The houses were then put in order for American and foreign workingmen with families who agreed not to crowd their houses with boarders.

The failure of the company to work out the housing needs of its low paid immigrant labor was emphasized by its apparent indifference as to where the "hunkies" found a new abode.

Gary's south side which has been privately developed presents the worst and most menacing housing problem. The prices which workers on low wages are inveigled into paying to speculators amount practically to robbery. To illustrate: a foreigner was induced to pay \$1,800 for two lots adjacent to two others which were bought for \$700 by persons who knew actual land values. The payment of installments on outrageous land contracts is a hard and unnecessary burden on many a struggling Gary family, and has pitifully limited the sum available for house building. Speculative builders have put up flimsy, box-like frame houses by the hundreds. Even so the scarcity of housing accommodations has made exorbitant rents possible.

The most flagrant examples in all this bad housing are to be found in a score or more of barrack-like shacks to which the former denizens of "Hunkyville" had to turn. A typical shack is about 18 feet wide, 100 long, and one low story in height. The little space at the end of a 125 foot lot is occupied by the privies, one for every two "apartments." When two of these shacks are on adjoining lots, there is scarcely more than three feet between them. Standing on posts a couple of feet above the ground, the structure is built solely of boards, outside walls as well as partitions. An "apartment" extends across the width, each of the two rooms thus measuring about 9 by 9 feet. The room on one side of the building has a door and a window; the other room, two windows. There is no running water and one pump usually serves all the people in an entire shack or perhaps two. Slops and the less bulky refuse are merely thrown out

TWO TYPICAL SHACKS

of the door of the apartment into the unpaved passage way. Two typical shacks, separated by a narrow passage way into which the doors of the "apartments" opened, contained eight apartments each, two of the sixteen being unoccupied. In the twenty-eight rooms no less than sixty people lived. In most cases the family has two or three boarders additional; and not infrequently one finds a group of single men keeping house—such as it is—by themselves.

Two-room "apartments" rented for \$6 to \$9 a month. The average would certainly not be lower than \$7.50. One shack contained seven apartments at this figure, and a small space at the end which was rented as a saloon at \$35 a month. When wholly occupied, the monthly rental would thus total \$87.50, and amount to \$1,050 in a year. At a liberal estimate the construction of the shack could not have exceeded \$1,700 and the cost of the lot \$500. On the total of this investment, therefore, the income was approximately 50 per cent a year. Even if some of the space was for varying periods unoccupied, the return would certainly be "good." Other shacks, containing eight apartments each, renting at \$6 apiece, cost, according to the owner's statement, about \$1,600; a contractor stated that he would be glad to build one like it for \$1,450, and another estimate was still lower. With all the apartments filled, the total rental per year would be \$575. In both of these typical cases no account has been taken of the amounts the tenants charged their boarders.

The building of such shacks, as well as of the ramshackle hovels of boards, tin and tarpaper, which are a remnant of the early days,

"HUNKYVILLE"

March 1, 1918.

is now fortunately prohibited in Gary, but they are sufficiently substantial to remain a serious problem for some time to come.

Nor is overcrowding confined to the shacks. Such cases may be found as that of a man with a wife and baby who rent a six-room flat at \$45 a month and sublet three of the rooms to lodgers, his own family using the kitchen, and even the bathroom sometimes, for sleeping purposes. In the ordinary four-room houses in Kirkville or throughout the south side the immigrant family which does not have boarders is an exception. Typical four-room households are: a couple with two children and five boarders—nine altogether; a man and his wife and ten boarders; a man and his wife and eight boarders. The head of the new Neighborhood House settlement vouches for one case of a Ruthenian and his wife and twenty-five boarders, all in seven rooms. The man does the cooking and prepares the lunch baskets.

A few of Gary's more public spirited people feel the reproach which these conditions reflect on her civic life. Not many share the point of view of one owner who, when asked if the city authorities were requiring better conditions in the shacks, said, "Yes, they even want us to put in running water, but a rail pen is good enough for 'hunkies.'" In unconscious irony he placards his barracks with the sign of the "Indiana Improvement Company."

As the construction period in Gary's industries has given way more largely to that of operation, the proportion of foreigners has decreased. In April, 1909, an estimate of Gary's population made by the superintendent of the Land Company, divided the 10,246 total into 4,500 Americans (including Scotch, Irish, English and Canadians) and 5,746 foreigners—about 56 per cent. A similar estimate made in November, 1912, places the number of foreigners at about 12,000 out of the 30,000, or about 40 per cent. As long as the actual number is increasing, however, the probability is that the shack owners will have no difficulty in making a big profit.

Gary's building code is inadequate to cope with the situation, and her building commissioner shows little grasp of the situation. The regulations contain scarcely a word calculated to prevent some of the things which have led to the worst slum conditions in other cities. Nothing is said about windowless rooms, minimum requirements of air space in bedrooms, the use of basements for living purposes, etc. Small shafts for light and air are required, but the proportion of the lot area which may be covered is absolutely unrestricted. In fact, the commissioner volunteered the information that when a cheap house is to be built, he urges that it be placed on the rear of the lot. A premium is

thus put on the building of two houses on a single lot. What this means could be learned by a visit to the tenement districts of a city like Chicago. It is not a minute too soon for Gary to begin to "head off the slum" by proper housing ordinances. The Indiana housing law<sup>1</sup> covers only the larger cities, and does not apply to cities of the fourth class, in which Gary's present size places her.

### *Living Costs*

Living costs in Gary, while at their highest in rents, are by no means low in other necessities. A comparison of food prices at two stores in Gary and at an average store in Chicago showed that the Gary rates were never less, and almost always more, than those charged in Chicago. Moreover, an investigator who inquires the prices at the Gary stores and then examines the grocery books found in the homes frequently finds discrepancies, which are always to the advantage of the store. Several household budgets were secured. Those of two Polish households, the one of a family group, the other of a boarding boss establishment, throw light on the housing conditions already discussed.

Family "A"—Polish—consists of six: man, wife, wife's brother, three children under seven. Expenses per month: Rent \$7.50; food \$37.50, fuel averages \$4.51 (\$5.42 in winter and \$3.60 in summer); clothes \$2; tobacco and beer, \$1.35; doctor \$6.00. Even with the absurdly low estimate for clothing—the wife said the man bought one second-hand suit a year, and that she sewed all the other clothing by hand—the budget amounts to \$58.36 a month. The head of the family earns \$2 a day in the steel mill.

Family "B"—Polish—consists of man, wife and ten lodgers. Expenses per month: Rent \$17; food \$62.46; fuel, \$5.42; clothing \$5; furniture \$5; water rate \$.75. Total \$95.63. The man earns \$1.43 a day, amounting to about \$40 a month. The ten lodgers pay a total of about \$90 a month, or more than double the man's earnings.

Three charity visitors, a settlement resident and a visiting nurse estimated<sup>2</sup> that in South Chicago the cost of securing for one year the bare decencies of life for a family of five amounts to \$630. In Gary this figure would be swelled considerably by higher rent and food costs. The wage scales at the Gary steel mills are the same as at South Chicago, and the problem at Gary of making both ends meet must be even more acute than at South Chicago, where, as Mr. Fitch shows, the common laborer, at 17½ cents an hour, can not earn this minimum in three hundred days of twelve hours each, nor

<sup>1</sup>See THE SURVEY for December 5, 1908; March 20, 1909, p. 1218; December 17, 1910.

<sup>2</sup>See THE SURVEY for April 6, 1912, page 19. The Labor Policies of Unrestricted Capital, by John A. Fitch.

### THREE OF GARY'S FINEST BUILDINGS

The Y. M. C. A. building, shown in the top picture, is the third largest in Indiana and cost \$250,000. It was given by Elbert H. Gary. The equipment and furnishings, which cost \$40,000 additional were a gift from the Steel Corporation. The Steel Company Hospital is shown in the center. The third building is the \$65,000 public library, given by Andrew Carnegie.

In the grouping of public buildings on Fifth avenue just west of Broadway, the Y. M. C. A. and Library face each other. The Post Office, for which the government has appropriated \$125,000, will be built just east of the Y. M. C. A.

in three hundred and sixty-five days of ten hours each. It is, of course, pointed out that many low-paid immigrant workingmen have hundreds of dollars in the banks at Gary. This may be accounted for in part by the large numbers of single men. And any one familiar with foreign colonies knows that many families, also, exist on the lowest standard of living in order to save. The problem for the family which desires normal home life is of course not solved by the savings of those who spend less than enough for physical efficiency or jeopardize their children's well-being by turning their rooms into sleeping quarters.<sup>1</sup>

### *Labor Organization*

Gary has been the scene of special effort by trade unions, alert to the significance of any success they may attain in a town controlled by a corporation which has so conspicuously fought labor organization. The American Federation of Labor in March, 1910, presented to President Taft bitter charges against conditions in the Gary plants. The efforts to organize the mills have not materialized; but the crying need of the town for more houses gave the building trades a foothold. The very fact that in 1910-1911 jurisdictional disputes among these unions nearly put a stop to all building operations indicates the extent to which they have taken lodgment. So critical did this become that the Commercial Club of Gary appointed a committee and went to great pains in its efforts to adjust the difficulties.

Demonstrations of what these organizations have accomplished for their members are bound to impress the steel workers. Ignorance of the English language is a barrier, but even the immigrant laborers in the steel mill who earn 17½ cents an hour can not fail some day to wake up to the fact that laborers doing similar work in Gary building operations are paid from 34 to 37 cents an hour. The present demand for labor has indeed drawn out a few "hunkies" from the steel mill to the better pay in the town.

Intermittency of work has not been a serious problem recently. But for several months, beginning in the fall of 1910, the mill was operated at only about 40 per cent of its full capacity. The unemployed included some who go from one point to another hunting jobs. One recent arrival from Westmoreland County, Pa., was still considerably preoccupied by the dangers of a region where "they shoots men."

### *Health*

Despite the poor housing and insanitary conditions described, Gary has not yet been men-

<sup>1</sup>There are undoubtedly some cases of what amounts to actual polyandry in Gary. A doctor of established position in the community is authority for the statement that ten boarders who lived with a couple habitually had relations with the wife, all with the entire knowledge and consent of the husband.

aced by any serious epidemic of infectious diseases. Climate, sandy soil, excellent water supply are important health factors. The water comes through a company tunnel which reaches a mile and a half out into Lake Michigan. The system is being extended throughout the city, displacing the many wells.

As the sewers also are developed, the dangers which now lurk in the privies and the indiscriminate throwing of slops ought to diminish. Some effort has been made to keep wells and privies reasonably far apart, but there are many evil conditions throughout large sections of the south side which could be eliminated under the state law, which makes it "unlawful for any person, firm, company or corporation to institute, permit or maintain any conditions whatever which may transmit, generate, or promote disease." The city does not appropriate funds sufficient to support an up-to-date health administration. In 1910 it paid \$1,837.55 to preserve its health, \$25,084.41 to keep itself from burning up, and \$33,583.26 to get itself arrested. One difficulty is a state law which limits the salaries of health officers.

One deputy health officer is charged with the inspection of food and its handling, including the dairies supplying milk. An excellent and obviously well-enforced regulation prohibits the display of goods on the sidewalks. Another deputy, a woman, devotes attention to insanitary living conditions. Although not possessed of much technical knowledge, she is active in dealing with obvious evils. Not only premises, but bad conditions inside the houses, even the care of babies, receive her attention. In a small way, moreover, she has brought various agencies to bear upon cases of dire poverty.

Cases of marasmus and other diseases due to poor nourishment or bad air are frequent, according to one of the health officials. The city has its full share of tuberculosis and pneumonia, and these diseases, he believes, are fostered by the fact that many men come from hours of work in a highly heated atmosphere into cold air and then breathe the foul air of the shacks.

The three health commissioners have taken turns in serving as executive of the board. One of them, whose training and professional record has been the subject of criticism, was more active than many another man of greater learning. Through newspaper publicity and talks on hygiene to the school children he kept the subject of health before the people. But both his ability and his singleness of purpose have been questioned by men who declare that his main object is to increase his private practice and his political prestige. One of his deputies habitually distributed the health commissioner's personal card, suggesting him as a good doctor to go to

in case of illness. The fitness of this deputy was indicated by a naive reply to a question regarding the milk supply, "The man brings it around." As a whole, the health administration fails to carry conviction.

### *Saloons*

Saloons are present in extraordinary numbers.<sup>1</sup>

In April, 1911, there were 238 to about 21,000 population. It is doubtful if another city of that size in the United States had so many. Miss Byington<sup>2</sup> reports that in Homestead, a city of 25,000 people, there were at the time of her investigation sixty-five saloons, ten wholesale liquor stores, a number of beer agents, innumerable "speakeasies" and a dozen or more "drug stores." Even if we lumped this assortment as a round hundred saloons, the proportion would be one saloon to every 250 people, whereas the proportion in Gary was one saloon to about every 88 people. This situation has improved, the proportion now being 198 saloons to about 30,000 people, or one to every 151. A typical working people's ward in Chicago has 304 saloons in a total population of 70,099—a proportion of one saloon to every 231 people. The McKeesport saloon keeper<sup>3</sup>, who started in without a cent and became a retired capitalist in four years is matched in the case of the young Italian in Gary who, starting similarly, is about to take a trip to Europe to celebrate his reaching the \$30,000 mark.

Gary started as a "wet" city, except that in the first subdivision the company stipulated in every contract for the sale of a lot that the premises should not be used for the sale of liquor. In only two places in this subdivision does it permit bars. Early in 1908 a petition was signed by a sufficient number of voters at the previous general election, though a comparatively small proportion of all the voters in the city at the time of the petition, to prevent for two years the granting of additional saloon licenses. When this more or less dry period came to an end, the rush to establish saloons rivaled that of a gold excitement.

In the spring of 1911, however, Indiana passed a law under which Gary saloon licenses rose from \$375 to \$725 each, of which amount \$500 goes to the city, \$200 to the state, and \$25 to the

INSANITARY CONDITIONS ON GARY'S SOUTH SIDE

federal government. Another provision of the same state law specifies that no new licenses shall be granted until the proportion of one saloon to every 500 people is reached. If the present 198 saloons are now paying businesses, they should reap large profits as the city rapidly grows.

### *Schools*

The schools of Gary are the special pride of the city administration, and, indeed, of most of the citizens. In the early days, when Broadway was just being laid out and not one permanent house had been erected, Thomas E. Knotts, the present mayor and at that time a member of the town board, was taking a Sunday morning walk along the sand hills flanking the street to be. On meeting a young man and finding him to be a school teacher, he recalled his own school teaching days and thought he would find out what the young man knew about education. "We hadn't talked long," said the mayor, "when I decided to shut up and listen." Before they parted the young man was asked whether he would consider a proposition to head the school system of the new city if at some time the offer were made to him. The time soon came, and the present admirable educational facilities of Gary are due more to William A. Wirt than to any one else.

This is not the place to deal with educational theories, or the more technical points of school administration and curricula. But it is worth pointing out that the provision for manual training, nature study, playgrounds and leadership, gymnasium equipment, and industrial education of the new town is fully up to the standard set by the most progressive and resourceful cities. The arrangement of school space, study periods, and service of grade and special teachers is devised with rare skill, economy and balance. The space used for some of these modern lines of school work is of the sort which is entirely

<sup>1</sup>Houses of prostitution, on the other hand, number not over a dozen.

<sup>2</sup>See By Margaret F. Byington. Homestead, a volume in the Pittsburgh Survey, page 27.

<sup>3</sup>See THE SURVEY for March 6, 1909, p. 1091.

Gary's finest school—the Froebel—is to be built in the midst of the poor foreign population of the South Side. It will serve both as school and recreation center. Cost, \$275,000; equipment, \$25,000; capacity, 2,700 students. The ground in front of the building is to be a public park open at all times. At either side of the building will be children's school gardens. A six-acre playground will be in the rear. The locker rooms off the swimming pools will have a capacity for 1,000 men and 1,000 women in addition to the school boys and girls. The auditorium will seat 1,000 people.

GARY'S SCHOOLS—HER 'BEST CIVIC ACHIEVEMENT  
Emerson school shown above.

wasted in many buildings. The time and activity of teachers also is so ingeniously planned that no more teachers are required than in many places are employed to handle the same number of pupils merely in the conventional classes. The all-round community value of the future citizen is the goal. With well-timed gradations the play spirit is naturally fused into work impulses.

Can the public save expense by providing playgrounds, swimming pools, gymnasias, etc.? Professor Wirt says it can if only their utilization during the school day is well planned. To quote him: "The children that are in the swimming pool at each hour of the day, for instance, would have to have a school room provided for them if they did not have this swimming pool. Since the swimming pool occupies less valuable space, it costs less than a class room. It is cheaper, therefore, to the taxpayer to have a swimming pool in the school than not to have one. . . . The play ground, gymnasias and manual training rooms are used every school hour, and all of these cost less per capita than regular classrooms."

The history of the Gary schools illustrates where the Steel Corporation fell short in its efforts to anticipate and master the civic needs of the community. The Jefferson school erected by the company in launching the town cost \$90,000, and as structures go is doubtless well built. It was built under pressure, and the steel company architect was, of course, faced with an extensive and many sided problem, on all phases of which no one man could be a specialist. But just as the company brought in no leading expert in city planning, it failed to gauge the country's advances in school architecture and call in the best specialist to be had. We may have our own surmise, however, as to the course which would have been pursued if some particu-

lar process in the manufacture of steel had been in need of equipment. It is to the credit, therefore, of the civic intelligence of the town that when the Gary school board undertook the building of school houses it retained the architect of the St. Louis schools, generally recognized as one of the foremost men in this special line in the United States.

He built the Emerson school for the school board, at a cost of \$225,000 for building, site and playground. This school is declared to be equivalent to five plants of the Jefferson type. To serve a population of 100,000, which would include approximately 15,000 school children—and Gary is expected to grow to this extent before many years—eight buildings of the Emerson type would be required, costing for annual maintenance far less than forty buildings of the Jefferson type. The company now recognizes gladly that the schools which the city has built for itself form Gary's proudest civic achievement.

The Gary school administration is progressive in its efforts to make the buildings serve as neighborhood social centers. The auditorium of the Emerson school is frequently used for evening lectures and other gatherings. The swimming pool is open two nights in the week to women and four nights to men. A night school is also conducted.

Some effort is being put forth by the churches also to reach the foreigners of the south side. There is a Polish Catholic church just next to a whole group of shacks. The Presbyterians have maintained a mission in the midst of the foreigners of the south side, and have recently built a Neighborhood House in which a Slavic speaking head resident has been installed. In addition to the denomination mentioned, the Congregational, Baptist, Methodist, Christian, Lu-

theran, Episcopal and Greek churches are all represented, several having one or more good edifices.

### *Parks*

Two small parks were set aside by the company in the first subdivision, and thus far one has been improved. In the regions to the south, which are so rapidly building up in a helter skelter way, space should be set aside by the city, even if it can not immediately be improved. The need of this section will be partly met by the splendid play park of five acres to be provided in connection with the new Froebel school.

But the thing most urgent is shore front for the people. The eight consecutive miles owned by the company block all direct access to Lake Michigan. When THE SURVEY pointed this out in 1909, the situation was recognized as so serious that three Chicago dailies devoted editorials to it. The citizens of Gary arouse themselves periodically, and the rumors that the Steel Corporation is to extend its holdings eastward have still further crystallized public sentiment. Efforts were made by Gary to condemn a tract just east of the company's land, but as it was in the town of Miller, successful objection was made by that place. In the spring of 1911 a board of park commissioners was established by city ordinance, and there are prospects that a good sized tract may be bought on the lake shore at Millers.

Another project is to make a park along the bed of the Grand Calumet River, south of the city. The plan involves the reclaiming of a couple of thousand acres which are periodically flooded. The digging of the so-called "Burns Ditch" would divert the waters of the river into Lake Michigan several miles east of the city.

### *Politics*

Politics, which are said to be Indiana's most popular form of amusement, are certainly not lacking in excitement so far as Gary is concerned. If you were to believe everything that appears in some newspapers, you would think that the entire voting population of the steel city celebrates election day by getting arrested. Probably most of the occurrences are not peculiar to Gary. But it is just as true that "things happen" there in a bewilderingly sudden and kaleidoscopic way. The pioneer spirit probably finds its readiest expression in the political life.

Another thing productive of sudden shiftings is the easy naturalization possible under Indiana laws. The large number of foreign voters, beset here, as in Pittsburgh, by the old cry that a protective tariff means good times in the steel industry, have in national elections usually given the Republican Party a substantial margin. The story is told that a group of "hunkies" who did

not understand very much English came into a restaurant. The waiter asked for their orders. They all promptly repeated their leader's reply of "Taft." But in 1912 the Progressive Party triumphed by a vote of 1,815 for Roosevelt, as compared with 1,286 for Wilson, 1,083 for Taft, 320 for Debs, and 33 for Chapin.

While in municipal issues the Democrats have always been victorious, the county, on the other hand, is usually Republican. This situation gives to each side some local authority which may be exercised at election time. The Democratic city administration always controls the police force and swears in a lot of special officers. Similarly, the Republican sheriff appoints a large number of special deputies. Whenever some disturbance arises at a polling place, a wagonload of special policemen and another wagonload of deputy sheriffs arrive on the scene; this does not always mean that the disturbance immediately subsides.

The success of the Democratic candidate for mayor is perhaps due more to the personality of the man than to any party affiliation. For the issue has much of the time been Knotts *versus* anti-Knotts. At one time a school teacher, at another an Indian agent among the Sioux, later an insurance man, he had served as a police commissioner of Hammond and as president of the town board of Gary, when, in 1909, Knotts was elected at Gary's first city election for a four-year term as mayor. Despite bitter feeling and graft "exposures," during which the mayor has been arrested no less than fourteen times in two years, there are not many citizens who express a downright distrust in their chief executive. On the whole, most people give him credit for a very real desire to do the best thing for the interests of the city.

As Knotts himself put it, "We" (meaning the town board) "were just three bushwhackers and we had to learn how to manage public affairs as we went along." In forming an opinion of the administration's efficiency some of the handicaps under which it labors must be reckoned. The mayor has had a "combine" against him in councils to contend with. The extraordinary number of saloons may perhaps account for the fact, which is none the less significant, that for a considerable period six of the nine councilmen—one from each of six wards and three at large—were saloon keepers, some of them most disreputable.

The graft "exposure" which was widely heralded to the nation did not make good very far. A man from Louisville wanted a franchise for a heat supply company. He claims that he found it necessary to bribe the mayor, the city engineer and several aldermen. By means of a dictagraph he reported the guilty conversations with the latter. But the mayor was made a more

spectacular culprit by the "discovery" of \$5,000 in marked bills in his desk. He claims that they were put there by men who wanted to trap him, and it must be said that the charge has yet to be proven. One alderman was convicted, but never served his term, since he died pending the appeal of his case. The jury disagreed in the case of the city engineer. But the prosecution in general was upset by the declaration of the dictagraph stenographer that, at the direction of the Louisville man, he "fixed up" the report of the bribery conversation. And then the former city clerk, whose testimony had been damaging to the alderman later convicted, disappeared and sent a deposition that his testimony was perjured. The whole prosecution was then abandoned. Recently he turned up and announced that the deposition was forced from him at the point of a revolver and under threat that his previous prison record would be exposed. Most citizens who are not

bitterly partisan in Gary politics are inclined to give the mayor the benefit of the doubt in the situation, and to an outsider this seems a reasonable point of view.

But out of it all has come a better board of aldermen. The recent elections have changed its complexion so that the saloon keepers, instead of being six out of nine, are now only three.

Knotts' election came after a campaign in which both parties were divided by bitter factional strife. On the Democratic side this strife was stirred up by a former mayor of Joliet, Ill., who, it is alleged in some quarters, came to the new steel city for the express purpose of contesting the power of Knotts, and with the encouragement of various steel company officials. Fair-minded men point out that steel company men are to be found in both parties and all factions. To an outsider there does not appear to be much ground for believing that the company has any deep laid designs for controlling the politics of the city.

Knotts fairly reflects the general sentiment that the steel company has done much for the city created by its enterprise, but that the people themselves have also done much, and that the city has its own life to live and affairs to manage. That there could be any variance of opinion on this

score appears curious to the outsider. But there have been a considerable number of people, especially in the early days, who, although not identified with the steel company, took the point of view that the company had made the city possible, and therefore ought to have anything it asked for. The company itself disclaims any desire for favors at the hands of the community.

### *Public Utility Franchises*

The failure of a group of men connected with the steel company to secure the trolley franchise

POLLING PLACE ON A TURBULENT ELECTION DAY

must, however, be reckoned with. Their proposition was for exclusive rights for fifty years, covering all existing streets and alleys, including their subsequent extensions, with authorization to charge a flat five cent fare. The terms granted to a rival company, which is now operating, although of fifty years' duration, stipulate the following: only certain streets to be used; company to pave 26 feet of the width of such streets; at the expiration of five years tickets to be sold at the rate of eight for 25 cents, but six to be sold for 25 cents from the beginning (the company anticipated its contract by furnishing eight tickets for 25 cents for use during the four hours a day in which laboring men go to and return from work); interurban railroads coming from a greater distance than five miles to be furnished with power and the use of the company's tracks at a rate not to exceed two cents per passenger, an arbitration plan being provided in case this rate is thought to be exorbitant.

How there could be any difference of opinion among the citizens as to which franchise to choose is a mystery. That a fifty-year grant under any circumstances to any company was even considered by an up-to-date citizenship is extraordinary, in view of the public attention which

ROAST FIG,  
SHACKTOWN  
STYLE

has been directed to the struggles of the larger cities against such long term grants.

The Gary Heat, Light and Water Company, a subsidiary of the Steel Corporation, supplies gas, electricity and water under a twenty-five year franchise, under which the city can buy the plant at its then value. The gas rate was \$1.10 per thousand, with a discount of 10 per cent for payment within ten days, bringing it down to \$1. The company claims that it seeks only a reasonable return on its investment, and is primarily seeking to give good service to the town. On July 1, 1912, it voluntarily reduced the price of gas to \$1, with a discount of ten cents if bills are paid in ten days. It may be pointed out that a committee of the Chicago City Council employed an expert, whose report, after several months of investigation, was that gas in that city could be sold at seventy-seven cents per thousand and still return a dividend of 8 per cent on the value of the company's property. Of course conditions may not make this possible in Gary, but it would seem that the large quantities of gas manufactured at the steel mill ought eventually in some way to make still cheaper gas available for the town.

Electricity was furnished at the rate of eleven cents per watt hour, with 10 per cent discount for payment within ten days, though users of large quantities could secure it at a lower cost.

These rates were reduced 20 per cent on July 1, 1912. The charge for water was thirty cents per thousand gallons, reduced July 1, 1912, to twenty-five cents. This rate is varied according to quantity used and certain conditions. For instance, in the poorer houses, where there is but one faucet, a flat rate of \$8 a year obtains. The rate of thirty cents per thousand seems high when it is known that at Hammond, a few miles west, a municipal plant supplies it at seven cents. The quality, however, is generally acknowledged to be far superior at Gary, and the plant, involving a large investment, has a capacity to serve the future needs of a quarter of a million people. Public regulation of rates is not provided for in these franchises; and must come, if at all, through whatever procedure the general laws of Indiana permit.

#### *Civic Interest*

Perhaps the most significant recent development in Gary is the rise of municipal loyalty and co-operation. Its growth is more manifest to one who occasionally visits the place than to the inhabitants themselves. The enthusiasm with which citizens of all classes not only serve as committee members or directors of local organ-

NEIGHBORHOOD HOUSE

Built and maintained by Presbyterians. Head resident speaks Slavic.

SHACK HOUSING EIGHT FAMILIES AND MANY BOARDERS

izations, but devote time and energy to such activities, shows a marked contrast to the early spirit in which the scramble for individual advantage seemed uppermost. And it betokens much of civic promise for the future.

It may be that the very lack of tradition has made co-operation easy. How many cities could show on a Y. M. C. A. board of trustees a Jew, two Catholics, an Episcopalian and a Presbyterian, all working together harmoniously? And where else can you find a Y. M. C. A. secretary serving as manager of a financial campaign which raised in one week more than \$40,000 for a Catholic hospital building—the Mercy Hospital—which will equip the town with facilities for the care of the sick to compare in some degree with the splendid hospital which the company built at the steel mill? The \$18,000 for Neighborhood House, to be sure, was raised almost entirely outside of Gary, but the community is evidencing a vigorous interest and hope in what it may accomplish. A strong body of citizens has launched an associated charities. Newspapers and commercial organizations are increasingly turning attention to affairs of community betterment.

Gary stands out today as the greatest single manifestation of industrial power to be found in America. The Steel Corporation's triumphs in the economics of production are only less impressive than its complete command over the army of workers it employs. These together are exceeded in significance at Gary only by the unparalleled opportunity this vast industrial power possessed to determine the living conditions of a great multitude of human beings.

At Gary, as nowhere else, the opportunity was completely unhampered. The conditions and forces which had to be reckoned with elsewhere did not exist, had not grown up. The hills, which in other places have steadily thwarted expansion, were in Gary only sandy undulations. As if to impress nature herself that here at least she must be completely subservient, the very landscape was planed level and the watercourses shown their places. Nothing man-made blocked

the way. Even who the citizens-to-be of the future town were to be was to a large extent within the willing of this industrial power to select. The streets and houses for their habitation, their necessities of life, the conditions under which their children should grow up, and their livelihood might all be decided at the nod of the rulers of steel.

The people of this country are increasingly asking an accounting of the way such power is used. If public welfare asserts its right to keep railroads within bounds in fixing transportation rates, what shall be its attitude toward a power that can fix the whole round of work and home

RUSSIAN CHURCH AT GARY

HUNKIES' TAR PAPER DWELLING

and community conditions for large masses of men, women and children. The industrial executives who created Gary reiterate that their concern was the establishment of a steel mill and allied plants, that into city building they went only so far as necessity compelled. But "only so far" involved the very plan of the city, and many of the fundamentals which would determine its civic growth.

What has been the outcome? It is clear that industrial arrangement had the right of way. In so far as the city interests have not conflicted with industrial plans, or in so far as they were essential to those plans, they have received such attention as the largely self-contained civic enlightenment of steel makers suggested. If industry needed Lake Michigan frontage, that was sufficient reason to deprive the city of any whatsoever—especially if the impregnability of an industrial fortress was at stake. The men who are content only with the most scientific, thorough and largest success in shaping steel, thought their own civic rule o' thumb entirely competent to shape the molds for the flow of human life. Their very super-qualities as architects of industry set a standard which the observer craves for and fails to find in the upbuilding of the

town. A great industrial power let slip through its giant fingers a chance to work out a civic achievement the like of which the country has not known. The opportunity was exceptional enough to have attracted the thought and service of men whose civic purpose and ability would have commanded the respect and confidence of the nation.

Was paternalism to be avoided? Then a civic construction commission would have been the best and clearest disavowal. Paternalism consists not in the quan-

tity of things done, but in the spirit and way in which they are done. Gary, the community, could have been better planned, housing could have been more extensively provided, larger civic responsibilities, at less exacting costs of time, could have been shouldered by the industrial leaders through such a planning and construction commission, all with far less paternalism than has been shown in things actually done.

Yet citizenship, at the same time, could have shared civic responsibilities from the outset more largely than was permitted. The creativeness, the appreciation of human values, which the new townspeople have put into their schools, are an increment which all the steam shovels along the lake front could not have dumped into the melting pot of the growing city.

Nor could they have stirred its idealism as did a Gary newsboy who risked, and lost, his life that the skin from his crippled leg might aid the recovery of a burned girl. It is not enough to supply house paint by the barrel—the poorest little Hungarian school girl must have opportunity to express the best she can learn and aspire to. The tonnage methods of industry are not adequate for life.

# WOMEN IN THE BOOKBINDING TRADE

"It's a strain in bindery work not to make mistakes," a girl worker told Mary Van Kleeck, the author of *Women in the Bookbinding Trade*, just published for the Russell Sage Foundation. "A book is easily spoiled. I know a girl that put a picture of Longfellow in a copy of 'As You Like It.' Nobody knew it until she looked in another girl's book that had a picture of Shakespeare. 'Well,' she said, 'that doesn't look like the picture I pasted. He was a funny looking man, but not as funny as that.'"

The reader who has come to a full stop in the middle of a book or of a magazine article because the "signatures" are mixed, may be in no forgiving mood with the girl who doesn't know Longfellow's beard from Shakespeare's, but he may have some sympathy with the fatigue and monotony of factory work. Another girl put it tersely: "When you do one thing all day you lose the feeling in your fingers; you are likely to pick up two sheets at a time."

The book contains many such personal touches, clear glimpses into the lives of two hundred girls and women with whom Miss Van Kleeck and her associates came into personal contact and whose life stories, interpreted by a trained investigator and student, go to make this most interesting and readable of recent volumes on women in industry.

In the binderies the industrial revolution is not a matter of history, but of the day's work. There is incessant competition between outgoing hand processes and incoming machine processes. The skilled craftswoman doing artistic hand work is a diminishing factor. The whole tendency is for a girl to learn one machine or only

a part of it. A year later that machine may be obsolete and her hard-won skill unsalable.

And it is her experience to be out of work or cruelly overworked, according to the seasonal demand for books, magazines and pamphlets. The weeks preceding Christmas are a stampede in the bindery.

There is not space here to go into details of Miss Van Kleeck's study of the shifting in the trade, of the wages, the hours, the home conditions. Her care in working out her points and her vigorous attitude toward the problems she discusses are well illustrated in the chapter where Wages and Home Conditions are considered together—as they should be. Of a group of 199 workers, 107 lived in families of which the father was the head; 59 in families of which the mother was the head; 23 of which another relative was head; 3 were married women whose earnings were needed for the family support—only 6 were boarders. In only half the homes was the father a contributor to the income, and even if the father was the head of the family he was typically a low-paid man, not earning enough to support his household. The wages of the girls were needed in every one

of the families, meager as they were, for on the average bindery girls earn little more than \$300 a year. Small chance here for the worn explanation that low wages are relatively justified for girls living at home and working for pin money.

*Women in the Bookbinding Trade* is a compact volume of 290 pages, freely illustrated from photographs by Hine. It will be sent postpaid for \$1.50.

MARY VAN KLEECK  
Author of *Women in the Bookbinding Trade*

Following her college work at Smith and Columbia, Miss Van Kleeck held the fellowship awarded jointly by the College Settlements Association and the Smith College Alumnae. Her subjects were overtime work of girls in factories and child labor in the tenements. She was industrial secretary of the Alliance Employment Bureau for two years and since 1909 she has been secretary of the Russell Sage Foundation Committee on Women's Work, of which Prof. Henry R. Seager is chairman.

*Women in the Bookbinding Trade* is the first published result of the committee's work. It will be followed by four other volumes, two of which are nearly ready—*Makers of Artificial Flowers* and *Women and Girls in Public Evening Schools*.

## THE PITH OF IT

THE Webb-Kenyon bill to prohibit the shipment of liquor in interstate commerce into states whose laws forbid its sale has been passed over the President's veto by both the United States House of Representatives and the Senate.

THE last of the cases growing out of the Lawrence strike of a year ago have been *nolle prossed* by District Attorney Henry C. Atwill who prosecuted the murder charges against Ettor and Giovannitti. Among the cases which were discontinued were those charging William D. Haywood, William E. Trautman, William Yates, treasurer of the strike defense fund, and Joseph J. Ettor with a conspiracy to intimidate the workers in the various mills.

"THE war on vice is a fight to the finish," writes Graham Taylor, and in this issue of THE SURVEY important developments of the warfare are set forth: the Supreme Court's upholding of the White Slave Law; the range of prosecutions under that law; the exposures of police graft in New York; the report of the Portland Vice Commission; the work of the Pittsburgh Morals Commission; and the work of the Bureau of Hygiene. Pp. 799 and 809.

UNDER the caption Post Graduates of the Hired Man, R. R. Reeder, educator and orphanage superintendent, shows how the problem of the sexes is not only a municipal but a household problem. P. 816.

THE twelve-hour day of the dye houses is one of the little known phases of the Paterson silk mill strike. "Dyeing" is carried on continuously and the workers want the twenty-four hours split up into three shifts.

THE two months' strike in the garment trade in New York is over. In men's wear the organized employers have held their ground against bargaining with the workers. In women's wear, protocols have been signed between employers' organizations and the shirt waist makers, the kimono makers, and the white goods workers. Developments under the two regimes will be watched with interest. P. 804.

THE struggle between two opposing theories of Socialist tactics in America has passed its first stage. The count of the ballots shows that William D. Haywood has been recalled from the National Executive Committee of the Socialist Party by a two to one vote.

THE time and place for the presentation of Brieux's "Damaged Goods" have been changed to March 14 at the Fulton Theater, Rich and Harris, managers. Managers of the Waldorf-Astoria, Little Theater and Thirty-ninth Street Theater, some of whom had previously offered their houses, withdrew their offers, fearing that their licenses did not cover that sort of production or that the police would interfere.

## SUPREME COURT UPHOLDS THE "WHITE SLAVE" LAW

February 24, 1913, will be remembered for generations as the day on which the Supreme Court of the United States declared that

"it is misleading to say that men and women have a right. Their rights cannot fortify or sanction their wrongs."

The Mann or White Slave Law had been attacked on the ground that the federal government was usurping the police power of the states, and that it interfered with the "right" of individuals to travel freely from one state to another, regardless of their motive. The decision is held to mark the most advanced step yet taken by the United States Supreme Court in construing the powers of the federal government over interstate commerce.

Lawyers believe that it perhaps foreshadows the attitude of the Supreme Court on such measures, proposed or existing, as prohibition of the shipment of liquor into dry states and interstate commerce in articles manufactured under conditions of hours or of sanitation not up to standard and the work of prisoners or children. All these have been deemed in some quarters to be of doubtful constitutionality.

This opinion on the Mann Law challenges the "right" of a woman to work at night, of a man to sell his labor where and for what he will, regardless of conditions.

The immediate effect of the decision will be to strengthen the hands of the United States district attorneys, who have had success in securing convictions in white slave cases; and to free volunteer workers for their pressing task of attacking the social evil in city and state.

Justice McKenna wrote the opinion of the court, which is in part as follows:

"It is said that it is the right and privilege of a person to move between the states, and that such being the right another cannot be made guilty of the crime of inducing or assisting or aiding in the exercise of it, and 'that the motive or intention of the passenger either before beginning the journey or during or after completing it is not a matter of interstate commerce.'

"The contention confounds things important to be distinguished. It urges a right exercised in morality to sustain a right to be exercised in immorality. It is the same right which attacked the law of Congress which prohibits the carrying of obscene literature and articles designed

for indecent and immoral use from one state to another. It is the same right which was excluded as an element as affecting the constitutionality of the act for the suppression of lottery traffic through national and interstate commerce. It is the right given for beneficial exercise which is attempted to be perverted to justify baneful exercise, as in the instances stated. This constitutes the supreme fallacy of the plaintiffs' 'error.' It pervades and vitiates their contention.

"Plaintiffs admit that the states may control the immoralities of their citizens. Indeed, this is their chief insistence, and they especially condemn the act under review as a subterfuge and an attempt to interfere with the police power of the states to regulate the morals of their citizens and assert that it is in consequence an invasion of the reserve powers of the states.

"There is unquestionably a control in the states over the morals of their citizens and it may be admitted it extends to making prostitution a crime. It is control, however, which can be exercised only within the jurisdiction of the states, but there is a domain which states cannot reach and over which Congress alone has power, and if such power be exerted to control what the states cannot it is an argument for—not against—its legality. Its exertion does not encroach upon the jurisdiction of the states. The pure food and drugs act is a conspicuous example. In all instances where the right of Congress to legislate for such matters has been attacked the clash of the national legislation with the power of the state was urged and rejected.

"Of course it will be said that women are not articles of merchandise, but this does not affect the analogy of the cases; the substance of the congressional power is the same, only the matter of its exercise must be accommodated by the differences in its objects. It is misleading to say that men and women have a right. Their rights cannot fortify or sanction their wrongs and if they employ interstate transportation as a facility of their wrongs it may be forbidden them to the extent of the act of July 25, 1910.

"The principle established by the cases is a simple one when rid of all confusing and distracting considerations, that Congress has power over transportation 'among the several states,' that the power is complete in itself and that Congress as an incident to it may adopt not only means necessary but convenient to its exercise and the means may have the quality of police regulation."

## COMMERCIALIZED VICE A NATIONAL PROBLEM

The upholding of the Mann Law comes on the heels of the New York vice revelations. These, like those of Chicago, are exhibits of a problem which each city must attack by itself. But organized vice, by ramifying across the continent, has linked them up into a national problem, vulnerable under federal law. There is pretty general agreement that the present point of attack on commercialized vice should, so far as the cases permit, be brought under the Mann Act.

The federal attorneys have piled up a record since the law went into effect in July, 1910, of 337 convictions with sentences totaling 607 years and fines aggregating \$66,605.50. One hundred and six cases were pending at the last report. There have been only thirty-five acquittals. A Detroit attorney has pointed out that practically no cases have been lost there in federal courts (twenty-nine convictions) while practically none, for very similar offenses, have been won in the state court.

In his annual report to the President, Attorney-General Wickersham asked for an increased appropriation (from \$100,000 to \$200,000) for the special commissioner and local white slave officers who have been chiefly instrumental in winning these government suits. Many individuals and local sex hygiene and similar societies are in hearty accord with the plan, and look upon the Mann Act as the most effective law we have ever had in dealing with the trafficking in vice.

Nevertheless, there has been strong criticism of the enforcement of the law in several jurisdictions because of light sentences. The law was drawn on broad lines, making it a violation for any person to knowingly persuade, induce, coerce, or cause, or to aid or assist any woman or girl to go from one state to another for prostitution, debauchery or other immoral purpose, with or without her consent. The maximum penalty, if the victim was over eighteen, was made five years' imprisonment and \$5,000 fine; twice that amount if she were under eighteen.

In the face of such a possible penalty, a probation officer in Pittsburgh protested vigorously when a white slaver, convicted there, was given a sentence of one day and a fine of only \$200. In Minnesota the women's clubs made a state issue of a case in which a married man, deserting his family, took a girl from Wisconsin to Minnesota, and was sentenced by Judge McPherson to three months in the county jail and a fine of \$1,000. The women's clubs petitioned the judge of the United States Court of Appeals, who makes the assignments of the district judges, to assign Judge McPherson to another district, "lest another case of white slavery be placed upon the calendar subject to Judge McPherson's

judgment." This petition was refused, on the ground that the degree of punishment is expressly entrusted to the trial judge. It was stated also that the United States district attorney who prosecuted the case was satisfied with the sentence. The man had pleaded guilty to taking a girl under eighteen across state borders for cohabitation. Judge McPherson defended his sentence on the ground that there was no evidence to show that the girl was coerced. The club women countered vigorously with a statement to the effect that coercion was not the point; that by the man's own story, plus all human experience, the girl was surely entered on a life of prostitution; what they wanted was such punishment as would be the talk of every barroom and a specter to any man who contemplated doing it in the future.

## CLASH OF NEW CONSCIENCE WITH OUR COURT DECISIONS

In the difference of opinion between judge and prosecutor on the one hand and club women on the other in this case lies the key to the criticism of the courts. For a summary of it and a study of the light sentences imposed in all jurisdictions THE SURVEY is indebted to Frederick H. Whitin, secretary of the Committee of Fourteen in New York, who, with the cordial co-operation of Attorney-General Wickersham, secured a great sheaf of letters from federal district attorneys.

The federal judges and attorneys, it appears, pretty generally take into account the circumstances of the case. In clear cases, where white slavery is effected through coercion, imprisonment and heavy fines have been imposed. But they were satisfied with comparatively light sentences, for instance, in all of the following: The Pittsburgh case, where the woman was an acknowledged prostitute; a New York case where the woman brothel keeper convicted was believed to be not the real offender, but his agent; a Louisiana case in which the women involved were acknowledged Negro inmates of the New Orleans levee taken to a lumbering camp in an adjoining state; an Oregon case, the woman in which is described by the district attorney as "a well-seasoned and hardened prostitute who, about the time of the arrest, did a fancy job of carving the white slaver with a butcher knife"; a similar case in Illinois, where the woman was "a female veteran of the under world"; a California case, in which the attorney ventures the opinion that to make a crime of interstate transportation of prostitutes "places a premium upon the daughters of our own state to be dragged into such a life"; finally, in another far western case, an opinion from the bench that violations under this law might appropriately be divided into three classes: (1) those in which the de-

## LIBERA NOS

FRANK THONE

We have grown to be a city; there's a host of hopeless men  
Who toil that they may eat and sleep—to wake and toil again,  
And to their helpless children they'll bequeath their slavery  
From the bondage of the Pharaohs, set us free, Lord, set us free!

We have grown to be a city; we are stricken with the curse  
Of those that stint the laborer's loaf that they may swell their purse;  
They give him books and churches, but they deny him half his pay—  
From the greed of Tyre and Sidon, Lord, deliver us, we pray!

We have grown to be a city; 'mid the factory's racking sound  
A thousand children slowly die to make the wheels go round;  
They moan aloud for mercy, but their masters do not care—  
From the crime that branded Herod, spare us, Lord; hear thou our prayer!

We have grown to be a city; and our high priests brand with red  
The wretches who have sold their souls to buy a little bread,  
But to the ones who grind them down they have no word to say—  
From the fate Thou gavest Sodom, spare us, Lord, another day.

We have grown to be a city, but our fathers are not strong,  
And they bow before the mighty who find profit in the wrong,  
For wrong is ever mighty, and our fathers are afraid—  
Help us, then, Lord God Almighty, for we surely need Thy aid!

Amen.

fendant persuaded a woman or girl of previous good character to enter into a life of shame, (2) those who habitually associate with women of immoral character and live off their earnings, (3) those who, while earning their own livelihood by some legitimate occupation, yet associate with this class of women and occasionally are the means of transporting them from one state to another.

In all these cases the judges and district attorneys make allowances for the degree of *coercion* involved. They also have to reckon with points of law and procedure, such as insufficient evidence making pleas of guilty or *nole contendere* acceptable (this happened in the Pittsburgh case, where, additionally, the defendant had been in jail six months awaiting trial).

Summing up all the evidence, Mr. Whitin says:

"The difference of attitude, which constitutes the real difference between the officials charged with the act's enforcement and its friends, runs through all the correspondence from all the districts. It must be recognized that the judges now sitting on the federal bench are generally men of the older generation—the generation which grew up and accepted from its fathers, without protest by its mothers, the theory of sex necessity for men. They do not, therefore,

look upon the commercializer of prostitution, if he is not a white slaver in the stricter meaning of that term, with the abhorrence which is growing so rapidly in the younger generation which has thrown a challenge to the theory of sex necessity. It comes, therefore, to a question of education—education of the courts' critics to distinguish between the personal safeguards which our forefathers fought so hard to obtain and the overgrowth of legal technique which chokes our criminal courts; education of the judges that they may be abreast of the moral sentiment of the day; education of the public so that all may unite in concerted effort to suppress the crime of the ages, commercialized sexual vice."

ROCKEFELLER BUREAU  
OF SOCIAL HYGIENE

When Mary Goode got up her Irish dander and told the Curran investigating committee the story of her dealings with men who "protected" her as the keeper of a disorderly house, she ran the whole gamut of the New York vice situation which differs but slightly from the vice situation in any other city. And her testimony led to a prompt public demonstration of that "new conscience in regard to this twin of slavery, as old and outrageous as slavery itself and even more persistent," which Jane Addams has foreseen.

While Mrs. Goode's statement was still fresh in mind came the announcement from John D. Rockefeller, Jr., of the Bureau of Social Hygiene, designed to meet and overcome the very conditions she had disclosed. For some time this bureau has maintained the laboratory of social hygiene at Bedford Reformatory,<sup>1</sup> to study the lives and needs of the girl inmates in order to prescribe for their treatment and rehabilitation and to learn the conditions leading to their commitment. Now it announces a "thorough and comprehensive survey of the conditions of vice in New York city," by George J. Kneeland, who had charge of the investigation for the Chicago Vice Commission; and a similar study of conditions in Europe by Abraham Flexner, widely known for his reports on medical colleges, made to the Carnegie Foundation for the Advancement of Teaching. Mr. Flexner has studied in particular the various European methods of dealing with the social evil, including state regulation and segregation. Mr. Kneeland will report not only on conditions but on the personal histories of 2,000 prostitutes and on a year's case records of hospitals and dispensaries "with a view to ascertaining the prevalence of venereal diseases and their ratio to all other diseases." Both reports should be epoch-making, for they are on a much greater scale than even the Chicago report. The study of European police systems now being made by Raymond V. Fosdick, formerly commissioner of accounts, is for the same bureau.

But this is only the beginning, for it is announced that the bureau is to

"go on, generation after generation, continuously making warfare against the forces of evil, which are never greatly alarmed at the organization of investigating or reform bodies, for they know that they are generally composed of busy people, who cannot turn aside from their own affairs for any great length of time to carry on their reforms, and that sooner or later their efforts will cease, and the patient denizens of the under world and their exploiters can then reappear."

Thus we are to have, for the first time, an organization to study not one or a few aspects of vice, but the whole, an organization possessed of ample means, and starting with a thorough survey of conditions. The present members are Katharine B. Davis, superintendent of the Women's Reformatory at Bedford; Paul M. Warburg, Starr J. Murphy and Mr. Rockefeller. It is the outgrowth of the latter's experience as foreman of the white slave grand jury in New York in 1910.

To many great interest will attach to an interview in the *New York Times* in which Mr. Rockefeller says:

"I say unhesitatingly that in the vast majority of cases she [the prostitute] is a victim. Prostitution as now conducted in this country and in Europe is very largely a man's business, the women are merely tools in the hands of the stronger sex. It is a business run for profit and the profit is large. It is my belief that less than 25 per cent of the prostitutes in this country would have fallen if they had had an equally good chance to lead a pure life. That they have been dragged into the mire in such large numbers is due to a variety of circumstances, among which are poverty, low wages, improper home conditions and lack of training, the natural desire for pretty things, etc. But while all these may be contributing causes, man is chiefly responsible."

This goes with the Chicago, Minneapolis, Portland and other reports and throws Lecky and "the scarlet woman" overboard, or leaves them for Mayor Gaynor who deprecates discussion of a white slave traffic, holds that all public discussion of the matter is mere aspersion on the fair name of New York and advocates "outward order and decency" as the sum of our ambition.

#### RELATIONS OF VICE TO POLICE GRAFT IN N. Y.

Mary Goode—to go back—is a woman of considerable education, the keeper of a quiet, rather small house of prostitution in an uptown flat building. Her statements of facts and figures cannot be accepted without corroboration, but they follow strikingly the Chicago report and the accepted statements of other investigators. In her testimony before the Curran committee she told:

—how the 35,000 prostitutes of New York are recruited from shop girls, earning four and five dollars a week, who have to go on the streets **at night**.

—how she had paid money every month to a beer bottler who in turn paid the police. This led to testimony by two Raines Law hotel keepers against a politician and a policeman who, to save himself from Sing Sing, told on his superiors.

—how the avarice of the graft collectors had reached a point where all the profits of her establishment went to them.

—how first, she had turned instinctively to a woman, known as a leader in the woman suffrage cause, who advised her to go to the authorities.

—how District Attorney Whitman's effective protection of his witnesses against Lieutenant Becker gave her courage to break with her "protectors" contrary to every instinct and practice of her class.

—how seventeen flats in her house, house after house in her street, street after street in the Upper West Side, were rented to tenants such as she, with the full knowledge of the police who collected graft from them and of the owners who collected exorbitant rents from them.

<sup>1</sup>See THE SURVEY for May 18 and December 7, 1912.

—how all that she asked was to be given protection, for which she was ready to pay, so that she might run her place unmolested, with "outward order and decency," which was her understanding of what the people of New York want.

There, pretty completely, is the vice situation with two things lacking. First, the question of venereal disease, which all employing prostitutes avoid; second, organized vice. The second exception is important, for if Mary Goode had been a part of the "vice trust" she would not have been an independent keeper of a house but an agent of men organized not only to run houses but to see to protection payments in bulk, to furnish a steady stream of new girls as needed and to regulate this stream so that dull times in one part of town can be discounted by adding numbers in other parts where there is more demand.

These points came out through other witnesses and every week has had its new exposures reaching deeper and deeper, or higher and higher, as one regards it as a social or a police problem. Recently admissions were made by a police captain which knocked the biggest hole yet in the wall of secrecy and graft surrounding the tenderloin. The whole relation of the Police Department to vice is being thoroughly aired by the Curran committee of the Board of Aldermen which resulted from the exposures following the murder of Herman Rosenthal, the gambler. It has had the co-operation of the Bureau of Municipal Research and of many citizens and is securing day by day practical results by placing all its findings at the disposal of District Attorney Whitman.

Among other features of a very full newspaper discussion provoked by these revelations, has been a symposium in the *Evening Post* by more than one hundred social workers, clergymen and others. This turned on a pretty general agreement with the *Evening Post's* suggestion that a vice commission is needed in New York, and this, very likely, led to the full announcement of Mr. Rockefeller's plans which had been going forward quietly for some time. So far as his announcement shows, the new bureau is purely an investigating body with no plans which would duplicate the militant work of law enforcement carried on by the Committee of Fourteen. This committee has practically cleaned out the Raines Law hotels and is now turning to new measures. Last week it had introduced in the state legislature a bill based on the Iowa Injunction and Abatement Act which, by means of an injunction, prevents the continued use of the same premises for disorderly purposes. It will shortly introduce another bill designed to stop the movement of disorderly women into tenement houses.

## CITIZENS' COMMITTEE REPORT IN NEW YORK

Attacking the same problem, but from a different angle, that of police reform, is the report of the Citizens' Committee issued last week. The committee was appointed at a mass meeting held in Cooper Union last August after the murder of Rosenthal, the gambler, for which Police Lieutenant Becker was later convicted and sentenced to death.

The committee finds that "conditions of police administration in the first American city are bad, have always been so within the memory of living men and show no gratifying improvement." Its principle for improvement is to take away from the police all control of the vices, leaving to them their constabulary duties of preserving peace and order. Its method is to create a board of social welfare to deal with vice, to double the salary and greatly extend the term of the police commissioner, and to open the saloons on Sunday. The last is first in order among the recommendations.

The suggestion of a board of social welfare follows somewhat the recommendations of the Chicago Vice Commission and the Morals Commission of Pittsburgh. The recommendation is that the members of the board, to serve without pay, be appointed by the mayor and subject to removal by the Appellate Division of the Supreme Court on conviction of charges of malfeasance or nonfeasance in office or of unfitness. The term suggested is seven years. The board would deal with the social evil, gambling, excise and amusements. Its executive head would be an associate commissioner of the Police Department. His staff, drafted from the police force, would be given increased pay in return for signing waivers of interest in the police pension fund and of any right of reinstatement. The board would have power to dismiss officers at will, to hire men outside and to pay them from a substantial contingent fund. This is aimed at the present difficulties of securing detectives and of discharging unfaithful officers, who frequently secure reinstatement with back pay as a result of suits brought in court and backed by their protective associations.

The recommendations regarding the police commissioner are that his appointment continue in the hands of the mayor but that it be for a period of ten years unless he be removed by the Appellate Division following conviction of charges brought against him; that his salary be increased from \$7,500 to \$15,000 in order to secure a higher grade of trained man. The committee finds that the great difficulty of the police commissioner is his short term of office. There have been eight commissioners in the past eleven

years. They believe a second rate man appointed for ten years would do better than a first class man in office a short time.

The recommendation in regard to excise is "that Sunday saloon selling within restricted hours and with other proper limitations should be permitted by law in New York city." The argument is that saloons are now open all day Sunday, illegally, leading inevitably to graft; that "it is the firm opinion of this committee, as well as that of practically every student of city conditions with whom this committee has conferred, that the Sunday sale of liquor in New York cannot be suppressed;" that "the world's experience shows it is futile to attempt to enforce regulations which contravene the daily habits of a considerable part of the public;" that "instead of opening the saloons, we think our plan may tend to close them the larger part of the day, and especially during church hours."

It is understood that the bill embodying this recommendation proposes that the open hours on Sunday be from 1 to 11 p. m., and that it will not be pushed for passage. No evidence is submitted on the recommendation, which is advanced as embodying the unanimous opinion of the committee and of the students it consulted. The names of the students are not given. The committee recommends the repeal of the Raines law, which permits a saloon maintaining ten or more bedrooms and serving a meal (defined by the courts as a sandwich) to take out a hotel license and sell liquor on Sunday.

The report of the committee came out earlier than was expected as a result of the hearings before the state legislative committee investigating vice and graft. It brought out a prompt announcement from the Rockefeller Bureau of Social Hygiene that, as commonly surmised, the trip of former Commissioner of Accounts Fosdick to study European police systems is on behalf of the bureau. It urges delay in police changes until his report is ready, some time this year.

## EVOLUTION IN THE GARMENT TRADES

The New York garment strikes, which have come to a close at the end of two months, are not local affairs. With the revolutionary development in ready-to-wear clothing even the customer of the village store is concerned in these labor disputes. The farm hand who wants a college cut to his Sunday suit is at one end of a chain that reaches back to the machine operators who during the past month have been picketing the loft buildings of Manhattan; the housekeeping of the best families of a middle-sized city, whose week's washing is piled with white goods they have bought at the local department store, is bound up with that of the home workers of the tene-

ments whose low-paid labor has complicated and undercut the pay in the factories.

The strikes are of national significance in a larger sense. For, unless all signs fail, they are likely to prove the occasion of notable changes in the organic development of industry. In the men's wear trade, the strike hung on with no constructive outcome; but in women's wear, this winter's struggle has ushered in the extension of the protocol plan to three divisions of garment manufacture in New York—shirt waist, kimono, and white goods. Thousands of workers and hundreds of manufacturers are thus brought together in grievance and sanitary boards, slowly, stitch by stitch, to endeavor to put order and health and publicity and responsibility into the fabric of their common work.

The view of the employers who enter into these protocols has been expressed by Julius Henry Cohen, the attorney who has been a central figure in many of the negotiations. "We have reached a point where the garment manufacturers are doing what the professions have long done," he said in a recent speech before the Efficiency Society. "We hold ourselves responsible for the scalawags of our trade. It does not make any difference how good the standards are a man wants to set in his own plant, the competitor who knows no limits in his treatment of his help undermines them and brings the trade into public obloquy. We are going to set the whole level of the trade on a higher plane, and we are going to count on the workers to join with us in doing it; to work things out together."

## LIKE THE RAFFLE OF A RICKSHAW

The garment industry in New York is so enormous and scattered that the management of an individual shop does not feel the pressure of public opinion the way it would in a small community. In the absence of a strong union, or of the joint form of trade government provided by the protocols, there is no hindrance to the unscrupulous employer.

To illustrate, a practice resorted to in one of the men's tailor shops now on strike is reported on the card record of a recent investigation by the Committee on Women's Work of the Russell Sage Foundation. We all remember the East Indian contractor in Kipling's *Incarnation of Krishna Mulvaney*, who made his coolie laborers raffle for a rickshaw out of each week's earnings and then accepted the rickshaw back again—a weekly gift from the winner, who had no use for it.

The incident is paralleled in a men's tailor shop in New York employing 500 girls and men. From the weekly pay envelope of each employe earning \$6 or over ten cents is held back to raffle for a suit of men's clothing of the value of \$7.

Raffling is thus compulsory. If a girl gets the suit she has nothing to do but give it back, or if she is very enterprising, take it and try to find a purchaser. One girl reports that she has paid in three years to the weekly raffle \$15 in all, and got nothing for it. Like the roulette wheel, the "bank" never lost; whoever won the suit the employer stood to win a no small sum from his girl employes each week.

Of the same firm it is recorded, also, that in the labeling department one dollar is held back from the employes' pay envelope weekly to put into a compulsory savings fund on which the employer gathers interest until the employe has a total of \$50 to his or her credit. Then only can the victim of this compulsory thrift draw out his savings.

#### MEN'S WEAR ON THE OLD BASIS

In this trade, which led off the strikes of four branches of the garment industry, no common basis of settlement for the body of employers with the body of workers has been agreed upon, the New York Clothing Trade Association being firmly opposed to collective bargaining.

It is generally understood that the underlying opposition of the clothiers is to the preferential shop, which they regard as a subterfuge for the closed shop, and a disinclination to turn their business over to their employes, which is their description of the protocols in women's wear.

Perhaps 20,000 of the tailors on strike had made settlements with individual shops when on February 28, the union declared the strike off and the balance of the strikers went back to work in open shops where the union is not recognized. The calling off of the strike was due to the following propositions of settlement made to their employes through Marcus M. Marks, who had more than once offered his mediation, by the advisory committee of the Allied Clothing Manufacturers' Association, made up of representatives of the New York Clothing Trade Association, the Tailors to the Trade Association, the American Clothing Manufacturers' Association of New York, and the Associated Boys' Clothing Manufacturers of Greater New York.

The terms under which the strikers go back to work follow:

The workers are to return to work immediately.

The question of hours is to be submitted to a commission consisting of the following, Robert Fulton Cutting, Marcus M. Marks, Dr. J. L. Magnus, their recommendations to be accepted as final and binding.

The findings shall be on the basis of establishing a standard of working hours per week that will maintain the industry in New York on a

competitive basis with other markets for the present and for the future.

Upon the resumption of work there shall be a general increase in wages to week workers in tailor shops of \$1 a week over wages paid prior to the strike, and to piece workers the rate shall be advanced in the same proportion.

No reduction in price in dull season. The maintenance of sanitary conditions.

The abolition of sub-contracting in contractors' and inside shops.

Hours and conditions in contract shops to be identical with those of inside shops.

The wages of cutters to be as agreed upon between the firms and their employes.

There shall be no discrimination in the re-employment of the workers.

The United Manufacturers' and Merchants' Association and the United Clothing Contractors' Association, whose protocol plan was refused by the strikers four weeks ago, are not officially included in this proposition, though they expect to act in co-operation with the other employers' associations.

The *Daily Forwards*, the East Side Yiddish Socialist organ, which was strong in its opposition to the protocol, favored the present agreement. The latest reports are that a considerable body of the workers have refused to accept the terms, and rioting has occurred before the offices of the *Forwards*.

The fact that the two great branches of the garment trade go back to work on different bases will afford a remarkable opportunity for comparing the results in efficiency, health, earnings and good feeling in men's wear, where the organized employers will continue in control of work conditions, with women's wear, where strong organizations on both sides are jointly responsible.

#### CONTROL OVER SUBURBAN SHOPS

The most sanguine observers do not, of course, regard protocols as panaceas, but as constructive experiments full of promise. Each is adding some new element. The cloak, suit and skirt protocol of 1910 initiated the preferential shop and the joint sanitary board, in addition to a grievance scheme. The shirt waist protocol, the first to be signed this year, added to these a wage board, while the white goods protocol put in a provision for a minimum wage.

The shirt waist protocol called for a joint label to enlist the support of purchasers all over the country in the New York sanitary reforms; while the protocol of the West Side wrapper and kimono workers attempts to regulate conditions in the suburban and city contract shops to which work is sent out. Its provisions under this head read:

"Within a radius of twenty-five miles of the city of New York standard union conditions shall prevail inside the factories of the members of the association, as well as their outside contractors; and if a member of this association shall send work to a shop within said radius where standard union conditions do not prevail, then upon request of the union such member or members of the association shall refrain from sending work to such shop or shops until standard union conditions shall prevail.

"Outside the said radius the members of the association may send work to any shop or shops, regardless of whether standard union conditions prevail or not, but if at any time a strike is declared in such locality by the union and at least one-half of the employees of such shop or shops respond to said strike, then the member of this association sending work to such shop or shops shall on demand from the said union refrain from sending further work to said shop or shops until standard union conditions prevail. . . .

"No agreement made between the union and the contractor shall be more favorable to the contractor than the terms of this protocol. Every agreement made between the union and the contractor doing business for a member or members of the association shall be upon the same terms as contained in this protocol, except as to the preferential union shop.

"Should any dispute arise between the union and a contractor doing work for a member or members of the association there shall be no stoppage of work being performed for such member or members, but such matters in dispute, if the same cannot be adjusted between the union and the contractor, shall be immediately referred to the Board of Grievances of the association, and their determination shall be rendered within five days from the date of the filing of such dispute with the association, and such determination shall be final.

"All employees of contractors doing work for a member or members of the association shall be returned to work immediately, provided such contractor or contractors shall sign an agreement similar to the terms of this protocol, excepting the preferential union shop."

#### THE STRESS OF THE SEASONS

The white goods or underwear trade concluded a protocol week before last. By a coincidence it was in January, the month of "white sales" in the department stores, that the working people in this trade went out. This trade was the subject of an investigation made by the Women's Trade Union League last winter. It is a trade in which only one worker out of ten has employment the year round. One hundred and twenty-nine factories were visited, employing 8,042 out of the estimated 15,000 or 20,000 workers in the trade. All but some 300 to 400 of these were women, of an average age of nineteen in the shops employing Jewish immigrants, and of

twenty-three in the shops employing Americans. A little over half the workers were Jewish, and 90 per cent of the cheaper grade underwear was made by them; a little over a quarter were Americans, this nationality predominating where the finer work is done. The rest were principally Italians and Slavs.

Judging by the report, conditions are much the same as in the shirt waist trade, and workers pass readily from white goods to waist shop. The report gives the clearest statement in regard to seasons so far given for the garment trades. Figures for shops employing 7,123 workers show only about 1,500 employed during July and August. In September the number is between 5,000 and 6,000, rising from October through December to over 6,400. In January, "between seasons," the number sags to below 6,000, but reaches the upper levels again from February through March, going back to the January figures in May, and in June to between 3,000 and 4,000. Though in the busy winter season there is much overtime work, it is a significant fact that during this season also there is a margin of only partially employed workers, the busiest month showing only about 6,800 of the 7,123 workers on full time.

Less than 60 per cent of the shops reported on unemployment. These showed 20 per cent idle during from two to four of the slack months, the time varying with the different shops. During this season 71 per cent had part time, from two to four days a week, and in some shops also the rate of pay was cut. Only 9 per cent of the workers had full employment during the whole year.

The facts in regard to hours and wages were not given in the league's report, but a canvass of over 270 girls taken in one meeting hall during the strike gave interesting light on the wages and financial responsibilities of this group of young girls. The approximate average wage figures, which were reached by taking the girls' statements in regard to earnings in busy and slack seasons, show that one-third of the total number averaged \$5 or less, one-third between \$5.50 and \$7.00. Only thirteen girls averaged \$10 or over.

As for their responsibilities, if we may trust the record, few if any of these girls worked for pin money. One hundred and ten Jewish girls had emigrated before their families and were paying board to "boarding mistresses." Of the rest about a third paid all their money over to their families; and others have on their records definite entries in regard to responsibilities. More than one supports an old mother and father; others support their family with the help of a sister, and half a dozen of the older women have one or more children to support.

## THE WHITE GOODS WORKERS PROTOCOL

The White Goods Protocol was hung up for several days by a moot clause, covering recognition, which read originally:

"The manufacturers, approving the principle of collective bargaining, believe that those who share in the benefits of the union should share in its obligations, and hereby pledge themselves not to discriminate against a member of a union; and, furthermore, the manufacturers agree not to oppose or discriminate against any employees who desire to join the union."

The latter part was adjudged to give the employers too much discretion, and it has therefore been modified to read:

"We believe that the welfare of the industry requires fair competition and uniformity in conditions of labor, and to this end a strong association of the manufacturers and a strong union are necessary."

This is not the preferential shop, but it is at least the expression by the manufacturers of a belief in organization.

Grievance and arbitration boards are to be established, but no sanitary board, as it is claimed that this is an "uptown" industry and sanitary conditions are for the most part good. One clause pledges the manufacturers, somewhat indefinitely it is true, to maintain safe and sanitary conditions in their own places of employment, and in the "outside" (contractors') shops to which they send their work. In order to still further control the contractors, every manufacturer is to register the name of his contractors with the union. After the expiration of six months the manufacturers agree to give out no more work to be done in tenements.

A minimum week's wage of \$5 is established, and no child under sixteen is to be employed in the making of garments. For permanent wage adjustments a wage board is established, which will make its first report in April, 1913, setting standard piece prices, on a basis of hour's pay ranging from sixteen to twenty-two cents, further adjustments of piece prices to be made by shop piece committees.

Pending the decision of this board all workers receiving under twelve dollars are to be given, in the case of week workers an increase of one dollar, in the case of piece workers a 10 per cent increase, but no increase is to give a weekly wage of more than \$12.

Hours are to be fifty, with price and a half for overtime. Three legal holidays are recognized, and "the refraining from work on the first day of May—the international 'labor day'—is not to be regarded as a violation of this contract."

## AN ILLINOIS COMMITTEE ON SOCIAL LEGISLATION

For some weeks past a federation of social agencies interested in securing legislation has been quietly forming in Chicago. Several meetings have been held by representatives of these agencies and recently a board of directors was elected.<sup>1</sup>

This organization will serve essentially as a clearing house for bills intended to improve social conditions. Its aim is to secure the enactment and enforcement of laws and ordinances bearing on social welfare.

The committee will

1. Gather information as to what is needed, and
2. Find out what is done elsewhere and how this has worked, thus building up a sort of reference bureau on social legislation.
3. Submit proposed measures to experts in their respective fields and to advisory committees of lawyers.
4. Watch proposed legislation and notify those interested as to the proper time for submitting information or urging action.
5. Encourage the enforcement of social legislation.
6. Study the administration and effects of such legislation and make recommendations for further improvements.

James Mullenbach has been appointed executive officer of the Illinois Committee on Social Legislation, resigning his secretaryship of the National Conference of Immigration, Land and Labor Officials, to give his time entirely to this work. Both in Springfield and Chicago he will inquire into the origin, history and purport of proposed legislation and its relation to existing laws or pending bills, reporting to the committee and its constituent organizations which include the following societies:

Anti-Cruelty Society  
Associated Charities of Danville  
Associated Charities of Rock Island  
Associated Jewish Charities  
Bureau of Associated Civics and Charities of Freeport  
Bureau of Personal Service  
Central Association of Charities, Evanston  
Central Howard Association  
Chicago Federation of Churches of Christ  
Chicago Medical Society  
Chicago Playground Association  
Chicago Tuberculosis Institute  
Chicago Woman's Aid  
Chicago Woman's Club  
Citizens' League  
City Club of Chicago  
Committee on Institutional Visitation  
Conference of Jewish Women's Organizations  
Consumers' League  
Elizabeth McCormick Memorial Fund  
Federation of Settlements  
Illinois Association for Labor Legislation  
Illinois Children's Home and Aid Society  
Immigrants' Protective League  
Infant Welfare Society

<sup>1</sup>The Board of Directors consists of: Chairman, James H. Tufts, Illinois Association for Labor Legislation; Vice-Chairman, Mrs. Arthur Aldis, Visiting Nurse Association; Secretary, E. T. Iles, United Charities of Chicago; Treasurer, Charles L. Hutchinson, Corn Exchange Bank, Chicago; Executive Officer, James Mullenbach; Jane Addams, Gertrude Howe Britton, Rudolph Matz, Sherman C. Kingsley, Minnie F. Low, James Minick and W. R. Stirling.

Jewish Consumptives Relief Society  
 Juvenile Protective Association  
 Lake County Tuberculosis Institute  
 Legal Aid Society  
 Peoria Association for Prevention of Tuberculosis  
 School of Civics and Philanthropy  
 United Charities of Chicago  
 Visiting Nurses' Association  
 Woman's City Club

The committee will be active not only through legislative sessions, but will work the year round, watching state officials, the Chicago city council and the Cook County Board of Commissioners, and aiding or checking legislation in those bodies, according as need arises from time to time.

#### NEW JERSEY CONFERENCE OF CHARITIES AND CORRECTION

Scientific study and research work were tied up with the practical work going on in charity and correction throughout New Jersey at the recent meeting of the State Conference of Charities and Correction.

A significant feature of the meeting was the participation of Princeton University. A few years ago Princeton took little part in social work in the state. The conference held in Princeton proved to be the turning point. At the Plainfield conference four Princeton professors took part and Princeton students attended to seek information along social service lines.

The Prison Labor Commission, appointed by Governor Wilson to inaugurate the "state use" system in New Jersey, took advantage of the conference to urge the gravity of the situation regarding prison labor by pointing out that only six months remained for providing means of setting prisoners to work when the contracts have expired. The commission wishes through the supplemental appropriation bill to get funds which will be immediately available for the purchase of unimproved land in southern New Jersey and a quarry in northern New Jersey where the men can be employed.

The proposed state wide program for the care of defectives was presented by Professor Johnstone of the state committee. His recommendations were that all mental defectives under school age should be cared for in their homes subject to visitation by social worker, health authority and visiting nurse. Children of school age, not sexually or otherwise dangerous, he suggested should be sent to special classes in connection with the public schools. Such classes are now in operation in Newark and Jersey City. He urged that state schools should be provided for defective children from rural districts where public school classes can not be organized. Admission to the New Jersey State Home for Feeble-minded Girls and Women, was recommended for dangerously defective girls above school age, while men who are capable of productive activity are to be placed in the custodial

Institution for the Unimprobable Feeble-minded which is now building at Skillman. For all those who may be trained to industries a farm colony it is expected will be undertaken on five hundred acres of uncleared land which has already been given by a public-spirited citizen.

The general topic of the conference was New Jersey's System of Humanics. Special sections were devoted to The Church and Social Service; Jails, Alms Houses and Inebriety; Mental Hygiene and Prostitution; Prisons and Reformatories; Feeble-mindedness, Eugenics and the Blind; and Prevention.

In the section on Jails, Alms Houses and Inebriety the chairman raised the question—why should there not be decent and adequate care for the respectable aged by the state and demanded the destruction of the traditional alms house. C. L. Stonaker, secretary of the New Jersey State Charities Aid and Prison Reform Association, declared that the county jail should be at least restricted to the detention of prisoners awaiting trial. He asked, "Is it not possible in this day and generation to devise some other penalty than a cash fine or imprisonment in the old antiquated jail?" He urged an extension of the parole idea.

The program of the conference was carried out exactly as planned. Every speaker was present and at the final session there was a crowded auditorium. The conference had the largest attendance of any that has yet been held.

#### LEGAL AID IN THE SOUTH

The first free legal aid bureau south of the Mason and Dixon Line has been established in Birmingham, Ala. It is an outgrowth of the Lawyers' League, which was organized in June, 1912, to promote the general public welfare and to better the making and administration of laws. This is but one step in the program of the league, which, under the presidency of George Huddleston, has named a committee to fight the fee system, a committee on reform of civil and criminal procedure, and a committee on complaints and grievances.

The legal aid bureau was suggested by Isadore Shapiro. The Lawyers' League appointed a committee which secured the following to undertake the work of the bureau: Isadore Shapiro, director; Clement R. Wood, vice-director; Hugo Black, secretary and treasurer; Dupont Thompson and Ben Davis, counsel for the State Federation of Labor. Many of the cases which have thus far come to the attention of the bureau involve victims of loan sharks. Mr. Shapiro has therefore been led to suggest the creation of a municipal loan office. Many other cases handled by the bureau are those of deserted wives.

## BIG BUSINESS AND WORKMEN'S COMPENSATION

PAUL KENNADAY

American Association for Labor Legislation

Big business and the American people are coming to close quarters in a new field. The fight is on in many states and soon will come in many more. The casualty insurance companies are trying with all the ingenuity of long experience to turn to their own profit the immense new business in sight with the passage of the workmen's compensation or insurance laws in state after state. We have been slow, heartlessly slow, as a people to write into our statutes the protection against the results of industrial injuries with which Europe has been familiar these many years. But now, as though making up for lost time and past neglect, we are all at it with a vengeance, turning heaven and earth to get the principle of workmen's compensation enacted into law, impatient of delay, regardless of mere constitutions, "godsakers" many of us, as Wells puts it, shouting for God's sake let us do *something*.

This something is "elective" compensation insurance. Seized upon with alacrity by reformers, fought at first at every step by the casualty insurance companies and employers, "elective" acts are now cherished like a prodigal son returned seeking forgiveness for rebellion, no more carrying disgrace and ruin in his wake.

"Elective" acts are drawn with the acknowledged purpose of subverting state constitutions. The New York Court of Appeals in the Ives case said that to compel an employer to give compensation without fault was taking property without due process of law. The thing to do, then, plainly, is to get around the constitution. The method is ingenious but effective. Write into a compensation or insurance act that employer or employee may "elect" whether they will come under it or no. If they refuse to elect, take away from employers their old stand-bys, those barbarous anachronisms of our present laws, the defenses of contributory negligence, fellow servant and assumption of risk which have done such noble service in leaving penniless injured workmen or their widows. Of course, employees by the law of the land enter into only free contracts, and so they too may elect to stay out even though their employer "elects" to come in. And in that case the employer has these three defenses which can still be used against the employee in case he ever sues for damages for injuries—and in case he retains his position one minute after he has exercised his "election."

From the casualty company's standpoint the peculiar advantage of this "club" feature, as it has been aptly termed, in these elective laws, is that if the law puts the scale of compensa-

tion high enough to be at all adequate for the makers, the cost of coming under the act will be so great, owing to the rates charged by the casualty companies, that most employers will stay out. But, staying out, they will still take liability insurance with these companies at lower rates, perhaps, yet at rates much in excess of present liability costs. For no employer can run the risk without insurance of damage suits with his old judge-made defenses taken from him. If, on the other hand, the law puts the scale of compensation so low that employers will elect to come under it, these casualty companies will reap a rich harvest in new business.

So we see the casualty companies aiding and abetting in the passage of "elective" laws. With equal determination they stop where they can, laws which give the employer no election, but compel him to insure. For there are states like Ohio and New York, where an amendment made or pending to the state constitution, gives the legislature power to pass such acts. And *compelled* to give compensation, the employer, if the legislature chooses, may be forced to give adequate compensation to his injured workers. And this again may, and probably will, lead the average employer to take state, mutual or self insurance in preference to the higher rates which private companies must charge to continue their profits and enormous salaries.

While this has been going on from Massachusetts to California, Big Business has been looking on, taking advantage of every false step, putting legislators and commissioners into false positions, proposing very quietly but very effectively, none the less, to let the American people once more deliver themselves over to private interests ever anxious to perform public duties.

Prospective annual profits in enormous amounts are at stake for the casualty insurance companies in this fight. Whatever the exact sum, it is certainly too large to let slip. And whatever we may think of state insurance, of its propriety or of its advisability at once, whether it is good or bad, the casualty companies can have but one opinion on the subject, that it is about as serious an injury to them as the loss of a man's head is to him.

And so the casualty insurance companies are to be found advising, wherever workmen's compensation is under discussion. At meetings of bar associations their attorneys have resolutions passed deprecating state insurance; at meetings of state commissioners they are free with their praise of that "New Jersey model" which has proved such a bonanza to the insuring interests; at legislative hearings they openly denounce as "Socialistic" and therefore to be cast out without more ado, state insurance, and like the trail of the serpent or the ways of a maid with a man their ways are often past finding out.

But the drift is setting against Big Business, here as elsewhere. The state of Washington led the way with a compulsory state insurance act, by driving out the casualty companies and leaving to them in the place of big profits but the small comfort of predicting the early collapse of a signal success in "state Socialism." The Ohio Senate and Assembly last week amended their former elective state insurance act, by giving employers two other options, self insurance and mutual insurance, but compelling them to insure in one of the three ways. This closes the rich Ohio field to liability insurance companies. In Oregon the House of Representatives has just passed a state insurance act and according to press despatches "casualty companies are resorting to every conceivable method to defeat the bill in the Senate, but it is confidently expected that the Senate will concur in the action of the house."

Compulsory acts are in force in Arizona and, as far as state employes are concerned, in Wisconsin, while Massachusetts is building up against the strenuous rivalry of private companies a strong state mutual insurance company.

In New York the fight is on in deadliest earnest, for not only is there open espousal of state insurance by the vigorous and determined state federation of labor but the situation is still more perilous for the casualty companies because looming up large is the specter of compulsory insurance—"state or otherwise." Last year the legislature passed a constitutional amendment to overcome the constitutional objections to a compulsory law, as explained in last week's SURVEY by Edward T. Devine. This year a Democratic Party which swept into power a governor and an overwhelming majority in Senate and Assembly pledged itself "to pass again this proposed amendment in the next session of the legislature," and the people are beyond any doubt in favor of such relief as this amendment will bring from "ambulance chasers," claims agents and judge-made defences raised against them in damage suits at law. No doubt Big Business would be glad to see the Democratic Party go back on solemn pledges to the people or to see the people led astray at the polls next November. But either of these contingencies in the present humor of legislators and their constituents is hardly within the range of practical politics.

Yet agreeable as it would be to some to have the impossible thus happen, no small measure of consolation is to be had by them in a bill last week recommended by the Senate committee on insurance. That committee is no more to be blamed than is the able commissioner of insurance, whose integrity and genuine desire to do justice to the overburdened workers of the state none can doubt. They have simply made ser-

ious mistakes in trying to solve, without taking sufficient thought, one of the most complex subjects with which a legislator is called to deal. Nevertheless, this composite bill has defects writ large upon every page. Not only does it provide for an Industrial Compensation Board drawing aggregate salaries of \$36,000 to do little more than oversee and approve agreements as to amounts to be paid in settlement of claims, but it leaves in the State Insurance Department (where the State Federation of Labor and many more do not want it), the fixing of rates and the whole administration of the state fund to which employers may contribute if they do not elect the other options offered of self insurance, mutual insurance or casualty company insurance.

That a bill put together as this one has been should have many serious defects in draughtsmanship was to be expected, but that it should be deliberately put forward with glowing encomiums as containing "the best features of compensation laws of other states" and of the five bills introduced in New York is a serious reflection upon the wisdom and deliberative methods of law makers. Constitutions are perhaps nothing among friends, but three constitutional objections to one bill is good measure—too much running over. Thus we see here an infant by implied waiver giving up a constitutional guarantee, we see that the employe unless he does an overt act, is held to have waived his constitutional right to trial by jury and finally we find a discrimination between those to whom the act does and does not apply, neither warranted by fact or defensible at law.

And while the legislature has done this, to escape one other constitutional defect in their former bill they have, in effect, turned the whole rich New York field over to the casualty companies. For now it is provided that the employer must "elect" his methods of insuring by an affirmative act, by filing his papers with the insurance department. And that plainly means that the average employer will do nothing at all until an agent of a casualty company comes to him and offers to attend to everything—in the meantime telling him what dismal failures have been, wherever tried, all state, mutual and self insurance "Socialistic" schemes.

Curiously enough, while men are deliberately and openly planning the utter rout of the casualty companies, no spokesman for those companies appears upon the field in New York. But why need they? A meaner bill to the workers of the state, the legislature could hardly consider if labor had no vote. A bill more profitable to Big Business could hardly have been devised had the big corporations and the casualty companies been requested themselves to write a law under which the people of the state would be compelled to continue tribute.

## EDITORIAL GRIST

### THE WAR ON VICE

GRAHAM TAYLOR

That the war on vice is a fight to the finish becomes constantly clearer. The campaigns waged against it are growing at once more extensive in area and more intensive locally. The variety and effectiveness of the attacks upon the strongholds of vice attest the versatility and the ability of the aggressors.

Latest and greatest of the war news from the front is that siege is being laid on the very citadel of vice by the Bureau of Social Hygiene in New York city. It proposes nothing less than the permanent and progressive investigation and disclosure of the sources from which vice springs and the social, moral, economic and political agencies which protect, perpetuate and promote it. To sap and mine ignorance, which is the last redoubt in which vice takes refuge, is the final stroke of strategy in this war without discharge.

Facing such an organization force and the Supreme Court's decision upholding the white slave law, the whole under world may well sound the alarm at the beginning of this turning of the light upon its darkness, of bringing knowledge to replace the ignorance on which it preys, and of enlisting the forces of public intelligence, medical science, civic patriotism and religion to act through education, legislation and police administration. If any force can overcome the persistence of the social evil and eradicate commercialized vice it is "the spirit which dominates the work of the bureau—not sensational, or sentimental, or hysterical, not a spirit of criticism of public officials, but essentially a spirit of constructive suggestion and of deep scientific, as well as humane, interest, in a great world problem."

In sorry contrast with this high-hearted, long-purposed, yet modest prospectus of a real scientific movement against vice, are the boastful, opinionated and unsupported conclusions which Samuel H. London, a Texas attorney, is reported to have alleged before the aldermanic committee of New York city. If his "seven years' investigation from Alaska to the Canal Zone," got no nearer the facts than he did in Chicago, his allegations in support of segregation are not to be taken seriously. For, every one in Chicago knows his assertion to be false that "in Chicago the police are not under civil service regulation." Upon this statement, absolutely contrary to fact, he bases his charge of "the unbelievable conditions of police graft." This he absurdly accounts for by asserting that "the police do not know how

long they will last in the department," and "in consequence they collect graft daily from every person whose calling makes him liable to police extortion."

The fact is that the Chicago Civil Service Commission, to whose trial board every police officer is amenable, has within the past two years dismissed from the force thirty-six superior officers for failing to suppress practices of disorderly resorts which were in violation of the orders attempting to regulate the segregated district. It is because of the segregation of vice, and not because of the lack of civil service, that the Chicago police have been demoralized, though never to the extent to which the New York city police apparently have, according to the facts officially brought out from the time of the Lexow Committee to the time the sentence of death was pronounced upon former Police-Lieutenant Becker.

Both in New York and Chicago the organized effort to secure the enactment and enforcement of law goes on apace. One evidence of this is the vigorous report of the reorganized Committee of Fourteen showing real progress in its efforts to prosecute offenders against existing law, to amend defective laws, to secure the co-operation of brewers, owners and surety companies in closing evil resorts, and in formulating a definite legislative program especially emphasizing penalties for the misuse of property.

In Chicago the morals committee which is federating the vice-fighting agencies and the reconstituted Committee of Fifty with assistance from the neighboring headquarters of the American Vigilance Association will prove more than a match for the vacillating city administration and the inactive states attorney. Neither the police nor their political superiors dare to reopen the red light districts, though avowedly desirous of so doing. Meanwhile the law-abiding, law-enforcing agencies and people have an immense advantage in preventing the reopening of these resorts and districts, in contravention of the law, the supremacy of which has so happily been re-established.

The most notable report of a vice commission recently issued is that of Portland, Ore. It includes a series of reports issued since the commission's appointment in 1911. One of the series deals with the places of public resort and accommodation affected by the social evil. It concludes with the famous "tin-plate ordinance," which requires that "on the front of every building used, either in whole or in part, as a hotel, apartment house, rooming, lodging, boarding, tenement house, or saloon, there shall be, at the principal street entrance, a conspicuous plate or sign bearing the name and address of the owner or owners of such buildings." This, of course, greatly facilitates the apprehension and

conviction of those responsible for violating the law against disorderly resorts.

This ordinance is reported to have had the effect of driving immoral people from the buildings they have occupied for years, because the owners were afraid to risk the publicity and responsibility of their presence and practices. Many of these buildings are now being remodeled and occupied by a better class of tenants.

Another report of the series deals with the legal and police aspect of the social evil which led to the enactment of the law for enjoining and abating houses of ill fame as nuisances. A bill was also recommended creating a morals court. Finding the division of responsibility a cause of inefficiency and corruption in the police department, the commission recommends the vesting of full authority over the department in one man, as the most effective way of handling the social evil problem. Study of the juvenile aspects of the social evil led to specific sources of vice and the beginnings of moral delinquency, and resulted in the recommendation that a child welfare commission be appointed, which should be "charged with the study of the general subject of juvenile life."

While realizing the desirability of requiring vice diseases to be reported and registered, the commission doubted whether public opinion would support the enforcement of such a law. It considered a vigorous campaign of education the most necessary step for the control of these diseases. It recommended, however, that all cases encountered in dispensaries, hospitals, juvenile and municipal courts, penal institutions, maternity hospitals, rescue homes, and all places of detention, should be officially reported. The commission also urged that the city contribute to the support of free dispensaries for the treatment of these diseases and that the Department of Health make tests for the diagnosis of these diseases without charge.

Wage scales were examined to determine the economic sources of the social evil and much interesting information was gathered. Human interest stories were revealed showing the need of a minimum wage for women workers, improved sanitation in shops and stores, shorter hours of labor, and industrial education.

The final report of the Portland Commission on segregation is in line with the conclusion reached by every other vice commission. To use the words of the commissioners "The history of every restricted district in the country has been the history of police and political corruption, of crime and bloodshed and scandal. Far from eliminating graft, such districts have proved the nursery of official blackmail, the central point from which the scheme of protection has reached out."

The commission records its emphatic opposi-

tion to segregation in Portland for the following reasons:

"Segregation does not segregate; deals only with a small percentage of the sexually immoral; promotes and justifies professional prostitution; does not reduce clandestine immorality; helps to establish a double standard of morality by stigmatizing the woman and ignoring the moral responsibility of the man; rests on the false presumption that sexual immorality is necessary; fosters the debauchery of the sex instinct; promotes the spread of disease; and affords official absolution for illegal and immoral conduct."

Perhaps the most significant assertion in the whole impressive report is this sentence: "When any considerable number of men question the necessity of an evil it marks the beginning of the end. It is here that this commission rests and finds justification of its labors."

State commissions for state-wide investigation of vice conditions and of the legal means of suppressing them have been initiated in Maryland and Illinois. In compliance with a recommendation of a recent grand jury sitting in Baltimore, Governor Goldsborough of Maryland, has appointed a vice commission of fifteen members, some of whom are women. There are also three to five associate members from the counties. The commissioners so far appointed include some medical specialists, two lawyers, two bankers, a merchant, a representative of the Bureau of Statistics, of the St. Vincent de Paul Society, of Jewish Charities, and J. W. Magruder of the Federated Charities. While there is no appropriation from public funds to meet the expenses of the commission, it is said the governor may aid its work by advances from his contingent fund.

The Senate of Illinois appointed a committee, consisting of the lieutenant-governor and four senators, to investigate vice conditions in every important city in the state. The resolution of the Senate creating the committee gives it broad powers to subpoena witnesses and compel testimony and the production of records and documents. It has power to punish those who refuse to testify with imprisonment for contempt. It is said that the committee contemplates new laws which will give to state prosecutors as complete power within the state as the Mann Act gives the federal authorities in dealing with the transportation of women for immoral purposes across state lines. If this is effectively done, it will apply within state lines, the strength of the strongest statute dealing with commercialized vice, which the Mann Act has proved to be. This is just where the law has proved weakest, or its administration most ineffective, in protecting the people of each state.

Another state-wide investigation is proposed in the first bill reported favorably to the Massa-

chusetts legislature by the Committee on the Social Welfare. Introduced by Representative Thomas J. Giblin, it provides for a commission of five to be appointed by the governor. This body is to investigate the white slave traffic and to report plans for preventing such existing evils as it finds. Authority is given to hold public hearings, administer oaths, require the attendance of witnesses and the producing of books and documents. No compensation is provided for the commission but necessary expenses are allowed. The commission is instructed to submit its report by January 10, 1914, together with such bills as it may believe are needed.

The Committee on Social Welfare of the legislature believed that the problem was limited to the large city but that the city, village, and country should come within the scope of the investigation. The friends of the measure are expecting its enactment and feel that if the attitude of the committee may be taken as any index of the work of the proposed commission, the investigation will be most thorough.

## BANNERS OF A NEW ARMY

ROBERT A. WOODS

South End House, Boston

For the sake of outlining the background for a substantial movement toward better things in the social morality of Boston, the following propositions were recently laid before two meetings which were held on the same day. One audience in the afternoon was composed of representative and responsible women; the other in the evening was a gathering of the men of the Boston City Club. These propositions are not set forth as having finality; I reserve the right to dissent from some of them under later information. They were submitted chiefly to indicate the various angles from which shafts of light are cutting into humanity's so long impenetrable abode of darkness.

There is a recently formed conviction which has swung reputable medical men aggressively against any form of prostitution. The possession of one particular truth is of unspeakable importance to each human being who has reached the age of responsible action. Every man with a sense of honor in the light of modern scientific knowledge is challenged by the fact that there is no assurance whatever of the cure of venereal disease; that years after it may seem to have disappeared it may pass to the pure wife and the innocent children. Every man who enters a house of prostitution is coquetting with a ghastly possibility which can wreck what is best in life. No form of segregated prostitution affords substantial protection against such disease. The false security which medical inspec-

tion suggests may even encourage the spread of the contagion.

Looked at as a business, the segregation of prostitution would give it the two cardinal resources of modern business, publicity and the power of combination. The persistent disintegration of its nests deprives it of both.

From a community point of view the proposal of segregation faces a stone wall when the proponent is asked, "In which place do you want the segregated district, where your wife and children would have to go through it, or where mine would have that fate?"

The reports of the Vice Commissions in Chicago, Minneapolis and other cities which are sustained by the highest medical authority, have finally disposed of the segregation project. It died in fact with the strongly supported medical conclusion as against the fixed ideas of many in the past—that no man is ever anything but the better for perfect continence.

The conclusion that prostitution is not necessary and that tolerance of it does not diminish its evil consequences, opened the way to a stock-taking of its effects. The words of scientists indicate that, as it is eliminated, half the misery of the world will go with it.

Sex education is sure to come throughout the community. Right methods can only be learned by experiment. Different methods must be tried. These will involve mistake and injury, but nothing compared with the overwhelming cumulative evils resulting from the present conspiracy of silence. As a suggestion of possible results, it is estimated that since such facts as are here stated have been put into the hands of the freshman classes in certain colleges a diminution of 25 per cent. in sexual immorality has taken place among these young men.

Some of our foremost medical experts hold that intense sexual passion is not strictly normal before the age of twenty-five, when complete development is reached and the human organism is fully prepared to reproduce its kind. It is believed that the recasting of tradition, the renewing of the moral atmosphere, and the reorganization of education from infancy up on the basis of revolutionary psychological discoveries, will reduce the intensity of that passion during the perilous years from fourteen to twenty-five. It is, of course, the habits of body and mind acquired during that crucial period which constituted almost the entire source of sexual immorality.

Much is to be hoped for from the attack upon the more immediate causes of prostitution. Poverty is not in itself a compelling cause in any considerable number of instances; but poverty keeps great numbers of young women near the brink where they may be carried over by the perfectly

natural desire for amusement and for a sharp reaction from monotonous work. The abolition of child labor and the establishment of a minimum wage for women will directly and indirectly prevent a great number of moral tragedies. Alcohol with both sexes is often a strongly conducive influence. Large-minded men who are close to the facts testify that the whole system of prostitution is so degrading and so repulsive that a great part of those who become part of it, both men and women, must first drug themselves or be drugged unawares in order to disarm their higher sensibilities.

Perhaps the most important recent testimony concerning the sources from which prostitution is recruited is that a substantial majority of prostitutes would properly be classed among the congenitally feeble-minded. This tends still more strongly to prove that the normal human being is relatively incapable of being drawn into this life. This fact also affords the promise of greatly reducing the ranks of prostitution. It is now possible before the adolescent period by scientific tests to identify beyond reasonable doubt all feeble-minded types; the progressive states of the country are moving rapidly in the direction of eliminating all such cases in their early years and placing them under permanent institutional care. It is estimated that in Massachusetts there are at present as many feeble-minded persons at large in the community as there are under institutional care. Every one of them is a source of moral danger.

The increase in the kinds and amount of self-supporting employment for women has lessened the number of candidates for the prostitution ranks. This tendency has without doubt increased the cost of securing and retaining recruits. The business organization thus made necessary in the shape of the so-called vice trust has in turn brought the whole matter to public attention in a new and distinctly disturbing way. This will still further make the enlisting of new victims difficult and expensive.

Fuller provision of efficiently managed rescue homes co-ordinated with the large program and leading out into opportunities of normal life will mean far greater difficulty and expense in retaining recruits after they are once secured; and the increased likelihood of cases of coercion being followed up will present a further substantial deterrent against the methods of the vice trust.

It must be remembered that it is part of the satanic program of the procurer that the victim will soon be caught in the toils of elemental impulse. The finer instincts of recoil become submerged in an undertow of actual, though subnormal, acceptance. Under such circumstances the mere offer of an alternative, as the facts

show, is almost meaningless. There must be on the side of rescue a competing coercive power, with a system which shall exhaust the resources of recuperation and of re-education.

Enlightened social science, besides developing every ingenious form for the prevention of degeneracy, is much concerned today to isolate from the community those victims of degeneracy who are an obvious danger to the community. The time must come when the black plague shall be a subject of registration by physicians just as the other plagues are today,—so that the continuous and pervading epidemic of venereal disease may be in a measure checked. A more immediate step would be to isolate in permanent detention colonies all confirmed cases of prostitution. Until recently, while this principle has been recognized, it has been felt that the difficulty of discovering and identifying such types would be very great; but it is now suggested that by the simple device of registering the finger prints of both women and men arrested for offences against chastity, and applying to them the principle of the cumulative sentence, such elimination is feasible.

A word about the Boston situation, which is perhaps suggestive of the problem of the city in which the first step has been taken toward the suppression of commercialized vice. The police commissioner has done commendable work in reducing to a minimum the number of organized houses of prostitution, and in suppressing solicitation on the streets. A large immoral business, however, still continues. Negotiations are conducted chiefly in three ways, all of which could be reached and practically eliminated by a determined purpose. There is the use of the telephone by houses of assignation. The telephone company could stop this if it were a matter of dividends to do so. There is the use of cabmen. This evil could be reached with comparative ease.

Both of these instrumentalities are, however, comparatively unimportant. The chief headquarters for the promotion of the prostitution traffic today are in some thirty or thirty-five licensed hotels, where all the preliminary negotiations are openly conducted. These hotels, which the most guileless person knows are not hotels in any real sense of the term, are given full authority by the Boston Licensing Board to continue a business which the members of that board and every knowing citizen understands to be nothing more nor less than that of an open prostitution market. Thus the city of Boston, through a board appointed and clothed with absolute power by the commonwealth of Massachusetts, is conducting a system for the public licensing of exchanges in which the contract and agreement stage of the prostitution business is, in the face of all observers, carried out nightly.

## PITTSBURGH CLERGY AND THE SOCIAL EVIL

RABBI RUDOLPH I. COFFEE

Member Morals Efficiency Commission

Dr. Howard H. Kelly of Baltimore is reported in the newspapers as saying that the solution of the social evil rests with the church. This is absolutely true. With the churches welded together regardless of theological differences to wipe out this traffic, with a united clergy refusing to marry persons who cannot bring a certificate of good health, with the church scorning relationship with any and every moral leper, and with the pulpit preaching the truths about prostitution and venereal disease as found in the Bible, such a wave of indignation would arise over this land as would sweep the men in this loathsome business from the society of decent people.

Pittsburgh clergymen have made a splendid start in this direction. On January 13, by unanimous vote, the Ministerial Union pledged support to the bill which the Morals Efficiency Commission is urging for adoption by the legislature requiring the possession of a doctor's certificate before a marriage license will be granted. These ministers put aside doctrinal differences and stood together as being unwilling to join couples in bonds of unholy wedlock. The husbands who contract tuberculosis from wives, the wives who are infected with venereal disease from husbands, the army of babies born yearly either blind or degenerate, are a disgrace to our day. The pulpit of Pittsburgh heartily supports our commission in demanding that these practices be stopped.

Last month, the clergy of this city rendered another and equally valuable service to our commission. In a previous article,<sup>1</sup> I told of the efforts of the under world to fight our body. They later prevailed upon a prostitute, Rose Drew, to sue two members of the commission for \$50,000 for injury to her reputation (?). The details of the story were furnished the press by her attorney, and certain papers gave them full publicity with glaring headlines. Not a word was stated concerning the true facts, or what the commission had done to save the woman. Then, the splendid social service committee of the Ministerial Union sent special letters with a correct statement of facts to over 450 clergymen in the city, requesting that the contents be read the following Sunday in church. This action completely nullified the newspaper publicity, and won warm friends for the commission, as many who had previously taken no interest in our work were made acquainted with our achievements.

In large measure, the success which has attended the work of the Morals Commission may be directly ascribed to the intelligent support of

the Pittsburgh churches. When newspapers have falsified the issue, as above, the pulpit has told the truth; when the press refuses to give space to the great educational work needed in this campaign, the church organizations have arranged for speakers from the commission, and no regard was given to religious affiliation. In fact, the social evil problem has done more to batter down theological fences than any other issue in this city. The church is awakening to the needs of the hour, and it can render a great service in this cause, if only it grasps the opportunity. The church must educate the people to the truth about this terrible black plague.

The public schools, to their shame be it said, are closed to us. In Pittsburgh, and no doubt elsewhere, the schools are still giving the child a general, perhaps a vocational, training. But what avails all this if we do not teach the child how to live? We give our boys and girls a text book on physiology with absolutely no word about the sexual organs, just as though they were non-existent. We practically graduate our children from school in total ignorance of the fundamental laws about hygiene, save what they learn from chance companions on the street. Since our educators will not have the children taught by competent persons that which is most essential for their well being, many ministers in Pittsburgh are providing instruction in sex hygiene in the Sunday School curriculum. I am not the only minister who insists that before a child is given a confirmation diploma from the congregation, the pupil must have received such information as a growing child should know concerning the care of the body.

A fine evidence of the growth of public opinion is found in the formation of a club of boys, one of whose pledges is to remain continent till marriage. The old dictum of Galen that continence is dangerous has been relegated to the realm of antiquity. They promise to associate only with girls who insist on the single standard. When our growing children have such thoughts, the disorderly house loses its charms. For here is the crux of the whole matter. What avails all our labor when a prostitute shows a roll of \$385 which represents her Christmas gifts from "friends." Many a working girl receives less for a whole year's labor. Education will certainly help keep our growing boys away from these houses of ill repute.

When a community is educated to certain needs, legislation is the next step. Many reformers to their sorrow reverse this process. Some people imagine that the social evil ceases the moment all houses are ordered closed. We know better now. Our commission avoided this error, and by gradual restriction of this evil, has been aiming at ultimate elimination. As a re-

<sup>1</sup>See THE SURVEY, November 9, 1912, p. 173.

sult, the city has fewer houses today than at any time in the last half century. We have stripped the houses of every allurements, that they might cease to be a paying proposition. Constructively, the commission has taken strong ground that the unfit should be prevented from propagating their kind.

We are agitating for the creation of night courts. We have received from the occupants of these houses a brief history answering questions as to their fall. The tabulation shows that a very large number enter this life through being seduced and then are afraid or unwilling to return home. We are constantly hearing that economic causes are at the back of this evil. They are, with the men. If people only realized the unholy zeal to make money from such channels, they would scarce believe it. Girls, once led astray, drift into houses of this kind because society refuses them fellowship. Usually these are the weaker girls, no doubt of poor heredity, and the need to deny parenthood to this class is most urgent.

Experience teaches that a special department can best handle the social evil problem. It must be apart from police control and separate from politics. A bill is now before the legislature to create a morals bureau of seven members, three of them women, to serve without pay. This bureau will have full power to handle the social evil and will elect a superintendent at \$4,000 yearly with police authority in his special field.

In connection with this bill we are urging a change in the system of police courts which will allow the introduction of the night court, much needed in Pittsburgh.

With legislation joined with education, the social evil will be overcome. The efficient church will and must help. Then, when the forces making for righteousness stand together against this shame, we shall see the gangsters of the city ruled by, instead of bossing, the better element.

## POST-GRADUATES OF THE HIRED MAN

R. R. REEDER

Superintendent New York Orphanage,  
Hastings-on-Hudson

In the *School Bulletin*,<sup>1</sup> Prof. C. R. Bardeen, dean of the medical school of the University of Wisconsin, writing on the subject of sex instruction, says:

"Curiosity, passion and idleness are the only features outside of medicine that call attention to sex glands. . . . Public talks to children will be pretty certain to arouse curiosity. They certainly will not subdue passion. In so far as curiosity concerning sex matters is spontaneous and natural it may best be turned in legitimate directions by quiet private talks with pure-minded friends. . . . So far as

<sup>1</sup>July, 1912.

passion is concerned it can be controlled only by the habit of self-control and the right kind of personal ambition, and these can best be cultivated in the young without reference to the physiology of sex."

This is just such a statement as you would expect to see from the pen of one whose point of view toward sex instruction is purely academic. On the day I read it one of the older boys of the orphanage who had just returned from a ten years' experience in both rural and urban life in Illinois, Kansas and California, called to see me. It was a pleasure to look into the ruddy face and clear blue eyes of a broad-shouldered, deep-chested, hundred-and-eighty-pound, husky, young man of twenty-four who had never been sick a day since leaving the home and who bore every evidence of living a clean, pure life. But as I inquired after this one and that one who had left the orphanage at about the same time he was discharged, the pictures he drew of their lives were not all bright.

"Only a few weeks ago," he said, "in Kansas City I ran across Will F—. He was down and out. Health broken, no money and no work most of the time. Women ruined him—he had been a victim of gonorrhoea for six years. I gave him a little lift for a couple of weeks, but he's too far gone. I persuaded him to write to his sister while he was with me. He had not heard from her for several years. Of course, he didn't tell her about his loose living. She answered at once and you should have seen him shed tears when he read the letter especially where she asked what church he attended. The poor devil hadn't seen the inside of a meetin' house in five years.

"But a funny thing happened while he was with me. I was walking with him one day and all of a sudden he said, 'Yonder is a fellow that looks like my brother; he's in the West somewhere, you know, and I believe that's him.' The young man he referred to looked like a sick hobo. He was a little lame, his clothes hung slouchily upon him. We went up to him and when Will asked if his name wasn't F—, he said, 'What business is it of your's what my name is?' But when Will gave him his own name and told him he looked like his brother Robert, Rob then recognized him and was glad to see him.

"But holy mackerel, it would have made you sick to look at him! He had been discharged a few days before from the hospital where he had been operated upon for venereal disease. One leg was shorter than the other, and poor Rob didn't look as if he'd ever be well again."

I remembered those boys well. They were both bright grammar school pupils, sound and well developed physically, with as promising a future as opens to most American boys. Both went on farms at fourteen years of age. At that age they were ignorant of sex knowledge except

such crude information as they may have picked up from other boys. Whatever they learned afterward in that field they gathered, as hitherto practically all farmer boys have, from vile sources, the lewd talk of the typical hired man. I know all about him. He was my teacher and he was on every farm of considerable size in Illinois in my boyhood days. But he's no worse than the young men of the village, or the city laborer with whom boys are in daily touch, except that his isolated life provides less of other attractions to take up his mind.

It is to such as these, the sewer gateway to sex instruction, that millions of the youth of our country are obliged to go to satisfy that "curiosity concerning sex matters" of which Dean Bardeen speaks. But these teachers don't wait upon the demands of curiosity from their boy pupils, they are ever on the initiative with sex instruction, anxious to impart all they know and more than they know upon this vital theme so close to youth as to involve the very life here and destiny hereafter. Their lewd talk is the expression of their own uncontrolled sex emotions, while at the same time it awakens like feelings in their innocent but eager pupils.

"In so far as curiosity concerning sex matters is spontaneous and natural it may best be turned in legitimate directions by quiet private talks with pure-minded friends."

What a strange view to take of such an important human interest! Can you mention an asset or concern of humanity that is fraught with greater possibilities for good on the one hand or evil on the other than sex physiology and the functioning of the sex organs? Is it reasonable or safe to leave instruction upon a subject so fundamental to social well-being and personal happiness to the accidental suggestions or demands of curiosity? Thousands of the youth of our country are taking the first steps toward moral ruin every day, like the two boys above mentioned, in almost absolute ignorance of consequences. Girls are as unprotected by the safeguards of proper instruction as boys. But they are more fortunate in their environment.

The greatest mistake we are all making is the assumption that if we, the teachers and parents, are not imparting sex instruction no instruction is being received, whereas the real condition is that the air is full of it. No boy can escape it. The home, the school and the Sunday school have not a monopoly of learning. They cover most fields of knowledge, but here is one which they have not dared to enter. It is closer to the child and more vital to every interest of society than three-fourths of the things we try to teach in these institutions. The child does not wait for this instruction as he does for other learning. It is thrust upon him and he welcomes it. He finds it in the street, in back alleys, be-

hind doors, in secret places, and in the dark. His teachers are the hired man, the teamster, the servant girl, the store clerk, the laborer, the loafer, the bar room habitué and the moving picture show. They have pre-empted and hitherto held this field of learning for the young. As evidence of this, just inspect the walls and partitions of the toilets of almost any public school in the country or associate for a few days with groups of boys or men anywhere. Our boys cannot escape the obscene signs and drawings or the vile songs and stories which are all about them.

The walls of the toilet room of the high school in which two of my boys graduated were decorated with vulgar markings. They were sandpapered and retouched from time to time by the janitor, only to be defiled again by the procession of new students.

No safeguards are thrown about the child as he receives this instruction from such sources. The low pleasure of lust with no emphasis upon the danger or responsibility of sexual indulgence is the phase presented to the youthful pupils. Is it any wonder that the two boys, whose sad story is briefly told above and thousands like them, are going to destruction every day? It would be a greater wonder if they did not do so. They had learned a great deal about the dynamo of human passion without acquiring any knowledge of how to protect themselves from its dangers.

The young, the ignorant and the uncultured, however, have not a monopoly of this sort of thing. Several years ago when a meeting of the superintendents' association of the National Education Association was held in Chicago, one of the courtesies of the local committee was an excursion on the lake. A young superintendent who has since climbed to the top of the educational ladder, now president of one of our large universities, and whose home training, religious training, virtuous heredity or some other blessed advantage over most of us, had protected him from or rendered him immune to the contagion of obscene song and story, told me on his return from the meeting how dumb-founded he was during this little excursion to hear from the lips of men holding prominent positions as superintendents, principals and professors, jokes, illustrations and stories full of obscene imagery and lewd suggestion. This was about twenty-five years ago. I believe a change for the better in this profession has been going on since that time, a real progress in refinement and culture, and that a similar criticism under like conditions could not be made today. But this improvement at the top has not reached very far down into the substrata of schools, and never will until we take hold of sex instruction in an intelligent and vigorous manner.

The mere fact that in order to teach sex knowl-

edge we must use a refined or scientific vocabulary elevates the subject and dignifies in the minds of the pupils the sex organs and their functions. The vulgar terms, obscene signs and smutty stories which boys habitually hear and associate with these organs, degrade their sacred functions and naturally lead the youth to regard the sex parts of our anatomy as vulgar and impure.

There is, as everyone knows, a complete unwritten vocabulary of terms for the sex organs and their functions. Thousands of youth all about us grow to manhood without learning or even hearing any other terms for these parts than those of this wretched out-cast vocabulary. Is it, therefore, any wonder that even the respectable family man, who loves his home and who has made the most sacred use of the sex organs in bringing sweet and happy children into the world, should still when alone with men companions lapse into the loose and low story and rhyme which represent the only sex instruction he ever learned in his youth? These early impressions, vile and catchy as they were, wore the brain grooves too deep to be effaced.

Only a few days ago, a young man under twenty, a member of a boat club near my home, returned from a rowing trip with several other men of the club. He expressed disgust at the prevalence of obscene suggestions, filthy jokes and incidents in their conversation on the trip. Several of them were married men. They were only giving expression to the thoughts, vile doggerel and imagery they had habitually associated with sex knowledge from childhood.

Most children learn while still very young that the subject of which we are speaking is tabooed in practically all places where instruction in other subjects is given. This gives it the added attraction of "forbidden fruit," and it is partaken of with all the more zest. Once bring it into the open, give it the same frank and refined treatment that we give other subjects and you will rob it of a large part, if not all, of this unwholesome, hidden, stolen-fruit element of attractiveness. Many a child instructed in this vulgar school of secrecy has been surprised to hear father or mother or teacher actually speak the name of a sex gland as they would any other organ of the body. Usually the only person who ever has the "immodest audacity" to do this is the doctor, and we accord to his profession license to do so. This veto upon the whole subject by decent society is what causes the child to seek his information under cover.

What defense can we offer for such a condition? I believe none whatever except tradition and the mistaken notion that the relation between knowledge and sin is more dangerous than that between ignorance and sin. We greatly fear that the child will "know too much," and therefore

meet his innocent questions with all sorts of lies and evasions.

I well remember the sudden advent of a little calf on our place when I was less than six years of age. I asked my mother where the mamma cow got it. In her answer she doubtless followed the example of her mother and told me the cow "found it in the woods." (We had a woodland pasture.) This greatly aroused my imagination, made me as restless and filled my mind with as many more questions as that of the small boy whose inquisitiveness annoyed a cripple. When asked about his misfortune he extracted from the child a promise to ask no more questions provided the one then pending were answered—namely, how the cripple lost his right foot. "Well, my boy, it was bit off," said he.

A friend of mine who was given a similar answer by her grandfather upon the appearance of a litter of pigs told me how she and her little companions tired themselves out hunting the farm over for some more pigs. Such is the satisfaction that many children receive from their innocent inquiries.

You who hesitate to impart sex instruction to children should bear in mind two things; first, that instruction from impure and forbidden sources is certain to reach at least nine-tenths of them without any effort or concern whatever on your part; and second, that nine-tenths of the danger involved lies on the side of either unwholesome instruction and the secret method by which it is imparted or of ignorance. While you hesitate boys and girls, young men and women, are going to perdition.

There is another aspect of sex instruction that is peculiar and which puts a compelling force into the demand for it early in the child's life, namely, the exuberant rush of passion which seizes the child in his adolescent period. Toward other fields of knowledge he is comparatively indifferent; toward this he is keenly alert and vehemently responsive. This is why instruction does not wait upon the natural teachers of the child—the parents, or those provided for him in the school or the church. He is too eager, he will take any instruction from any source whatever. The more obscene and suggestive the method the more it arouses his passions, and if he has received no previous instruction—as most boys and girls have not—he knows none of the dangers and feels little of the moral restraint necessary to safeguard his purity of character. Much of what he learns at this time could have been taught to him earlier, before he felt any other than an intellectual or academic relation to such knowledge. If this were done it would go far toward inhibiting this welling up of the sex passions at any or every suggestion, picture, or exhibit in nature of animal mating, which many a youth feels and suffers in silence.

## BOOKS

### THE NEW INDUSTRIAL DAY

By WILLIAM C. REDFIELD. The Century Co. 213 pp. Price \$1.25; by mail of THE SURVEY \$1.33.

This is an unusual and, in many ways, a remarkable book. Mr. Redfield is a large employer of labor; he is more than an employer, however! Besides being a highly successful manufacturer he is an extensive traveller, a close observer, and he has lately entered the political field and has served a term in Congress. Consequently, it is with a voice of some authority that he speaks of industrial affairs.

The book is a tract, a sermon, a rallying call, a prophecy—each of these and all together, with human conservation as its theme. If the book “shall help to add to the appreciation of man for man,” says the author in his foreword, “if it shall aid to take away the unnecessary burdens placed by man on man, if it shall in any degree lead to the happier and more productive working of man with man, its purpose will have been fully served.” So he proceeds to discuss efficiency in production, with especial reference to the employee. He lays it down almost as an axiom that the better labor conditions are, the greater the output and the larger the profits.

Two chapters are devoted to a consideration of costs, and these two chapters constitute also an argument against a protective tariff. The protective argument, he says, is based on the idea of equalizing costs of production at home with those abroad, and the inference usually drawn is that the difference is due to higher wages paid in this country. This, he declares, is obviously illogical because not only do costs in different plants in America vary, thus making it impossible for any single rate to be equally protective, but wages often have very little to do with high costs. To illustrate this, he cites the selling of American locomotives in Great Britain, Brazil and Japan, American shoes in Calcutta, and American steel products in all parts of the world.

He intimates, on the one hand, that American wage-earners are not such beneficiaries of the tariff as its advocates would have us believe; and on the other hand, he states that there are American firms paying as high wages as anyone, that make goods for the export trade alone, in competition with Europe's “pauper labor,” and who therefore get no benefit from the tariff.

There is so much that is quotable in Mr. Redfield's book that it is difficult to make a selection. Here are some striking sentences, however, culled here and there from pages of the book which tend to indicate its spirit:

“When a great state loses its sense of right values so far as to permit its children to be exploited to their injury in mills or mines in the production of wealth, or to refuse to protect its men and women from excessive hours of labor,

then that state has become disloyal to its best self.”

“The call of labor for a larger share in the products of industry is the normal response to the efforts of many masters in industry to get too great a share for themselves.”

“We may think well to crowd our machinery to its limit and scrap it in a few years because a new invention shall have then replaced it; but we must learn not to crowd men that way, for we cannot scrap men.”

“Given the scientific spirit in management, constant and careful study of operations and details of cost, modern buildings and equipment, proper arrangement of plant and proper material, ample power, space, and light, a high wage rate means inevitably low labor cost per unit of product and the minimum of labor cost.”

Mr. Redfield's optimistic conclusion is that a new industrial day is dawning in which there will be more justice and consideration in the relations between employer and employee, higher wages, shorter hours, greater profits, lower prices and far greater and more general contentment.

JOHN A. FITCH.

### SECOND INTERNATIONAL MORAL EDUCATION CONGRESS

Published by the American Committee, 2 West 64th St., New York City. 195 pp. Paper 67 cents postpaid.

This separate publication of the American contributions to The Hague Congress on Moral Education turns a whole battery of searchlights upon the perplexing questions as to what moral education comprehends and how its teachings can be brought to bear upon people of all ages, especially youth.

Before religious faiths became so heterogeneous and intermingled and before the democratic state began to assume the ascendancy in teaching, these were academic questions and were scarcely raised in America, except in doctrinaire or Utopian discussions. Morals were correlations of religious tenets. The dominant church taught both. As there was a single source, so there was a sole responsibility for moral education.

But now the very basis of morality is in question, and a basis for teaching it by the state must be sought outside of sectarian tenets in schools supported by taxing citizens of all sects or none. Now, the responsibility must be shared with the church by the family and the state. The very division of responsibility and diversity of bases in teaching morals increase and complicate both the theoretical and practical problems of moral education.

The variety of points of view, the diversity of suggestions, and the independence and lack of correlation in these twenty-three contributions, by our most eminent American specialists,

constitute the most significant statement of the complexity of this problem.

Its solution, however, can be hoped for only in this very way, by focusing intensive inquiries upon single factors, which, when better understood, may all contribute to some solution. Everyone interested in almost any view of the subject will find among these highly specialized and condensed statements of view, something to inspire and inform for further effort, and those wrestling with the whole subject, especially with the public aspects of it, will see more clearly what they have to reckon with, not only in the varied views held by these advanced thinkers, who are in substantial agreement, but also in the more irreconcilable ecclesiastical positions, which are conspicuous by their absence from this discussion.

GRAHAM TAYLOR.

#### THE ELEMENTS OF CHILD PROTECTION

By SIGMUND ENGEL. The Macmillan Company. 276 pp. Price \$3.50; by mail of THE SURVEY \$3.63.

The writer of this book is a Socialist and an evolutionist. In his own words, "The intimate interdependence of child-protection with Socialism and with Darwinism must on no account be overlooked. It was my own assurance of this two-fold interdependence which led me to undertake the study of the whole system of child-protection from the joint outlook of Socialism and Darwinism. . . . My aim has rather been to effect a lucid presentation of all the problems of child-protection than to attempt myself to supply the solution of all those problems."

The book is divided into two divisions, a General Part and a Special Part. In the General Part questions of birth rate, sex relations, child mortality, eugenics, education, remedial child-protection vs. prevention of the causes that make child-protection necessary, and the executive instruments of child protection are discussed.

The Special Part is subdivided into the three main departments of Civil Law and Individual Rights, Local Administrative Activity, and Criminal Law.

Under the first sub-division marriage and parental authority, heredity, illegitimate children and the powers and guardianship of minors are considered, in the second are all the problems of prenatal care, birth, infancy, child-labor, health and elementary education, while under the third the topics are criminality in youth, penal methods, prostitution and punishable offenses against children.

Although the author admits (pp. 52 and 54) that child-protection existed prior to the development of capitalism he asserts that "child-protection has received much more attention than in former times. This extensive development of child protection is one phase of that general development whose other phase is the development of capitalism. . . . Capitalism gives rise to numerous diseases in the social organism, and then endeavors to cure them, for the most part, by the methods of child protection."

It follows in the author's opinion that child protection at best is but a palliative and that "true child-protection, the child-protection of the future, will take the form of the destruction of capitalism."

Meanwhile, "the question presses, should we postpone our attempts to deal with the symptoms of the disease, to palliate the defects of the existing social order, until the day arrives when we shall be in a position to deal with these evils once and for all by radical measures? No! Even today we have to concern ourselves with child-protection. . . . Today child-protection is useful and even indispensable. It is true that a well-planned social order affords the best child-protection in the narrower sense of the term; but this does not make the latter form of child-protection superfluous."

These quotations must serve to illustrate both the author's social philosophy and his frank statement of it. Within the limits thus set for himself the writer discusses each topic in a judicial manner, presenting in some detail different and conflicting views and closing the discussion with a criticism of the weak points on each side, and a statement of the view that he thinks is demanded by evolution.

As an able statement of the great variety of problems involved in child-protection in civilized countries, and for its mild belief in the sure-coming of a better though deferred day, the book has its chief significance.

HENRY W. THURSTON.

#### HELPING SCHOOL CHILDREN

By ELSA DENISON. Harper and Brothers. 352 pp. Price \$1.40; by mail of THE SURVEY, \$1.52.

Nothing better expresses the community conscience than the growing number of organizations whose main purposes are co-operation with the public schools. Our schools have been almost the first object of volunteer civic co-operation; indeed they largely owe their existence, and particularly their best features, to private initiative and experimentation.

Miss Denison's book is a stimulating survey of volunteer effort in hundreds of American cities aiming to make the schools and education more serviceable to the children and to society. Her study illuminates the wide range of private enterprise in a democracy working through contact with the tax-supported schools and their problems. Service of this kind is of singular value, quite beyond its immediate objective, for in its exercise there is developed a civic resourcefulness which if applied to other public institutions much in need of just such co-operative interest would humanize and lift them to their best uses.

Helping School Children is much more than a catalogue of activities in behalf of schools, teachers, parents and children. It is an able interpretation of one of the most far-reaching forms of social service. The book is timely, immensely suggestive, and invaluable to those whose conception of neighborliness and duty has outgrown the narrow circle of the familiar.

MEYER BLOOMFIELD.

## SCHOOL ORGANIZATION AND THE INDIVIDUAL CHILD

By W. H. HOLMES, Ph.D. Davis Press. 211 pp. Price \$2.00; by mail of THE SURVEY \$2.14.

School Organization and the Individual Child is a compilation, not an argument. It is an exposition of plans for adapting school organization to the needs of individual children. The first half of the book is devoted to grading, classification, and special schools for normal children; the second to special classes for sub-normal children.

The plan of the book is to describe in one place different methods which have been tried out here and abroad, for the treatment of a special problem. A clear, concise statement is given of each method, its advantages and disadvantages, together with running comment by the author. Opinions of educators and students are quoted at some length. Reference is made to the training of teachers for giving individual instruction, work in special classes, and correction of speech defects. Some space is devoted to promotion intervals, classification, departmental teaching, "manumetal" schools, and the Montessori methods. The second part of the book deals with a description of auxiliary schools for mental defectives here and abroad, plans of study, and various psychological intelligence tests.

The book offers no conclusion and makes no plea. It assembles a store of information, and leaves the reader to make what use of it he wishes. It is, as it was intended to be, a book for reference only. But as such it has grave defects. There is no table of contents, and therefore, no way of knowing what the book treats of without examining every chapter. The index is in two parts, both incomplete. Proper names are incorrectly given. Diagrams are unnecessarily confusing. Another fault, and one more difficult to remedy, is that the author, being himself thoroughly conversant with the subjects he treats, takes it for granted that the reader is also, and uses technical phrases and historical allusions without interpretation.

On the other hand, the book is supplied with careful footnotes and an excellent bibliography. The subject matter is briefly treated, and an immense fund of important material gathered into small space. It is to be regretted that a book showing such careful study, impartial presentation, and large store of valuable information should be rendered difficult of use by reason of mechanical defects in its construction.

MAY AYRES.

## SOME EXAMPLES OF INDUSTRIAL EDUCATION

By FRANK M. LEAVITT. Ginn & Company. 330 pp. Price \$1.25; by mail of THE SURVEY \$1.37.

Of what moment is it to the people of this country that 85 per cent of the children who enter the public schools drop out between the ages of twelve and fifteen? That most of these have not completed the elementary course? That at least half of the total number have not been trained with any reference to the work which they subsequently take up? That they therefore begin life wastefully and go through it perpetually handicapped?

In a general way, these are the questions which are demanding more and more attention in educational reform. In the United States that reform bids fair to lack head and guidance for some time to come. Everywhere teachers, parents, social workers, law makers, employers and workers are searching for the light, experimenting in this direction and in that. Isolated and fitful though many of these experiments are, there is in them, of course, a wealth of suggestion and experience. To make education count toward life is the aim of them all.

The main purpose of Mr. Leavitt's book is to present briefly some of the more notable of these attempts. At the outset he excludes those phases of vocational education which have to do with professional, commercial and agricultural training, or training in domestic arts and sciences. Industrial education, he says, means much more than the introduction of shop work into the present curriculum. It means "a thorough revision of our school system with the purpose of furnishing for the working classes an education which bears somewhat the same relation to their prospective life work as does the college education to the future work of the professional and managerial classes."

In addition to examples of out-and-out industrial education, intended for boys and girls of fourteen or over, the book presents some of the attempts that have been made to save two wasted years *before* fourteen, as well as after. These lie in the direction of changed methods of instruction, different plans of grading and promotion and more purposeful selection of subject matter. The latter merges into prevocational instruction, to which the author devotes a separate chapter.

Although the adequate reorganization of existing public school systems in accordance with new ideals will require time, the author thinks it may be advantageous to formulate deliberate plans. He himself proposes one, which he calls a "plan for immediate reorganization" and which is intended to embrace all the children in a given community. Its chief feature is its provision for a change in the *goal* toward which a child may be aiming. Such a change is made possible at four points, namely, at the close of the sixth and eighth grades of the elementary school, and of the second and fourth grades of the present high-school period. The author would provide that at the various places of branching some subjects may be common to the curricula of both or of all courses furnished. His plan contemplates that all instruction, cultural and intensely vocational alike, should be under the control of the existing public school system.

So many are the experiments now being made in industrial education, and so confusing do they become to one who would try to extract the good from all, that it seems regrettable that Mr. Leavitt has not attempted to weigh values for us. The book is perhaps too much a *What's What* in the field of industrial education. It lacks, doubtless intentionally, on the side of interpretation and estimate.

W. D. L.

## THE MIDDLE CLASS—A PLAY

By J. ROSETT, M. D. Phoenix Publishers, Baltimore.  
124 pp. Price \$5.50; by mail of THE SURVEY \$5.55.

George Bernard Shaw in *Widowers' Houses*, one of his prentice plays, held up to contempt the respectable man who extracts an income from squalid tenements; Ibsen in *An Enemy of Society* displayed the middle class, the little men of property, in snarling revolt against the reformer who threatened their dividends by exposing insanitary drainage in a health resort. Dr. Rosett combines the themes in a play, which, while lacking the brilliancy of Shaw and the technique of Ibsen, proves a convenient vehicle for caustic criticisms of American philanthropic society in 1913.

Dr. Bensel, an idealist, is appointed health commissioner by a reform mayor of easy morals and ready shifts, at the request of a quackish doctor, who, though presented as the devil of the piece, is so mildly satanic as to seem quite at home in his surroundings. Dr. Bensel's prosecution of the grocers for selling rotten food and of the owners of a particularly unsavory block of tenements soon brings him from the clouds. The secretary of the Charity Organization Society, pictured with sly unveracity as a well-nourished man of elegant ways, pleads with Dr. Bensel not to dry up the sources of charity by curtailing the income of the agents of the nasty property, who are generous contributors to the society. Dr. Anderson, the leading physician, turns out to be the owner of the threatened shacks and pleads for two months' delay to enable him to sell them to some innocent investor.

Most of the slums are owned by men whose wives and daughters are prominent in housing associations, associations for improvement of the condition of the poor, and so on. Business is threatened. Tax-payers cannot be philanthropists if the laws are enforced, for the surplus income from which their doles are made will be cut off. Clearly Dr. Bensel must go. So orders the boss, whose insolent way to the reform mayor would jar were not the mayor himself an incredible fool and hypocrite. But the mayor finds an easy way out, much easier on paper than in real life, by insinuating to Dr. Bensel's wife, with whom he has had an unexplained and irrelevant "affair," that her husband is too fond of a woman clerk in his office, and induces the wife to prevail on the husband to resign.

While the episodes are unconvincing and the character drawing is negligible, the play may stir charity workers and their patrons to some healthy self-examination. In a small town, where the large incomes are nearly all derived from allied industries, the connection between improper incomes and charitable gifts may be as close as the author pictures; but in metropolitan communities there are so many forms of social oppression, as well as of social uplift, that a man may be righteously indignant with the forms of oppression in which he does not happen to share, and unconscious that the customs he upholds and profits from are equally obnoxious to those whom he opposes and who, in their turn, are con-

tributing to the overthrow of his form of oppression. A lawyer for an anti-social monopoly may honestly support a housing committee, while the slum owner, with equal sincerity, denounces the transit monopoly. An employer of sweated girl labor may sincerely condemn stock gambling, while the chief contributor to the consumers' league, which blisters the employer for the starvation wages he pays, may himself be a miscreant who rigs the stock market and comes under the whip of the sweating employer. Possibly only the paid social workers maintain a purity of purpose that will stand analysis; though some cynics aver that there is no more charity or patriotism in working for a salary in the office of a charity organization society than in the office of the steel trust. "There is none good, no, not one."

JOHN MARTIN,

## PENAL PHILOSOPHY

By GABRIEL TARDE. Translated by Rapelje Howell.  
Vol. VI of the Modern Criminal Science Series.  
Little, Brown and Company, Boston. 581 pp. Price  
\$5.00; by mail of THE SURVEY \$5.21.

The social workers of this country owe a debt to the American Institute of Criminal Law and Criminology for making possible the publication of the Criminal Science Series. Americans are in general loath to acquire foreign languages, even for reading and scientific purposes. The series embraces works of de Quiros, Lombroso, Saleilles, Gross and Tarde, already published, and promises works of Ferri, Bongier, Garofalo, and Aschaffenburg. Putting it bluntly, there will no longer be the excuse of those who may admire American empirical criminology to the exclusion of foreign important thought that translations are not available.

Tarde's *Penal Philosophy* is particularly sympathetic, as the German phrase has it, for American social workers interested in delinquency. He saw with remarkable clearness the social causes of crime, was impatient with the dogmatic propositions of Lombroso's criminal anthropology, saw in imitation a strong factor in producing crime, and gave to the principle of opposition a considerable weight. The criminal must be studied as primarily a social, and not as an organic, individual. His *Philosophie Penale* discusses at much length the problem of the freedom of the will, finding in man's freedom to act according to his own nature, or, in other words, his social responsibility, the answer as to his relation to the criminal act.

Naturally, the wealth of knowledge upon which Tarde bases his theses does not render his work the "last word" in criminology. The value of each volume of the Criminal Science Series for Americans lies not in the permanent defining of the predominant causes of crime nor in the most effective methods of combatting crime or of dealing with the offender; the value lies in giving to American students the horizon in criminology that for a generation has been broadening in European countries. Abroad, the problems of freedom of the will and determinism, penal law and prison science have been

and are being debated to an extent hardly imagined as yet by many of us who have most to do with delinquency.

ORLANDO F. LEWIS.

#### WHAT THE OTHER CHILDREN DO

By ELIZABETH GRIERSON. The Macmillan Co. 166 pp. Price \$1.25; by mail of THE SURVEY \$1.35.

#### THE DIARY OF A FREE KINDERGARTEN

By LILEEN HARDY. Introduction by KATE D. WIGGIN. Houghton Mifflin Co. 175 pp. Price \$1.00; by mail of THE SURVEY \$1.08.

Using romance to familiarize young people with history has long been a device of the story writer. Here is a book that adopts a similar method (except that there is no love plot) to acquaint them with conditions in the congested parts of a great city. Two children who start out to spend six weeks with their cousins in Perthshire stop on the way at their Aunt Marion's settlement in Belchester, a part of Edinburgh, Scotland. While there they learn that scarlet fever has broken out in the home of their cousins and so they become marooned in the heart of the slums. From their vantage ground in the settlement they make voyages of discovery into the unknown regions around, learning many things, from how coal tickets are distributed to the poor to the inside workings of a school for the crippled.

\* \* \*

Today there are ten free kindergartens in Great Britain, most of them depending on voluntary contributions and living largely from hand to mouth. It is their aim to provide early and thorough care for the "slum children" in the cities. The Diary of a Free Kindergarten is an intimate story of the day-to-day hardships and triumphs of one such kindergarten in a dreary corner of Edinburgh, written by the woman who founded the kindergarten and whose life became its life.

Kate Douglas Wiggin writes in the introduction:

"Here is a modest, unpretentious record of the daily life of one Kindergartner, who is doing her little best to make the world a better place in which to live. . . . I wish any word of mine might help to earn a little flood of golden sovereigns, and so this beautiful work be strengthened and developed. 'The hope of the world lies in the children.'"

## TREND

## LEADERS IN THE MONTH'S MAGAZINES

**U. S. INSPECTED AND PASSED.** By Caroline Bartlett Crane. *Pearson's*. The first of a series by the instigator and chief witness in the Congressional hearings of last year on the need for an investigation of the federal meat inspection service. Mrs. Crane's article is designed to show simply and convincingly that our laws and law enforcement have through the treachery of officials of the Department of Agriculture become an asset to meat packers and a menace to meat eaters.

**THE JEWISH INVASION OF AMERICA.** By Burton K. Hendrick. *McClure's*. A study of what the Jewish immigration to the United States, the second greatest Jewish country in the world, has meant to the immigrants freed from the economic and political disabilities which beset them in Europe. A successful minority has almost absorbed the clothing and theatrical business and has succeeded notably in many other industries.

**HOW THE MOVIES WERE SAVED.** By Will Irwin. *Metropolitan*. The moving picture shows were going to destruction or leading young folks there; the only choice seemed to lie between suppression and voluntary censorship. They chose the latter, and in this article Mr. Irwin shows how the National Board of Censorship does its work.

**WRECKS—WHY THEY INCREASE.** By Albert W. Atwood. *American Magazine*.

**WHEN THE ENGINEER FORGETS.** By Charles Frederick Carter. *Technical World Magazine*.

**THE TROJANS OF THE WRECK TRAIN.** By Bailey Millard. *Railroad Revolution*. By Charles Edward Russell. The latter two are in *Pearson's*.

Four contributions to a subject which has been occupying the public attention through the recent probe of the New York, New Haven & Hartford Railroad.

The first tells the actual statistical causes of wrecks, which may be summed up in defective rails and defective engineers, as well as the underlying reasons for the causes—overspeed and overstrain.

The second tells of the efforts to perfect the automatic train stop, which bids fair to offset the element of human weakness in the engineer. Mr. Millard tells of the quiet rushing men who come after the wreck is over to save lives and money. Mr. Russell marshals somewhat the same facts as Mr. Atwood to show that in his opinion no amount of regulation under a profit system of railroad running will solve the problem of railroad wrecks. His remedy is government ownership.

\* \* \*

**T**HAT "United States inspected and passed" on American meat sold outside the United States means much, but that "United States inspected and passed" on meat sold to us in the United States means something less than nothing, is the gist of the first of a series of four articles on our federal meat inspection by Caroline Bartlett Crane. These articles will appear in the March, April, May and June issues of *Pearson's Magazine*.

As long ago as 1903 Mrs. Crane induced the legislature of Michigan to pass a meat inspection bill which she had drafted. In the following year she was invited to address the International Congress of Butchers, meeting at the World's Fair at St. Louis, and it was only last year that she was the instigator and chief witness at the hearing before the Congressional Committee which was considering an investigation of the federal meat inspection service.

In the first of these articles, as a result of her sanitary surveys of American cities, she declares that we pay \$3,000,000 a year for a meat inspection service which enables the meat packers to sell to foreign trade and serve to us the leavings not accepted by the rest of the world. She charges that, contrary to the pub-

lished regulations, secret orders are issued by our government which require that diseased meat must not be certified for export, but allow it to be approved for home use. In support of her statement she quotes from an inspection service announcement of October 15, 1909: "Inspectors are directed in future not to certify for export edible organs such as livers which have been mutilated or from which portions have been removed."

Under this rule she asserts that though in England "United States inspected and passed" means the liver is whole, in America it means that a tumor or an abscess or a nest of flukes (worms by no means microscopic) may have been cut out.

In her next article, it is announced, Mrs. Crane will discuss what she calls secret orders "which are carefully kept a secret from the American people."

\* \* \*

## "AS YE DID IT NOT"

CHARLES L. GREAVES in the *Independent*

JESUS CHRIST is passing by,  
Throw thy cheerful casement high;  
Haste, oh haste! bid Him abide  
This day with thee, the Crucified!

"Nay, nay, it is not He,  
No lambent glory do I see,  
No angels fill the throbbing air,  
No being passes, kingly, fair;  
'Tis but a beggar in the throng,  
Who drags his shuffling feet along,  
All weakened, wrinkled, pale of face,  
He treads the street with weary pace."

Haste, oh haste! He comes again,  
Jesus walks the ways of men,  
Thy door throw open, open wide,  
And draw the heavenly Guest inside!

"Nay, nay, no star I see,  
I hear no holy minstrelsy,  
No ringing shout, no kingly cry;  
'Tis but a child is passing by,  
All soiled and touseled, of the street,  
With hatless head and shodless feet,  
Pushed, and jostled, giving place  
With timid tread and pitiful face."

Jesus Christ is passing by,  
He is coming, He is nigh,  
He is looking to your door,  
He may never pass you more!

"Nay, nay, ye do but jest,  
For I see no holy Guest,  
No hosannas do I hear,  
Proclaiming that the Lord is near:  
But I see a swarthy slave,  
Bending 'neath his burden grave,  
Numb and silent in his woe,  
Down the sultry roadway go."

Blind, blind! ye would not see,  
Jesus Christ came thrice to thee;  
Pray, that on some sad tomorrow  
He doth not despise thy sorrow,  
When thou tread'st the tearful way,  
That the Saviour trod today.

\* \* \*

**PIGS IS PIGS, BUT BABIES** is the title that M. G. Franklin gives to her description, in a recent issue of the *Technical World* of the babies' health contest at the last Iowa State Fair. Iowa has long been the first state in the Union in the quantity and quality of her carefully nurtured hogs. Since the state fair last August,

when Mary L. Watts forced the babies on the attention of the state its citizens have begun to ask themselves the question: "If a hog is worth saving, why not a baby?" Not only that, but Oregon, Missouri and Colorado have, since the Iowa fair, held baby contests, and the work of baby saving is under way in all four states.

\* \* \*

THE New Year saw the launching of a new Socialist weekly, the *New Review* (150 Nassau Street, New York), whose editor, Hermann Simpson, formerly editor of the *New York Call*, is one of the foremost students of Marx in America. The *New Review* responds to a distinct and recognized need for a Socialist periodical whose work shall be the education of party members, rather than agitation.

The word education is interpreted by Mr. Simpson in its broadest sense. In an editorial in the first issue, he says:

Socialist education cannot be confined to the study of certain books or theories or modes of action. Our movement has long ago passed the stage of utopian construction, esoteric sectarianism, or secret conspiracy. It has broken through the bounds of local and national isolation. It has now become synonymous with the world-wide struggles of the workers against the monopolists of the means of work and of life. It is as many-sided as are these struggles. Local and partial strikes, "general" strikes extending over entire localities or industries, participation in local and national elections, efforts for the introduction and extension of political democracy and economic reform, public demonstrations and strikes *en masse* for the attainment of political objects, unions and co-operatives and Basel congresses—all these forms of working class activity and struggle are now regarded by friend and foe as a part of the general Socialist movement, the ultimate aim of which is the complete overthrow of the existing social order.

A movement so comprehensive, so universal, so Protean is not to be educated or taught or trained in accordance with the rules of the schoolroom, workshop, or barracks. An educational organ of this movement must not presume to impose upon the movement its own superior theories, irrefutable principles, and infallible dogmas. All it can do, all it can hope to do, is to impart correct information, to subject the multifarious manifestations of the movement, and of society in general, to a searching and fearless analysis, and to develop in its readers a spirit of free inquiry and criticism.

But this does not imply that the *New Review* has no definite standpoint. . . . We have a coherent body of theory that has withstood triumphantly all the assaults of the intellectual champions of capitalism, one that has stood the test of the most searching criticism—the criticism of actual fact.

It will be one of the principal tasks of the *New Review* to make known the achievements of Marx and his successors to the Socialists of America, so that we may attain to that fundamental unity of thought without which unity of action is impossible.

\* \* \*

GOVERNMENT is not, according to Albert Bushnell Hart, fundamentally a matter of law, but of the spirit of the men who make or influence the making of the laws. Among these he names the reformer whose influence has been apparent on American law for two hundred years. In his presidential address before the American Political Science Association he thus characterizes the reformer:

Rarely he reaches office; usually he is a critic, often he is a crank. American government owes a great debt to these self-designated counsels of new client-principles. What would the world be without these one-sided men, who by their public addresses, their books, their organizations push on the unpopular cause, which in due time shall capture the citadel and install itself sovereign? Take, for example, our sister Society for Labor Legislation; how much it does to concentrate public interest and power on one of the greatest problems of civilization. The reformer brings to law making that breezy emotion, that appeal to sentiment, that incessant action, that faith in his fellow men, which is lost in the calmer decisions of the cabinet or the court-room. As Emerson puts it in his imperishable *Politics* "I have just been conversing with a man to whom no weight of adverse evidence will make it for a moment appear impossible, that thousands of human beings might exercise toward each other the grandest and simplest sentiments, as well as a knot of friends or a pair of lovers." Government needs that spirit, that brotherhood, that intense, narrow and immensely effective propaganda.

\* \* \*

SAYS Walter H. Page in his statement for 1913 of "What the *World's Work* is Trying to Do:"

The first quality required to make a helpful magazine is a balanced judgment, an intellectual inability to be drawn off into the advocacy of any fad or cure-all, or to allow one's personal tastes and particular enthusiasms to dominate the whole periodical—in a word, the refusal to become sensational. "Movements" are necessary and desirable in the free life of the United States; but the free life of the United States is a very complex thing, and no "movement" carries all salvation with it. Good judgment calls for the reporting of all sorts of good work but for very wary acceptance of all men's burning enthusiasms. Common sense is the most useful quality that you can get into an editorial office.

## JOTTINGS

### AMERICAN PAGEANTRY BOARD FORMED

The American Pageantry Board was organized recently in Boston after a two days' conference under the auspices of the drama committee of the Twentieth Century Club. William Chauncey Langdon of New York was chosen president; Lotta A. Clark of Boston, secretary; Howard H. Davenport of Somerville, Mass., treasurer. The distinctive thought of the conference was that in the pageant lies the hope of the discovery and development of the American note in music, art, and literature. The value of the pageant as a short cut to reach the people was emphasized. People from various parts of the country who are interested in pageants attended the conference.

### A SOCIAL WORKERS' WHO'S WHO FOR NEW YORK

Thirty-five hundred of the charitable, social and religious agencies of New York together with a limited number of those of the state and nation, are listed in the Twenty-Second annual Charities Directory, which has just been published by the Charity Organization Society of New York. It is a reference book for information regarding any department of philanthropic work.

The directory includes agencies for the relief of children, immigrants, the unemployed, the aged and infirm, the sick, tubercular, incurable blind, deaf and dumb, crippled, insane or feeble-minded, and inebriates. The volume is not in any sense an endorsement of the organizations included but every one listed has been required to submit enough data in regard to its work to permit its general efficiency to be assumed.

A name index of 8000 persons connected with the 3500 institutions, as officers, directors or secretaries, has been added this year. This list is a who's who of social workers in New York.

### ON TAG DAYS

Business men from the Board of Commerce of Detroit recently called upon Mayor Marx to protest against the large number of tag days which are held there each year. The committee took no ground regarding the scheme itself but objected to its utilization by an increasing number of societies.

This points out, according to Francis H. McLean, one of the difficulties connected with tag day schemes. So many think that they are easy to work up that organization after organization tries the plan. There are tag days which, it is generally conceded, are managed in such a way as to obviate the serious evils. But such as these are not numerous, say those who have seen many fail, and the example set almost inevitably leads, they declare, to the kind of situation which has arisen in Detroit. In Chicago tag days became so numerous that the mayor has refused to issue any more permits.

## THE Three Gifts of Life

A Girl's Responsibility for Race Progress

By

**NELLIE M. SMITH**

*Lecturer for the American Society of Sanitary and Moral Prophylaxis*

With an Introduction by THOMAS DENISON WOOD, M. D.,  
Professor of Physical Education, Teachers' College,  
Columbia University

Its aim is constructive rather than destructive; to give a higher interpretation of the meaning and purpose of life, a saner, more wholesome view of the every-day relations between the sexes, and a broader vision of the possibilities of advancement when both men and women work together for the good of the human race rather than the satisfaction of personal pleasure.

Net, 50 cents. Postage, 6 cents extra.

**DODD, MEAD & COMPANY**  
PUBLISHERS : : NEW YORK

## SOCIAL PROBLEMS AND SOCIAL SOLUTIONS

The tour last year under the leadership of Dr. E. E. Pratt was so successful that it will be repeated this year.

Denmark, Norway, Germany, France, Holland, Belgium, England, Scotland will be visited.

The subjects to be studied are City Planning, Garden Cities, Labor Problems, Municipal Ownership, Social Insurance and many others.

For full information, address

**DR. E. E. PARTT,**

Business Arrangements, 225 Fifth Avenue,  
Bureau of University Travel. New York.

### WORKERS WANTED

**HIGH CLASS** Lady Field Secretary for noted Philanthropic Institution. Must produce results. Address 1001 SURVEY.

**WANTED**—To correspond with a first class institution band master and choir leader. This with a view to employing, permanently, the right man. Address C, No. 838 Oliver Building, Pittsburg, Pa.

**TRAINED** nurse, stenographer, typist, student of social conditions, desires work as secretary to philanthropist or organization. Address 1093, Survey.

### SITUATIONS WANTED

**WANTED** position as Matron in Institution, has years of practical experience. Best references. Address 1092, Survey.

## THE PITH OF IT

LIKE Kipling's cat, the manner of the Princeton tiger has been other than gregarious. It has gone its way, waving a wild tail in a wild lone. In the years when Chicago, Cornell, Wisconsin, Pennsylvania, Johns Hopkins, Columbia—a score of universities and colleges—were contributing to the public impulse,—when Harvard was establishing a museum of social ethics, and the incursion of "Bill Bailey's classes" from Yale were an annual event on the East side, Princeton seemed self-engrossed and socially dormant. But Old Nassau's arrears were paid in heaped-up measure on March 4, when President Wilson gave to the nation that searching human document, his inaugural address. P. 840.

THE clash as to vocational education—between school teacher and trade trainer—is on in Illinois. P. 832.

COMPENSATION reports and legislation in Pennsylvania, Massachusetts, Colorado, Connecticut, Oregon and other states. P. 828.

PUTTING the ultimate responsibility for public health up to the state in New York. P. 838.

ONE thing revealed by the Progressive campaign last fall was that the people of the United States are eager to learn about social insurance. The American Association for Labor Legislation has taken time by the forelock and appointed a national committee to sound the need and come forward with a constructive program. P. 827.

BOOKER T. WASHINGTON writes on the rural school. P. 837.

WHETHER Dr. Friedmann is or is not a faker, his proposal to combat tuberculosis through the employment of live bacilli is in the direction toward which scientists are beginning to turn their eyes. And his coming has laid bare the quivering hope of the unnumbered sick in a way more stark and tragic than a thousand tuberculosis exhibits. P. 834.

THE labor issue squarely met by President Taft when he vetoed the sundry civil bill. P. 835.

TEN charges are made against Joseph F. Scott, superintendent of the state prison department of New York, in the report of Governor Sulzer's Commission of Inquiry. One is that Colonel Scott permitted Frederick H. Mills to continue as prison sales agent after a special report to the governor that Mr. Mills was conducting a private business which divided his allegiance to his public duties. Superintendent Scott is quoted as saying that the charges are part of an attempt to force him out because he refused to name a Democrat as warden of Auburn Prison.

EDWARD T. DEVINE, Director  
CARL KELSEY, Director of Summer Session

## SUMMER SESSION 1913

JUNE 16—JULY 25

A six weeks' institute for experienced social workers.

## SUBJECT: DELINQUENTS

Requirements for admission: A full High School course or its equivalent, and at least one year's experience in social work. Size of class limited.

TUITION \$20.00

Application for enrollment should be made before May 1 to

THE NEW YORK SCHOOL OF PHILANTHROPY  
105 East 22d Street

# THE COMMON WELFARE

## NEW COMMITTEE ON SOCIAL INSURANCE

Announcement is made by the American Association for Labor Legislation of the appointment of a Committee on Social Insurance.

What is contemplated is an inquiry more fundamental, thorough and scientific than has heretofore been made, not only of methods of insuring compensation risks, but of the whole field of social insurance—all as the basis for formulating a comprehensive plan adapted to the conditions of American political and industrial life.

It is said that the first task of social protection was to safeguard the citizen against violence; that the second task was to protect him against fraud; and that the third, on which we are about to enter so far as practicable, is to protect the citizen against misfortune. This last represents the field before the committee, which is the outgrowth of the earnest discussion of the subject at the annual meeting of the Association for Labor Legislation in Boston last December.

Prof. W. F. Willoughby of Princeton, president of the association, has appointed the following to begin the work: Edward T. Devine, chairman; Miles M. Dawson, actuary and member of the New York bar, who has taken an active part in the discussion of workmen's compensation and insurance; Carroll W. Doten, Massachusetts Institute of Technology, member of the state commission which investigated employers' liability in Massachusetts, leading up to the present mutual compensation law; Henry J. Harris, of the Library of Congress, formerly expert of the Bureau of Labor; Charles R. Henderson, University of Chicago, author of *Industrial Insurance in the United States*; Frederick L. Hoffman, statistician of the Prudential Insurance Company; I. M. Rubinow, actuary of the Ocean Accident and Guaranty Corporation, Ltd., former expert of the United States Bureau of Labor; Henry R. Seager, professor of political economy, Columbia University, author of *Social Insurance*; John B. Andrews, secretary of the American Association for Labor Legislation, secretary.

That the scale of compensation adopted by American compensation acts is highly unsatisfactory and does not meet the problem created by industrial accidents is the first pronouncement of the new committee. In pointing out the niggardliness of American compensation acts the committee holds that an adequate scale of compensation would require:

- (1) That the maximum rate of compensation for disability and for dependents in case of death should be fixed at not less than two-thirds of the wages;
- (2) That compensation for widows should last as long as widowhood lasts;
- (3) That compensation for orphans should last at least until the age of sixteen;
- (4) That for disability, whether total or serious though partial, the compensation should be for the entire period of disability.

The principle of compensation adopted by the committee as fundamental is that "the cost of industrial accidents should be distributed among, and be paid by, the consumers of a product." In order to secure this result it is further maintained that compensation acts should always take the form of an obligation upon the employer to insure such compensation to be paid to employees or their dependents in some manner which will absolutely secure the payment of such compensation.

Besides accident compensation, sickness insurance will receive much attention and the committee will emphasize the fact that social insurance is insurance for the masses, for those who would not otherwise be insured. In the words of a member of the committee, "we should inquire into the desirability of insurance against all emergencies of life of the working classes. When we classify the causes of poverty, we enumerate the various kinds of insurance."

The extension of the compensation principle to embrace occupational diseases is already provided for in the association's bill recently introduced in Congress by Senator Kern. It is understood that sub-committees have already begun the careful investigation of the operation of state insurance funds established in several states for the purpose of providing workmen's compensation.

The first definite action taken by the committee is to prepare for a national conference on social insurance to be held in Chicago in June. This will be the first attempt in the United States to provide for a thorough-going and comprehensive discussion of this subject in a representative gathering called especially for the purpose. It may be expected to have an important bearing on the development of public interest in advance of the International Congress on Social Insurance in Washington in 1915. It is anticipated that the members of the American committee of the International Congress will participate in the June conference.

## COMPENSATION BILLS PROPOSED BY PENNSYLVANIA COMMISSION

The latest state compensation commission heard from is that of Pennsylvania. The commission's report is devoted almost entirely to its seven proposed bills, the short preliminary statement being little more than an explanation of these bills. The commissioners had eighteen months to do their work and instead of spending this time in gathering accident statistics, they made use of data already collected by the state Department of Factory Inspection and studied the statistics and experience of other state commissions.

The proposed legislation shows that they made a full analysis of all the laws passed by the earlier commissions, for their proposals deal with some of the outstanding problems of compensation legislation. Among the proposed bills are an act requiring the reporting of industrial accidents, an act to provide for the incorporation and regulation of employers' mutual liability insurance associations, and an act providing that in case of the insolvency of an insured employer, the insurer shall make the payment direct to the injured employee. An act is also before the legislature creating a commission for further study.

In view of constitutional difficulties, a compensation bill of the so-called elective form is proposed. To pave the way, however, for more advanced legislation hereafter, the following amendment to the state constitution is proposed:

"The General Assembly may enact laws requiring the payment by employers, or employers and employees jointly, of reasonable compensation for injuries to employees arising in the course of their employment and for occupational diseases of employees, whether or not such injuries or diseases result in death, and regardless of fault of employer or employee, and fixing the basis of ascertainment of such compensation and the maximum and minimum limits thereof, and providing special or general remedies for the collection thereof; but in no other cases shall the General Assembly limit the amount to be recovered for injuries resulting in death, or for injuries to persons or property; and, in case of death from such injuries, the right of action shall survive, and the General Assembly shall prescribe for whose benefit such actions shall be prosecuted. No act shall prescribe any limitations of time within which suits may be brought against corporations for injuries to persons or property, or for other causes, different from those fixed by general laws regulating actions against natural persons, and such acts now existing are avoided."

The elective bill which covers all employments presumes acceptance of compensation in default of rejection. It is made more exact in the defini-

tion of terms used than other laws in order that the operation of the law may not be hindered by uncertainties.

The rate of compensation is not high, being 50 per cent of wages or wage loss, but the act contains the compensatory clause that cases of total permanent disability shall be provided for for life, the rate of compensation being lowered after three hundred weeks to 40 per cent of wages. The provision for medical or surgical care is, on the other hand, only \$25, a lower rate than is provided in any other bill, and obviously inadequate in cases of serious injury. Compensation is not to be paid for the first two weeks after injury. Non-resident aliens are, by the terms of the bill, to be provided for on the same scale as residents.

The commission, believing that since "a fertile cause of accidents recognized by every authority is . . . excessive hours of labor," suggestions for legislation regulating hours lay well within their scope, propose as their seventh bill an act reducing the maximum hours of women's labor in Pennsylvania from sixty to fifty-four. Most of these bills have been introduced into the state legislature.

The compensation committee of the National Association of Manufacturers, whose work for national insurance for industrial accidents is well known, has recently framed a compulsory and also an elective bill along the lines of the English system. The bills contain a compulsory insurance clause with choice of methods, among them mutuals of employers or of employers and their workmen, the latter with additional benefits in proportion to the workman's contribution. Heavy fines are the penalty for failure to insure, or to deposit security with the state insurance department.

The bill would cover all employments, except casual labor and domestic service where no machinery is used. Accidents which can be proved by the employer to be due to intoxication or the neglect of safeguards provided are excluded, the latter provision being designed to stimulate accident prevention by employers. A compensation commission appointed by the courts and approved by the supreme court would administer the act.

Fourteen days must elapse before the payment of accident benefits, but medical care must be supplied during the time. The amount of medical care is not, as in many of the state laws, limited to any fixed sum, but the expression "such charges as prevail in the same community for similar treatment of persons of like standard of living" some people will criticize in view of the low grade of medical science which the poor are able to employ for themselves.

The benefits are not large. For total incapac-

ity the amount would be 50 per cent of wages for a maximum of five hundred weeks; for partial incapacity 50 per cent of wage loss. The maximum death benefit is 50 per cent of wages for three hundred weeks if two or more total dependents survive, less for one total dependent or for partial dependents. To non-resident families of aliens no benefits would be paid.

The following clause, in conjunction with compulsory insurance is designed to provide for the injured person in the event of the employer's insolvency:

"No policy of insurance issued under this act shall contain any provision relieving the insurer from payment if the insured becomes insolvent or discharged in bankruptcy during the period that the policy is in operation, or the compensation, or any part of it, is due and unpaid. Every policy shall provide that the workman shall have a first lien upon any amount becoming due on account of such policy to the insured from the insurer, and that in case of the legal incapacity, inability or disability of the insured to receive the amount due and pay it over to the insured workman, or his dependents, said insurer shall pay the same directly to such workman, his agent, or to a trustee for him or his dependents to the extent of discharging any obligation of the insured to said workman or his dependents."

#### OTHER STATE REPORTS AND PROPOSED LAWS

The Massachusetts Commission, after its elective insurance act has been in operation six months, has published its full report, which contains the complete text of all state compensation laws passed up to this year.

The Colorado Commission, hampered by the fact that the money appropriated to it was not forthcoming, has issued only a small pamphlet report but has introduced a bill into the state legislature.

From the Connecticut Commission comes a report devoted to its compulsory compensation law recently introduced into the state legislature. It covers twenty general classes of hazardous trades. The commissioners reject the elective plan because they believe that the withdrawal of the defense of assumption of risk under so-called elective laws may make them unconstitutional. Even aside from the constitutionality question, they believe that such a law does in fact deprive the employer of the equal protection of the law. A compulsory law should, they believe, pass the constitutionality test. The verdict in the Washington case, has, they believe, put upon a firm basis the opinion already held by many lawyers of high standing that the "principle of the Ives Case [declaring unconstitutional the New York compulsory compensa-

tion law] was not sound and will not be followed in other jurisdictions."

The Oregon Commission has also printed a short report and its bill for an elective state insurance law has passed both houses of the state legislature. A law has passed both houses in West Virginia as has an amendment to the Ohio law, both of which will be outlined in *THE SURVEY* later. Laws or amendments to laws have also been introduced into the legislatures of Maine, Iowa, Montana, Nebraska, Missouri, California, Wisconsin and Minnesota.

Though the Missouri commission never issued a report an interesting local investigation into a hundred industrial accidents in Kansas City has, however, been published by the Factory Inspection Department of the Kansas City Board of Public Welfare, supplemented by the study of 220 fatal industrial accidents in St. Louis conducted by the School of Social Economy. The Kansas City investigation was made by W. I. Potter, city factory inspector, and the studies of the two cities are brought together in one publication to furnish an answer to these three questions:

Why does Missouri need a Workman's Compensation Law?

Why does Missouri need a thorough and comprehensive act providing for the health, safety and comfort of her workers?

Why does Missouri need an adequately supported state wide factory inspection system?

Fifty-four per cent of the Kansas City accidents were preventable, 24 per cent of them being due to the workers' own or fellow workers' negligence and 30 to employers' failure to provide safeguards. Of the eighty-five non-fatal accidents, sixty-one received no wage payment during illness, the average length of disability being nine and a half weeks. Of these, thirty were the sole support of seventy-three persons including thirty-six children under sixteen. Only nine had no dependents or semi-dependents. The fifteen who met with fatal accidents left thirty-six persons wholly dependent on them. Of the fatal accidents four received compensation in amounts ranging from \$125 to \$2,000, and eight had suits pending; about half were insured. Thirty-three of the eighty-five had received some compensation; twenty-three suits were pending.

The study of the St. Louis cases shows that financial aid, in the 104 cases where it could be traced, amounted to almost \$73,000; of this \$40,000 came through insurance and other forms of providence on the workmen's part, and less than \$33,000 from compensation through liability suits. Almost one-fifth of the number of injured persons were left without resources and 180 of the victims of fatal accidents were fifty years or under in age.

The following St. Louis cases are typical:

No. 82—This girl, nineteen years old, was killed because of a defective elevator. Her parents received no insurance or compensation. The young man to whom she was engaged went crazy as a result of the loss, while the shock also caused the mother's death.

No. 207—This man was a city inspector. While inspecting a bridge which was in the course of construction, he lost his balance and fell. The city for which he had worked seventeen years did nothing for his widow and child fifteen years old, but he had \$3,500 insurance.

#### "LOWER RENTS" AS A CITY SLOGAN

B-z-z-z-z-z-z went the bell every five minutes throughout the lower rents exhibit of the New York Congestion Committee. "Every time this bell rings," explained a placard, "land values increase \$1,000 in New York. Who gets it? Land speculators. Who makes it? You, when you pay your rent."

The device was only one of many used to portray the social evils of high rents, and the legislation which the Congestion Committee holds will ameliorate them. For the exhibit, avowedly a piece of propaganda in favor of a specific change in the tax laws, was more than a tract on rents. It showed, through printed signs, cartoons, maps, and plaster dummies of a consumptive, a laborer, a working girl, etc., the disease, congestion and poverty that exist in large sections of Manhattan, and called for a greater measure of public control over real estate than the present tenement-house laws afford. The attendance for the first two days was over 11,000. Incidentally, the exhibit was perhaps the sharpest attack on land speculation that has been made recently in New York.

To establish the fact of high rents, the findings of the recent investigation made by the English Board of Trade in twenty-eight large cities in the United States were displayed. The predominant rents in New York are more than half as high again as the rents in eleven of these cities and more than a quarter as high again as the rents in nineteen. The English board found that the lowest weekly rent for three rooms in New York is over a fifth more than the rent for the same number of rooms in Chicago, Cleveland or Philadelphia.

The placards set forth that the rent for a good three or four room apartment in most parts of New York near factories is at least \$180 a year. They compared the average earnings of eleven classes of workers with this figure to show that rent eats up 30 per cent of the average annual earnings of all workers in factories in New York; 32 per cent in the case of clock and watch makers; 41 per cent in the case of

hosiery and knit goods workers; and as high as 45 per cent in the case of box makers.

Such rents as these, it was contended, make it necessary for people on small incomes to crowd into few rooms and take lodgers; for scrubwomen and seamstresses to spend for shelter what they need for food; for young children to go to work instead of to school; for consumptives to go back to work before they are able, and for working people to strike for higher wages. A three room apartment, such as would rent in different sections of the city for from \$11 to \$16 per month, was reproduced in one corner of the hall. This was made to serve two purposes. The interior was darkened so as to show the conditions permitted by the tenement house law in rooms that are technically light—a plea for standards of daylight as well as cubic space and openings to the outer air. This apartment was equipped with new furniture, cooking utensils, stove, chinaware, etc., costing \$87.73, or about one-half of the annual rental of the apartment. In other words, such a family has to spend for rent each year twice over the total value of its household belongings.

One cartoon showed a stork bearing a child about to light on the roof of a shack. The father is leaning out of the window exclaiming, "How can I pay the rent?" A second figure, personifying land ownership, rubs his hands, saying, "That means \$800 a year more in land values for me." The drawing, at first sight, looks far fetched. The point of the words put in the landowner's mouth is, of course, that if you divide the increase in land values in New York in recent years by the increase in people, you get \$800. And the father's remark turns out to be a translation by the cartoonist of a passage contained in the 1908 report of the Association for Improving the Condition of the Poor. This read:

"It is well known among social workers that the birth of a child is a serious menace to the prosperity of the ordinary day laborer's family, and that in the case of the unskilled poor in our great cities the birth of a second or third child even in prosperous times often brings disaster to the home."

Below this quotation the congestion committee asked: "Must we cut the babies out, or shall we get rents reduced so that the birth of a child is not a tragedy?"

How charitable relief by itself falls short of meeting the situation was the theme of other placards. Indeed, a sprightly unexpectedness was lent to panel after panel by the liberties taken with photographs and statements of philanthropic bodies. The outgivings of housing committees, tuberculosis dispensaries and relief societies were grist to the tax reformers' mill.

On one placard, for example, was pinned a genuine letter of appeal, which recited under the letter-head of a well-known organization that Mrs. D., who had four small children and no husband, was sick. Ten dollars a week, it was explained, was wanted for the woman until she could go to work, and five dollars thereafter until her oldest boy could help her. Four hundred dollars, it was declared in the letter, would be ample, and all of this, it was added, would be used for the rehabilitation of the family. The committee's caustic comment on this was as follows:

"If this \$400 is expended thus: \$10 a week for 10 weeks and \$5 for 60 weeks—the rental for the 70 weeks will be about \$140. Does this sum go for rehabilitation or for exorbitant rents?"

#### DO SWELLING LAND VALUES BELONG TO THE COMMUNITY?

There is general agreement as to the existence of high rents and the evils of congestion in New York, but when it came to analyzing causes and offering remedies, the committee was entering controversial ground. It contended:

"The chief reason for the high rents is the fact that buildings are taxed at the same rate as land values. This discourages the natural construction of buildings, and encourages the holding of land out of use for the speculative increase in the value, chiefly due to the presence and the industry of the city's population."

The committee's further way of putting this was to say that a tax on buildings is substantially a fine on buildings. For example, for replacing

an old dark room tenement, assessed for \$5,000, by a healthful tenement assessed for \$30,000, the fine is \$457. For constructing a factory assessed for \$50,000 the fine is \$915. For building a \$3,000 home the fine is \$54.90.

To demonstrate that large quantities of land actually are being held in an unimproved condition, the committee gave some interesting figures. In Manhattan, it declared, out of a total of 94,496 parcels of land 7,622 are being held without improvements. These 7,622 parcels have a valuation of \$169,793,000. In the Bronx, out of a total of 63,047 parcels, 32,016 are vacant. Their value is \$135,496,508. In Richmond, out of a total of 31,443 parcels, 17,531 are vacant. Their value is \$13,831,037. The 79,681 vacant parcels in Queens, out of a total of 126,065, are valued at \$142,722,081. In Brooklyn 49,144 parcels are vacant out of a total of 206,279, and their value is \$161,892,217.

To support its contention that swelling land values in the cities are created principally by the mere presence and labor of the people who make up the population, the committee quoted from the *New York World* for October 18, 1912. The *World* reported the recent sale of a piece of land on Wall Street at the rate of \$25,000,000 per acre; another parcel at the corner of Broadway and Sixth Avenue sold at the rate of \$16,000,000 an acre; and a third, at the corner of Broadway and 34th Street, at the rate of \$38,000,000 per acre.

From insisting that such values as these are largely socially created values, the placards passed on to the contention that in mere justice a greater percentage of those values ought to be

A JOY RIDE

A cartoon shown at the New York Lower Rents Exhibit

restored to their creators, the people of the city. It was pointed out that in 1912 the ground rental of land in Manhattan, at 6 per cent of its assessed value, would be \$187,663,148. The community secured from taxes on this land \$57,239,700, or less than one-third that sum.

How to get more of this value for the people was the main propaganda of the exhibit. The recommendation was that the tax rate on buildings be reduced and that on land increased. This is the aim of the Salant-Schaap bill now before the New York legislature. The specific proposal of this measure is that the tax rate on all buildings in New York city shall be gradually reduced to one-half the tax rate on land. This is to be brought about by five equal reductions in five consecutive years, beginning in 1914, provided the measure be approved by a majority of the votes cast on a referendum in a municipal election this fall. It is the contention of the committee that the Salant-Schaap bill will compel land owners in greater New York to pay \$20,000,000 a year more in taxes than the \$83,000,000 now derived from that source. Students of taxation are fairly agreed that it is much less easy to shift land taxes onto the tenant than it is to shift building taxes. Further, that the owners of buildings would pay smaller taxes, and could afford to charge less rent, owners of vacant land would throw it into the market rather than hold it speculatively, and the competition of new structures would at least keep the rents of existing buildings stationary and open many new buildings, and so relieve congestion. In bringing the figures down to terms familiar to the average tenant's pocketbook, the exhibitors went so far as to prophesy that if the Salant-Schaap bill goes through, the referendum carries, and the five-year reductions are made,

every tenant in New York will be saved at least a month's rent a year, nearly every owner of a small home will be saved from one-sixth to one-tenth of his taxes and most owners of factories will be saved an eighth to a tenth of their taxes.

As a final warning to those who had made the round of the four walls, the exhibitors evidently took a leaf out of Mr. Bryan's famous 16-to-1 speech. A monumental cross, nine feet high, bears this inscription:

"Sacred to the memory of New York's martyred men, women and children, unnumbered and unknown, who are taxed to death every year to save land owners from paying their share of taxes."

Here, then, as in the tariff agitation, a question of personal morals is thrust into the discussion of the fiscal system. By chance it was in this same building that, before the November elections, the Wilson Campaign Committee conducted its chamber of horrors; and by a coincidence Benjamin C. Marsh, the executive secretary of the Congestion Committee, was in charge of it. Not only the real estate interests, but various public bodies are opposed to halving the tax rates on buildings, either in principle or as a practical measure. The most frequent criticism made is that it is a thin veneer for the single tax; the most serious that it will not break up congestion or improve conditions for the small home owner or the wage-earning tenant. These critics have yet, however, to resort to an exhibit to put their opposition in terms that all who run may read. Meanwhile, Mr. Marsh's show, which goes from Manhattan to Brooklyn and the Bronx, is shrewdly calculated to catch the eye of those who walk and hang on straps, rather than those who run six-cylinder cars.

#### VOCATIONAL EDUCATION MEASURES IN ILLINOIS

Vocational education, long a matter of national importance, is rapidly becoming one of popular interest. Witness the intense discussion that has been going on for six months in Illinois, where parents, educators, bankers, merchants and manufacturers have carried on a fight by press, pamphlet and report that has attracted the attention of interested persons throughout the country. The first rumblings of the battle were heard three years ago. Since then investigation has been added to investigation and at least one trip has been made to Europe to bring back the lessons of foreign experience. It wasn't long before the public began to see that such recondite phrases as "part time plan," "continuation schools" and "dual control" really had to do with the vital question of how the citizenship of the future should be trained to meet the de-

mands that will be put upon it. The Chicago *Tribune* ran a series of articles by leading educators and social workers dealing with the various plans proposed, and the *Record-Herald* sent a man to Madison to study the workings of the Wisconsin experiment.

Almost from the first interest centered around the question whether the new education should be incorporated in the present public school system, under the same control as the elementary curriculum, or whether it should be granted separate schools and independent control. Three bills, representing three interested groups, were put into the field. These were taken into a series of conferences and in January one bill came out. This measure, known as the "conference bill" is now before the legislature. One other measure may be introduced. The two bills reflect the two points of view with regard to "control."

Up to the present time so little has actually been achieved in establishing vocational education that plans now adopted are likely to exert great influence on future development. Close attention is being paid, therefore, to the progress of events in Illinois. In 1909 and 1910 reports were made on some phase of vocational or industrial education or committees were appointed to study the question by the Chicago Association of Commerce, the Commercial Club, the City Club and the Illinois Bankers' Association. Perhaps nothing indicates more clearly the status of vocational education in Illinois at that time than the following quotation from the report of the Illinois Educational Commission, made early in 1911:

"The commission regards the whole question of industrial and vocational training as in such nebulous condition that it does not feel that any definite recommendation concerning it as it applies to the public schools of the state can be made without a painstaking and thorough investigation of the whole subject."

## TWO BILLS AND WHAT THEY MEAN

In the winter of 1911 and the spring of 1912 the matter of securing state legislation for vocational education was brought gradually to public attention. At a conference held under the auspices of the Illinois Bankers' Committee, to which the state teachers' association and others were invited, a committee was appointed to draft a bill. It was understood that this bill would ask for state aid for vocational education which should be given under the direction of the regular school authorities, and should foster impartially agriculture, commerce, and the domestic and industrial arts. The apparent purpose of the measure finally drawn was the promotion of manual training, agriculture and domes-

tic science, rather than the inauguration of specific vocational training.

Meanwhile the Commercial Club and the City Club had prepared bills embodying their views. The Bankers' Committee now enlarged its conference and invited representatives of several bodies, among them the commercial and city clubs, to consider the three bills together. A committee was appointed to draft a new measure. The chairman of the committee was the president of the University of Illinois and the commercial and city clubs were represented in its membership. After several committee meetings and two full conferences the bill known as the Conference Vocational Education Bill was adopted. This was in January of this year.

Notwithstanding that this measure was drafted by a committee in which the Commercial Club was represented, it is probable that that organization will insist on presenting its bill also to the legislature. In brief, the latter bill proposes a system of supplemental schools for children who have left the present system. These schools are to be supported by a special tax, one-half local and one-half state, and are to be administered by a separate state and a separate local board. The report which accompanied the bill recommends the German system of vocational education and urges it as the only adequate means of securing real vocational training. It says also on this point:

"It is plainly impossible to provide in the present system of elementary and secondary schools the instruction recommended. Separate schools are necessary whose equipment, corps of teachers, and board of administration must be in the closest possible relation to the occupations. In such schools the applications of general education to vocational work can be made only by men who know the vocations."

The "Conference Bill" provides state aid to any school district maintaining vocational or prevocational courses in agriculture, commerce, or in the domestic or industrial arts. Provocational courses may be maintained in connection with the regular program of studies in the elementary or high schools, and vocational courses may be so conducted or may be organized in separate schools or departments of schools. The bill further provides that, while the vocational work is to be administered by the regular school board, no state aid can be received without the approval of a local Committee on Vocational Education, appointed by the Board of Education. Among other duties this committee is charged with formulating and recommending to the Board of Education rules and regulations for the conduct of such schools or departments as, under the act, are entitled to state aid.

It will thus be seen that the former of these bills is specific, relatively narrow in scope, but

consistent throughout. The program which it proposes could, its enemies admit, be carried out effectively. Its advocates say that it is intended to leave the present school system *untouched*. Its opponents declare that this is no credit to it because the regular schools *need* the regenerating influence of specific vocational purpose and method.

The "Conference Bill" is more general and attempts an improvement in the present school organization. If effectively carried out it is believed that it would have a profound effect on public education. That it can thus be effectively administered, its opponents claim to be extremely doubtful, because of the inability and disinclination of school men in general to work out the many problems incident to the establishment of genuine vocational courses.

### THE AWAKENING OF THE PEOPLE

The discussion of the several measures has been marked occasionally by personalities which have prejudiced judgment and obscured the real issues, but there has also been thoughtful effort to present with fairness all sides of a complicated question. A strong popular interest has been aroused not only in vocational education but in the whole school system. Whether the "dual" or the "unit" party as they are called will develop the greater strength, few at this time feel qualified to predict. Few organizations have formally approved the dual system, though it has the support of many able and respected individuals. On the other hand, letters received by the state superintendent of public instruction, who has had a heavier correspondence on this matter than on any other single question, have almost invariably protested against the "dual" system. They have come from all parts of the state and have represented many different kinds of bodies. This is taken by many persons to indicate that the people of Illinois are inclined to repudiate the assertion that the school system cannot be developed so as to meet any and all demands which an evolving social and industrial order may make upon it for the good of the whole people.

The "Conference Bill" is in the hands of the Senate Committee on Education, not having been introduced into the House. It is felt generally that there is little chance of any legislation unless the two factions get together.

There seems little doubt about the attitude of the teachers. The Illinois State Teachers' Association in December, 1912, passed the following resolution:

"That vocational education should be so administered as to maintain the unity of the public school system."

### FRIEDMANN'S CURE FOR TUBERCULOSIS

While all eyes are turned toward Dr. Friedmann's widely heralded cure for tuberculosis, the disease recognizes no armistice and is steadily advancing. This is not the time for the forces arrayed against the white plague to mark time, declares the National Association for the Study and Prevention of Tuberculosis. The Executive Committee of the association emphatically pointed out this danger when some Ohio legislators wanted to halt the public tuberculosis campaign in that state until they ascertained the value of Dr. Friedmann's treatment.

The plan of the same legislators to appropriate state money for an investigation of the treatment was characterized as a "sheer waste." "If there is any value in the treatment, it will be determined by the United States Public Health Service investigation," the committee declared in a telegram sent to the supporters of pending tuberculosis legislation in Ohio. The message also expressed the hope

"that the bills now before the Ohio legislature, providing for adequate supervision of tuberculosis by the state board of health and for extension of hospital provision, visiting nursing, and education, will be enacted into law, and that no ill-advised temporary excitement will obstruct the progress of the campaign in Ohio which is proceeding on sound lines and in the only way which promises success in the future."

This may be assumed to be a message which the association would send to all communities where a similar situation exists. The official organ of the association, *The Journal of the Outdoor Life*, denounces the "abuse of publicity" by a syndicate which has

"flooded the country, and particularly the west, with extravagant accounts of the 'cures' accomplished in Berlin and which the most casual investigation shows to be still open to question. . . . There is no worse cruelty than to rouse false hopes in the army of struggling sick, and that bitter disappointment awaits thousands of eager sufferers is the strong probability in the present instance."

In New York, meanwhile, the Board of Health has refused him permission to treat patients in the hospitals under its jurisdiction. The unofficial explanation given for the step was that Dr. Friedmann has not yet promised to furnish the details necessary to a bacteriologist. These details were furnished by Ehrlich, Behring and Koch. Dr. Lederle, commissioner of health, has stated, however, that the board will make certain tests of the sample of his vaccine which Dr. Friedmann has turned over to it. The Federal Public Health Service will do the same.

## LABOR AND THE SHERMAN LAW

Since the decision of the United States Supreme Court in the Danbury hatters' case, organized labor has been in fear of the Sherman Law. In that case the court held that the boycott conducted by the hatters was an act in restraint of trade, and mulcted the union in triple damages. At the recent Rochester convention of the American Federation of Labor speakers asserted that the decision put the treasuries of all labor organizations in jeopardy and pointed to the fact that the United Mine Workers were being sued for \$750,000 under the Sherman Law. Several attempts have been made to get a bill through Congress exempting from the operation of that law labor unions and organizations of farmers. These have failed, however, and of late organized labor has been endeavoring to secure indirectly what it has failed to accomplish by specific legislation.

One of the last official acts of William H. Taft as President of the United States was the veto of the sundry civil appropriation bill, involving \$113,000,000. Of this sum \$300,000 was apportioned to the department of justice to use in prosecuting violations of the anti-trust law, but a rider had been attached providing that no part of this sum could be used in suits against organizations of working men or of farmers. The President vetoed the bill, criticising this particular feature of it as "class legislation."

Three years ago the matter came to the fore in exactly the same way. An amendment was attached to the sundry civil bill prohibiting the use of any part of the appropriation by the department of justice in the prosecution of organizations whose objects were to increase wages, shorten hours, or better the conditions of labor. It became known that the President was opposed to this measure. The Brotherhood of Locomotive Firemen and Enginemen happened to be in annual convention at just this time, and under instructions from the convention President Carter sent a letter of protest to the President. Mr. Taft's reply states his objections to the rider. A part of his letter follows:

"I am entirely opposed to such class legislation. If it was proposed to amend the language of the Sherman Anti-Trust Law itself so as somewhat to narrow its scope, that would present a proper question for consideration, but so long as the present anti-trust law remains upon the statute books, an attempt to modify its enforcement so as to render immune any class of persons, rich or poor, employers or employes, is improper legislation, and in my judgment ought to be opposed by your brotherhood. The laboring man and the trade unionist, if I understand him, asks only equality before the law. Class legislation and unequal privilege, though

expressly in his favor, will in the end work no benefit to him or to society."

The New York *Evening Post*, commenting on this year's attempt to exempt labor unions from the operation of the Anti-Trust Law, declares that "if the thing is to be done, there is just one regular and honest way to do it, and that is by amending the Anti-Trust Act so as specially to exempt labor unions and farmers' organizations." This attempt to accomplish indirectly the same end, says the *Evening Post*, "has now been blocked by Mr. Taft, and the question will be among the troublesome ones put over to the new administration. It will, however, require only courage and straightforwardness on President Wilson's part to deal with it satisfactorily."

## RECONSTRUCTING A PROBATION SERVICE

Exceptional attention has been given to the examinations for the position of probation officer of the Juvenile Court of Chicago, the results of which have just been announced by Judge Pinckney.<sup>1</sup> The decisions of the state Supreme Court, which excluded probation officers from the application of the civil service law, left their appointment in the hands of the circuit judges. They delegated the duty to Judge Merritt W. Pinckney. To assist him in examining the applicants, he appointed an advisory committee consisting of Mrs. Joseph T. Bowen; Sherman C. Kingsley; Rev. Father Quille; Mrs. T. J. Meder, president of the Federation of Catholic Women's Charities; and Dr. Emil G. Hirsch of Sinai Temple.

Sixteen applicants entered the competition for the position of chief probation officer. At the head of the list stood Joel DuBois Hunter, who for six years resided at Chicago Commons. He was at once appointed to fill the office.

Over three quarters of a thousand people competed for appointments as probation officers. Only 149 of these passed the written examination, and but eighty the oral test. Of the sixteen appointments already announced for the thirty-eight vacancies, nearly all had been in some form of philanthropic work. In the order of their standing the list includes a truant officer; a probation officer; a visiting housekeeper; a Jewish Aid Society worker; a United Charities employee; a colored woman student at the School of Civics and Philanthropy, who came from Fisk University and has worked with the Juvenile Protective Association; an adult probation officer; an agent for the Pennsylvania Children's Aid Society; and another probation officer from Springfield, Ill., who also graduated from the Chicago School of Civics.

<sup>1</sup>See Probation and Politics, THE SURVEY, March 30, 1912.

## INTERSTATE CONFERENCE TO FIX MILK STANDARDS

State Control of the Milk Industry and Bovine Tuberculosis were discussed at a conference recently held under the auspices of the New York Milk Committee at the New York Academy of Medicine. The conference was composed of delegates appointed by the governors of the New England and Middle States, representatives of the Public Health and Marine-Hospital Service, the Federal Bureau of Animal Industry, state anti-tuberculosis organizations, and officials of the health departments of several of the larger cities which receive interstate shipments of milk.

At the request of the committee each governor sent three delegates, representing respectively the state Health Board, the State Agricultural Department or Cattle Bureau, and the dairy interests of the state. The committee stated in its letter to the governors that several of the New England and Middle States are actively considering bills for the better control of dairy inspection; that the interests of the consuming public in this group of commonwealths are identical, and that a greater uniformity in the laws is needed.

The milk for Boston's morning cup of coffee comes from all of the New England states and from New York; New York city secures its supply from New York, New Jersey, Pennsylvania, Vermont, Massachusetts and Connecticut, while Philadelphia draws upon Delaware, Maryland, Pennsylvania, New York and New Jersey. It was further urged by the committee that the imposing of restrictions in one state which are more severe than those of its neighbor causes the latter to become a dumping ground for bad milk.

This move to further a more complete control of the milk industry is an indirect outcome of the appointment in 1911 by the milk committee of a national commission on milk standards. The findings of this body were published by the national government in the Public Health Reports (May 10, 1912), and have been made the basis for a great deal of the milk reform agitation during the past year.

A day each was devoted by the conference to the consideration of state control of the milk industry and of bovine tuberculosis. This program was planned to provoke discussion of the committee's plan for uniform state legislation fixing milk standards. The delegates approved of most of the propositions presented by the committee and agreed that the resolutions adopted at the conference should be made the basis for future legislation. The more important resolutions in substance were as follows:

That the inspection of dairy farms should be under the supervision of the state authorities;

That the state control of the dairy inspection should be centralized in the Department of Agriculture or the department having jurisdiction over live stock;

That it should be the function of the State Department of Agriculture, or department having jurisdiction over live stock, to perform the following work: Veterinary inspection of dairy cattle, including physical examination and tuberculin tests, sanitary inspection of dairy barns and their surroundings, water supply, drainage systems, etc.;

That the following work should be performed by the State Department of Health: Medical inspection of dairy employes and milk handlers at creamery and shipping stations; sanitary inspection of human dwellings, water supply, drainage systems, milk houses, shipping stations, factories, etc., and laboratory tests of milk;

That the control of local milk supply by municipal and town boards of health should include such duties as the issuance and revocation of licenses of local distributors, classification and labeling of milk, inspection of all places where milk is handled and sold, and the making of laboratory tests to determine the efficiency of pasteurizing machines and methods;

That it is unnecessary and inadvisable to demand the destruction of cattle reacting to the tuberculin unless they show signs of generalized tuberculosis, and finally;

That the dairy products from such cattle as react but do not show signs of tuberculosis on physical examination should be subjected to such measures as will render their products safe for the food of man or animal.

## CENTRAL COUNCILS FOR LARGE CITIES

Chicago is the first city of over a million people to consider a central council of social agencies. The subject was discussed at the meeting of the Social Service Club on January 20. The speakers were Eugene T. Lies, general superintendent of the Chicago United Charities; W. C. Cross, secretary of the Missouri State Board of Charities; and Francis H. McLean, general secretary of the American Association for Organizing Charities.

It was granted by those present that the need of an organization to bring about a constructive unity in the social work of private agencies, was just as necessary in Chicago as in a smaller place. It was further urged by the speakers that the business men of the city because of the hap-hazard individualism which now permits anyone to undertake a new work even if inopportune might rush into some narrow scheme of financial federation calculated to handicap development under present conditions. It was agreed that if a central council should be developed, it would probably have to be on a group plan, a delegate from each group of societies serving on the central committee.

## NEW TYPE OF RURAL SCHOOL

BOOKER T. WASHINGTON

In many sections of the South, the parents of rural Negro children are ignorant ex-slave folk whose lives have been spent entirely on farms. They know nothing of intelligent cooking or proper housekeeping, nothing of the rules of health. Broken chairs, floors with holes in them, broken windows, leaky roofs, ragged and

unwashed bedding, soiled dishes and table linen—these are the home surroundings of many of these children from infancy.

In view of these conditions, it early became clear to us at Tuskegee that if we really wished to dovetail school work into the real life of the people as a factor in their uplift, something more than the abstract teaching of cube root and verb conjugation should be offered in the class room.

In Macon County, Alabama, a plan is being carried out which seems a good solution of this problem. It was decided that, to be of the greatest service to the child, to combat his environment, not only a special class room should be provided but everything surrounding the child should serve to instruct. As an experiment we constructed a building on the order of our southern cottages, containing rooms for a family and, in addition, a large assembly room. A family, in which both parents were teachers, were obtained to live in the building. It was made clear to them that every room in the house and every thing about the house should serve as an object lesson; that front yard, back yard, stable,

horse, cow, garden and the little farm adjoining should have their place in the day's schedule of teaching.

Dining room, kitchen, and bedroom are used daily in teaching these children the different phases of housekeeping, they actually doing the work. The girls of a certain grade take turns at the cooking. They come to the cottage in time to prepare the morning meal for the teachers and family. This is properly served in the dining room which has been set in order by another group of little girls—the aim being that all shall learn the best methods of service. The pupils set the bed-rooms in order and look after the small children of the teachers. All this is done under the vigilant eye of the mother teacher, who is thoroughly competent, having been trained at Tuskegee Institute, mastering trades as well as academic work. The girls in the

higher classes are taught cooking, but all the girls receive instruction in gardening, housecleaning and sewing.

The boys come directly under the eye of the man of the house. They care for the small farm, the stock, yards and garden and do in addition a certain amount of farm carpentry. These are all real lessons with practi-

### RIISING STAR SCHOOL

Top picture shows school before improvement; center, school after remodelling. Bottom view, a domestic science class.

cal demonstrations quite as thoroughly explained as the black board exercises in the class room. We call it the Model School, meaning not that it is a model to any other school, but that everything in it and about it is a model to the girls and boys who attend.

A double purpose is served in the Model School. It fits the child for life in the community in which he lives and it affords material to give life to the exercises in his text books. The boy not only constructs the fence, but he figures out its cost—cost of nails, lumber, time—a live exercise in arithmetic. In his grammar lesson he uses words suggested by his

fence and writes short compositions on his work.

The same is true of the girl in the work of cooking, bed-making and table-setting. The tasks are done and then used to demonstrate the lessons in books. This gives real interest to the classroom work as both teachers and children feel that they are writing, talking and figuring on actual things.

To keep up interest in the school we frequently invite the parents to be present. They are made to feel that the school is a center for their activities. They become interested themselves, because their children in learning useful things are doing work that the parents understand and appreciate. They go home with information about cotton, corn, winter greens; about the care of live stock and soil. They gain some idea about washing dishes, setting table and putting a room in order.

The effect of the idea embodied in this school has been highly gratifying. A new light has come into the community which shows in the faces of many of the hard-headed old black folk, who used to be none too enthusiastic about education. The change is only in process, of course, but there are fewer rags in the windows of the community, fewer tumble-down fences. This training has taken nothing from the "book learning" of these children's education. Their teaching is thorough. In the Model School they complete the sixth grade, being admitted by certificate to the corresponding class in Tuskegee Institute. Some, preferring to take a written test, have made the next higher class. With this double training of mind and hand the children of this community are brighter and happier and are doing much to add sweetness and contentment to rural life.

## SOCIAL HYMNS WANTED

In response to Dr. Patten's editorial on the poetic expression of the social movement, *THE SURVEY* has received the following. Verses are still coming in and more are desired. Dr. Patten plans some general treatment of the subject when sufficient material is in hand.

TITLE	CORRESPONDENT
A communication .....	Fritz Tauber.
Humanity .....	Sarah Martyn Wright.
America Triumphant .....	John Haynes Holmes.
A Hymn of Justice.....	
The City of the Light, by Dr. Felix Adler.....	Dr. Henry Neumann.
America the Beautiful, by Prof. Katharine Lee Bates of Wellesley.....	Kate E. Putnam. Marion Pelton Guild.
The American .....	George E. Day.
Praise Service .....	O. D. Ehlers.
O God, Save Thy People, by Ebenezer Elliott.....	Frederic Almy.
Motherhood .....	
Today's Prometheus Bound .....	Isabel Kimball Whiting.
Peace Gifts .....	

TITLE	CORRESPONDENT
The Children's City.....	Rev. Charles O. Greshaber.
Thy Kingdom Come.....	James E. Clarke.
O Brother Christ.....	Ross W. Sanderson.
To a Trained Social Worker.....	E. H. I.
Verses .....	Rhea A. Smith.
Marching Song of Brother- hood .....	Margaret Sewall.
Oh, Hark for the Hour is Coming, (author unknown).....	Allan Robinson.
A World of Loving Men.....	Christopher Ruess.
Progress .....	
The Children of the Snow.....	H. A. Brandt.
Ultima Thule .....	
Ode to Social Justice.....	S. P. Quigley.
Ode to the Nation.....	S. E. Howard, M.D.
This Our Hymn of Grateful Praise, by Follitt S. Pierpoint.....	Ross L. Finney.
Poem on Child Labor.....	Emma D. Phillips.
Pilgrims .....	Mary Antoinette Cannon.
The Breath of Life.....	Francis McKinnon Morton.
Ode to Social Justice.....	
A Plea for and to Humanity.....	S. P. Quigley.
Prayer for Social Justice.....	
Song: It Seems to Me.....	

## EDITORIAL GRIST

### A HEALTH PROGRAM FOR NEW YORK STATE

WILLIAM H. ALLEN

Director Bureau of Municipal Research, New York

The political millennium is not so far away as we have been taught. At least its "rosy-fingered dawn" is here with assurance of a day that shall fulfill the promises of its early messengers.

My proof? The report of Governor William Sulzer's "special commission to collect facts, receive suggestions and make recommendations as to changes in the public health laws and their administration" for New York state.

Important enough for its statements of fact and its recommendations, this report is bound to have nation-wide by-products in new kinds of social service by state health and school departments; new conservation activities by rural districts; new direction for volunteer social service; and new ways of fulfilling pledges, making friends and disarming enemies by governors and other public officers.

Here in this report we have the most notable single program as yet enunciated by Governor Sulzer. It was drafted by a special commission—not merely non-partisan but *other-partisan!* Had a chairman been sought to excel in non-partisanship, none better could have been found than Dr. H. M. Biggs, whose professional and personal associates never think of him as having even party knowledge. Had a Democratic governor sought a secretary and assistant secretary to excel in opposition to Tammanyism and to old style and new style Democratism, he could

hardly have found more ardent Bull Moosers than Homer Folks and John A. Kingsbury, known first, however, to New York state as enemies of disease and maladjusted industry and government. M. Adelaide Nutting as a representative of the nurses, Ansley Willcox and Doctors E. R. Baldwin, W. E. Milbank and John C. Otis complete the commission.

Appointed January 10, the commission reported in part on February 15. In the meantime it held ten public hearings, received suggestions and information from sixty persons, wrote 836 typewritten pages of testimony, communicated with 1,033 health officers in 1,435 towns and villages, analyzed replies from 652 health officers, addressed forty-eight municipal health authorities, and analyzed the replies from twenty-eight.

This is the governor's summary of the special commission's recommendations:

1. That the tenure and compensation of the state health commissioner be such as to secure and retain the most efficient man in the state for that service, and that he be required to devote substantially his entire time to his official duties.
2. That a public health council be established with power to adopt sanitary regulations
3. That the state commissioner of health exercise supervision over local health authorities and be specifically charged with the enforcement of the public health law
4. That the state, outside of New York city, be divided into at least twenty sanitary districts with an expert sanitary supervisor in each devoting full time to health work
5. That the duties of town and village health boards otherwise provided for be transferred to town boards and village boards of trustees
6. That health officers of towns and villages receive an annual minimum salary equivalent to at least fifteen cents per inhabitant of the village or town
7. That health officers of towns and villages be charged with the following duties: (1) Annual survey and a continuous supervision of their districts; (2) examination of all school children; (3) inspection of all school buildings and places of popular assemblage; (4) popular education as to public health; (5) securing full registration of communicable diseases and of births and deaths; (6) enforcement of public health laws and regulations
8. The enactment of a modern statute for birth registration and other vital statistics
9. Authority for each city, county, village and town to employ trained nurses, as infant welfare nurses, school nurses, tuberculosis nurses, and to visit the sick

10. That the tuberculosis law be amended so as to provide (1) for more complete reporting of cases; (2) for supervision of reported cases by trained nurses; (3) for compulsory removal and detention of dangerous cases
11. Additional state provision for incipient cases of pulmonary tuberculosis
12. That a bureau of child hygiene, and a bureau of public health nursing, be added to the state department of health
13. County hospitals for tuberculosis where not already established
14. Adequate laboratory facilities readily available for all health authorities
15. Establishment of contagious disease hospitals by local authorities, and their inspection by the state health department
16. Regulation of midwifery
17. Reports of health officers made presumptive evidence of facts stated
18. Extension of educational work of the state department of health
19. Encouragement of courses in sanitary science in educational institutions

Omit the name New York and these nineteen recommendations would with one or two exceptions fit almost any state. There is still time to have your governor propose them for your state. Similarly the findings upon which the recommendations are based accurately describe conditions in most states although it is only fair to many of our smaller states to confess that especially in its educational work the New York Health Department is not only behind the best but probably below the average.

May I confess to a slight disappointment because (1) the city of New York is specifically exempted from the supervision of the proposed State Department of Health; (2) because the commission has not recommended the transfer of the quarantine service from New York state to the United States government and the consequent release of almost as much money as it would require to carry out all the recommendations including treatment of tuberculosis; (3) because the physical examination of school children is placed with health officers rather than with school officers in the smaller communities; (4) because \$10,000 is suggested as necessary to "secure a physician or recognized authority in public health work"; (5) because the relation of the state health service to clean milk is not quite clear; (6) because the report seems to concede, what facts actually disprove, that without any reorganization and with its present powers New York's state health office could have accomplished vastly more by way of health promotion and education?

## THE NEW ADMINISTRATION

Both the President's inaugural address, voicing as it does the spirit of the new administration, and the personnel of his cabinet, the ten men who, above all others, he must count upon to translate that spirit into action, are of unusual concern to all those at work for social advance.

The inaugural address deals only in the broadest terms with the sphere of legislative effort, but there is no mistaking its vivid characterization of evils, its appeal to the sense of justice and right with which the nation started, and its plea for a mustering of the forces of humanity and of "all honest men, all patriotic, all forward-looking men."

Says the President:

"We have been proud of our industrial achievements, but we have not hitherto stopped thoughtfully enough to count the human cost, the cost of lives snuffed out, of energies overtaxed and broken, the fearful physical and spiritual cost to the men and women and children upon whom the dead weight and burden of it all has fallen pitilessly the years through. The groans and agony of it all had not yet reached our ears, the solemn, moving undertone of our life, coming up out of the mines and factories and out of every home where the struggle had its intimate and familiar seat."

The changed conditions of our national life, the effort to get our bearings anew, and to steer our course accordingly are pointed out:

"No one can mistake the purpose for which the nation now seeks to use the Democratic Party. It seeks to use it to interpret a change in its own plans and point of view. Some old things with which we had grown familiar, and which had begun to creep into the very habit of our thought and of our lives, have altered their aspect as we have latterly looked critically upon them, with fresh awakened eyes; have dropped their disguises and shown themselves alien and sinister. Some new things, as we look frankly upon them, willing to comprehend their real character, have come to assume the aspect of things long believed in and familiar, stuff of our own convictions. We have been refreshed by a new insight into our own life."

Service of the people through government is emphasized as the great new task which we are only beginning to set ourselves to work out:

"Nor have we studied and perfected the means by which government may be put at the service of humanity, in safeguarding the health of the nation, the health of its men and its women and its children, as well as their rights in the struggle for existence. This is no sentimental duty. The firm basis of government is justice, not pity. These are matters of justice. There can be no equality of opportunity, the first essential of

justice in the body politic, if men and women and children be not shielded in their lives, their very vitality, from the consequences of great industrial and social processes which they cannot alter, control, or singly cope with. Society must see to it that it does not itself crush or weaken or damage its own constituent parts."

The newer righteousness is proclaimed in these words:

"Justice, and only justice, shall always be our motto.

"And yet it will be no cool process of mere science. The nation has been deeply stirred, stirred by a solemn passion, stirred by the knowledge of wrong, of ideals lost, of government too often debauched and made an instrument of evil."

And a stirring call for support and service rings out in the last paragraph:

"This is not a day of triumph; it is a day of dedication. Here muster, not the forces of party, but the forces of humanity. Men's hearts wait upon us; men's lives hang in the balance; men's hopes call upon us to say what we will do. Who shall live up to the great trust? Who dares fail to try? I summon all honest men, all patriotic, all forward-looking men, to my side. God helping me, I will not fail them, if they will but counsel and sustain me!"

If the new administration is a gauge of the temper of the American people, the watch-words with which isolated men and women have been heartening each other in the slow task of social reconstruction, and interpreting of the "solemn, moving undertone" of the life about them, have become the shibboleths of an epoch of internal statesmanship.

The general feeling among social workers is that individually and as a body the new cabinet may be counted upon to be progressive in its attitude toward social measures,—Bryan, whose sympathy with the common needs and aspirations of the great mass of plain folk has never been clouded by his elevation to leadership, nor embittered by disagreement with his policies; McAdoo, who not only outwitted the engineers of New York by tunnelling the Hudson, but gave a new slogan for public service corporations—"The public be pleased"; Lane, who brings a record of independence and force on the Interstate Commerce Commission to the portfolio of the Interior Department, to which Walter L. Fisher has rendered such aggressively efficient service; McReynolds, who has been associated with Mr. Wickersham in an administration which has not only set a new standard of trust prosecution, but has shown social perspective in its attitude toward white slavery, the treatment of federal prisoners, etc.; Houston, who brings the training of a political economist to the Depart-

ment of Agriculture; Garrison, who is hailed by the peace advocates who did not want a militarist at the head of the War Department—and so on to the end of the list.

The one unexplained gap is the absence of Louis D. Brandeis of Boston, whose name had been on the anticipatory lists until just before the inauguration. If the size of a man is to be gauged by the enemies he makes, the antagonism at this juncture of the interests—professional, political, business—which Mr. Brandeis has fought in his campaigns as “attorney for the people,” was a rare tribute to the man. His absence is the question mark which social workers have put over the Wilson administration, until the broad terms of the inaugural address are translated into action.

Social workers are, of course, especially interested in the change whereby the former Department of Commerce and Labor has now become two departments, and in the men selected to head them. The new secretary of commerce, Mr. Redfield, is a manufacturer known not only as an indefatigable free trader but for his breadth of view, his cordial relations with employees and his optimistic vision in the field of labor conditions. Work in his plant has meant livelihood—not for a day or a decade, but for a lifetime—for scores of men; there have been few managers so outspoken and vigorous in asserting that low labor costs and progressive labor conditions go hand in hand.

The new Department of Labor, which is composed of four bureaus heretofore in other departments—the Bureau of Labor, Bureau of Immigration, Children's Bureau, and Bureau of Naturalization, has for its first secretary William B. Wilson, author of the bill creating the department. Particular interest attaches to the fact that he went to work as a miner at the age of nine and served as secretary of the United Mine Workers of America at the time when John Mitchell was president of the organization and thus served during the great anthracite strike of 1902. Mr. Wilson was chairman of the House Committee on Labor of the Congress just closed—a session in which with the new Democratic backing, more labor legislation was passed than for years preceding. Among these measures are the “phossy jaw” act, the extension of workmen's compensation, the creation of the Commission on Industrial Relations, and the eight-hour law for government contract work.

One of the first acts of the new President—undoubtedly with the cordial desire of the new secretary—has been the reappointment of Commissioner Charles P. Neill who will head the new Bureau of Labor Statistics and resume his arbitration work under the Erdman Act.

## TREND

### PEBBLES

DENNIS A. MCCARTHY in the *Journal of Education*.

When you read about the trouble in the mine and in the mill,

When you read about the lockout and the strike;  
When dishonor and dishonesty your morning papers fill  
In a way no decent citizen can like;

Then there comes a strong temptation to have doubts  
about the nation,

And to fear some dark disaster in the fogs;  
But take heart, my honest fellow, don't you show a  
streak of yellow,

For this country is not going to the dogs!

When you read of rotten politics in city and in state,  
When you read of juggling justice on the bench;  
When the price of food makes leaner every day the poor  
man's plate,

When the social muck is making quite a stench;  
Then a man may fairly wonder if there hasn't, crime or  
blunder,

Been a monkey-wrench dropped in among the cogs;  
But a state of abject terror is a most colossal error,  
For this country is not going to the dogs!

For this good old ship, America, has weathered many a  
gale,

She has sailed thru many a thicker fog before,  
And her crew have learned the habit of not knowing how  
to fail,

Howsoever the stormy seas around may roar;  
She is staunch and stout and roomy, and tho seas and  
skies be gloomy,

Let us leave all coward croaking to the frogs,  
Let us face in manly fashion all the panic and the pas-  
sion,

For this country is not going to the dogs!

\* \* \*

“TIM” CALDWELL Co-operator is a true story of collective ownership by F. P. Stockbridge in the *World's Work*. He tells of Lakefield, Minn., and the man who is responsible for its being the “most completely co-operative community in the United States.” Practically all its rural needs are community owned.

\* \* \*

A FARM hand had worked in the field from dawn until darkness, doing the chores by lantern light. “I'm going to quit,” he said to the farmer, at the end of the month. “You promised me a steady job.”

“Well, haven't you got one?” was the astonished reply.

“No,” said the man; “there are three or four hours every night that I don't have anything to do, and fool away my time sleeping.”—*Western Architect and Builder*.

\* \* \*

SPENCER J. GIBB, writing in *The Child* (London) reviews the special perils of the working boy. These are economic waste in the dead end uneducational trades; forced maturity, which suppresses the spirit of boyhood, and substitutes knowingsness for the acquirement of knowledge; and physical overstrain, which stunts the immature body. He notes among the forms of physical strain to which the working boy is subjected the excessive amount of walking which many of them have to do, and gives one case where an office boy's record, kept on a pedometer for a week, showed that he averaged twenty-eight miles a day in the performance of his work.

To save from moral, mental and physical overstrain Mr. Gibb recommends protective labor legislation, vocational training with part time work up to seventeen years, and the furnishing of opportunities for club and social life.

\* \* \*

ONE by-product of the Lawrence Strike and the legal proceedings at Salem; the San Diego vigilantes; the jailing of Mayor Lunn of Schenectady and other like happenings has been an outpouring of verse in the radical press, for which religious and secular history have been rifled for analogies. Many have been crude; some have been of the sort not easily to be tossed aside. Of such, is *The Outcast* by Reginald Wright Kauffman in the *International Socialist Review*:

#### THE OUTCAST

They would not hear him. How they smiled  
That he, who talked with courtesans,  
Who said: "Be led as by a child,"  
Who supped with low-browed publicans.  
Should dare to preach! A hare-brained boor,  
A rustic in a city stew!  
They could not listen—that was sure—  
They could not listen then; can you?

And when he turned to violence,  
Assaulting brokers—men of peace—  
The priests themselves, in self-defense,  
Surrendered him to the police—  
A sweat-stained working-man to them,  
They jeered him up the hill of death:  
This carpenter of Bethlehem,  
Jesus, this chap from Nazareth.

What has been shall be; so today  
In strict accordance with the law  
We hoot the jay and turn to slay:  
We send our Christs to Golgotha;  
Where rotting hovels bring the rents,  
Where there is darkness and disgrace,  
Where there are "model tenements,"  
We keep the rascals in their place.

And so, in children bleached by toll,  
In working-women starved to shame,  
In farm-hands fettered to the soil,  
In trades you scarcely dare to name,  
In shop and office, mine and mill,  
With bloody brow and riven side,  
With hands that wrought your safety still  
Writhes Labor, crowned and crucified.

\* \* \*

A WRITER in *Men's Wear* attacks the "ink-raker" who in his opinion, has, of late, sought to "increase his circulation" by an attack on the department stores. He believes that such writers do more harm than good to the saleswomen they seek to befriend by misrepresenting the conditions under which they work. Says he:

When a magazine finds a merchant who transgresses morally, I am for the magazine dealing with him faithfully and fearlessly; and publicity such as they give it may serve a wholesome end, and as a warning for bad men.

But when the magazines seek to raise questions of economic responsibility, and rest their charges on unsound foundations; when they explain in language all too plain for young women to read that it is impossible to be good, for lack of a living wage, then are they damaging the cause they assume to serve. The most selfish man, the most greedy, as well as the most just merchant in

this land, want efficient saleswomen, and efficient women are well paid, and I defy the magazine man to successfully contest that statement. I appeal to the magazine man who prints so much of this mischievous and insidious stuff, so damaging to the girl, to use better logic. Who will dare tell you and me what a green, undisciplined, untrained, stubborn girl is worth; and can any thinking person claim that the merchants of this country owe her a living wage? What will Mr. Magazine Man offer such a one for the work she, as a beginner, can perform in his office?

I tell you, Mr. Magazine Man, that you are opening the door of restraint; breaking down self control; giving the weak girl a plausible excuse for selecting what appears for the moment the line of least resistance; an easy way of escaping from the path of rectitude.

\* \* \*

#### QUESTION

ALFRED TENNYSON.

"A voice spake out of the skies  
To a just man and a wise—  
'The world and all within it  
Will only last a minute!'  
And a beggar began to cry,  
'Food, food, or I die!'  
Is it worth his while to eat,  
Or mine to give him meat,  
If the world and all within it  
Were nothing the next minute?"

#### ANSWER

WASHINGTON GLADDEN in *Collier's Weekly*.

If the world and all within it  
Could only last a minute,  
A voice from beyond the sky  
To the good and wise would cry:  
"Let the last minute shine  
With the light of a grace divine;  
Let the hungry see thee stand  
With a loaf in the helping hand;  
So the world and its works shall end  
With the benison of a friend."

\* \* \*

THE vital task of social science today is, in the opinion of Albion W. Small, to confirm or remove the suspicion that the capitalism of our day is destined to undermine our social system as the latifundia system did that of Rome. The task will not be finished, he said in a recent address as president of the American Sociological Society:

without the co-operation of all our social sciences from the historical, functional, moral, and instrumental standpoints. The indicated function of social science is to be the chief organ of social self-examination. The changed outlook of the social sciences since the eighteenth century discredits the social science which is content to let eighteenth century social interpretations stand unimpeached by twentieth century conditions. We are in danger of mistaking capitalism mitigated by patriarchalism for capitalism corrected in principle. In no period of history has it been possible for social scientists to perform more fundamentally constructive public service than present conditions throughout the world demand.

## COMMUNICATIONS

### WIDOWS' PENSIONS IN NEW YORK

TO THE EDITOR:

While the discussion on widows' pensions in *THE SURVEY* has been made as widespread in its scope as it is general in its interest, the Association of Neighborhood Workers believes that it would be well to say a word in regard to the New York state situation.

The association wishes to record itself as favoring a department of home assistance as defined in the Levy Bill No. 744. We also intend to inaugurate a movement for the appointment of a commission to study this question as a part of the greater problem of public insurance.

While opinions on the proper method of dealing with this subject vary, the principal parts are clear enough to warrant immediate action pending a more scientific solution that should result from a study of public insurance. The death of the wage-earner brings many a family to the line of dependency. Heretofore we have either forced the mother of such a family to seek work outside or bring it into the home, or we have relieved her of the burden of the support of her children by placing them in public institutions or in other private families.

All four methods are ineffectual and costly, and usually serve but to add to the misery and degeneracy of those from whom death took their natural protector. For years the private relief societies have striven to relieve the distress of worthy widows but despite their most valiant efforts such relief has admittedly been inadequate.

Thus we see that even in those exceptional cases in which a plan of family rehabilitation can be worked out and put into practice there is not sufficient money to make unnecessary the use of these other makeshifts. As a consequence society has almost forced the widow to earn sufficient for her children's training at the cost of the home, or to drive from that home the children she should train.

We wish to amend the Levy bill by striking out those sections that deal with the payment of public moneys to private societies. Undoubtedly the intention of this indirect method of distribution was to guarantee the proper standard of investigation and service, but while we realize the dangers of improper or inadequate inspection we feel that they are not as great as those attendant upon the subsidization of private societies by the public treasury. Surely the fact that the board of this newly created department is to be composed of persons nominated by the large relief societies will be adequate to secure full and effectual co-operation between the public and private agencies.

We do not think that this bill will ensure a return to the evils of the old time system of outdoor relief. We believe rather that it is a

great step in advance in the ever enlarging development of the social conscience as expressed in government. The state must spend every effort to keep the family together in all cases save where degeneracy or disease make special treatment necessary. We believe that the establishment by legislation of such a principle is timely and therefore intend to work for the passage of this bill with the suggested amendments.

However, we feel it is more important that a demand should result in the appointment of a competent commission to make a searching study of the situation and recommend a comprehensive plan of public insurance which will provide for all worthy citizens who become dependent upon us without the taint of private charity, or the taunt of public pauperism.

MARY K. SIMKHOVITCH,

[Chairman Committee on Widow's Pensions, Association of Neighborhood Workers.]

ALICE ROBBINS,

ANNA REED,

RICHARD NEUSTADT,

[Secretary Association of Neighborhood Workers.]  
New York.

### THE NEW YORK FIRE BILLS

TO THE EDITOR:

The article by H. F. J. Porter on the fire bills of the New York State Factory Investigating Commission in *THE SURVEY* for February 22 might mislead those who have not seen the bills. It is hard to comprehend how one who has read the bills understandingly could say: "Nor will the recommendations in the legislation proposed by the commission in the five bills above referred to affect this condition materially," i. e., the conditions which were responsible for the Asch building fire.

The provisions of the bills are summarized in part by Frances Perkins in the same issue of *THE SURVEY*. These bills afford just what Mr. Porter demands: "Measures . . . to cure these conditions and to prevent their future recurrence."

In actual fact they largely follow his own recommendations to the commission published in the preliminary report in 1912. Mr. Porter nowhere states in what respect they fall short so as to justify his sweeping assertion that "The commission has failed to fulfill the chief object of its creation"; except in so far as he charges by implication that the bills fail to meet what he regards as the necessary requirements of such legislation.

These he gives as follows: "A law should be drafted requiring architects and builders to design buildings so that they may be emptied within a reasonable time, say three minutes. Before being accepted by the proper authorities, the law should require these buildings to pass an emergency exit test and to provide for periodical exit tests to insure the maintenance of safe conditions."

The bills introduced by the commission do this very thing and go even further. They not only require buildings to be so constructed as to

be readily emptied, and prohibit the employment of more persons than can escape by the existing exits, but they require them to be so constructed and maintained as to guard against the occurrence of fire at all. Legislation which would confine itself to getting people out of a factory after a fire has started, as suggested by Mr. Porter, would rest on a basis both narrow and unsound. It is far more important to prevent fires from occurring.

The commission's bills do both: They seek to prevent the occurrence of fire and they provide for the escape of occupants of a building if one does occur.

The first object, the prevention of fire, they encompass by requiring (1) all future factory buildings over four stories in height to be of fire-proof construction; all over one story to have incombustible roofs and cornices and other structural requirements partly contained in the bills themselves and partly left by them to the industrial board; (2) factories to be kept free of all unnecessary inflammable material, to guard gas jets and other like maintenance requirements; (3) automatic sprinklers where manufacturing is carried on above the seventh floor so as to put out a fire in its incipency.

The second object, the escape of occupants in case of fire, is provided for by requiring (1) sufficient exits and of sufficient size and character to afford means of egress for all the occupants, the exit requirements being based on the number of occupants; (2) the safeguarding of exits by separating enclosures and other structural requirements stated more fully in Miss Perkins' article above referred to; (3) preserving free means of access to all exits, both from every employe's station to the exit and from the exit to the street; (4) fire alarm signal systems to apprise the occupants promptly of a fire; (5) periodical fire drills to familiarize employes with the location of exits and with the use of them. These provisions, if observed and enforced, will insure every factory building being readily emptied in case of fire.

Tests and investigations to determine whether these requirements are complied with are also provided for. It is made the duty of the commissioner of labor to enforce these provisions and he is given in the reorganized Department of Labor a force adequate for that purpose. He and his representatives are given power to inspect all factory buildings, to pass on all plans for construction and alteration and to see to it that the law is obeyed. The fire commissioner in New York city and the state fire marshal elsewhere is charged with the duty of enforcing the requirements as to automatic sprinklers and other fire extinguishing appliances and of supervising and regulating fire drills. It is made a misdemeanor to conduct a factory in any building not conforming to all the requirements of the law.

These provisions are merely the minimum requirements. It is impossible to write into a statute detailed regulations applicable to all kinds of factories or factory buildings under all con-

ditions; and, therefore, the Industrial Board is empowered to supplement these minimum requirements by such rules and regulations as it may from time to time deem necessary after public hearings.

This comprehensive plan would seem to meet all the exigencies of the situation. Wherein does it fall short? Mr. Porter does not say. Perhaps his real objection is that the bills accomplish too much rather than too little. Is it possible that he would be taken literally and that he would advocate a statute which should merely provide in substance: "All buildings shall be so designed that they may be emptied within a reasonable time, to be determined by emergency exit tests and periodical exit tests?" Would he prefer such an abstract declaration of principle to a set of statutes and rules and regulations which inform architects, builders and factory owners how they must design, construct and maintain their factories, so as to enable them to be readily emptied? If so, the proposition is hardly worth discussing. It would amount to preferring a declaration of principle to an enforceable statute, and a pious wish to a legislative command.

LAWRENCE ARNOLD TANZER.

[Legislative draftsman, N. Y. Factory Investigating Commission.]

New York.

## THE UNITED STATES ARMY

TO THE EDITOR:

I have been receiving your publication for the last year, through the courtesy of a friend. Your fairness in publishing Archibald Hopkins' letter<sup>1</sup> criticizing your selection in *The Trend* relative to the United States Army influences me to continue my subscription for another year.

When the majority of citizens in any country lose faith in the existing forms of government, change must take place, but few believe in the permanence of any condition without systematic regulation. In other words, the brains and brawn of any state will assert themselves in uniting to support a dictatorship in preference to anarchy. The industrial civilization demands the same basic fiber as the militant; honor, courage, fidelity and subordination to proper authority. The most dominant trait of all malcontents is insubordination. The suggestion that "who knows but this boy may be President" has led many boys to "look down and not up," preparing the way for an army of generals. If the boys constituting the "gangs" of our large cities, were subjected to army or navy discipline during the formative period of their lives, they might become useful and valued members of society. I contend that enlistment in either branch of our service, is an evidence of sound common sense and is an honor and dignity to every man wearing the uniform of "our United States."

SEYMOUR CUNNINGHAM.

LITCHFIELD, Conn.

<sup>1</sup>See *THE SURVEY*, January 11, 1913, p. 483.

## FARM COLONY FOR NEW YORK

TO THE EDITOR:

It was reported in *THE SURVEY* of November 23 that the Board of Inebriety had acquired a farm in Orange County, near Greycourt, to be used as a site for an industrial and farm colony for the care and treatment of inebriates. This announcement was premature and caused regret as at that time it was thought the site would have to be abandoned because of a defect which was discovered in the title to the premises.

I am now glad to state that on February 4 title to all the land of the farm was vested in the board, together with eight acres of land under water of Wickham Lake, and that an arrangement has been made to acquire an additional 130 acres of land under water of the lake as soon as the title to it has been perfected.

Architects have been selected and are now employed in the preparation of plans for the proposed buildings.

The board is deeply appreciative of the fact that no part of its functions can be exercised "until it shall have certified in writing to the mayor that the hospital and industrial colony is ready to receive inmates," and will do everything possible to bring this about without delay, in order that the city may obtain the advantages contemplated in the establishment of the Board of Inebriety.

CHAS. SAMSON.

[Executive Secretary, New York Board of Inebriety.]  
New York.

## THE SURVEY AND THE PULPIT

TO THE EDITOR:

Your issue for February 8 contains a communication from an Ohio clergyman which aroused my interest. This letter leads readers to infer that the use of Strong's Studies in Social Christianity and the reading of *THE SURVEY* brought on criticism which led to this clergyman's removal from his pastorate.

I fear that these statements will strengthen a wrong impression, so I hasten to correct the belief that ministers are not free to preach as they feel led of God. For almost nine years I have had the inestimable privilege of expounding living truths from Baptist pulpits. During most of this time I have read *THE SURVEY*. I have never kept quiet on any matter of public responsibility whenever I have felt it my duty to speak out fearlessly. I cannot now remember that any one, either officer or member of the church, has ever called in question, directly or indirectly, my freedom of speech.

I have had churches East and West, in town and city. They have contained farmers, workmen, and business men. The last church I ministered to was in Detroit. The members were mostly workmen who were employed in an automobile factory. There I was free to touch on subjects of industrial and sociological import.

In my present charge I found a situation strik-

ingly different. The membership of this church includes eight families whose wealth figures from \$100,000 to \$1,000,000. There are also working people who own their homes and scores of poorer men and women. The chairman of the board of trustees is the president of the First National Bank, while the head of the board of deacons is the janitor of a number of buildings including the church itself. I believe like situations can be found in many churches. From my pulpit I have declared that the administration of justice in our country is defective. I have preached in the presence of the wealthy that, in the last analysis, wealth belongs to the people and that it must be used for their good. No word of criticism has ever reached me, and no one has ever tried to influence me to drop any subject.

I myself am Hungarian born and came over in the steerage thirty years ago. I was bred in the home of a poor immigrant and I think I understand the burdens of the poor. It is a matter of tremendous satisfaction to me that so many of my members are active along almost every line of public service. One is president of the Parent Teachers' Association which has just persuaded the electorate to buy a piece of real estate for a children's playground and which has raised the money to stock it with apparatus, two are members of the probation board which has done excellent work in protecting young girls, a number are back of the Coffee Club which provides reading and rest rooms for men and women.

My only excuse for this letter is that I believe whole-heartedly in the church of Jesus Christ, and sometimes I cannot but wonder what would be the effect on all reform and social betterment movements if this most wonderful of all organizations should cease to be.

F. I. DREXLER.

[Pastor First Methodist Church,]  
Willows, Cal.

## INDUSTRIAL HYGIENE

TO THE EDITOR:

*THE SURVEY* for February 8 contains a statement by Dr. Winthrop Talbot (p. 638) to the effect that the only course in this country on the subject of industrial hygiene is the one given in Teachers' College, under Prof. C. E. A. Winslow. As I am a physician who is training himself for public health work, and am especially interested in industrial hygiene, I should like to correct this. I know of at least one other such course, for I am myself studying this subject at the Massachusetts Institute of Technology, under Prof. S. M. Gunn. The course here is a comprehensive, admirably presented series of lectures extending through one and one-half terms of the year, and covers both industrial diseases and industrial accidents. Lectures are given on the trade poisons, mining and railroad accidents, industrial insurance, occupational tuberculosis, ventilation of factories and machine guarding.

DONALD B. ARMSTRONG.

Boston.

## JOTTINGS

### ONE EFFECT OF POSTAL SAVINGS SYSTEM

International postal money order business decreased nearly \$12,000,000 during the past year. The decrease was due almost wholly, according to postal authorities, to the operation in this country of the postal savings system. In the two years preceding the establishment of the system, international money order business increased at the rate of \$12,000,000 a year. In the 13,000 postal banks the deposits now aggregate \$35,000,000. Postmaster-General Hitchcock believes that the total during this fiscal year will reach \$50,000,000.

### COMMISSIONER OF SOCIAL WELFARE SUGGESTED

A commissioner of social welfare whose duties would be to investigate social conditions in rural and urban communities, has been proposed in a bill introduced in the New York legislature by Assemblyman Bovey. The holder of this novel position would endeavor to bring about neighborhood co-operation in civic and social affairs calculated to "promote the well being of the community and the individual." The commissioner's salary is fixed at \$5,000 a year with \$3,000 for traveling expenses.

### SCHOOL CHILDREN FARMERS

A bulletin of the Federal Department of Education describes how twenty-two school children of Driver, Va., paid the expenses of a vacation trip to Washington out of the profits of their individual school farms.

"Further inquiry," says the bulletin, "showed that this is not the first time the children have learned that intelligent farming brings in a cash return. Each student makes regularly a profit of from \$25 to \$100 on the individual garden patch he cultivates. In addition, the children help in working a school farm, which after paying all expenses, including the wages of a man who serves both as a farm-hand and school janitor, shows a profit of about \$200. The director is confident that with a seventy-five-acre farm, which he hopes to have soon, his boys will be able to earn their own living entirely while attending school."

### LESSON IN CIVICS FOR THE EAST SIDE

A lesson in civics for the East Side—that is what some have called the series of municipal departmental exhibits which was recently opened in New York by the University Settlement. Profiting by the experience gained from the municipal budget shows of 1910 and 1911, the settlement is trying by a graphic exhibit to show the fledgling citizens of New York's Ghetto just what Father Knickerbocker does for their benefit.

The first of the series was conducted under the auspices of the Tenement House Department. Besides supplying material indicating some of the forms of dilapidated buildings that it has to guard against as well as the sanitary evils it is

fighting, special evening meetings were held for the benefit of various organizations which emphasized such subjects as the methods for preventing fire.

Among the groups which were addressed by John J. Murphy, tenement house commissioner, and representatives of the Tenement House Committee of the Charity Organization Society, were the clubs of the settlement, the janitors and landlords, clubs from neighboring settlements and recreation centers, residents, business men, social workers and the League of Settlement Mothers' Clubs.

A year ago the settlement undertook to exhibit a survey of the neighborhood from the standpoint of housing conditions. The results of this survey were tabulated and put on maps so as to add a local touch to the exhibit. The exhibit is to be followed later by a loan from the Park Department and another from the Bureau of Weights and Measures with the aim of making the workings of these departments and their accomplishments more real to the neighbors of the settlement.

### ADULT PROBATION IN CHICAGO

The first annual report of the Adult Probation Office of Cook County, Illinois, is brief, but optimistic. One thousand and seventy-four persons, 431 of them being from seventeen to twenty years of age, were put on probation between Oct. 1, 1911, and Sept. 30, 1912. Of these, 860 remained on probation at the later date.

Of 235 who had passed from probation, 171 were reported improved, 42 unimproved, 1 dead and 21 committed. The optimism centers more, however, on the fact that those who were on probation and known to be working earned during September, \$30,-905.50.

Besides these money earnings thirty-one men were running their own business, sixteen were working but earnings not known, and forty-three were housewives and girls working at home. At this rate and adding the cost of keeping the probationers in jail and subtracting the cost of the probation service, a net money gain of \$439,970.04 to society is claimed for the year.

A fact challenging inquiry is the variation of from 1 to 128 persons put on probation by different judges of the municipal court.

ARTHUR P. KELLOGG, Secretary

The membership of the Survey Associates has passed the 500 mark as we go to press. That is pretty sturdy backing to this adventure of ours in co-operative journalism—the sort of backing that gives THE SURVEY its best chance of success.

Most of these members are co-operating subscribers at \$10 each. These pages are addressed this month to those whose means and interest warrant them in giving more, for it is to those of large means and constructive vision that we must look for a considerable share of our budget.

Our appeal this year was for a round \$20,000—a sum a trifle under the total contributions received the preceding fiscal year. But \$3,000 of that figure was an appropriation from the New York Charity Organization Society which could not be renewed to the new organization.

At the outset of the year, then, we figured that we could clear this \$20,000 on the new basis, if we

	1911-12	1912-13	
increased our co-operating subscriptions from	650	to 800	\$8,000
doubled our \$25. contributions	14	" 28	700
" " \$50. " "	6	" 12	600
" " \$100. " "	15	" 30	3,000
renewed all large contributions (over \$100)			8,350
			\$20,650

Five months have passed, and the showing is distinctly encouraging. We have secured

513	out of the 800	co-operating subscribers	\$10 each
14	" " "	28 contributors of	25 "
7	" " "	12 " "	50 "
14	" " "	30 " "	100 "

We have hopes of renewing all the small but interested group of contributors of over \$100. We are redoubling our efforts to enlist a full 800 readers as co-operating subscribers at \$10.

It is then on the response to our appeal for funds in amounts of from \$25 to \$100 that we must depend in rounding out this initial year. Can the Survey Associates complete it in a way commensurate with the opportunities before them? Since October 1 last, when THE SURVEY was launched as an independent venture, staff and council have been feeling their way. From 32 to 48 pages have been cut from the issues published each month as a measure of economy and safety. How much has been sacrificed in valuable material never published, in important chronicles which have come out belatedly, in constructive experience which could not be spread before social workers throughout the country, in quick staff investigations of matters which demanded investigation but which could not be attempted on our meager resources—only those who have been facing the problem from week to week at THE SURVEY headquarters know.

The "productive" months are fast slipping by. Now is the time when your contribution will count for the most.

# SURVEY ASSOCIATES, INC.

# DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but memberships not required of those seeking information. Correspondence is invited. Always enclose postage for reply.

**CHARITIES AND CORRECTION**—The Proceedings of the National Conference of Charities and Correction sent free to each member. **BUREAU OF INFORMATION** on any topic of philanthropy, penology and kindred subjects free to members. Alexander Johnson, Sec., Angola, Ind. Next meeting, Seattle, July 5, 1913.

**ORGANIZED CHARITY**—American Association of Societies for Organizing Charity. Francis H. McLean, gen'l sec'y., 105 East 22d St., New York City. To promote the extension and development of organized charity and of community co-operation in social programs in the United States.

**THE CHURCH AND SOCIAL SERVICE**—The Federal Council of the Churches of Christ in America operates through its Commission on the Church and Social Service. For literature and service address the Secretary, Rev. Charles S. Macfarland, 215 Fourth Ave. (at 18th St.), New York.

**STUDIES IN SOCIAL CHRISTIANITY**—*Jany.*: Poverty. *Feb'y.*: Wealth. *March*: Socialism. See the lessons for classes and individuals in *The Gospel of the Kingdom*, published monthly by the American Institute of Social Service, 82 Bible House, New York city. Price 50c. per year.

**EPISCOPAL SOCIAL SERVICE**—The Joint Commission on Social Service of the Protestant Episcopal Church. For literature and other information address the Field Secretary, Rev. F. M. Crouch, Church Missions House, 281 Fourth Avenue, New York City.

**UNITARIAN SOCIAL ADVANCE**—The American Unitarian Association through its Department of Social and Public Service. Reports and Bulletins free. Lecture Bureau. Social Service Committees. Rev. Elmer S. Forbes, Secretary of the Department, 25 Beacon St., Boston.

**METHODIST SOCIAL SERVICE**—Methodist Federation for Social Service; Literature; Bureau of Information, Speakers' Bureau; Reading and study courses; Invites all Methodists to extend its usefulness and use its facilities. Rev. Harry F. Ward, Sec'y., 2512 Park Place, Evanston, Ill.

**BAPTIST SOCIAL SERVICE**—Baptist Department of Social Service and Brotherhood. To study social questions, publish findings, suggest ways whereby Christian men may become socially effective, and co-operate with similar bodies. S. Z. Batten, Secretary, 1701 Chestnut Street, Philadelphia.

**CONGREGATIONAL SOCIAL SERVICE AGENCY**—*The Congregational Brotherhood of America*, Henry A. Atkinson, Secretary, 19 S. La Salle Street, Chicago, Ills. Programs and information furnished. Study Course: Speakers' Bureau; Publications. Service available for Institutes, Conferences and Addresses. Correspondence and inquiries invited.

**PRESBYTERIAN SOCIAL SERVICE**—Bureau of Social Service, The Presbyterian Board of Home Missions; Rev. Charles Steizle, Supt., 156 Fifth Ave., New York. Sociological surveys made. Clearing house for city problems of the Church. Correspondence Course in Applied Christianity. Methods for Church Publicity.

**THE AMERICAN SEAMAN'S FRIEND SOCIETY**—Rev. J. B. Calvert, D.D., pres. George McPherson Hunter, Sec'y. The national seamen's society has stations in the United States and abroad, relieves shipwrecked and destitute seamen. Annual membership includes all literature, \$5.00 a year. C. C. Pinneo, Treas., 76 Wall Street.

**REMEDIAL LOANS**—National Federation of Remedial Loan Associations, 31 Union Square, N. Y. Arthur H. Ham. Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

**SOCIAL BETTERMENT FOR NEGROES**—National League on Urban Conditions Among Negroes, 281 Fourth Avenue. E. R. A. Seligman, Chairman; G. E. Haynes, Director. Develops welfare agencies. Trains social workers. Aids travelers. Supports probation officers. Seeks industrial opportunities. Correspondence invited.

**NEGRO AND RACE PROBLEMS**—National Association for the Advancement of Colored People, 26 Vesey Street, New York. O. G. Villard, Chairman, Board of Directors; M. C. Nerney, Secretary; W. E. B. Du Bois, Director Publicity. Publishes Crisis Magazine. Investigation, Legal Redress, Literature, Lectures, Lantern Slides.

**IMMIGRATION**—National Conference of Immigration; Land and Labor Officials, 22 East 30th Street, F. A. Kellor, Sec. Information affecting aliens *after admission*, especially in reference to labor, land, education, protection and distribution. No matters of admission or restriction dealt with.

**IMMIGRATION**—North American Civic League for Immigrants, New York-New Jersey Committee, 95 Madison Ave., N. Y. C. Protection, Education, Distribution and Assimilation of Immigrants. Printed material furnished upon request. Grace E. J. Parker, General Secretary.

**IMMIGRANT GIRLS**—Council of Jewish Women (National) Department Immigrant Aid meets girls at docks; visits, advises, guides; has international system safeguarding. Work in Religion, Philanthropy, Education, Civics. Invites Membership. Address Sadie American, Exec. Sec., 448 Central Park West, New York.

**AID FOR TRAVELERS**—The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex. For literature address Orin C. Baker, Gen. Sec'y., 238 East 48th Street, New York City.

**SURVEYS AND EXHIBITS**—Department of Surveys and Exhibits, Russell Sage Foundation, 31 Union Square, New York City. A national clearing house for advice and information on social surveys and exhibits and for field assistance in organizing surveys and exhibits.

**PROBATION**—National Probation Association. The Capitol, Albany, N. Y. Arthur W. Towne, Sec'y. Advice and information; literature; directory of probation officers; annual conference. Membership, One Dollar a year.

**LABOR LEGISLATION**—Workmen's Compensation; Industrial Hygiene; Labor Laws. Official Publication: *American Labor Legislation Review*, sent free to members. American Association for Labor Legislation, 131 East 23d St., New York City. John B. Andrews, Secretary.

**PRISON LABOR**—National Committee on Prison Labor, 319 University Hall, Columbia University, N. Y. City. Thomas R. Slicer, Chn.; E. Stagg Whitin, Ph. D., Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

**SETTLEMENTS**—National Federation of Settlements. Develops broad forms of comparative study and concerted action in city, state, and nation, for meeting the fundamental problems disclosed by settlement work; seeks the higher and more democratic organization of neighborhood life. Robert A. Woods, Sec., 20 Union Park, Boston, Mass.

# THE COMMON WELFARE

## NATIONAL EFFORTS TO GET WORKMEN'S COMPENSATION

The failure of the Sutherland workmen's compensation bill for employes of interstate carriers to pass the House of Representatives at the last session of the Sixty-second Congress has brought discouragement to many persons who have been active in pushing this legislation. The measure has had many honest enemies and some dishonest ones. The most striking argument made for it was that of Representative D. J. Lewis of Maryland:

"In the coming year 90,000 men are to be injured on our railroads and 10,000 killed. That is as much to be expected as the orderly operation of the planets themselves. Under existing law less than one-third of these victims will receive some \$15,000,000, certainly not more than \$20,000,000, with their lawyers to pay. Under the bill that is presented to the House tonight all the victims will be compensated and that sum will be lifted to from \$48,000,000 to \$60,000,000 as a compensation to the victims of industry. We are confronted by a practical question. Are two-thirds of these victims to lose some \$40,000,000 next year because lawyers would like to adapt this measure to the old legal remedial forms of procedure rather than accept it as an adequate principle in itself?"

At the instance of the American Association for Labor Legislation, Representative W. B. Wilson introduced into the House, and Senator John W. Kern into the Senate, during the last week of the Sixty-second Congress a bill "to provide compensation for employes of the United States suffering injuries or occupational diseases in the course of employment." The bill will be reintroduced and pushed at the extra session of the Sixty-third Congress which will convene on April 7. It was drafted by experts after months of investigation and is designed to supplant the present law which went into effect on August 1, 1908. That act, which was the first of the kind in America, has been quite widely judged inadequate from the beginning. The maximum benefit allowed, even in case of total blindness or death, was only one year's wages. The Kern-Wilson bill is more liberal in its provisions and includes a unique feature—compensation for such occupational diseases as lead poisoning as well as for accidents.

In the meantime a system of workmen's compensation applicable to Canal Zone employes went into effect March 1. This system was established by Mr. Taft in accordance with a pro-

vision in the Panama Canal Act of August 24, 1912. His order was the result of a study of conditions peculiar to the Zone, and was drawn by officers of the government with the aid of Middleton Beaman of the Legislative Drafting Research Fund of New York. The evidence collected by the Federal Workmen's Compensation Commission, of which Senator Sutherland of Utah was chairman, was freely used.

The terms of the order, which is really the law of the Zone, abolishes the defenses of the old liability system and establishes automatic compensation regardless of fault except wilful negligence or intoxication.

Says Secretary of War Stimson:

"This measure for the first time brings the federal government abreast of the most advanced thought and experience of other countries in dealing justly with its employes at a time when they and their families are most in need of justice."

The rates of payment under the order are low. Death payments for a widow without child are 35 per cent of the monthly wages of the deceased for a period of six years, and between 20 and 30 per cent thereafter, the pension to be stopped at death or marriage. Ten per cent is added for each child up to a limit of 50 per cent. In the case of total disability the employe receives for the first six years 50 per cent of his monthly pay in monthly installments. Partial disability gives the employe a monthly compensation equal to 50 per cent of the difference between his monthly pay and his wage-earning capacity per month after the beginning of partial disability.

An interesting feature of the order is the fact that all employes, including those on salaries, come under its provisions. If the monthly pay of an employe is over \$200 that sum is considered to be his wage, and the compensation is adjusted on that basis. Provision is made for the commutation of periodical payment for beneficiaries who receive less than \$5 a month, who are not citizens of the United States, or who are non-residents of the United States. Such persons may receive a lump sum payment equal to two-thirds of all future payments of compensation. Section 28 of the order applies to attorney's fees, and declares that no claim for legal services in connection with any case arising under the order shall be enforceable unless approved by the governor of the Panama Canal.

## EIGHT-HOUR BILL FOR WOMEN WORKERS KILLED

In spite of the best efforts of its friends, the LaFollette-Peters eight-hour bill for women workers in the District of Columbia died in the last hours of the Sixty-Second Congress. It had succeeded in passing the Senate, though in amended form, but when it reached the House of Representatives it was referred to the Committee on the District of Columbia. From that committee the strongest force which the friends of the measure on the floor of the House could muster was unable to wrest it. Representative A. W. Lafferty of Oregon, in the midst of the confusing parliamentary wrangle over the status of the bill, thus clearly expressed the peculiar situation:

"Suppose every member upon this floor was desirous and anxious to pass this eight-hour bill, but the chairman of the committee over in the House Office Building was barricaded behind his doors, refusing to deliver the engrossed copy to the House, which in effect is what he is doing. Under the precedent which I have read it is in order for the speaker to entertain a motion to suspend the rules, to discharge the committee, and pass the bill. But under that precedent the speaker can not put the question upon the final passage until the engrossed copy is brought over."

Representative Lafferty thereupon attempted to get the House to order the bill out from the custody of the chairman of the House Committee on the District of Columbia, Representative Ben Johnson of Kentucky. Asked if he desired to explain his position, Mr. Johnson said: "No; I do not care anything about it." Whereupon Mr. Lafferty asked for immediate consideration of his order to discharge Mr. Johnson's committee. A page of the *Congressional Record* is filled with the motions for recesses and adjournments and other tactics employed to get rid of the eight-hour bill and to get at the appropriations. Representative Mann of Illinois, who aided in the obstructionist tactics, ironically summed up the situation in these words from the *Congressional Record*:

"What are the rules for, except to let us do what we want to do . . . ? [Laughter]. Necessity is the mother of invention. Force is the only power that controls. [Laughter]."

The eight-hour bill must now be reintroduced in both branches of Congress. Whether those in control of the policy of the committees will allow it to be taken up at the extra session, to be called for April 1, can not yet be ascertained. Congress, however, even at extra sessions called for special purposes, has usually proved itself responsive to public opinion and powerful pressure expressed through letters to the newspapers and to congressman and senators. The House

Committee on Labor and the Senate Committee on the District of Columbia have on hand a limited supply of printed copies of the hearings had on this bill.

## SOCIAL LEGISLATION OF 62ND CONGRESS

The social legislation passed at the session of Congress just ended was not especially extensive, and the failure of some important measures, including the compensation and eight-hour bills already referred to, is perhaps as conspicuous as the list of bills passed.

The hospital ship bill was killed in the House Committee on Merchant Marine and Fisheries. Little progress was made on the Booher bill giving states the power to prohibit the bringing of convict-made goods across their borders. The Seamen's bill passed the House but was so changed by the Senate Committee on Commerce that President Taft pocket-vetoed it. The immigration bill did not muster enough votes to triumph over its veto by President Taft. The Sutherland workmen's compensation bill for employes of interstate carriers failed to pass the House. The anti-injunction and contempt bills died in the Senate Committee. Mr. Taft vetoed the sundry civil appropriation bill because it contained a provision which in effect would have exempted labor unions and farmers' organizations from prosecution under the Sherman anti-trust act. Senator Kenyon's bill to establish, through federal control of interstate commerce, the eight-hour day for women in all the states got little beyond its introduction.

The Owen public health bill was not even seriously considered, and the jail inquiry was stricken from the House calendar.

Social legislation which received the endorsement both of Congress and the President, includes:

An amendment extending parole to life prisoners on good conduct.

A loan shark bill for the District of Columbia.

Amendment of the pure food act so as to require a statement on packages of the contents in terms of weight or measure. "Reasonable variations" from the statements are allowed.

Creation of the Department of Labor as a separate activity with an officer in the cabinet.

Amendment of the act creating the Bureau of Mines so as to secure greater efficiency and broader scope for the bureau.

Extension of the power of the commissioner general of immigration by the establishment of immigrant stations at interior points. Provision was made that aliens in transit from ports to these stations should be accompanied by inspectors.

Passage of the Webb bill to prevent shipment of liquor in interstate commerce into states whose laws forbid its sale. This legislation furnishes a precedent for future measures designed to make

use of the interstate police powers of the federal government.

Limitation of the hours of dredge-workers employed on public works to eight per day.

Passage of the interlocutory injunction bill. This makes it impossible hereafter to suspend the enforcement of a statute in a state or an order made by an administrative board or commission under the laws of the state.

Establishment of the "Alaska fund," created from liquor licenses, etc., in the territory. Ten per cent of this fund is for the relief of old persons, the sick and the indigent, and those who have met with accidents. The rest is to be used in the construction of roads, bridges, etc.

To summarize the progress made by this Congress, however, the measures passed at its earlier session, should be included:

Establishment of the Children's Bureau.

Establishment of the Commission on Industrial Relations.

The Phosphy Jaw Act, prohibiting the use of white phosphorus in the manufacture of matches.

The eight-hour law and the eight-hour provisions in the postal, fortifications, and naval appropriation bills—not new legislation, but an extension of old.

The provision in the postal appropriation bill allowing federal employes to petition Congress and join what organization they please.

Extension of the Federal Workmen's Compensation Act to more classes of government employees.

Amendment to the postal appropriation bill, giving to publications of labor and fraternal organizations the same postal privileges as are given to other publications.

### THE HENRY NEIL LEAGUE FOR MOTHERS' PENSIONS

On page 891 of this issue appears a letter from Henry Neil of Chicago, which is apparently intended as a reply to the statement in THE SURVEY of February 1, entitled Henry Neil, Pension Agent. All who are sincerely interested—from whatever point of view—in the subject of mothers' pensions should be in possession of the facts concerning Mr. Neil's activities in this direction.

Mr. Neil states that he has not received any personal profit from the league. This was not charged against him. He offers no reply or reference to the charge actually made, namely that the league offers unknown membership collectors 50 cents on each dollar they collect.

Despite the fact that Judge Lindsey resigned as vice-president of the Mothers' Pension League in December, a letter which has filtered into THE SURVEY office shows that as late as January 20 Henry Neil was still quoting the Col-

POWER ELDER, BOSTON, CHAIRMAN      JUDGE BEN B. LINDSEY, Vice President      HENRY NEIL, Secretary

## Mothers' Pension League

FOR HOME AND HUMANITY

“Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me.”

Matthew 25:40

“Whoever shall give to one of these little ones a cup of cold water shall not lose his reward.”

Matthew 25:40

*This Certifies: That the Holder hereof has been enrolled as a Charter Member of the Mothers' Pension League.*

Henry Neil, Secretary      William B. Lindsey, President

**MEMBERSHIP CERTIFICATE IN MOTHERS' PENSION LEAGUE**  
A month after Judge Lindsey had resigned as vice-president Mr. Neil was still using his name on the league's letter head.

orado judge as endorsing the league, and still carrying his name on the letterhead.

The general scheme of giving 50 per cent to collectors for the Mothers' Pension League is set forth by Mr. Neil in the following paragraphs from this letter:

"We will pay \$5.00 a day to an efficient woman to do this work providing that at least ten new members to the league are secured each day that the organizer works and providing also that the membership fee of \$1 a year is collected in advance from each new member.

"You can send us a money order for the amount you collect less the amount of your pay for organizing.

"In but a short time the extent of this movement, we believe, will assume such proportions in your locality that you will require assistance in your work of organizing and our charter members will get the preference for positions of chief organizers. In this way if you are an efficient and steady worker you will have the management of a large field, with greater opportunities for the accomplishment of good and increased pay for yourself.

"The most efficient organizers will secure more than ten new members each day they work but we make a minimum day's work ten new members. If you have other duties or for any other reason cannot put in sufficient time each day to secure at least ten new members, then you can work part time and count as a day's work, the securing of ten new members and the collecting of the membership fee from each."

In view of Mr. Neil's reference to the financial methods which have been employed in the Mothers' Pension League, it is interesting to note that neither the National Probation League nor the Mothers' Pension League, of both of which organizations Mr. Neil is secretary, appears in the latest published list issued by the Subscriptions Investigation Committee of the Chicago Association of Commerce. This list covers the philanthropic organizations which the committee believes worthy of the support of all anxious to further systematized social work.

Mr. Neil's letter states that Mr. Carstens has repudiated the press summary of his report on mothers' pensions. In this Mr. Neil ignores Mr. Carstens' communication published in *THE SURVEY* a month prior to the receipt of Mr. Neil's letter. Mr. Carstens said:

"It is true that an advance press notice, condensing *THE SURVEY* article and not prepared by me, inadvertently substituted the word 'immorality' for 'low moral tone,' and was to that extent inaccurate. . . . The advance notice was a good general summary of my Chicago findings and of my general conclusions."

The league, Mr. Neil says, "distributes authentic information." His standard for "authentic" is discredited by his own letters. He says in his letter to *THE SURVEY*:

\*See *THE SURVEY*, January 25, 1913, p. 556.

"The Pennsylvania legislature had enacted a Mothers' Pension Law in 1907—and for the past six years the organized charity people had been using it to get the money out of the public treasury to pay for the keeping of children after taking them away from their own mothers. . . . When I showed these facts to the people of Philadelphia they demanded that their Pension Law be construed correctly and they then and there put into correct operation their Mothers' Pension Law."

Another letter from Mr. Neil, received recently by a resident of South Bend, Ind., was identical with the one received by *THE SURVEY*, except that it contained this additional clause:

"and pensions are now being paid to hundreds of mothers of dependent children in Pennsylvania."

The law Mr. Neil evidently referred to is a juvenile court law, and its first section reads as follows:

"Section 1. Be it enacted, etc., that whenever hereafter any indigent or dependent child shall be committed by any judge or other competent authority to the care and custody of any person or family, for the purpose of maintenance and education in the home of such person or family, such child shall be conveyed to such home by the county commissioners, sheriff, or other proper officer, at the expense of the proper county, and the cost of maintenance of such child shall also be paid by the proper county, but at a cost not exceeding what it would cost to maintain and educate such child in the house of refuge or other public institution of such county."

#### MR. NEIL'S DISTRIBUTION OF "AUTHENTIC INFORMATION"

The only basis of the Neil claim that the "organized charity people had been using it [the law] to get the money out of the public treasury" appears in the fact that about \$17,000 was paid in 1912 by the Philadelphia County Commissioners to the various children's agencies which receive children under the act from the Philadelphia Juvenile Court. The sum per capita amounted to about \$1.87 per week. This was less than the per capita amount spent by the receiving agencies on the children committed to them by the court. Consequently, each of the societies spent for the children committed to its care not only the entire amount of public money allowed, but some additional money from its own funds.

So far as diligent enquiry has been able to show, no pensions have been granted to mothers for the care of their own children under this law. Evidently at Mr. Neil's instigation, the *Philadelphia Evening Telegraph* brought a test case on January 13, 1913, to determine whether the law could be used as authority for a pension to a mother. After five weeks' consideration the

court refused the petition on February 17, seven days prior to the day that Mr. Neil's undated letter reached *THE SURVEY*.

A further statement with even less basis in fact has been circulating under Mr. Neil's signature in various papers recently. We quote it from the Norfolk (Va.) *Pilot* of March 2, 1913:

"In St. Louis, Mo., the organized charities, being in control, have just secured the passage of a law which allows 25 per cent of the taxpayers' money to the mothers of dependent children, and 75 per cent to the charities for overseeing the spending of it."

The law referred to, an ordinance of the city of St. Louis, contains no reference whatever to the proportion to be given to the mothers and the proportion to be used for supervision. Roger N. Baldwin, secretary of the Civic League of St. Louis, and formerly chief probation officer of the Juvenile Court of that city, has characterized the Neil statement as "entirely inaccurate."

Mr. Neil was recently accorded an interview by Jessie Wilson, one of President Wilson's daughters. A few days later reports of that interview, accompanied by a picture of Miss Wilson, began to appear in various middle Western papers, from one of which, the *Superior* (Wis.) *Telegraph*, of February 6, we quote the following:

"Mothers' pension has a new champion in Miss Jessie Wilson. . . . Miss Wilson is not only interesting herself actively in the effort to obtain mothers' pension laws in the various states, but expects to continue her efforts after she enters the White House. Along with this activity, she is studying juvenile court conditions, particularly in New York, where 23,000 children are brought every year. She is satisfied that a general adoption of mothers' pension would greatly lessen the number of 'delinquency' cases and make the work of the juvenile courts much easier."

When this newspaper item was shown to Miss Wilson, she authorized the following statement:

"I expressed, as I thought, merely interest and a strong wish to investigate the subject further. I have taken no active interest in the matter *at all*, and his [Mr. Neil's] statement to that effect, if he is responsible for this clipping, is entirely unwarranted."

#### WHO SHALL PRESCRIBE EDUCATIONAL DIET?

Whether the polyglot population of New York's public schools shall have courses of study prescribed for them by professional educators or by laymen is declared to be the principle at stake in a fight now going on over legislation pending at Albany. Black-eyed youngsters with the air of the Bay of Naples still in their hair, Jewish children still reading the Pentateuch in the

Cheder, Bohemian boys and girls whose parents teach them religion out of a book on biology, and native youths whose racy speech gives them at least one advantage over their foreign classmates are having settled for them who shall determine the contents of their education.

The measure in question, known as the McKee bill, proposes what is seemingly an insignificant amendment to the charter of New York city. Its purpose is to put into the hands of the Board of Education "the power to change the grades of all schools and of all classes and to adopt and modify courses of study for all schools under its supervision." Under the present arrangement the power to adopt and modify courses of study is lodged in the Board of Education "upon the written recommendation of the Board of Superintendents."

The difference is vital, say those who oppose the change, because the new wording removes the initiative in altering courses of study from professional educators to laymen who can not be expected to be experts. To those who contend that the new power conferred upon the board is not important it is answered that the phrase to "adopt and modify" means nothing less than to "remake." Modification, it is asserted, is a matter of degree. The decision as to what subjects shall be taught and how much of each shall be taught is declared to be an expert function, properly performed only by those familiar with the technique of constructing curricula and with what has been done in other places.

The Public Education Association, which is fighting the bill, quotes many educational authorities against it. Prof. Paul Hanus, of Harvard University, who directed the inquiry into New York's schools authorized by the Board of Estimate and Apportionment, is opposed to it.

Friends of the measure, who include many teachers in the city, deny that the Board of Education would presume to "make" a course of study even if the bill were passed. They say that the most it would do would be to make needed changes. To this it is answered that the giving of the power is itself an evil and that subsequent boards may not be so scrupulous in leaving important matters of policy to the city superintendent and his associates.

But advocacy of the measure is put on broader grounds. It is the "experts," say the friends of the change, who have made the curriculum in the New York public schools what all admit it to be now—dull, inert, detached-from-life. They cite the Hanus reports themselves to substantiate this criticism. Let us then, they argue, give to this pabulum with which we are feeding hungry minds the many-sided touch of those who know life from divers angles. Only when it has had that can it meet the wants of growing

boys and girls of a score of nationalities and a thousand different aims and aspirations.

The reply to this contention is that the bill is piece-meal legislation. We can not secure a proper vitalization of the public schools, say its opponents, by giving both the initiative and the approval of changes in the course of study over to those who have neither experience nor continuity in office. The result would be both ill advised and changing policies. On the other hand, they point out, New York has just had a thorough inquiry by specialists into the needs of its school system. Let legislation, they urge, come after reflection and let it be linked up to a general scheme of reform, based on the recommendations of this investigation.

The measure has been reported by the cities committee' of the Assembly and indications on Monday were that final action would soon be taken.

## MY HERITAGE

A SURVEY ASSOCIATE

In writing to avail myself of the privilege of becoming a co-operating member of *THE SURVEY*, I used the expression "I was happy enough to inherit from my father an interest in good causes." The editor of *THE SURVEY* has asked me to enlarge a little on this, suggesting what such an inheritance has meant. However inadequate such an attempt may be, perhaps some influence may speak through me from my father's life and memory.

To begin with, may I tell something of what my father's ideas were? I might say that he died more than thirty years ago and that in some ways his views seem to me to have been in advance of his time. He was a successful business man, but he had no ambition to build up or leave a large fortune. He did not consider the inheritance of wealth a blessing. The idea of "Christian stewardship" was with him intensely real, and he faithfully lived out this ideal, giving away money *as he made it*. He used to say that most men with the ability to make a fortune, seemed unable to realize that it required quite as much brains to do good with money as to make it!

All through his life, in addition to activity in business and exceptional devotion to the interests of his family, he gave time and thought, freely and ardently, to many lines of philanthropy. His office was the resort of workers in many fields who availed themselves of his business advice and that of his brothers. My father was one of the founders and supporters of his own church, and a liberal contributor to other churches, was much interested in Sunday school work, in home and foreign missions, in all the best local enter-

prises, in educational institutions, in philanthropic work in the South, and in a really great variety of the causes best worth supporting. In addition to his gifts of money, he gave himself to personal work in various lines, and took a warm interest in many individuals whom he could help.

Now, how about the "inheritance?"

To speak in very personal terms, I will first say that I sincerely thank my father for leaving me an income large enough to live on comfortably, while I am free from the difficulties still comparable to those of a camel passing through the eye of a needle! Perhaps it is a happy thing to have the much-talked-of "simple life" brought within easy reach by a limited income. With the searchlights of today thrown on our consciences, and all our queries as to the just distribution of money, it is a happiness to know that what one's father earned honorably by work he shared freely, in his own day, for the needs of his generation, instead of "heaping up riches."

Then as to the interests we inherited. As I turn back the pages of memory, one of our first lessons in humanity seems to have come in the attitude we saw shown to those employed in our household. Justice, consideration and kindness for them were an unwritten law and we were unconsciously learning to think of all under our roof as fellow-beings—an important lesson, it seems to me. This was a "good cause" with which to begin at home.

Then, in our household, we inherited some acquaintance with "the best people." Among our many visitors, we had the privilege of meeting workers in varied fields of philanthropy. Happy the home that entertained, even briefly, Charles L. Brace and General Armstrong! One of my earliest memories is of a Mr. Van Meter who thrilled us children with the story of *The Little Wanderers' Home*, . . . A New York institution, I think. And what a benediction seemed to rest on our household at the times when it had as guest an elderly missionary from Syria whose beautiful face spoke truly of his consecrated life! And other missionaries made Hindoos and Hawaiians and even South Sea Islanders seem real people to be really helped. So our young imaginations were well stretched.

But not only the far off people were brought near. Some of the remotest in our own community, so to speak, were drawn into the circle of our thoughts. My father often went to the jail on Sunday afternoons to talk to prisoners. I am sure his merciful interest and racy speech must have done them good, and from what he let fall afterward, we learned, in part, to think of prisoners as *men*, not merely as evil-doers.

On other Sunday afternoons visits were made to the truant school, where thirty or forty lively boys

were spending the term for which they were committed. Not long ago I came across a letter from the devoted woman in charge, written after my father's death, telling how much his interest had helped her. He often took me with him, and to this day I can see the boys' eager attention and hear the Sermon on the Mount repeated by some of them in a rich brogue.

Father had a plan by which he paid the boys, I think at the rate of a penny a verse, for learning chapters in the Bible. If they earned \$5, as a number did—this being the goal aimed at—he deposited it to their credit in the Savings Banks and gave them their bank books. Their pride in these was great, and he felt that the idea of depositing savings later had been made definite and easy. Only the other day, a driver from a livery stable who had taken me out several times, said, "You didn't know, Miss ———, did you, that I was one of your father's boys?" and told me that he was one of the truants who attained to a bank-book and remembered father gratefully. So all along through life, I have run across footprints where my father passed and some of the good seed he scattered so freely has sprung up.

All my father's interests such as I have suggested not only enlarged our general outlook, but gave his children some idea of the noble army of workers for human welfare who fail not from generation to generation. The life of the world can never seem petty or dull to those with a realization of the great battle for right always being waged, however small one's own little corner may be. Then the memory of my father's own life must always be an inspiration. But not only in memory does the thought of him abide with his children. How can we reasonably believe that such a vital, sympathetic, far-reaching personality went out like an extinguished light?

"Somewhere, surely, afar,  
In the sounding labor-house vast  
Of being, is practiced that strength,  
Zealous, beneficent, firm."

THE SURVEY is not only a chronicle of work for humanity, but also an inspiration to service. Do its readers altogether realize that when men serve humanity they serve also their children? The desire for wealth, for social prestige, or any form of worldly fortune to bequeath, seems poor compared with a present sharing of wide and worthy interests and the legacy of a memory of life devoted to human service.

## FINGER PRINTS

### A TWO-FAMILY APARTMENT

A. H. ESTABROOK<sup>1</sup>

The mother is a feeble-minded woman now about forty-five, who does not know her own age. She cohabited for many years with an ignorant, inefficient, mildly intemperate veteran of the Civil War, much older than herself. The pair had four feeble-minded children, two of whom are now with the mother, the other two being elsewhere in the community reproducing their kind. A few years before the father's death, the woman was legally married to him in order to lay claim to the widow's pension. Eleven years ago the husband died. Since then, the widow, with her pension of \$36 quarterly, has been able to get along without work. In these eleven years, she has had four illegitimate children, three of whom died from neglect. Two years ago the family moved into the barn-like building shown in the illustration—not in a rugged mountainous district, but in a thickly settled farming section of New York state, within easy reach of all the elevating social influences of present-day civilization.

Her shack is divided into two parts. Imagine the visitor's surprise upon rapping at the door on the left to receive an animal-like grunt in reply. Examination proved this part of the house to be a pigpen, now inhabited by a sow and litter of pigs. The door on the right opens into a single room lighted by two windows. Here dwell the mother and her three children: a boy of fifteen, a girl thirteen, and the baby, a puny, underfed, syphilitic and neglected child of seven months. The walls of the room have

<sup>1</sup>Field Worker, Eugenics Record Office, American Breeder's Association.

AFTER THEIR KIND

been covered with wrapping paper, behind which rats can be heard scurrying about and are so bold as to appear in the presence of the family in the daytime. There is a single bed, a table, some chairs and a stove. The stove-pipe leads through a hole in the wall. The outer end of the pipe is fitted with an improvised check draft consisting of an old dish-pan hung over the end. (See the right of picture). Filth abounds everywhere, the two families rivals in this respect, the humans being slightly in the lead.

What is the meaning of this to the community? The woman is an illegitimate child of a feeble-minded mother, herself now the mother of feeble-minded children. What if the originator of this group had been placed in custodial care at the beginning of her reproductive period, and thus have prevented at once the transmission of this defective germ plasm to succeeding generations?

Read, if you will, in the archives of the state the record of the Jukes family and know that this is but a very human footnote to its long-drawn chronicle of poor heredity, of faulty environment when young, of the listlessness of society toward its more helpless members.

Know that the house of the two families is the home of descendants of these same Jukes, who in 1875 numbered 709 persons who could be counted, and probably 500 more of whom all trace had been lost.

## TEMPLES

KATHARINE ANTHONY

Small as the tenement home is for the ordinary daily uses of eating, sleeping, working, living, it becomes pitifully cramped when the use expands into a ceremony. Yet one day there comes to every tenement family an event which changes the dark little flat into a temple of sorrow or a temple of joy.

Such a change came to the Regan flat on a November day when Mrs. Regan's body lay in state in the little sitting-room. In the middle of the tiny box-like chamber the tall, gaunt form of the woman lay at rest in a great, polished casket.

The shutters were closed, though the room was already dark enough at midday to satisfy the requirements of ritual. Four white candles burned at the head and four others at the foot of the bier. The tallest one in each row was left unlighted, for they reached almost to the ceiling and there would have been actual danger of fire.

The young workingman and the two children who stood beside the bier had come in from the flat opposite, for death had literally crowded them out of their little home and neighbors had taken them in to sleep and eat. The casket stood there between the narrow walls as if it had already come to its last resting place. The room seemed indeed more like a mausoleum than a house of life and the home of children.

\* \* \*

The Klauser flat is a three-roomed counterpart of the Regan's. Every Christmas it becomes the scene of a festival. The tiny sitting-room is invaded by a tall balsam tree. The green tyrant stands on the only table the Klausers possess, reaches its head to the ceiling and stretches its branches from wall to wall, obscuring the only two outside windows the Klausers have.

Yet, for all its noble proportions, the tree cost but a quarter. Mrs. Klauser bought it on a falling market late at night on Christmas eve. She has her own way of playing the market, has Mrs. Klauser!

There the balsam tree stands from Christmas to New Year's. Nobody grudges it house room, though Mrs. Klauser's housekeeping is disorganized and Klauser and his pipe are crowded out of their usual corner. The family eat and sit where they can.

And the four little Klausers go to bed every night on a shakedown right under the glorious tinseled branches!

### PLAY CENTERS FOR THE POOR

HENRY DePEYSTER

PARIS

Through the changes which have revolutionized the industrial world, the home life of the poor has suffered. In the morning the household disperses, the younger children being left without care when the parents and older children hurry off to factory or shop. Boys and girls whose childhood is passed under such conditions are not propped up by the family traditions which made the strength of past generations. As they have not been carefully brought up themselves, they will not be able to rear their own children well. It is therefore necessary to give to the children of the poor an illusory home.

So obvious is this truism that in every great manufacturing center charitable organizations have been founded to occupy the playtime of the poor. Of vacation schools none has a more homelike spirit than the *Jugendheim* of Charlottenburg, a suburb of Berlin. The children are gathered together in a few well-lighted rooms arranged as a living apartment. White curtains at the windows and flowers on the shelves produce a pleasant homelike atmosphere. In this quiet home the children learn their lessons, play indoors or in the garden, according to the weather, and are taught handiwork. They grow flowers and vegetables in a large kitchen garden; but, above all, they learn housekeeping. Both boys and girls are taught how to keep the home clean, to mend their clothing, to prepare meals, and to wash their linen. The *Jugendheim* is almost too perfect. Its success is due to careful motherly attention to a chosen few. Moreover, it is of comparatively recent origin. When it was started, ten or twelve years ago, the Swiss and Scandinavian recreational workshops had for many years completed the educational work of the public school.

A Swede has the honor of founding the first recreational workshops for the children of the poor. Anna H. Retzius, daughter of the great philanthropist, Lars Hierta, and wife of the prominent scholar, Gustav Retzius, has inherited a deep affection for the poor and a strong taste for rearing children. She is largely responsible for starting household teaching in Sweden; and afterward, in 1887, she founded the first workshop. This idea has been adopted in many other countries. Mrs. Retzius' experience convinced her that good manual training is the best if not the only way to prevent idleness and to reorganize family life on sound principles. Though no longer young, she has remained the shrewd, young-minded and indefatigable apostle of this fruitful idea. Success has rewarded her efforts. Workshops have been founded all over Sweden, some of which are attended by 500 children every day. So far as known, not a boy in any of the eighty workshops has ever been found guilty of delinquency.

The condition of French, English and American boys is much worse than that of the Swedish. It seems almost chimerical to attempt to wrench from the street all the boys of a large city. In a remarkable address Mrs. Humphrey Ward reckons that charitable organizations ought to offer a daily shelter outside of school hours to at least 760,000 London children.

Such a number is at first disheartening, as it seems hopeless to check the evil. With a clear view of the situation, Mrs. Humphrey Ward has appealed to the London County Council for financial help, as she feels certain that private organizations can not save more than a few chil-

Anna H. Retzius has published several leaflets on the Swedish workshop in French, German and English.

The Playtime of the Poor. By Mrs. Humphrey Ward, London, 1906.

dren. Private organizations are, in fact, almost powerless without the help of the state. The largest of the associations in Great Britain entirely supported by private contributions is probably the English Children's Happy Evenings Association. It cares for 14,000 children; but what are 14,000 out of 760,000?

The only way to prevent juvenile delinquency is to organize vacation schools outside of school buildings and without the co-operation of school-masters, but with the financial help of the education boards. Care must be taken to avoid anything that may remind the children of their school hours. A play center does not win a strong grip on a child's mind unless it feels that the center holds in its life the place of love and help the children of bygone times found in their own homes.

But what kind of method is to be adopted? Is manual training to have the first rank almost to the exclusion of other work? Mrs. Retzius strongly believes in its merit, and the handwork shops founded in Sweden, Norway, Denmark, Finland, Russia and Poland are wonderful successes. Their success is partly responsible for the vote of the International Congress of Education assembled at Brussels in 1909 to recommend to education boards the introduction of manual training in every public school.

Somewhat different is Mrs. Humphrey Ward's point of view. She believes that the first task is to make brighter the lives of children who need it. Mrs. Retzius founded workshops; Mrs. Ward organizes play centers. Singing, dancing, playing, and dressing dolls are the main occupations of the children who go to the centers started after Mrs. Ward's design in England, in Italy, and in America.

Owing to different circumstances, the question has been looked at in quite another way in France and in Germany. Children leave school much later in the afternoon. When they come home they have lessons to learn. It was equally impossible to organize workshops after the

Swedish plan or play centers in the true sense of these words. Small private organizations, most of them with a slight inclination to religious proselytism, have founded homely shelters where the children gather after school and work quietly, superintended usually by young girls of the upper classes.

These shelters are no less successful than the Swedish workshops or the English play centers, but, after all, they are not so wholly different. The main point is to give the child a shelter, to make it familiar with moral principles, and to take the place of its family removed by the hard pinch of poverty.

Play is the purpose aimed at by Mrs. Humphrey Ward; but children quickly get tired of mere play and drill, dancing and singing. Dressing dolls and making toys are common features in English play cen-

ters. Even better, easy handwork, joinery or cookery are useful tasks which are most popular with the children.

Manual training has a much larger share in the plan in Sweden. When they leave school at the age of thirteen or fourteen the children who have joined Mrs. Retzius' workshops know how to prepare meals, to cut out and sew dresses or shirts, to repair shoes, to weave mats and rugs, to make brushes, toys and knickknacks of many kinds. All the boys have learned joinery and carpentry. They can furnish their homes with chairs, stools, tables, cupboards, trunks, or shelves, made with their own hands. But at the same time play has never been neglected. In Sweden the manual training teachers go through the teachers' training-school of Naeaes, where they learn old national Swedish dances and games. There is not as sharp opposition in the idea of the Swedish workshops and the English play centers as might appear; there is only a difference in the share of play and work assigned to each element.

France has learned a good deal from the English and from the Swedes. By degrees the French have improved their refuges. Play has been organized. Attention has been given to manual training. But the question is far from being solved. In every country the want of helpers makes it necessary either to welcome few children or to leave them almost undirected. The most perfect of the refuges for children is the *Jugendheim* of Charlottenburg, but it offers a shelter to only a bare handful of boys and girls. The most important society is the Playground and Recreation Association of America. It has helped to found play centers which welcome more children than all the other bodies together. But though the American associations have an income several times larger than that of all the other associations of the world combined, it seems, at least to an outsider, that their shelters are often merely playgrounds, and that too many children are under the supervision of

very few teachers or helpers.

This may, however, be quite a false impression and involves, of course, no criticism of the admirable movement for playgrounds. The Playground Association of America, however, is a power organization, and the playgrounds themselves are too extensive to give the children the illusion of a home. On this score they are inferior to the *Jugendheim*.

A recreation school is almost useless if a child can not find a shelter within it whenever his parents are not at home. It is quite a charming idea to ask young ladies of the upper classes to come once a week or once a fortnight to teach poor children. But what good does it afford to the children who remain undirected and unprotected every other afternoon in the week? The English play centers of the Children's Happy Evenings Association and the French patronages or *écoles du jendi* are of no moral effect. The money wasted entertaining 20,000 or 25,000 children once a week could be better used to give a permanent shelter to a much smaller number.

Organizers of recreation schools must bear in mind that the children of the poor are in every way undirected. In bygone times the father used to teach his sons how to furnish the home; the mother used to show her daughters how to keep it clean and how to prepare the meals. This breaking up of poor families has largely contributed to the progress of vice. Intoxication is the deadly and unavoidable entertainment of men who are unable to busy themselves at home and find a bad dinner when they come home tired from work.

The result a play center must aim at is not the training of clever handicraftsmen; it is to make

A HOLIDAY GATHERING OF PUPILS.

Thursday in the French Public Schools is a half holiday.

poor people able to furnish their homes better and to make much of their clothing. It must seek to breed in their hearts a strong taste for family life. It must put the poor women in a position to earn decent wages at home, where they can watch over their children. From these aims proceeds the method to be adopted in play centers. To prove thoroughly effective vacation schools must be continued all the year, and especially during the holiday months, when the children are left undirected the entire day.

A great effort ought to be made all over the world for the expansion of vacation schools, as there is no other way of preventing juvenile delinquency. Prevention is more effective than punishment and more consistent with Christian principles. It is a task grand enough to join together all those who take an interest in the condition of the poor.

## GOVERNOR SULZER'S FINANCIAL PROGRAM

PAUL C. WILSON

NEW YORK BUREAU OF MUNICIPAL RESEARCH

Governor Sulzer deserves the commendation of the citizens of all states as well as of New York for having recognized, almost immediately upon assuming office, the necessity for reorganizing the financial methods of the state. To learn where improvements were possible he appointed a committee of inquiry to study the effect of the methods now employed by the legislature and the various departments in appropriating and disbursing state funds.

As a result of this committee's inquiry, Assemblyman Levy has introduced a group of interesting bills. The object of these measures is to remedy improper administrative conditions by securing adequate control of the state's finances, which have long been in confusion, to prevent waste and extravagance. These bills aim first to improve the method of preparing the annual

budget; second, to effect economies in the state contracts and supply purchases by establishing a board for the central control of supply contracts; third, to secure more careful audit in the office and field by the state comptroller.

These results are to be effected by the following proposed innovations:

1. Establishing a new State Department of Efficiency and Economy to make general and specific recommendations to the governor concerning any branch of the state service.
2. Establishing a State Board of Estimate of nine members to consider the budget estimates, in order that it may make proper recommendations to the legislature.
3. Establishing a State Board of Contract and Supply of seven members, with exclu-

sive authority to let contracts for furnishings, materials and supplies.

4. Requiring (a) the comptroller's approval for all state contracts in excess of \$1,000; (b) immediate notice to the comptroller when any liability is incurred, and (c) that he shall receive a duplicate invoice for every supply simultaneously with its delivery to the state office.

5. Permitting the comptroller to appoint counsel and other necessary employees and to issue subpoenas for persons and records in order to prove claims presented.

It is certainly in harmony with modern methods of public administration that the governor of New York state should be provided with an agency to furnish him general and specific information concerning the government under his charge as provided for in Assembly Bill No. 1152. In the office of commissioners of accounts the mayor of New York city has had at his disposal service of this character for more than thirty years. The establishment of the new state department follows the example set by ex-President Taft, who established the President's Commission on Economy and Efficiency.

Many features of this bill are excellent, such as the power granted the commissioner to prescribe the forms upon which detailed information shall be furnished him and the power to issue subpoenas for persons and records in any examination being conducted by him. Certain important features, however, are somewhat hazy, and the effectiveness of the legislation would probably be increased if definite provisions were made for:

1. Publicity of all the commissioner's recommendations and reports.
2. Public access to reports, records, etc.
3. Removal of the commissioner upon charges or at the will of the governor.
4. Definite qualifications for the higher grades of employes of this department.
5. Independent examination and investigation by the commissioner; and
6. The submission of all budget estimates and supplemental requests for funds in quadruplicate to the governor, the senate, the assembly, and the commissioner of efficiency and economy.

The proposed State Board of Estimate provided for in Assembly Bill No. 1149 consists of nine members, five of whom, including the lieutenant-governor, are drawn from the legislature. The principal working member of this committee would be the new commissioner of efficiency and economy. This board is practically a conference committee, since it is granted no power by the legislature except to investigate and to make recommendations to the legislature relative to the budget estimates. The Board of Estimate has no power by which it can make its recommendations effective. All of the duties imposed on this new board could probably be discharged more effectively by the commissioner of efficiency and economy if he were required to present the result of his budget investigations and

examinations to the governor, the Senate and the Assembly, without having first to submit his report for preliminary approval to the State Board of Estimate.

The chief question to be considered with respect to the bill presented for a central purchasing agency for the state is whether the control of purchase should be given to a board of seven members rather than to one official to be appointed by the governor. As in the case of the State Board of Estimate, the members of the proposed supply board have other important duties, requiring the major portion of their attention. Practically the only working member is the new commissioner of efficiency and economy. Moreover, all will be members of the proposed State Board of Estimate. Thus the same individuals who in large degree determine the amount of money available for purchase of furnishings, etc., will make contracts for those purchases. A single head of a department of this character would, if properly controlled through reports and audits by the Department of Efficiency and Economy, prove more efficient than a board of ex-officio members.

The bills affecting the duties of the state comptroller should be amended to give that official power to conduct a field as well as an office audit of all state revenues and expenditures.

The bill for the establishment of the new Department of Efficiency and Economy, if clarified and strengthened by amendment, should be adopted by the New York Legislature.

It is suggested that action upon the bills establishing the new Board of Estimate and the new Board of Contract and Supply might well await definite recommendations for legislation on these two subjects to be prepared by the new commissioner of efficiency and economy after he has had time to make a comprehensive examination and study of the present conditions.

## MAKING CITIZENS IN LOS ANGELES

DANA W. BARTLETT

Member California Immigration Commission

The Board of Education of Los Angeles has undertaken the education in citizenship of the resident aliens. A large number of elementary schools are open for evening instruction to adults, where the pupils are taught not only to read but also to learn the fundamentals of citizenship. These schools are largely attended by men and women of many races.

One school is set aside for those who are preparing to take out their second papers. The instruction is based on a schedule prepared by the local naturalization officer and by the special teachers. Those who finish this three months' course pass an almost perfect examination before the court. Following the granting of the second papers to the members of the class the judge instructs them to go to the high school auditorium, for a public recognition service.

The last recognition service was held in the auditorium of the Los Angeles high school. The new citizens sat on the stage as guests of honor. The high school orchestra furnished vocal music in several languages; Mr. Jones, the federal

naturalization officer addressed the audience, composed largely of foreigners; Judge Wills, the presiding judge, gave a speech; the editor of a German paper spoke for the naturalized citizens; Mayor Alexander, himself once an immigrant, welcomed the men to their new duties; and the writer gave the right hand of citizenship, making the occasion seem almost like an initiation service.

The director of the high school social center has organized the men into a new citizens' club, for further study and discussion. This recognition service will be repeated each month, as the succeeding classes pass through the court. Two other suggestions have been made. One is a correspondence school, to be conducted in the interest of those who cannot finish the entire three months in the citizenship school. The other is that those who graduate from the school shall receive a certificate which may be offered to the court in lieu of a public examination.

Because of the great increase in immigration after the opening of the Panama Canal, Los Angeles feels the special need of training foreigners to become leaders among the many alien residents of the Pacific Coast.

### NEWSBOYS' REPUBLIC

B. E. KUECHLE

Wisconsin Industrial Commission

The Milwaukee Newsboys' Republic recently celebrated the inauguration of its first officials. The event was attended by many prominent men, including Governor McGovern, who delivered the main address of the evening.

The republic grew out of the difficulty of enforcing the Milwaukee Street Trades Law without the co-operation of the boys themselves. Its objects are stated in the preamble of the constitution:

"We, the newsboys of the city of Milwaukee, in order to become familiar with the daily duties of American citizenship, to familiarize ourselves more closely with the machinery of government in a representative democracy, to promote the welfare of our fellow citizens and to enforce the Street Trades Law, to learn the methods employed by our government officials in the performance of their work and arouse among our colleagues patriotic motives in the performance of their every-day duties, and to train ourselves in parliamentary practice, do bind ourselves, ordain and establish this constitution for the newsboys of Milwaukee."

Early last October Supervisor Powell of the Milwaukee Street Trades Department began to interest leaders among newsboys in the plan for a republic. The work was done entirely by the boys, most of them under sixteen years of age, advised by Mr. Powell and other social workers. The constitution, representing hours of labor and study, was adopted by a mass meeting of the newsboys.

The young legislators provided for all phases of government. The legislative department consists of a senate and a house of representatives. The city is divided into six states, among which

congressmen are apportioned in proportion to the number of citizens. Each state has four senators. Congressmen are elected from among the boys at annual elections, while senators are appointed by the president, with the approval of the house, from among men interested in the republic.

The executive department consists of a president and a vice-president, elected by direct vote of the boys. A cabinet is appointed by the president, consisting of secretaries of state, the treasury, athletics, health and welfare, and the interior, and an attorney general.

The judicial department is vested in a supreme court, one inferior federal court, and such other inferior courts as Congress may establish. The supreme court is to consist of men acting for the Wisconsin Industrial Commission, which has supervision over the administration of the Street Trades Law. Mr. Powell is to act as chief justice. The inferior court is to consist of two men appointed by the Industrial Commission, and three boys elected annually by their comrades.

Immediately after the adoption of the constitution two parties, the Peoples Party and the Independent Party, were formed. Conventions were held at which candidates were nominated and platforms adopted. After an active campaign, with several large meetings by each party, the first election resulted in the victory of the Independent Party candidates.

### DULUTH SETS GOOD HOUSING STANDARDS

The national awakening to the importance of wholesome housing for the people of our cities has begun to show in constructive legislation. In half a dozen of our cities official commissions and citizen's committees are drafting laws or ordinances designed to set a standard which will assure that their homes in the future will at least be well lighted and well ventilated, provided with water and with sanitary toilet facilities and reasonably well safe guarded against the fire hazard. Among these half dozen Duluth has been the first to actually enact its proposals into law, following the example of Columbus which a short time ago celebrated the close of the first year of successful enforcement of its housing code.

The Duluth code, like that of Columbus, followed an investigation of local housing conditions which showed that Duluth, like every other city which has let things go, houses some of its people in dark interior rooms and dark, damp basements; that it has room overcrowding and lot overcrowding; and that its toilet facilities were in many instances not conducive either to decency or to health.

The first result of these discoveries was the appointment by the Common Council, on the recommendation of the mayor, of a housing committee. This committee at once set about the task of drafting an ordinance, based, like the Columbus code, upon the model law. A draft of this ordinance was submitted to the National Housing Association for comment, it was made the subject of several public hearings in Duluth and finally passed by a vote of 9 to 6.

At the hearings a considerable amount of opposition developed, some of it due to the fear of the speculators that their profits would be curtailed; some to an honest misunderstanding of the scope of the ordinance and its effect upon real estate investments. The hearings convinced most of the second class of objectors that the proposed legislation would not interfere with legitimate building and that proper regulation in other cities had encouraged rather than discouraged the erection of houses.

Hereafter in Duluth both tenement houses and single family dwellings must have enough open space on their lots to light and ventilate every room, rooms must be large enough for habitation and must have windows opening to the outer air, the height of wooden tenement houses will be limited and other safeguards provided against fire. Every new tenement house must have within each apartment a proper sink with running water and a water closet located either in a bathroom or in a separate compartment. Every dwelling house, when water main and sewer are accessible, must also have running water and a water closet within the house.

For existing houses the regulations, of course, are not so strict as for new buildings; but for them also the standards have been raised in the interests of decency and health. So Duluth takes its place among the cities of America that are intelligently safeguarding the people's homes.

#### JOTTINGS

##### MUNICIPAL RESEARCH REACHES OSSINING

Ossining, N. Y., is ambitious to become a model town both in municipal procedure and in public welfare work. As a step toward realizing this goal the village has engaged a non-resident, D. O. Decker, to perform the duties of village clerk. Application was made to the New York Bureau of Municipal Research for a man who could install a new system of accounting, establish a classified budget and cost records. The village officials plan to hold public budget hearings, and later on a budget exhibit. The work is being done in co-operation with the Westchester County Research Bureau, and will involve health reforms as well as changes in accounting and office methods.

##### NEW JERSEY HOUSING CONFERENCE

During the second National Housing Conference, which was held in Philadelphia last December, the New Jersey delegates decided to arrange for a state housing conference in March. W. L. Kinkead of Paterson was elected chairman and instructed to appoint a committee of nine to arrange for this meeting.

Through the courtesy of Col. Franklin Murphy, Jr., the committee held its first meeting on January 28 at the Essex Club, Newark. It was decided to hold the conference in the Newark City Hall on March 28. Three sessions will be held, at 10:00 A. M., at 2:30 P. M. and at 7:45 P. M. Lawrence Veiller has agreed to preside at the evening meeting, at which it is expected a state housing association will be organized.

The need of a housing association in New

Jersey was forcefully urged two years ago by Mr. Veiller before the New Jersey Conference of Charities and Correction. Mr. Veiller said: "First of all, you are to see that there is an organized public sentiment behind the work that has been done in the past and that is now being done. If you want to improve housing conditions in New Jersey, if you want to stop manufacturing poverty, vice, crime and disease, you have got to do something yourselves. The people of New Jersey have got to show that they care about it, and when they do show that and show it in an organized way, you will get results and get them quickly."

##### CIVIC LEAGUE VICTORY IN CONNECTICUT

Agitation by the local Civic League for an improved water supply for New Canaan, Conn., recently won, through the Public Utilities Commission, a victory which may lead to important results throughout the state. The league, aided by an engineer and a sanitary expert, after a three-day hearing at Hartford, secured an order directing the private water company to install a filtration plant and equipment to purge the water of all odor and color.

The lawyer for the water company in his brief declared that if the request of the petitioners was granted the previous railroad work of the commission would be small in comparison with what was ahead in adjudicating similar appeals relating to water supply in other towns. "The commission," said one of the petitioners after the verdict had been handed down, "has rendered this decision, so let us hope that good days are ahead for Connecticut in regard to water supply, and that it may lead to an efficient system of state inspection."

##### HOUSTON ADOPTS SOMERS TAX SYSTEM

Houston has adopted the Somers system of taxes which has already been introduced in Cleveland and Columbus, O., and Springfield and East St. Louis, Ill. In this system the citizens take part in the appraisement of their lands and buildings. Maps are made of the various sections of the city and men familiar with city values make a tentative value of a front foot of a middle lot on the block. Then various citizens and municipal organizations consider this value and give their estimate. After the value of this middle lot is agreed upon by the Board of Appraisers all other lots are assessed in proportion to their accessibility to those advantages which create land values. Buildings are measured as to size and considered as to quality of building material. The assessment is proportioned to the price per square foot of floor space.

In Houston land values are assessed at seventy cents on the dollar and improvements at twenty-five cents. Personal property for the most part is exempt. The inequalities of the previous taxes may be judged, says the *American City*, by the fact that the new assessment "raises the total from \$64,000,000 in 1910 to \$94,000,000 in 1912 and yet more than 3,000 property owners paid less taxes at the \$1.50 tax rate in 1912 than they did at the \$1.70 tax rate of 1910."

## HEALTH

**A** NEW habit-forming drug has suddenly come to public notice, and the increasing number of cases of its use has startled physicians as well as laymen. Heroin, which is a comparatively new opium derivative, has been popular with physicians as a mild and supposedly harmless sedative, and is often prescribed for coughs. It seems that doctors who would not think of giving any other opium derivative without great care have been using it incautiously. Indeed, in some instances, they have even prescribed it for morphine habitués as a harmless substitute for a harmful drug.

A short while ago the Juvenile Protective Association of Chicago discovered several youthful cases of heroin addiction, as serious and as hard to control as if the drug had been morphine. They found also that heroin could easily be bought by boys. Not only does the law framed to cover the habit-forming drugs fail to mention heroin, but druggists who are fairly conscientious and who would not think of selling morphine illicitly feel no scruple about heroin. The various cough remedies that contain this drug are usually claimed to be quite harmless, and of course the ordinary citizen has no knowledge to offset such a statement. Medical journals are beginning to warn their readers that heroin is a dangerous habit-forming drug, and recommend that cities which are framing laws to control the sale of such drugs include all possible derivatives of opium.

\* \* \*

**MUCH** as we have heard of late concerning epidemic poliomyelitis, our knowledge is still fragmentary. The medical world and the public are waiting for the results of the experimental research which is still being carried on under Dr. Flexner at the Rockefeller Institute. In his last report Dr. Flexner tells of attempts to prove how this disease is transmitted in cases where there has been no direct exposure. He describes one instance in which it was possible to prove that the virus was present in the sweepings from the sick room. But clinical observations have tended to show that healthy persons may act as carriers of the infection and it was this point that Flexner set himself to examine. It is a difficult task to prove the presence of this virus, for, as has already been explained in *THE SURVEY*, it is invisible. The only demonstration is to implant it in a susceptible animal, when it may cause the symptoms characteristic of acute infantile paralysis. Flexner has just succeeded in proving by this method that the virus was present on the mucous membrane of the nose and throat of the parents of a child who was suffering from acute epidemic poliomyelitis. This

<sup>1</sup>See *THE SURVEY*, November 23, 1912, p. 241.

means that healthy persons who come in contact with the disease may act as carriers of the infection without showing any warning symptoms themselves.

\* \* \*

**T**HERE have been 30,000 to 50,000 cases of pellagra in the United States within the last six years, with a death-rate of about 39 per cent. These figures constitute only a rough estimate of the number of cases, owing to the incomplete machinery for securing vital statistics in this country.

Lavinder of the United States Public Health Service has gathered figures on the prevalence and distribution of pellagra in the United States. Figures have been secured from state authorities, from public institutions and from private sources. A map shows that pellagra has been reported from every state in the Union except New Hampshire in the east, and the group of western and northwestern states comprising Minnesota, Montana, the two Dakotas, Utah, Wyoming, Idaho and Nevada. The greatest prevalence is found in the group usually spoken of as the southern states. In only one state is the disease reportable by law. Pellagra cannot be compared in prevalence with such a disease as typhoid fever, for example, yet the large number of cases and the high mortality-rate together with its wide and apparently increasing distribution make it a disease of grave national importance.

The cause of pellagra is still an unsolved problem, on which students here and in Europe are eagerly working. When the disease was first discovered in this country, we took it for granted that the conclusions of the Italian scientists would apply here. The Italians have had opportunity to study pellagra a long time. They have diagnosed it to be a disease of the abjectly poor, chiefly the peasants, and have supposed that it was caused by the lack of some needed substance in the diet, as would be the case with an almost exclusive corn-meal diet, or to some poison in the food, as from a diet of partly spoiled corn.

\* \* \*

**BUT** when American physicians began to study the cases over here they found that many of them would not fit the Italian theory at all. Several differences were found between Italian and American pellagra, for it is not in this country a disease of the extremely poor, but is one to which women are peculiarly liable. In some places there are more than three times as many women afflicted with it as men. As in Italy, it is more rural than urban, but small cities and towns are not free from it.

These facts have made American observers to a great extent give up the corn-meal theory and

look further for the cause. The preponderance of women victims leads Beall to insist that the cause must be sought for "in and about the house," and various insects have been suggested as conveyors of the infection. Sambon believes that certain species of the black fly or sand fly carry it, but this theory has not been confirmed. More lately Jennings and King have suggested that it is the biting stable fly—*Stomoxys Calcitrans*—the same insect which has also been accused of transmitting epidemic poliomyelitis. Their arguments are based on what may be called purely circumstantial evidence, ruling out the insects which would attack men and women equally, and emphasizing the fact that in the communities where pellagra is found the women do the milking and are near the stables more than the men. The next step, of course, is to prove or disprove the insect-borne hypothesis by animal experiments. As it is now, public health officials and superintendents of insane asylums where the disease is prevalent are utterly at a loss to know how to keep the infection from spreading.

\* \* \*

OUR knowledge of the causes of infectious diseases has advanced not uniformly, but by leaps and bounds as new methods have been developed and new incentives have arisen. With the evolution of bacteriology, following the work of Pasteur and Koch, there was a rapid expansion in our knowledge of infections. The discovery that Texas fever was transmitted by the tick started extensive studies on the relation of insects to the transmission of disease. The demonstration that certain diseases are due to germs too small to be seen through the microscope rapidly led to a study of many obscure diseases and cleared away much of the confusion regarding them.

In addition, greater experience in interpreting results; the training and development of men for research; the foundation and endowment of large institutions for research, such as the Rockefeller Institute, the Memorial Institute and the Hygienic Laboratory of the United States Public Health Service, and the adoption of new methods by research workers, have made possible the recent increase in our knowledge of this class of diseases.

The use of the monkey for experimental purposes, instead of the small animals usually employed, has contributed more than any other factor to the important recent additions to our knowledge of the acute infections, says the *Journal of the American Medical Association*. Recent work has shown that the monkey is susceptible to a number of diseases which affect man but which are transmissible with difficulty, if at all, to the small laboratory animals, such as rabbits, rats and guinea-pigs. Without the monkey as an experimental animal our knowledge of typhus fever, poliomyelitis, measles, cerebro-spinal meningitis and scarlet fever would not have made its recent great advances.

But the application of this knowledge to the control and eradication of the diseases has not

kept pace with its acquisition. With a few notable exceptions, such as the control of yellow fever through mosquito eradication and of bubonic plague by rat campaigns, health authorities have been slow to apply the great mass of information now available to them by reason of the researches of the last few years. What at present is more needed perhaps than research is a more general application of the results already at hand.

\* \* \*

AN analysis of the legislation relating to two rather newly recognized dangers, the common drinking-cup and the roller towel, is given in a recent Public Health Bulletin (No. 57) of the United States Public Health Service. It seems that the public drinking-cup was looked upon as a serious danger in times of epidemic centuries ago.

Statements in the available literature make it appear that as early as 1564 during an epidemic in Strassburg individual communion cups were used at the suggestion of a professor of theology to prevent the propagation of disease through this medium. A similar statement is made by Martin for the city of Chiavenna, Italy. The records of the Protestant church at Bopfingen, Wurtemberg, show in the inventory of 1703 "one small gold-plated cup for the sick, one tin cup for infected persons." Similar tin cups were carried on the inventories as late as 1832. The danger of contracting various infections, especially syphilis, was emphasized during the eighteenth century by Metzgar Hufeland and other writers.

The question as to actual danger from the common drinking-cup centered at first, in this country at least, around the communion cup, but presently came to include all vessels used for public drinking. As to what we actually know about this danger it may be briefly stated that bacteriological examinations have shown the presence of diphtheria bacilli and pus-forming bacteria in the dregs of wine in communion cups, and on the edge of drinking-cups used in railways, schools and offices. It is probable that tubercle bacilli are also present, but they are far more difficult to demonstrate. The same is true of the infectious agent of syphilis.

Kansas was the first state to pass a regulation against the common drinking-cup in 1909. Then Michigan and Mississippi followed. Massachusetts passed the first law to abolish the common drinking-cup in 1910, and at present there are twenty-six states and one territory which have either a law or a regulation for this purpose. In addition many large cities have passed ordinances of their own.

The evidence against the common roller towel seems to be not as conclusive as that against drinking-cups, and apparently this source of infection has not caught the attention either of the public, or of scientists as much as has the former. Nine states only have taken action against the public roller towel and in some of these the restriction applies only to schools or to railroads.

# RESTRAINT FOR CERTAIN CONSUMPTIVES

H. W. CAREY, M. D.

To those who have followed the development of the tuberculosis crusade in New York state the great progress made in the last five years under the guidance of the State Charities Aid Association and the State Department of Health must be evident. Credit is due both these organizations for educating the people of the state as to the best ways of combating the spread of the disease, for building county hospitals and sanatoria, and establishing dispensaries for the care of consumptives.

The slogan of the anti-tuberculosis societies, "No Uncared-for Tuberculosis in 1915," seems in a fair way to be realized in so far as it relates to the opportunity afforded to consumptives for treatment and supervision either at home or in hospitals. At the present rate of increase in the number of county hospitals there will soon be sufficient accommodation for all who should have hospital care.

The care of consumptives in hospitals affords the public the most effective protection and, except in few instances, offers the sufferer the best chance of recovery. But only a small percentage of the afflicted will consent to enter hospitals, and most cases must, therefore, be supervised at home.

The supervision of consumptives at home, however successful it may be in effecting the cure of the afflicted individual, assures but slight protection from infection for well people. Supervision must be intermittent at best and from a public health standpoint cannot be considered successful.

Many consumptives, moreover, will neither submit to hospital treatment nor observe at home the precautions necessary for the protection of those about them. At present no authority can be exercised over cases of this sort. They can not be forced to enter hospitals and if they do seek admission they can leave whenever they wish. Consumptives under home supervision are entirely without control.

Something more is needed than merely to create opportunities for consumptives to receive treatment. Some restraint should be exercised over them if the public is to be protected against the disease. The following figures, taken from the records of the Lakeview Sanatorium in Troy support this contention. There were 304 patients with tuberculosis of the lungs admitted up to October 1, 1912; 152 (just half) of these were discharged, only twenty-six of them on the advice or with the consent of the physician. Of the remainder 119 left against advice and seven were dismissed for conduct prejudicial to the discipline of the institution. The twenty-six patients leaving with consent can be classified as follows: Incipient, with no tubercle bacilli in the sputum sixteen; moderately advanced four; advanced six. In other words 136 out of the 152 patients discharged were in open, infectious

stages of the disease capable of transmitting it to others.

The length of time these patients remained in the sanatorium is given in the following table:

Months	1	2	3	4	5	6	7	8	9	10	11	12 or over	Total
Incipient	10	1	3	0	1	0	2	0	0	0	0	1	18
Moderately Advanced	17	8	0	2	0	2	0	0	1	0	0	2	32
Advanced	57	10	13	5	4	5	0	3	3	1	0	1	102
Total	84	19	16	7	5	7	2	3	4	1	0	4	152

It will be seen that the duration of treatment for more than half of these patients (eighty-four) was one month or less. It was less than six months for 131. The time for almost all was far too short to effect much lasting benefit to the patients while the protection afforded the families of the patients and the public in general was of such short duration as to be almost negligible.

In the patients discharged against advice it was found that the chief predisposing factor in seventy-three cases was alcohol. The greater number of these will probably resume their former habits of living after discharge and in all probability suffer a relapse of the disease. The remaining seventy-nine cases can be grouped in three classes: those temperamentally unsuited to hospital life, the ignorant or indifferent, and the unmanageable. Among those temperamentally unsuited to sanatorium life may be placed those who are homesick or worried over family affairs. Such cases are not numerous but when they do occur it is better that they be supervised at home if it is possible to do so.

As an example of the ignorant or indifferent group is the case of a man forty-four years old who was admitted in August, 1910, to the Troy sanatorium with moderately advanced pulmonary tuberculosis. The sputum contained tubercle bacilli in abundance. The patient had been unable to work for three months previous to admission, but he improved greatly under treatment. He left in October, although warned that it was not safe for him to do so. He was visited in his home and it was found that for lack of room one of his three children slept with him and the other two were with him constantly during the day. The oldest child did the housework and attended to her father while the mother worked out to support the family. The patient was instructed to sleep alone, was given a tent and recliner and kept supplied with sputum cups. He followed instructions only indifferently. He was readmitted to the sanatorium in February, 1911, with the disease advanced. He improved considerably under treatment but left again in March against advice. Home conditions remained unchanged. In July, 1911, he applied for readmission again and remained until Sep-

tember, showing little change. He was visited in his home by a nurse and occasionally by a physician before he died the following winter. During his last stay in the sanatorium his oldest daughter developed tuberculosis and was admitted to the state hospital at Ray Brook.

This patient could contribute nothing to the support of his family. He knew that his wife could scarcely support herself and the children and that his care only added to her burden. He realized that he was constantly exposing his children to the disease and yet he was grossly careless in following instructions given for their protection. He realized too that he did much better in the sanatorium than at home, yet he could not be prevailed upon to remain there.

A man thirty-one years old who was admitted to the Troy sanatorium in December, 1910, with advanced tuberculosis of the lungs is a fair type of the unmanageable group of patients encountered in institutions. He lived in the home of his sister part of the time but most of the year wandered about the country working as a helper on farms. Under treatment he improved but

left against advice in January, 1911. He was readmitted on seven different occasions and was twice dismissed for misconduct toward other patients and his nurses. During the past summer he worked on a dairy farm that supplied milk to a large city. Because he had a hemorrhage while at work he was discharged. Shortly afterward he was arrested for vagrancy and served sixty days in jail. He was very careless in the disposal of his sputum and did just as he liked both in and out of the sanatorium.

Indifferent or ignorant and unmanageable consumptives are surprisingly numerous, and I believe that the records of other county hospitals will support this opinion. It is obvious that if the crusade against tuberculosis is to be successful restraint of some kind must be placed upon consumptives of these types. They constitute a source of infection of the most dangerous kind. The remedy lies in legislation that will make it possible to compel consumptives who will not protect those about them, to accept hospital care and permit their detention there until they have recovered or are no longer infectious.

## DUST AND PULMONARY TUBERCULOSIS<sup>1</sup>

LOUIS I. DUBLIN, Ph.D.

STATISTICIAN METROPOLITAN LIFE INSURANCE COMPANY

That there is a direct causal relation between the prevalence of occupational dust and the incidence of pulmonary tuberculosis has been accepted as proved by sociologists and vital statisticians generally. Reference need only be made to the frequent occurrence of tuberculosis as a cause of death in those occupations known as the "dusty trades." Yet this evidence is not in itself entirely convincing. Experimental laboratory demonstration of the close relation existing between the inhalation of dust and the production of pulmonary disease is, therefore, of great value as it is the one link in the chain necessary to make the evidence complete.

Such evidence is now available in a report on experiments made by Dr. Cesa-Bianchi, recently published in *Il Lavoro* (Vol. V, 21), journal of the Milan Clinic for Occupational Diseases. Dr. Cesa-Bianchi subjected guinea-pigs to the inhalation of air containing quantities of mineral dust for from two to four hours daily during eight to ten weeks. He found that in these robust, well-nourished animals with healthy respiratory systems, the dust alone did not produce grave lesions in the respiratory organs. The animals, however, were not left entirely unaffected by the continued inhalation of dust, as is shown by a series of later experiments.

To determine whether there was increased susceptibility to tuberculosis in animals so treated, Dr. Cesa-Bianchi subjected a number to infection. Each one received a single injection, either subcutaneous or intraperitoneal, of

attenuated tubercle bacilli. As a control, a number of healthy guinea-pigs, not previously exposed to mineral dust, received similar injections and were thenceforth kept under identical conditions. Finally, as an additional check, two animals that had been subjected to dust were kept under normal conditions without receiving any bacilli.

The results of these experiments may be summarized as follows:

1. The guinea-pigs subjected to the inhalation of dust and later kept under normal conditions showed no noteworthy degeneration, even after an autopsy.

2. Almost all the control animals (those that were injected with the tuberculous material without having been previously subjected to the inhalation of dust) survived. A few died within two months after the infection.

3. All the guinea-pigs which had been subjected to the inhalation of the dust and which were later exposed to the tuberculous injections, succumbed to violent pulmonary tuberculosis. In some, the degenerative process had a rapid course; in most, however, the process was slower. The animals wasted away steadily and did not suffer death until two or three months had elapsed after injection. In these cases grave lesions of the respiratory organs were almost always found on autopsy, as well as lesions in other organs.

Although these experiments leave much to be desired because of the small number of animals involved and the total absence of statistical data in the descriptions, two conclusions are justified:

<sup>1</sup>A review of experiments made by Dr. Cesa-Bianchi of the Milan Clinic for Occupational Diseases.

First, that mineral dust, though in itself unable to produce extensive lesions of the respiratory organs, nevertheless constitutes an important contributing factor in developing susceptibility to tuberculous infection.

Second, that when an animal has been subject to the inhalation of dust, tuberculous lesions of the respiratory organs develop regardless of the point of entry of the infection.

To apply these conclusions to the more general problem of the effect of dust on industrial workers, we need only recall that workers in

the "dusty trades" are constantly exposed to possible tuberculous infection through channels such as milk and other foods, dried sputum, and from contact with materials infected from other sources. Whatever be the point of entry of the tuberculous material, whether through skin abrasions, the alimentary tract, or the respiratory system, the bacilli ultimately find their way to the lungs where they develop characteristic lesions in tissue whose normal resistance has been lowered through earlier inaction and irritation by dust.

## HEREDITY AND RESPONSIBILITY<sup>1</sup>

ALICE HAMILTON, M. D.

Heredity has become a word to conjure with, and few of us now dare voice our inner protest when scientists tell us that all characteristics, mental and moral as well as physical, are predetermined in the germ cell, the result of age-long heredity and utterly unaffected by subsequent environment. We have been told that "laziness is due to inheritance or to parasites, the latter can be cured, the former never. Law breakers and murderers should be pitied; if blame attaches to their deeds, it falls on the marriage bureau and the parents. The world needs hospitals and sanatoria and sterilization institutes for the criminal and vicious, and punishments should be visited only upon the parents to the third and fourth generations. As all teaching, all government, becomes illogical and men are useful or useless members of society according to their inheritance, the only hope of the race is in eugenics—always supposing that enough freedom is left to men or to society to control the important function of choosing a mate."

In earlier times the adherents of such a theory of human responsibility were called predestinationists. Heredity then was the will of God, "His eternal purpose, whereby for His own glory He hath foreordained whatsoever comes to pass." But these rugged Calvinists and Port Royalists never followed their theory to its logical conclusion, as do the preformationists of today. Indeed, they presented the amazing paradox of at once denying free will and insisting upon the sternest morality. Their common sense and knowledge of their own natures was too great to permit them to accept the freedom of responsibility for their actions which their Paulist theology implied.

Nor has the world at large ever been able to accept such a theory, whether stated in theological or scientific language; yet if it is scientifically true it must be accepted, no matter at what cost. It is therefore a pleasure to see, in a recent copy of *Science*, a paper by Prof. Edwin G. Conklin of Princeton University, which discusses the results of scientific studies of heredity and weighs the actual evidence in support of such radical conclusions as that quoted above.

The paper is sane, judicial, and at the same time delightful reading.

Professor Conklin says that students of development, whether it be that of the individual or of the race, are like those early mariners who sailed the dreaded strait between Scylla and Charybdis; "in shunning the Scylla of predetermination they fall into the whirlpools of no-determination, while the narrow channel of truth runs somewhere between these two." At present there can be no doubt that we are sailing nearer the pre-formation coast than at any time since the modern study of development began under von Baer. "We formerly heard that all men were created free and equal. We now learn that all men are created bound and unequal. We once thought that men were free to do right or wrong, and that they were responsible for their deeds. Now we learn that our reactions are predetermined by heredity, and that we can no more control them than we can control our heart beats."

Emphasis must, of course, be placed upon the complexity of the germ plasma and the intrinsic factors of development, which do fix by heredity the main characteristics. "Race, sex, character are predetermined in the germ cell, and perhaps in the chromosomes, and all the possibilities of our lives are there fixed, for who by taking thought can add one chromosome to his organization?" But it is the possibilities that are fixed, not the actual characteristics which will emerge. It is one thing to say that all the potentialities of our lives are marked out in the germ, and another to hold that all that will actually develop from the germ is there determined, and cannot be altered. The characteristics which will actually appear depend not only on the potentialities in the germ, but also upon many complicated reactions of the germinal units with one another and with the environment. "In short our actual personalities are not predetermined in the germ cell, but our possible personalities are."

Professor Conklin goes on to consider the potentialities of development which are great—the physical in lower animals, the mental and moral in man—so far greater indeed than the actualities, that many must remain latent because not called out by environment. The organism

<sup>1</sup>Review of a paper by Prof. Edwin G. Conklin of Princeton, which appeared in *Science*, vol. 37, 1913.

develops in response to stimuli, internal or external, and habits are formed by repeated responses which by repetition become more rapid and perfect. The simple response to external stimuli is gradually changed or inhibited by the appearance of internal stimuli which are the result of hereditary constitution and past experience, for behavior is determined, not only by present stimulus and hereditary constitution, but also by the experiences through which the organism has passed and the habits he has formed.

Responsibility consists of the ability of an individual to respond to rational, social and ethical stimuli, and to inhibit responses to stimuli of an opposite nature. As we have seen, responsibility then depends partly upon the environment with its complexity of stimuli, and partly upon the capacity of individuals to respond to these stimuli. A man might be quite responsible in savage society, who would be quite irresponsible in civilized communities. Also the capacity to respond to stimuli varies in different men according not only to inheritance, but to training, habits and physiological states, for it is different at different times in the same individual.

Man has of all animals the most extensive and varied environment, and its effect upon his personality is correspondingly great. He has also the longest period of immaturity, during which time stimuli from his environment modify his development, and it is largely environment which determines whether or not the hereditary possibilities will develop or will remain latent.

Carrying his conclusions into the field of practical sociology Professor Conklin urges great caution upon the advocates of state control of marriage and the scientific breeding of the race. Speaking of eugenics, "that infant industry," he says:

"Undoubtedly it represents an important application of biological discoveries to human welfare, but it seems to me that it cannot wisely go farther at this time than to attempt to eliminate from reproduction the most unfit members of society. Giving advice regarding matrimony is proverbially a hazardous performance, and it is not much safer for the biologist than for others.

"Apart from certain bodily peculiarities, he would be a bold prophet who would undertake to predict the type of personality which might be expected in the children of a given union. Could any one have predicted Abraham Lincoln from a study of his ancestry? Observe that I say predict, not explain, after his appearance. The time may come when it will be possible to predict what the chances are that the children of given parents will inherit more or less than average intellectual capacity, but since germinal potentiality is transformed into intellectual ability only as the result of development, such a prediction could not be extended to the latter unless the environment as well as the heredity were known. Society can safely eliminate its worst elements from reproduction, but it cannot wisely go farther at present."

## FEDERAL HEALTH EXPENDITURES

During 1912 the United States government spent \$19,800,086.23 for "its health departments, bureaus, and all other health activities in its various branches." This information has just been compiled by the secretary of the treasury in response to a resolution of inquiry introduced by Senator Works of California. The estimate includes not only the Public Health Service, together with the medical and hospital work of the War Department, the Navy Department, the Department of Agriculture and the Panama Canal sanitary service, but also various bureaus and funds little known to the public at large.

Among these last may be mentioned the International Sanitary Bureau, the International office of Public Health, the International conference of the Red Cross, and the International Congress on Hygiene and Demography—all under the State Department. Under the Department of Justice come the health activities in connection with the support of United States prisoners, amounting to \$39,759.76 and the National Training School for Boys.

The number of officers and employes on the federal pay rolls engaged in public health and medical service is between 15,000 and 16,000.

## HOUSE INFECTION

House infection as a cause of the spread of tuberculosis is discussed in a study of Deaths from Tuberculosis in the Fifth Ward (Philadelphia) during a Period of Forty-seven Years, by Dr. Frank A. Craig, which appeared in the *American Journal of Public Health*.

From the data available, Dr. Craig concludes that house infection is "one of the most fruitful sources of infection." He declares that 78 per cent of the houses in the Fifth Ward of Philadelphia show evidence of having harbored one or more cases of tuberculosis. He finds that 11.2 per cent of the total deaths in forty-seven years (2,248) occurred in a very small proportion of the houses in the ward, 3.6 per cent, and that these latter dwellings averaged 4.96 deaths per house.

Inasmuch as the period covered (1863-1910) was so long, an arbitrary limit was made as to the time within which a death might occur as a result of infection from a fatal case of tuberculosis in the same house. This limited period was set at four years. Out of the 2,248 deaths in forty-seven years, 353, or 15.7 per cent occurred within this period of four years following a previous death in the same house.

Judging by the data available Dr. Craig concludes:

"In other words, 15.7 per cent of all deaths in forty-seven years were possibly due to house infection. Of the 353 cases, sixty-two were apparently related. Omitting these, we still have a percentage of 12.9. Of the 540 cases occurring in houses in which a previous death had occurred, 65.3 per cent of them came within the four-year period."

---

# EDUCATION

---

## TEACHING WHAT THE TWENTIETH CENTURY WANTS

WINTHROP D. LANE

What may prove a thoroughly revolutionary step in education, from the standpoint of social workers, was taken at Philadelphia the last week in February by the National Council of Education. A Committee on School Efficiency was appointed to give head and guidance to the growing demand for investigating schools and testing the efficiency of school systems.

This action was taken after a spirited debate by some of the leading public school men of the United States, in which everything from Mozart to mother-love was cited as a reason for throwing out the proposal. The stranger catching only stray phrases of the argument might have imagined himself at a political convention or a conference of social workers. "Reactionary" and "irresponsible critic" were words often on the lips of speakers.

"I want to say, sir, that there are some factors in education which cannot be measured or surveyed," said one of the announced speakers, who, with raised forefinger, put the case for those who were not ready for the plan.

"You may apply a yardstick to the physical equipment of a building or to the work of the janitor. But the real efficiency of education is revealed only in the contact of individual teacher and child. You can no more measure this relation than you can measure the divine influence of a mother's love."

The point was carried further by J. M. Rice, editor of *The Forum*, long known for his interest in educational problems. Standards of efficiency, he said, can be developed only for tangible or objective things.

"For example, you can't measure a child's vocabulary. My estimate of the number of words a child should know would be between 4,000 and 5,000, but a friend puts the number at 2,000, and there you are!"

As a matter of fact, an investigation of vocabularies used by average Americans in personal and business letters has just been made by the Russell Sage Foundation, with the idea of finding out what words ought to be emphasized in spelling courses. Mr. Rice's position was contested by another from the "outside," though to be sure one who has had a long previous experience in training both general pupils and prospective teachers—Jesse D. Burks, di-

rector of the Philadelphia Bureau of Municipal Research. Mr. Burks brought the point of view of the man whose trade tool is one form or another of the efficiency test.

"Sixteen years ago Dr. Rice broke up an educational conference by raising the question whether any one knew the proper amount of time that should be devoted to spelling in a school course. If this audience were as progressive as it ought to be, it would have been broken up by Dr. Rice's contention today that there are only a few factors of educational efficiency that can be measured or standardized. There is not an effective factor in school work that can not be measured.

"By obtaining the consensus of expert judgment, even such elusive qualities as appreciation of music, power of literary expression, or maternal affection can be as definitely, though not so readily, measured as ability in spelling, arithmetic or physical strength. Standardization means defining the best. It does not mean dragging all down to the lowest level."

Henry Suzzallo, professor of educational philosophy at Columbia University, followed with the statement that all the tests and scales of measurement mentioned so far were applicable only from within the school system. The one test pre-eminently needed, he said, had been ignored. This is the test of "social need," to which every factor in education must be submitted. He instanced the recent erection of a new school building in a section of San Francisco which had not enough children to fill it, so that there were many empty seats, while a neighboring part of the city was turning children away through lack of room. "How could we have foreseen this?" asked the school authorities. If they had studied the movement of industry and the consequent trend of population, answered Prof. Suzzallo, they would have been spared the blunder.

But even the curriculum must undergo the test of "social need," Professor Suzzallo went on:

"The greatest waste in education is not in bad teaching, but in teaching things that the twentieth century doesn't want. I fancy that if we went out into fifteen industrial shops in this city we could learn a great deal more than we know now as to what arithmetical processes

should be taught. We might get rid of the cube root."

The mention of arithmetic drew a recital in point from Leonard P. Ayres, director of the Division of Education of the Russell Sage Foundation. Dr. Ayres' staff examined at the request of local authorities the school curriculum of a large New England town. It was discovered that the course in arithmetic for the seventh grade, the grade from which children were dropping out in largest numbers, dealt almost entirely with the various tables of measurements. Ten representative problems from this course were submitted to ten business and professional executives in New York, men whose salaries ranged from \$3,000 to \$15,000.

The highest mark was scored by the secretary of a well-known propagandist society in social work. His grade was twenty-five. There were several zeroes. Two of the problems were concerned with buying and selling paper in bulk. One of the men who took the examination was the editor of a magazine and another was the head of a book publishing house. Both failed on these two problems. They declared that the terms employed in the problems had not been in current use for fifty years. Each of the ten men explained his low grade by saying, "I learned that stuff once, but I haven't had any use for it since."

Mr. Ayres was vigorously applauded during this story, but he left the platform in silence after asking:

"If there is no way of telling which of us is more efficient than the rest of us, why are some of us trying to get higher salaries than others of us?"

#### *Functions of the Committee*

No fewer than seventeen educational bodies held meetings in Philadelphia at this time. The most important were the National Council of Education and the Department of Superintendence, both parts of the National Education Association. The membership of the national council is limited to 120 members of the National Education Association. These members hold office for six years, twenty new members being elected each year, ten by the council and ten by the association. By a sort of comity members of the council are usually re-elected, so that its roster is fairly permanent. The council therefore is commonly regarded as the most select and authoritative body of educators in the United States.

It was to this body that report was made by a Committee on Standards and Tests of Efficiency of Schools and School Systems, of which George D. Strayer, professor of educational administration at Teachers College, was chairman. The report recommended that the council establish a board or commission to carry out three functions:

It should offer encouragement, expert advice and opportunity for publication to those

engaged in scientific work in deriving scales of measurement and in applying them to actual school situations.

It should offer expert advice with respect to the nature and scope of educational surveys, investigations or inquiries to be undertaken in any part of the United States.

It should offer to members of the teaching profession engaged in administrative work the opportunity to secure a scientific investigation of their systems of schools under the direction of professional experts.

By action of the national council these recommendations became the working program of the Committee on School Efficiency, appointed at the Philadelphia meeting to carry them out. In making up the membership of this committee,<sup>1</sup> Charles H. Keyes, president of the Skidmore School of Arts, Saratoga Springs, New York, and also president of the national council, declared that it was the most important educational body constituted within the last twenty-five years. Prof. Strayer compared its opportunity in the educational field with that in the social field of the new Bureau of Surveys and Exhibits created by the Russell Sage Foundation to help cities and towns desirous of taking stock of civic and sanitary needs.

#### *School and Life*

To one interested in interpreting the larger bearings of these educational conferences this clash on school efficiency was full of significance. To be sure, there were many discussions from which the 2,000 superintendents, principals, supervisors and teachers assembled received more practical help in solving their specific problems. There was a great deal of technical and professional argument. But this was the clearest cut instance of those who want to move swiftly in the attainment of new standards and ideals in education joining issue with those who prefer to go cautiously, holding fast to that which is good. And, indeed, even the more technical part of the program showed everywhere the ferment of unrest. If the talk turned on the curriculum, vocational guidance and training thrust their twin heads up for consideration. If administration was the topic, then team play between the school and the city, the schoolmaster and the citizen demanded attention. In tossing the retort courteous staid school men, whose pupils at home doubtless regard them as

<sup>1</sup>The Committee on School Efficiency has fifteen members, as follows: George D. Strayer, professor of educational administration, Teachers College, Columbia University, chairman; Paul Hanus, professor of education, Harvard University; F. E. Spaulding, Supt. of Schools, Newton, Mass.; Calvin N. Kendall, commissioner of education for New Jersey; C. H. Judd, director, School of Education, Univ. of Chicago; John H. Phillips, Supt. of Schools, Birmingham, Alabama; E. P. Cubberley, professor of education at Leland Stanford, Jr., Univ.; Katherine Blake, public school principal, New York; E. C. Elliott, professor of education, University of Wisconsin; Mrs. Ella Flagg Young, supt. of schools, Chicago; Adelaide S. Baylor, deputy state supt. for Indiana; E. L. Thorndike, professor of educational psychology, Teachers College; Benjamin F. Blewett, supt. of schools, St. Louis; William H. Maxwell, supt. of schools, New York; and James H. Van Sickle, supt. of schools, Springfield, Mass.

the very embodiments of calm dignity, flashed sharp language in the defence of their convictions.

How closely the audience often followed the speakers was shown when one of them parenthetically declared:

"The teacher is the most important feature in education—"

"I thought the child was," shot back a listener.

Space cannot be taken here to tell of the many attempts described by which school administrators are trying to make their schools play a more vital part in the working scheme of community life. Superintendent C. S. Meek, of Boise, Idaho, told how vocational activities had been introduced into the curricula at Boise, and declared that high school students had built fifteen private dwellings in that town.

L. R. Alderman, state superintendent of public instruction for Oregon, described how credit was being given in the schools of Salem for housework done at home. Supt. F. E. Spaulding, of Newton, Mass., exhibited charts showing what part of each dollar spent on public education in his town goes to buy instruction in Greek, what part instruction in grammar, in history, shop work, etc. There was a report on sanitation in rural schools, and another on the salaries and cost of living of teachers.

The fact that this last report cost nearly \$9,000 throws light on the campaign authorized at Philadelphia to raise \$1,000,000 as a permanent interest bearing fund for the National Education Association. One reason given for this step is that intensive and large scale investigations by committees of the national council will play a much larger part in its work than heretofore. A circular telling about this campaign declares that "a crisis period has been reached in American education, as in American politics. Science and industry are pressing home on educators new problems for solution. The National Education Association must have enlarged means with which to investigate, weigh, decide, advise."

#### *Four Standards for Teachers*

It was the conception of the teacher as the most potential social servant of the community which lifted out of the sphere of mere professional interest a plan put forward by Professor Suzzallo for a new organization of teachers, and gave it a vital significance for the man on the street. Professor Suzzallo submitted four standards of service to which teachers, like members of other professions, must measure up. First, they must have a ready and progressive power to meet new and changing needs—economic, political, social. Every school superintendent, he said, should aim to master the difficulties of the society in which he lives to the fullest degree that the right education of men and women will demand. No teacher, if he be modestly efficient, he declared, will forever crave one school system, an unchanged course

of study, the same subject and the same grade. He will be happy for the adventure of meeting new problems, glad to hear a call to his resources.

The second standard is that of expertness. Talking as a teacher to teachers, he declared that "in a world full of intelligent people, we shall have to stir ourselves to keep ahead in a work which has so much to do with life in general, a field in which all men play some part." He then laid down specific technical requirements.

The third standard, he said, is that of social servanthip. Teachers are not mere wage-earners; neither are they teaching just arithmetic, reading, writing and the rest. They are making men, the pillars of social institutions. "Our scholastic point of view," he said, "like the monastic vision of ministers, may make us scorn the world a bit, when it is in that real outer world our product must be tested."

The fourth standard is that of ethical co-operation. This requires, he declared, a more or less complete reorganization of the present relationship of teachers. The influence of partisan and personal politics, he insisted, still interferes with a full rendering to the public of an expert educational service. With adequate organization of the half million teachers in the United States, he said, "we can force commercial concerns into fair dealing, compel boards of education to recognize expert judgment, and force out of existence the teachers' agencies which thrive on our professional neglect."

#### *How Teachers Should Organize*

Professor Suzzallo advocated local guilds of teachers, the territorial unit for each being small enough to insure attendance at meetings. Cities of considerable size should have several guilds. Then there should be a state association of teacher guilds in each state. Finally, a national council of teacher guilds should consist of representatives from each state. The primary purpose of such an organization, formed thus from the bottom up, should be to increase the efficiency of teaching as a public service. And as a mode of attaining this end, its secondary purpose should be to improve the status of teachers.

There were those who feared that such a body might become, as they put it, "a mere trade union, concerned solely with advancing the class interests of teachers." It was declared also by friends of the scheme that many who opposed it feared that the power lodged in such an organization might bode ill for administrative school officers.

It was voted, however, to refer Professor Suzzallo's plan to a committee<sup>1</sup> of the national council for report at the next meeting of the National Education Association.

<sup>1</sup>The committee consists of C. H. Judd, chairman; C. S. Meek, supt. of schools, Boise, Idaho; Katherine Blake; Augustus Downing, first assistant commissioner of education for New York state; John R. Kirk, president State Normal School, Kirksville, Mo.; David Snedden, commissioner of education for Mass.; and F. Bolton.

# INDUSTRIAL EDUCATION AND DEMOCRACY

JOHN DEWEY

PROFESSOR OF PHILOSOPHY, COLUMBIA UNIVERSITY

[In the Education Department (February 15), *THE SURVEY* published an article on the Wisconsin Experiment in Industrial Education by H. E. Miles, chairman of the Committee on Industrial Education of the National Association of Manufacturers and president of the Wisconsin State Board of Industrial Education. The plan in operation in that state puts the control over industrial schools in the hands of state and local boards distinct from those which control the traditional public schools. This arrangement has come to be known as the "dual" system.

The case against this system is put in the following article by Professor Dewey, the first part of which was written in direct answer to Mr. Miles' statement in *THE SURVEY*. The second part is reprinted from *The American Teacher* for January. In it Professor Dewey uses the situation in Illinois, where legislation is pending,<sup>1</sup> as a text for protesting that the essential weakness of dual control is that it strikes a blow at democracy in American education—Ed.]

## I.

In his recent interesting article, Mr. Miles has raised the question of the "control" of education as it affects the movement for industrial education. According to him, it is a question of whether teachers or business men shall control. It would be hard to find a mode of statement more fitted to befog the real issue, or one better adapted to bring into clear relief the animus of many of those who are interested in establishing segregated schools for the training of their future employes. There is not a city or town in the country, so far as I know, where control of the school system is lodged in teachers. In many cities the superintendent of schools himself is not even a member of the board in control. School boards do not represent either the teachers nor yet "the business men" for whom Mr. Miles is so solicitous. They represent the community as a community in behalf of the community—something considerably wider and more important than the class either of teachers or of business men. The real issue is whether this community control in the interests of the community is to continue, with such developments as changing needs may call for from time to time; or whether this social control is to be abrogated in behalf of a control by business men in the interests of business men.

It may be true, as Mr. Miles intimates that (in some localities at least) business men have not had sufficient share in the active direction of the policies of the schools. The logic of Mr. Miles argument is that as long as business men are required to take an interest in education from the standpoint of the well being of the community as a whole, they will not exert themselves; that only when it is a question of specialized education affecting their pecuniary interest as employers of labor will they take an interest in education. Mr. Miles presumes to speak for his fellow "business men"; I should be sorry to make or to believe such an accusation against the public spirit of business men.

<sup>1</sup>For a fuller news statement of the Illinois situation see *THE SURVEY* of last week, page 832. Professor Dewey refers specifically to the measure advocated by the Commercial Club, not yet introduced into the legislature. Another bill, more nearly embodying Professor Dewey's ideas, is before the state senate.

## II

### *Two Movements on the Inside*

No question at present under discussion in education is so fraught with consequences for the future of democracy as the question of industrial education. Its right development will do more to make public education truly democratic than any other one agency now under consideration. Its wrong treatment will as surely accentuate all undemocratic tendencies in our present situation, by fostering and strengthening class divisions in school and out. It is better to suffer a while longer from the ills of our present lack of system till the truly democratic lines of advance become apparent, than to separate industrial education sharply from general education, and thereby use it to mark off in the interests of employers a separate class of laborers.

These general considerations have a particular application to the scheme of industrial education which has been proposed for adoption by the next legislature of the state of Illinois—one of the leading industrial states of the Union, and containing its second largest city. This scheme proposes a separate state commission of vocational education, wherever the community may wish to develop any form of industrial education. In other words, the entire school system of the state as a whole and of such communities of the state as may desire to do something definite in the direction of industrial education is split into two for the education of all above fourteen years of age. Since whatever a state like Illinois may do in such a matter is sure to have influence in other states in this formative period, educators all over the country should be aroused to help ward off what, without exaggeration, may be termed the greatest evil now threatening the interests of democracy in education.

The statement of the scheme ought to be enough to condemn it. The least reflection shows fundamentally bad features associated with it. First, it divides and duplicates the administrative educational machinery. How many communities have such an excess of public interest in

education that they can afford to cut it into two parts? How many have such a surplusage of money and other resources that they can afford to maintain a double system of schools, with the waste of funds and the friction therein involved? Second, the scheme tends to paralyze one of the most vital movements now operating for the improvement of existing general education. The old time general, academic education is beginning to be vitalized by the introduction of manual, industrial and social activities; it is beginning to recognize its responsibility to train all the youth for useful citizenship, including a calling in which each may render useful service to society and make an honest and decent living. Everywhere the existing school system is beginning to be alive to the need of supplementary agencies to help it fulfill this purpose, and is taking tentative but positive and continuous steps toward it. The city of Chicago in this same state of Illinois probably ranks behind no other city of the country in the extent and wisdom of the steps already taken, steps which will of necessity be followed by others just as fast as those already taken demonstrate their efficiency.

#### *Its Arresting Effect*

These two movements within the established American public school system, the proposed scheme, if adopted, will surely arrest. General education will be left with all its academic vices and its remoteness from the urgent realities of contemporary life untouched, and with the chief forces working for reform removed. Increasing recognition of its public and social responsibilities will be blasted. It is inconceivable that those who have loved and served our American common school system will, whatever the defects of this system, stand idly by and see such a blow aimed at it. Were anything needed to increase the force of the blow, it is the fact that the bill provides that all funds for industrial education raised by the local community be duplicated by the state, although the funds contributed by the state for general school purposes are hardly more than 5 per cent of the amount raised by local taxation.

#### *A European Example*

Third, the segregation will work disastrously for the true interests of the pupils who attend the so-called vocation schools. Ex-Superintendent Cooley of Chicago, who is understood to be responsible for the proposed bill in its present form, has written a valuable report on Vocational Education in Europe. He quite rightly holds in high esteem the work and opinions of Superintendent Kerschensteiner of Munich. It is noteworthy that this leading European authority insists upon all technical and trade work being taught in its general scientific and social bearings. Although working in a country definitely based on class distinctions (and where naturally the schools are based on class lines), the one thing Superintendent Kerschensteiner has stood for has been that industrial training shall be primarily not for the sake of industries, but for the

sake of citizenship, and that it be conducted therefore on a purely educational basis and not in behalf of interested manufacturers. Mr. Cooley's own report summarizes Mr. Kerschensteiner's views as follows: "If the boy is to become an efficient workman he must comprehend his work in all of its relations to science, to art, and to society in general. . . . The young workman who understands his trade in its scientific relations, its historical, economic and social bearings, will take a higher view of his trade, of his powers and duties as a citizen, and as a member of society."

#### *Industrial "Classes" the Consequence*

Whatever may be the views of manufacturers anxious to secure the aid of the state in providing them with a somewhat better grade of laborers for them to exploit, the quotations state the point of view which is self-evident to those who approach the matter of industrial education from the side of education and of a progressive society. It is truly extraordinary that just at a time when even partisan politics are taking a definitely progressive turn, such a reactionary measure as the institution of trade and commercial schools under separate auspices should be proposed. It is not necessary to argue concerning the personal motives of the bankers and manufacturers who have been drawn into the support of the measure. Doubtless many of them have the most public spirited of intentions, but no one experienced in education can doubt what would be the actual effect of a system of schools conducted wholly separate from the regular public schools, with a totally different curriculum, and with teachers and pupils responsible to a totally independent and separate school administration. Whatever were the original motives and intentions, such schools would not and could not give their pupils a knowledge of industry or any particular occupation in relation to "science, art and society in general." To attempt this would involve duplicating existing schools, in addition to providing proper industrial training. And it is self-evident that the economical and effective way to accomplish this move is to expand and supplement the present school system. Not being able to effect this complete duplication, these new schools would simply aim at increased efficiency in certain narrow lines. Those who believe in the continued separate existence of what they are pleased to call the "lower classes" or the "laboring classes" would naturally rejoice to have schools in which these "classes" would be segregated. And some employers of labor would doubtless rejoice to have schools supported by public taxation supply them with additional food for their mills. All others should be united against every proposition, in whatever form advanced, to separate training of employes from training for citizenship, training of intelligence and character from training for narrow industrial efficiency. That the evil forces at work are not local is seen in the attempt to get the recent national conven-

## CHURCH AND COMMUNITY

Edited by GRAHAM TAYLOR

---

### EVERY-DAY WORK OF THE SUNDAY SCHOOL<sup>1</sup>

Not long ago a correspondent suggested that we "make a little survey of the work being done in the training of boys and girls in the theory and practice of social service." The writer was "particularly anxious to know if anything is being done through the Sunday Schools of the country."

Another correspondent wrote that he and others connected with Sunday school work for years "feel that we are not reaching and holding the boys as we ought to, and as we must do if our work is to be called fully successful and efficient." In this correspondence it was estimated that in their town there are 12,000 Protestant boys under twenty years of age who ought to be in Sunday school and only 4,000 of them are enrolled. This lack of interest these Sunday school workers think might be due to the fact that "the Sunday school reaches them only one hour a week. If some provision for every-day clubs in club-houses could be made, it might help solve the problem."

This second correspondent also asked THE SURVEY for information based on a practical experience. Thus incited we made a few inquiries. These elicited a mass of interesting facts, some of which are reserved for later publication.

We first wrote for facts to Marion Lawrance, general secretary of the International Sunday School Association. In response he sent an account of a session of the Pennsylvania State Sabbath School Association. At this meeting he had suggested that "the Sunday school become an important factor in social service work by remaining open seven days in the week" and that "moving pictures be adopted as an adjunct of Sunday school work." The president of the convention, H. J. Heinz, buttressed these suggestions by asking: "Would any business man think of running his plant one day out of seven? His business would not make much progress at that rate. He runs his plant on full time and gets the best results out of it. Let us conduct our Sunday schools on business principles." Then superintendents and teachers replied in the following strain:

"Our Sunday school is thrown open to the public every night in the week. Winter nights we have a big sign over the door which reads 'Come in and get warm. Coffee and sandwiches served. You must not pay.' We have clubs and a gymnasium for young people. The Sunday

school is a great social center in our community."

Others told of week-night programs, literary societies, gymnasiums, and club-houses. Moving-picture shows were said to have been so successfully used by Sunday schools in some counties that they are driving the saloons out of business. To all of which Mr. Lawrance answered:

"Friends, there is no more important question before this convention than this one of bringing our young people to look upon the church as a social center. We have allowed our young boys and girls to be taken by the world. The time has arrived for us to reclaim them by strengthening the social life of the church."

Then he urged every school "to make a beginning, to keep its rooms open week evenings, to open a reading room or a rest room."

The *Ladies' Home Journal* for April will contain an article by Marion Lawrance on What the Sunday School Does During the Week, from which by editorial courtesy we are permitted to quote in advance of publication. The article will surprise and inspire even those who are well informed about Sunday school work. Mr. Lawrance himself seems to have been surprised by the facts which led him to assert:

"There was scarcely a feature exploited by the social service specialists in the continent-wide campaign of the Men and Religion Forward Movement which was not already being effectively carried on in the Sunday school, chiefly through the 35,000 organized classes of people over sixteen years of age."

Week-day recreative and industrial activities range all the way from birthday parties to week-end and summer camps, from story hours to debating clubs, and from seed sowing and gardening to handicrafts, photography and dressmaking. The largest amateur baseball organization in the world is the league under the direct supervision of the Sunday School Association of Chicago. Eleven leagues of six teams each, having 1,000 members, are enrolled. Each member is eligible only upon regular Sunday school attendance certified by the written statement of the pastor or superintendent. Through other athletic leagues, organized outings of all kinds, gymnasiums and indoor recreations, the play-life of the young is being safeguarded and enriched.

<sup>1</sup>These facts reported by Protestant churches it is hoped will be followed by reports from Roman Catholic parishes and Jewish synagogues.

Among the outreaching helpful agencies conducted by Sunday schools which are described in this informing *Ladies Home Journal* article are: Business college scholarships for young women, college tuition for young men, and night classes in common branches of learning and circulating libraries for rural communities. A Bible class composed of firemen secured funds to build a hall for a camp of tuberculosis patients. Other Sunday schools lend invalid chairs, take shut-ins out for automobile rides, provide free medical dispensaries and hospital beds and visit poor farms, asylums and homes. A union of ten schools made improvements in a local jail. Men's classes have sick, accident, out-of-work and loan benefits for their members and free employment bureaus. Another Sunday school group helps paroled prisoners. Others cultivate and beautify vacant lots. A divided neighborhood was united by enlisting the neighbors for service in a tenement house district. Children's work took the form of hospital care for deformed children, free kindergartens, public playgrounds and penny entertainments.

Mr. Lawrance concludes his article with the prediction that the Sunday school will soon be recognized as "the church's best channel for social service, the community's best leavener for good and the nation's best good citizenship builder." He cites these reasons as the basis for this conclusion:

## SOCIAL APPLICATIONS OF SUNDAY SCHOOL TEACHING

A most significant index of the attitude of the churches toward their responsibility for training the youth in civic and social duties appears in the official announcements of the lessons and studies by their Sunday school and publishing agencies.

The Standard Curriculum of the General Board of Religious Education, published in the *American Church Magazine* for February, includes among the six divisions under which the course is arranged, Christian Service. It designates "the activities of the pupils in the parochial and social life of which they are a part, both as members of the congregation of a particular parish and as members of the city or town in which they live." And the training for these activities is co-ordinated with that for "church knowledge and the devotional life."

The Christian service in which the pupils in the several departments of the Sunday school should be trained is specified as follows:

**PRIMARY DEPARTMENT:** (Kindergarten, ages 4, 5; Primary Grades, ages 6 to 8).

- (1) Acts of loving kindness to people and animals, helpfulness to parents and teachers, and pleasantness in home life.
- (2) Ministry to sick and needy.

**JUNIOR DEPARTMENT:** (Ages 9 to 13).

- (1) Personal and social duties to God and our neighbors based upon holy scriptures and set forth in the catechism.

(2) Share in the corporate life of the parish, through the various parochial activities and guilds; e. g., junior auxiliary candidates' class for the Girls' Friendly Society, Boy Scouts, Knights of King Arthur, etc.

"Because it is found everywhere, no other institution being so near to all the people; it is prepared, because it is already organized; it is economical, because no new buildings are required; it is ready, because it lives the year round and is always at its post; it is strong, because it represents more than sixteen million members, of whom two million and a half are men; it is efficient, because it is equipped with earnest workers, and in its sympathies needs only to enlarge upon its policy of helpfulness."

Nevertheless, every one must admit that so far the civic and social activities of the Sunday schools and the churches themselves are sporadic, scattered, and without co-ordination or well-defined program. These limitations, however, always characterize such new projects as spontaneously arise out of the various activities of life. New significance and promise accrue to these endeavors, when viewed as the impulses of classes that are organized and federated in local, denominational and inter-denominational fellowships of a world-wide movement. The Sunday school's concerted efforts for better local government and against intemperance, vice and gambling in the home land; against the opium and drink traffic abroad; and for the lepers, the sick and unfortunate in many lands, are intimations of what the federated churches and their schools may do for international peace and "the federation of the world."

(3) Efforts to bring others to church and Sunday school.

(4) Gifts to missions based upon concrete information.

(5) Taking part in mission plays, and making articles to be sold for the Lenten offering.

(6) Collecting magazines for homes and hospitals.

(7) Giving to specific local needs.

(8) Making friends and being friendly to new boys and girls in the schools, playgrounds and other social centers.

(9) Visiting the sick and needy and institutions as far as suitable.

**SENIOR DEPARTMENT** (Ages 14 to 17).

(1) Encourage the pupils to fulfil their responsibility to other scholars as leaders, helpers and examples, especially in bringing others to church, confirmation and holy communion; and to continue their share in the parochial and general activities of the church, such as membership in missionary societies and missionary study classes.

(2) Older scholars should be interested in matters pertaining to the public welfare as expressions of their Christian faith and life.

**GRADUATE DEPARTMENT** (Ages 18 and over).

All members should be engaged in some definite active service in the church, and should prepare themselves to become teachers in the Sunday school.

Other religious bodies which, like the Protestant Episcopal church, have their own systems of religious training, are extending their applications to social and civic relationships. Lutheran, Moravian and other denominations of native and foreign origin are doing this in their own ways. The denominations using the international graded lesson system, in accordance with its provision for social service, are organizing their social teaching and activities. This is especially true of their senior grade and in adult Bible classes.

### *Social Service in the "International" Lessons*

The most systematized curriculum is that for the first year of the senior department. This, in substantially the same form, is separately issued and edited by the official Sunday school agencies of the Congregational, Presbyterian, Methodist-Episcopal and Disciples' churches. The very title of this course is significant—The World a Field for Christian Service. Still more so is the substitution of the "discussion" method for the recitation, "to encourage students to express themselves freely on the problems and so work out for themselves Christian principles and ideals of conduct." The "foreword" to the student is:

"This course of study comes to you when you are standing on the threshold of a larger, more mature life. The world is before you. You feel its challenge and long to enter the lists. The question before you is, 'When and how can I best use my life in the world's activities?' It is hoped you will find in this course of study an answer. The subjects suggest the practical problems of life, especially in its relation to others."

These studies truly have a new and far-reaching significance. Starting with youth, life and the world's needs, they treat of physical, mental and spiritual efficiency in the specific opportunities for service open to the young; for young men in agriculture, industry, commerce, the professions and public life; for young women in teaching, business, nursing, housekeeping, cooking, home-making and motherhood. The specialized church callings to the ministry, church and social work are emphasized. In the same way the call to home and foreign missions is attractively addressed to "pathfinders or the frontier," "Christian leaders in every land," and "ministers of healing." The lessons on Opportunities for Service in Public Life, Champions of Good Citizenship, Working for the Physical

and Social Welfare of Others, are practical and effective. Among the character qualifications for service frankly and firmly treated are honesty; fidelity in daily tasks; justice to others; truthfulness and cleanness in speech; high ideals of each sex for the other; liquor, tobacco and opiates as a social menace; the use and abuse of pleasure; friends and companions; "the social significance of youth."

The world's Sunday school convention at Zurich, Switzerland, may lay the basis for advances in the teaching of its constituent schools by the report of an able commission on adolescence.

### *A Methodist Local Demonstration*

The way in which this social Sunday school training works out in the local church is exemplified by this report from the Epworth Memorial Methodist Church of Cleveland, Ohio:

"We are using the graded lessons which lay emphasis upon social service. All our classes in the intermediate department are organized under the direction of the teacher. They do calling, visit the sick, look up new members, go to the hospitals and social settlement houses. Two strong young people's classes carry this work further. Closely related to the Sunday school is the work of our Boy Scouts and Camp-Fire Girls as laid down by these national organizations. In special instruction at Easter to prepare groups of boys and girls for church membership special lessons in social service are included. 'White gift service' at Christmas provides holiday baskets for the poor. Our Friendship Hour Sunday evenings gathers into the Friendship Room of the church many of the young men and women from the rooming-houses, who are thus led into the young people's prayer meeting. Special addresses are frequently given on such subjects as tuberculosis, temperance and kindred things."

## RELIGIOUS TRAINING FOR CITIZENSHIP

The Epworth League of the Methodist Church South has changed the name of its department of charity and help to the Department of Social Service. The *Epworth Herald* wants the northern church league to follow this example. The *Herald* is doing its best to broaden the idea and work of this department so that it will be in fact not only a relieving and reforming agency, but a preventive, constructive, formative force. To this end, the *Herald* publishes inciting programs for league meetings and platforms for community service.

Effective community action in Chicago has been advanced by the Christian Endeavor Union which has combined the young people's efforts in the several denominations. The union conducted the campaign that secured Sunday rest for more than 5,000 postal employes in Chicago, many of whom now attend church. Through its influence, congressional action has extended

Sunday rest to postal employes throughout the nation. It helped defeat the bill to legalize prize fighting in Illinois. It supports a chaplain at the Cook County Hospital, and provides an organized body of volunteer workers to assist him by providing flowers, reading matter, entertainments, and spiritual comfort to thousands of patients. "Comfort bags," containing sewing and writing materials and a Bible, are distributed among the sailors on the rivers and lake. An "efficiency campaign" designed to draw out and develop the abilities of the 15,000 members of the union is a novel and successful feature of its work.

### *Summer Vacation Bible Schools*

Daily Vacation Bible Schools were conducted last summer in twenty-six principal cities. Seven hundred teachers served 38,306 children in 160 schools, at an average cost of only a dollar for

each child. The association promoting this work claims that in fifty of the largest cities, after existing agencies for child welfare have done their best, there are still 1,500,000 boys and girls unhelped by any organized philanthropy who spend sixty-two vacation days on the street, exposed to physical and moral dangers.

The association aims to promote "the community use" of 100,000 church buildings for child welfare on broad and non-sectarian lines when public schools are closed in summer; to promote the social welfare of children, irrespective of race or creed, by good teaching and songs, and by happy occupations and oversight of games; and, finally, to employ in this field, including 18,000,000 children, alert college men and women, fitted to be efficient leaders of children in worship, work and play.

#### *The Friends' Adult Schools*

A type of organization and method for religious social training which is reproducing itself in varied forms among other religious bodies both in America and abroad is furnished by the adult schools of the Society of Friends in England. It is described by J. Wilhelm Rountree<sup>1</sup> as "the method of Socrates and the message of Christ;" as finding its basis "in the promotion of a vivid sense of human fellowship, rooted in an all-embracing divine love;" and as providing "a bridge to a different form of church fellowship—to some future church order in that wider brotherhood, which in the far-off years will fuse the sects, embracing them as one in living bonds, where there will yet be a place for the 'round-table,' for the sweet discourse of kindred souls, breaking in common the spiritual bread of life."

Just what this means may be told best by this official statement of the purpose of an adult school and by a single concrete description of one of them:

"To make and develop men and to teach them the art of life; to study the Bible frankly, freely, reverently, and without prejudice; to establish an unsectarian basis for Christian effort and unity; to bring together in helpful comradeship and active service the different classes of society; to stimulate and educate public spirit and public morality; to teach men the responsibility of citizenship; to advance as far as may be the equality of opportunity; in short, to help men to understand and to live the life of Jesus Christ, and to encourage them in their personal allegiance to him."

The Barton Hill branch of the Bristol (England) Adult School works among the men of the densely populated artisan district in a building specially erected for its work, after this manner:

"A fatherly man lies in wait at the entrance with a good handgrip for all arrivals early Sunday morning. At 8:25 a. m. secretaries of the Burial, Sick and Coal Clubs, the Savings Bank

<sup>1</sup>History of Adult Schools by Rountree and Binns. Headley Bros., London.

and the early attendance fund are at the receipt of custom. The school opens at 8:30 with a prayer and hymn. The men divide into small groups to discuss the lesson for the day with the leader and each other, while the registry of attendance is marked. At 9 a. m. the groups merge again. Reports are received from members and from deputations who have visited other schools. New members are introduced by name. Those absent on account of sickness are mentioned. After the visitors are posted as to whom to visit the class separates after prayer at 10 a. m."

The axis on which the scheme revolves is the Bible lesson with entire freedom of discussion, which turns on a great catastrophe, such as some bill before Parliament, the death of a preacher or statesman, the local horse-races, the public house evil, or some recent book or article on social and religious questions.

Social clubs for swimming, cricket, football, cycling, rambling, are features of some schools, as are temperance societies, lectures, excursions and devotional meetings. These social features prove so advantageous that they are considered indispensable to the up-keep of the adult school system.

In the Philadelphia Adult School the men and women discussed their lesson on My Neighbor and His Possessions (scripture text "Thou shalt not covet") after this fashion:

—"What is likely to result from coveting another's possessions—to the nation, to the individual? What light does this law throw on the true path of social reform and progress? Descriptions of the occupations of the members of the class were exchanged. A class in economics met once a week. Closely associated with Adult Schools in Baltimore and Philadelphia are social settlements, which are the outgrowths of this work."

#### *And the End Is Not Yet*

That all this development of religious training for citizenship and social work is only in its inception, let this letter from an observant pastor attest:

"Throughout the Sunday school world today there is a growing demand for the social service side of our church activities. If this is to be met, it must be by the development of a new generation with such ideals. In the Sunday-school program and literature there is no uniform recognition of the principles underlying such service. The ideas and activities of the Sunday school teachers and church workers along these lines are very chaotic, and are not directed with regard to the fundamental and universal principles which I feel sure underlie this expression of the religious life.

"Your opinion is asked with a view of getting out a book for the direction of Sunday school teachers and church workers along these lines. Towards formulating this volume, I am gathering opinions and data from religious workers and leading sociologists throughout the country as to two phases of this problem:—

"By the use of what material and by what methods of presentation may we develop the social consciousness of religion among those from six to twelve years of age, from thirteen to sixteen, from seventeen to twenty-one, and from twenty-one years and upwards?"

"How can the work and teaching of the Sunday school be connected in a practical way with the concrete problems of the local community?"

### *The Reaction*

The reaction from the rapidly increasing social interpretation and application of Christianity is surprising more for its feebleness than its strength, for its few spokesmen than its prevalence, for its adherence to the letter than its vision of the spirit, and for its misunderstanding of the social view of religion than for its exclusively individualistic view of Christianity.

The attempts at organized reaction against these social developments within the churches are two: One was made in the conference of the Federal Council of the Churches of Christ at Chicago in a committee report and recommendation, warning against the unspiritual tendency of social work; the other is an organized opposition within the Presbyterian church to the senior and intermediate grades of the Sunday School lessons described above.

Perhaps a fair statement of sincere doubt and dissent regarding the social movement within the churches is that of Hugh R. Monro in the *Sunday-School Times* for November 2 and November 9, 1912, under the title *Is Christ's Cross in Modern Social Service?* While sympathetic with the aims and spirit of the social propaganda, he challenges it on the "single issue between the New Testament gospel of salvation which Christ's church has followed, even though falteringly and imperfectly for nineteen centuries, and the modern movement of 'Social Service' as a new gospel and a new method now urged upon the church." His objections to it are based upon his own views that it is "an entirely new" conception of the church's mission and of individual Christian responsibility and a new outlook upon society; that its adaptation of the great texts and terms which enshrine certain fundamental truths of Christianity will soon make "our whole Christian terminology count for nothing;" that it obscures the distinctive teaching and preaching ministries of the church, by "mass methods of uplifting humanity in which Jesus took no part and evidently never intended that his disciples should take part;" that it deals with "physical conditions," which distinctly lie within the political sphere, "since they are mainly dependent upon legislative measures for realization," while "the mission of the church lies in the spiritual sphere and concerns itself with the transformation of men's lives by the power of Christ, and building them up in Christian character;" that such activities as the regulation of public dances, the emancipation of athletics, or the promotion of a higher standard of theatrical performance, are difficult to reconcile with the pursuit of the

ideals in "the ministry of God's Word, prayer, Bible study, the family altar, subjection to the Holy Spirit, and an absorbing devotion to the will of God;" that it is false to assume character to be "in any large sense the product of environment"—since "scores of redeemed men in our great cities and elsewhere are living radiantly happy and useful lives amid the very scenes of their former degradation, at the same time reaching out for their fellows in the power of Jesus Christ." These, he claims, to be "the chiefest of social results."

His final conclusion is that "there has always been a fundamental incompatibility between this doctrine of the Cross and the commonly understood social or humanitarian program of effort. The Cross must fill the whole horizon, or it is nothing. Looking both to the welfare of the church and the uplift of society, this is the one measure of superlative promise."

To this array of objections the editor of the *Sunday-School Times* adds in black-faced, double-leaded type a still more surprisingly indiscriminate arraignment of "organized Christian social service conducted within the church and in the name of Jesus Christ." He characterizes social service work as "a real peril," as "a substitute for the Gospel," as "a short-cut to social regeneration," as "one of the greatest perils confronting the church and the world today"—"a tremendous crisis of the twentieth century church to be faced only with the decision to follow in their steps who followed our one Lord, by the way of Calvary only."

Thus fairly to state these sincere objections is but to show how they beg the question in stating it, in so far as it claims to be a statement of the point of view taken by those within the evangelical churches who are identified with "organized Christian social service." They yield nothing to these critics in being loyal to Christ and His Cross, to what he taught and died to do. They reply, "these things ought ye to have done and not to have left the others undone." For if "these things" are the fundamental propositions of the Gospel, then it follows that these other things are their inevitable corollaries.

Moreover, the social propagandists may claim that where a community of Christians is not a Christian community, one of two things is apparent: either the church fails "to react powerfully upon the life of the community, touching all its social, political, philanthropic, commercial and other interests," as Mr. Monro promises it will; or it cannot claim "the presence and working of God's spirit," which, he says, characterizes the church that does so react. If the failure thus to react be denied, then the conditions existing in communities where church influence preponderates will be difficult to account for. If the claim of these churches "to the presence and working of God's spirit" be denied, it will excommunicate many a church and unchurch many a community. Is it not to save Christianity from just this dilemma that the Christian social movement has arisen? Is it not coming to the kingdom for just such a time as this?

## VALUE OF A CHURCH COMMUNITY SURVEY

JOHN TIMOTHY STONE

PASTOR FOURTH PRESBYTERIAN CHURCH, CHICAGO

The pastor of a large city church finds himself surrounded by conditions which are not ideal according to the former definition of a pastor's duties; his long hours of poring over his books; a systematic and faithful house to house visitation of members of his parish; his pre-eminent emphasis on the regular church services and preparation for the same—these still stand for him as an ideal. In so far as he is able to attain that ideal, he is a fortunate man; but if he is alive to his present opportunities he will probably find that his schedule will have to be rearranged to meet a hundred and one other demands that come in upon him as a practical agent of administration.

On the other hand, he will make a great mistake if he intends to be the executive himself, aiming and attempting to do the things which a hundred others ought to do under his guidance. Organization for organization's sake is a pure fallacy, but organization for the sake of accomplishment and effective results pertains today to every line of aggressive and successful Christian activity. This by no means is being disregarded by Christian leaders. Our foreign as well as home missionaries are marked examples of careful and large administrative work. In some of our mission stations, where scores are involved in various departments, the whole work seems to go on with the perfect mechanism of exact machinery.

It is wise for us to consider, first of all, the necessity of a comprehensive and painstaking survey of the field if we are to be able to accomplish results without duplication. Cross purposes and cross activities injure one another. There should be a dovetailing of work in order to gain efficiency, and this relation can not exist unless a thorough and complete knowledge of the field is obtained.

We ought to consider also as a primary requisite the opportunity which the church of God has today in any field to co-operate with present active and worthy agencies. The easiest thing in the world is to form a new organization, and one of the hardest things is to utilize the present organizations in scientific and practical co-operation. The trouble has been in so many instances that a man of personality, thrift or enthusiasm starts in to do everything his own way, and starts another organization, perhaps under the guidance of his church, thus centering everything in his one plan, and duplicating the work which older agencies have carried on in his neighborhood. He is a law to himself, or would be, because he feels he can work more easily from his own center than to know and understand the splendid work which has been done, and relate himself to it. This may not be his object; frequently it is simply a matter of ignorance. He has come into a field, and has been approached by a good many enthusiastic

### POPULATION

U.S. Census 1910 - 21<sup>st</sup> Ward.

47,906 .....

POPULATION  
U.S. Census 1910 - 21<sup>st</sup> Ward

47,906

#### PEOPLE IN THE FOURTH PRESBYTERIAN CHURCH'S NEIGHBORHOOD

"There is an average population of 63.58 persons per acre, which is slowly increasing. The proportion of minors in the population is decreasing. The problem of the foreigner in this field is a very small one. Yet no other area in Chicago furnishes as many types of people living under every conceivable standard."

## • HOUSING •

### Occupied Lodging Houses

Section 43-44 & Part of 59 Chicago Telephone Co Study

(River to North Av. Wells to Lake - with a few Additional Blocks.)

## • HOUSING •

### Occupied Housekeeping Apartments

Section 43-44 & part of 59 Chicago Tel Co Study

(River to North Av. Wells to Lake - with few Additional Blocks.)

## RENTS

### TWENTY-FIRST WARD HOMES

"Some of the worst housing conditions in the city are to be found here, although the evil of bad housing may not be apparent. Houses built for private residences have been converted into cheap boarding or lodging houses. Landlords are striving to adapt the old buildings to their new purposes. This has resulted in overcrowding, lack of light and proper sanitation."

individuals as to various lines of activity. He has started in without much direct analysis, and has kept busy all the time doing one thing after another as it came up. Hence, before very long a center of activity has grown up around him,

of which he is the head, and a score of activities are at work from his one center without the information and the knowledge which years have acquired in the painstaking work of many organizations working in the very same line.

Now, it is not so much the duty of the local church to start new organizations as to co-operate in wise and helpful affiliation with all existing organizations, in so far as they are doing their work aright. Of course, it is understood if an organization is not worthy and is not carrying out its practical end wisely, it is time to start a reform, or form another efficient organization in the same line; but a little careful study and thoughtful investigation would tie up the church in almost any locality to a score of active agencies. These are led by splendid men and women, who are able and willing, and in fact eager, to receive the co-operation of the churches.

This latter process will take time and thought, and can not be done carelessly. The young men and the young women of the parish, of the Sunday school in its various departments, and of all other agencies, can associate with the splendid social organizations now doing the work of general philanthropy in the spirit of Jesus Christ.

The organized charities of the city are scientifically and effectively seeking to solve the problem of poverty and want. A large percentage of their ablest workers are loyal Christian men and women. The Juvenile Protective Association, the Boy Scouts and many other such organizations are ready to co-operate in every way to assist in the local problem, and to receive the assistance of those who are locally interested.

## MANUFACTURING PLANTS

### 4th Presbyterian Church Community

— 18 PLANTS INVESTIGATED —

Total Number of Employees 2,872

— HOURS OF WORK —

### HOURS OF LABOR IN NEIGHBORHOOD FACTORIES

"The average number of hours per day the employees work is 9.36"

Too many times we act without thinking, or we leap before we look, and the object of a survey such as we have carried on is not simply to know the conditions of our own field, but to find out as well the present work of earnest, active agencies who are also working, in order that we may thoroughly co-operate with them.

The object of the church is not to denominationalize the community, but to give to the individuals therein the capability of working out their own problem, spiritually and morally; and this from the standpoint of their own conscience. We aim, however, to assist them and the church may, in bringing them into personal contact with the Fountainhead of strength, give them the power within themselves to administrate their own affairs and work out their own salvation.

This survey which we have just completed in a large portion of the twenty-first ward of Chicago is the result of a painstaking canvass by some twenty or twenty-five young men, some of whom were connected with a class at McCormick Theological Seminary, led by G. B. St. John of New York city. Mr. St. John is engaged in the Social Service Department of the Board of Home Missions of the Presbyterian Church. This department is under the leadership of Charles Stelzle, and is supervised by the secretary of the home board of the church. Constant experience in this line of work, and con-

sultation with the local pastor, gives to them the opportunity to carry out the survey on the basis of the need of the local field.

Many of the conditions which we supposed we understood thoroughly, the survey has proven false, whereas many more which we estimated as correct have been verified. The survey has opened the way for an immense amount of additional activity among our church members and organized forces. Thousands of names of those who are partially interested have been given to us, and can be visited. Hundreds of names have come to us of those who have expressed a definite preference for our demonination and our church, a large share of whom we did not know. The value of such a survey is not only in the gathering of these facts, and in the enlightenment which results, but in the "follow-up" work. A survey for a survey's sake is as useless an undertaking as the act of a vain man sitting for his photograph in order that he may hang it in his own study! But a survey which leads to direct and active "follow-up" work is of just as practical value as the work of a forester who surveys the timber before the lumberman begins his work.

Of course, one of the dangers is that such an immense amount of material is gathered which is not used that it is somewhat discouraging when compared with the actual work followed.

### RECOMMENDATIONS FOR SOCIAL SERVICE

OFFERED BY THE COMMUNITY SURVEY OF THE FOURTH PRESBYTERIAN CHURCH:

*Ask each member in what activities he or she is engaged and how many contribute toward the support of charitable agencies.*

*Courses in social service should be conducted for men and boys, women and girls.*

*Scouts should represent the church at social agencies and report the work of each to the church group especially interested.*

*Representatives of the church should belong to the local league of the Juvenile Protective Association.*

*Men of the church should walk about the park summer evenings to discover the danger to unattended girls because of a lack of supervision.*

*A look-out should be constantly kept by all members of the church for the sale of liquor, tobacco, and indecent pictures to minors, for disorderly pool rooms, street trades, and other conditions contributing to juvenile delinquency.*

*Men and women should volunteer for friendly visiting, professional men to give legal, medical or dental service; women to be visiting housekeepers, to aid in clerical work, to accompany women and children to dispensaries and hospitals; men and women to volunteer co-operation with department of health, schools, tenement house inspection, hospitals, police; to be responsible for the enforcement of law in the dance halls, and to provide a recreation center for adults in the center of the field.*

This affords, however, an opportunity to discriminate between the important follow-up work and the unimportant, and also puts before the local church the ideal of that to which it may attain. It also gives the spirit of patience to the workers.

It has been demonstrated in many churches and locations that the great difficulty has been that men have not stuck to their own jobs patiently, persistently, faithfully, and constantly. Many a man is more popular in speaking in different places around the country and telling other churches how to work than he is useful in his own field. A survey means that patient, continuous years must show the result of his earnest leadership and labor. A community can not be changed in a month nor in a year. One thing after another must receive the impress of many personalities until the reforming process has resulted from the regenerating process of indi-

vidual life. Theories and plans will not effectually change cities or wards. They are important, but only important when faithful, constant work, together with careful organization, work out results.

A survey such as this also inspires prayerful and conscientious workers to greater effort and to a *greater faith*. The need is seen, and with the need the power of the unseen but all powerful leadership of God is recognized. Men "attempt great things for God," and they are willing to begin in quiet, practical ways, for they also "expect great things from him."

We believe this survey will result in a more definite consecration, and in a more comprehensive view than anything which has ever been attempted in our parish, but we do not mean to philosophize so much as practicalize, and the test of efficiency after all will be seen in the development of the work of years.

## FORD HALL: A SPIRITUAL PLYMOUTH ROCK

WILLIAM HORTON FOSTER

"I could easily imagine the Galilean on that Ford Hall platform answering the eager, earnest questions of the perplexed multitude." In this way William T. Ellis described the Sunday evening forum in Boston whose fifth birthday was celebrated February 23.

Eleven years ago, Daniel Sharp Ford, publisher of *The Youth's Companion*, in his will gave the Baptist Social Union of Boston absolute control of the imposing building opposite the State House on Beacon Hill, as well as a considerable income from invested funds. He desired these gifts to be expended as the union should see fit "to soften the inevitable conflict between employer and employed." In the building was a hall admirably suited for use as a forum. Obeying the wish of the philanthropist, the union has promoted and managed a series of Sunday night meetings, modeled on the Cooper Union gatherings in New York, but having a distinct religious tone.

The prime mover in this undertaking is George W. Coleman, a Baptist layman. His broad social vision discerned the unchurched crowd and he was moved with compassion for it. He saw the "common denominator of ethical impulse," to use his own phrase, which could reduce to common terms varying races and creeds. He believed that a weekly open discussion and conference would help find that common ground upon which men of all creeds and of no creeds could stand together. He further believed that such a meeting would fulfill the letter and the spirit of Daniel Sharp Ford's will.

At the first meeting, February 22, 1909, a labor leader, a settlement worker, a trustee of the union, and the president of the Universal Peace Society addressed the 150 men and women present. At the next meeting, one week later, Charles Sprague Smith of Cooper Union, New York, spoke on the Brotherhood of Man. That brotherhood has been voiced at every meeting

since, but from almost as many points of view as there have been speakers and addresses.

Fully 75 per cent of the members of the audience are men, and about as many confessed to going to no other Sunday religious service. A large majority declare themselves without interest in any form of organized religion. The faith most largely represented is the Jewish; nearly every known creed finds adherents in the congregation—for such it truly is. People of all walks in life, except the leisure class, are represented. About 40 per cent are trade workers, largely union men; about 30 per cent are clerks and salespeople, while the professional and student classes form about equal divisions of the balance.

For all their difference in creed and race, there is one dominant controlling note in all, a passionate longing for light. They are reaching for something somewhere, and there is a dignity about their striving which makes every form of self seeking or self serving look petty and mean. Everything from Socialism to the religion of India is discussed, and every man and woman present is eagerly responsive. The questions are pertinent, often subtle and searching, but a common ethical impulse animates all; men and women of all faiths and no faith sing together *America and Brotherhood* and join reverently in "Our Father who art in Heaven." As one sits night after night and gazes into the faces of the audience he sees them melt into a composite photograph of hope and longing and almost of faith—a picture which has no counterpart outside the records of the vision of a prophet.

There has been no preaching at Ford Hall and yet the majority of the speakers have been preachers. Those who believe that the church will see that its mission is to save the world as well as to save sinners—to guide the poor battered world into a safe port as well as rescue

those poor sailors who have fallen overboard—to use Professor Peabody's fine figure—can take comfort that among clergy as well as laymen are to be found those who can rightly tell the story of brotherhood. And there are ministers in the audience—men who come for fresh inspiration and go back to give to their churches the lessons they have learned from the unchurched.

Already some eleven similar forums are maintained in and about Boston, while five more are about to start and others are forming. New Orleans and Colorado Springs have flourishing forums frankly copying Ford Hall, and Minneapolis, Detroit and Nashville are making preparations for similar undertakings. *The Youth's Companion* is not the only Daniel Sharp Ford institution which is far-reaching in influence.

From the start, the attendance at the meetings has rapidly increased. Hundreds are turned away and the line waits outside for hours. There is never any crowding or jostling, and through friendly contact in this way the audience gets to feel cordial and unrestrained. *Ford Hall Folks*, a journal containing a stenographic report of the address given each week and the questions asked afterward, is passed around before the meeting opens, and for the next half hour the audience busies itself in discussion of the meeting of a week ago. Genuinely good music makes up the first half-hour of the program. Then comes the address and then the questions. And those questions! David Starr Jordan refers to the "exciting pleasure" of his address. He must be a brave man who would face a Ford Hall audience. Some restless questioner seems always able to find the weak spot in the most carefully prepared address. The real spirit of the questions and the questioners is courteous—no matter how stinging may be the form of the remark.

The most enjoyable feature about the questioning is George W. Coleman. He as chairman—and he has been in charge of the meetings ever since they started—receives the questions and passes them on to the speaker. Of course, the audience is human as all audiences are, and occasionally a little animosity creeps in; occasionally a "thinker who has never been able to harness up his theories to actual life" gets lost in the mazes of his own question. But they all respond to the lightest suggestion from Mr. Coleman. Anything he says goes with them, for he belongs to them and they love him.

The human equation in it all is George W. Coleman. A little Jewess of sixteen said in a letter: "I am one of the girls you used to meet on your way to work and whom you have converted to desire to do unto others as you would have them do unto you." Busy business man as he is, one would judge from the account—an account difficult to obtain!—of his kindnesses that serving his Ford Hall folks is his chief occupation. He carries them always in his heart. He knows most of them by name—the atheist in the far gallery, the Italian tailor down in front, the militant trade unionist on the left, the I. W. W. laborer back by the door, the So-

GEORGE W. COLEMAN

cialist in the front corner—yes, and the little Jewess near the large pillar—he knows them all and they know he knows them, really knows them, and that's why they love him.

Since the first season, Mary C. Crawford, formerly secretary of the Woman's Trade Union League, has acted as secretary at the meetings. A college graduate and trained journalist, she has brought to the multitudinous details of the work the system and the push that have been necessary to energize it.

On their anniversary the Ford Hall folks presented to George W. Coleman a beautiful bound volume of touchingly appreciative letters from men in every part of the country who are prominent in various walks of life as well as from the regular attendants at the meetings. The following examples will serve to tell the story of Ford Hall and to present a composite tribute to the chairman of the meetings.

"I never believed it possible to love in such a personal sense every member of an aggregation of people," declared one who says the meetings have revived his religion and his hope.

The secretary of a cigar makers' union says: "A trade unionist, pure and simple, who believes in the fatherhood of God and the brotherhood of man, I desire to express my appreciation of what Ford Hall is doing. . . . Truly the Christian is beginning to understand christianity."

A Boston woman, born of Pilgrim ancestors, meets "at Ford Hall men and women of all nationalities from all countries, and some of no country to judge by their confessions of faith. We feel that we are all one people for we are all searching for the same truths. It is wonderful."

FORD HALL CONGREGATION

Freda Rogolsky says: "Ford Hall is a 'melting pot' where we all come together, forgetting all prejudices, and are brothers listening to how we may better the conditions and make this world a better place to live in for our next generations."

A blind man says: "You are helping to work out the grand thought of the poet:

"So many gods, so many creeds,  
So many paths that wind and wind,  
When just the art of being kind  
Is all the sad world needs."

Meyer Bloomfield adds his word: "The Ford Hall meetings have been a school of democracy where the faculty has been the audience."

Rabbi Wise: "I think, Dear Coleman, that your very special if not unique achievement lies in showing forth as you do, with earnestness and power, what I venture to call the practicability of religion—the realization of our ideals."

Norman Hapgood declares "Perhaps the greatest problem of democracy is to bring into the lives of the working majority as fine a spiritual and intellectual element as can be had by what are now the more favored classes. Towards this end your work at Ford Hall is contributing nobly."

Rev. Harold Marshall writes: "For a hundred years we Universalists have been proclaiming a belief that religion is a human attribute; but here in the cradle of liberal Christianity we left it to you to conduct the first serious laboratory experiment to test the theory. Some day Ford Hall will be recognized as a *spiritual Plymouth Rock*."

A Jew writes: "I am a Jew, you know, and some of the dearest friends I possess were formerly rabid Jew-haters. But such animosity cannot exist in Ford Hall atmosphere; it melts. And you may rest assured that I, in return, have learned to love my Christian neighbors, God bless them. Such is Christianity, stranger, as Ford Hall expounds it."

And then mark what Lyman Abbott says: "You have proved in Boston . . . that whenever the church forgets itself and thinks only of the service which it can render, it finds that the people are interested in problems of the religious life more profoundly than in any other problem, and will flock in great numbers to hear these problems discussed in a vital way by vital men."

And finally a cluster of epigrammatic appreciations of what Ford Hall has meant to regular attendants at the Sunday meetings:

"These meetings stand for the highest type of moral and educational influences."

"Ford Hall stands for the biggest and broadest brotherhood."

"Each lecture affords me a continuous pleasure for the week."

"I have never left a meeting without feeling uplifted, strengthened, benefitted."

"Aching to tell what Ford Hall has done for me."

"Ford Hall meetings are more to me than a college education."

---

# INDUSTRY

---

## LABOR CONDITIONS AND INTERSTATE COMMERCE

ADELBERT MOOT

FORMER PRESIDENT NEW YORK STATE BAR ASSOCIATION

*[In many quarters the recent decision of the United States Supreme Court upholding the Mann Act, in the white slave cases, has been regarded as foreshadowing the entrance of the federal government upon many lines of legislation that have been considered, heretofore, as exclusively within the province of the states. In this article Mr. Moot shows how the result in the Mann case marks the culmination of a line of decisions which may establish the right of Congress to enact social legislation controlling all industries that enter into interstate commerce.—Ed.]*

In his striking inaugural address, President Wilson said:

"We have been proud of our industrial achievements, but we have not hitherto stopped thoughtfully enough to count the human cost, the cost of lives snuffed out, of energies overtaxed and broken, the fearful physical and spiritual cost to the men and women and children upon whom the dead weight and burden of it all has fallen piteously the years through. The groans and agony of it all had not yet reached our ears; the solemn moving undertone of our life coming up out of the mines and factories; and out of every home where the struggle had its intimate and familiar seat. . . . There can be no equality of opportunity, the first essential of justice in the body politic, if men and women and children be not shielded in their lives, their very vitality, from the consequences of great industrial and social processes which they cannot alter, control, or singly cope with. . . . Sanitary laws, pure food laws, and laws determining conditions of labor which individuals are powerless to determine for themselves are intimate parts of the very business of justice and legal efficiency."

Has the national government power to remedy the conditions the president describes and suggests should be remedied? A brief consideration of our Constitution and some of the decisions under it may be of value in answering this question.

The power granted the national government by the Constitution to deal with such matters is contained in the following words:

"The Congress shall have power . . . to regulate commerce with foreign nations and among the several states, and with the Indian tribes;"

and in the supplemental grant of power:

"To make all laws which shall be necessary and proper for carrying into execution the fore-

going powers, and all other powers vested by this Constitution in the government of the United States, or in any department or officer thereof."

Any thoughtful consideration of the language used in the Constitution will show that the extent of this grant of power to the national government depends upon the exclusive or inclusive meaning put upon the words "to regulate commerce." What do those words mean? In what sense are they used in the Constitution? The Constitution itself is silent upon that subject. Consequently, we must look to decisions made in cases involving laws of the states and of the United States, for the answer the courts have been forced to make to these questions.

The first great case to come before the courts (*Gibbons vs. Ogden*, 9 Wheaton, 1), was a case involving the navigation of the Hudson river, wholly within New York. The state of New York assumed it had the right to control the navigation of this river, and it granted to Fulton and his associates the exclusive right to navigate the Hudson river with the steamboats built under Fulton's patents. In due time, this exclusive right was questioned by others who also desired to navigate the Hudson river with steamboats. The resulting litigation passed through the courts of New York, and in those courts one of the greatest judges of his time upheld the exclusive right granted by New York state, and enjoined Gibbons from navigating the Hudson river for that reason. Gibbons retained Daniel Webster and William Wirt, two of the most eminent lawyers any country ever saw, to present his case to the United States Supreme Court. They were met by lawyers almost equally proficient, and the case was ably argued in that court in the February term, 1824.

The result of that argument was the first

great decision as to the meaning of the language quoted from the Constitution, one of the most important decisions ever rendered by any court. In substance the court held in this case that Congress had the power to prescribe the terms and conditions under which vessels might navigate the great rivers and lakes of this country.

This decision really turns upon the meaning of the single word "commerce." In the decision, Chief Justice Marshall thus defined that word:

"The counsel for the appellee would limit it to traffic, to buying and selling, or the interchange of commodities, and do not admit that it comprehends navigation. This would restrict a general term applicable to many objects, to one of its significations. Commerce undoubtedly is traffic, but it is something more; it is intercourse. It describes the commercial intercourse between nations and parts of nations, in all its branches, and is regulated by prescribing rules for carrying on that intercourse."

This singularly clear decision as to what the word "commerce" means, as used in the Constitution, has been quoted again and again in numberless decisions since, but so well has it stood the test of time that no serious or lasting criticism of it has ever been made. The statement that it includes "commercial intercourse . . . in all its branches" proved most illuminating. Under this ruling it was conceded that where Congress spoke on the subject by statute, all state laws must yield, but in the absence of congressional statutes it has been conceded that within reasonable bounds states might legislate as to commerce within state boundaries. Where the subject is national, and admits of only one uniform system of law, state laws are invalid, but where the subject is one that has a local as well as a national character, there may be both state and national laws on the subject, if they do not conflict.

And so, following this first decision came others holding that all vessels, crews, passengers, freight, bridges, and the like, substantially involving interstate commerce by water, are subject to national regulation.

Then came the statutes and decisions following the same case, holding that all railways, engines, cars, railway passengers, passenger rates, freight, freight rates, safety appliances, telegraph lines, hours of labor, and employers' liability, are subject to the same law where interstate commerce is substantially involved.

But a momentous question remained unsettled as recently as 1903, and that was the meaning of the word "regulate." Did it include prohibition of that which is evil? In 1895 Congress made it a crime to carry lottery tickets in interstate commerce, by mail or otherwise, and the legal question raised was, had Congress the power thus to prohibit such interstate traffic.

So well was this question argued at the October term, 1900, that it was ordered re-argued at the October term the following year, and again ordered re-argued at the October term, 1902. As the result of these three arguments, a bare majority of the court finally sustained Justice Harlan in a decision thus carefully stated by him:

"We decide nothing more in the present case than that lottery tickets are subjects of traffic among those who choose to sell or buy them; that the carriage of such tickets by independent carriers from one state to another is, therefore, interstate commerce; that under its power to regulate commerce among the several states Congress, subject to the limitations imposed by the Constitution upon the exercise of the powers granted, has plenary authority over such commerce, and may prohibit the carriage of such tickets from state to state; and that legislation to that end and of that character is not inconsistent with any limitation or restriction imposed upon the exercise of the powers granted to Congress." (Lottery Cases, 188 U. S. 325, 363.)

Having these cases in mind, it will be seen that commerce includes intercourse between the states, and Congress, having the power to prohibit immoral commerce, or intercourse, or traffic, that thereby the interstate channels may be left free and unobstructed for moral and harmless commerce and intercourse, it follows that the Mann Law, prohibiting the importation of white slaves from one state to another, or from one country to another, is the mere exercise of the great power of Congress granted to it by the Constitution and upheld by a long line of decisions of the courts, of which the few striking ones referred to are only illustrations.

Let us add one further illustration of the power of Congress in all these matters.

In 1906 Congress enacted an Employers' Liability Law, that was soon pronounced unconstitutional because it did not carefully observe the rights reserved to the states in such matters, as to concerns not engaged in any way in interstate commerce; but that decision plainly showed that an act properly drawn as to interstate commerce employers would probably be upheld by the Supreme Court. (Employers' Liability Cases, 207 U. S. 463.)

Accordingly in April, 1910, Congress amended the Employers' Liability Act to make it conform to this decision of the Supreme Court. The amended act, however, was also attacked as to its constitutionality, but it was upheld by the court. In upholding that act the court quoted with approval from the able brief of the late Solicitor General Bowers the following clear statement of the "settled" law:

"The act of interstate commerce is done by the labor of men and with the help of things; and these men and things are the agents and

instruments of the commerce. If the agents or instruments are destroyed while they are doing the act, commerce is stopped; if the agents or instruments are interrupted, commerce is interrupted; if the agents or instruments are not of the right kind or quality, commerce in consequence becomes slow or costly or unsafe or otherwise inefficient; and if the conditions under which the agents or instruments do the work of commerce are wrong or disadvantageous, those bad conditions may and often will prevent or interrupt the act of commerce or make it less expeditious, less reliable, less economical and less secure. Therefore, Congress may legislate about the agents and instruments of interstate commerce and about the conditions under which those agents and instruments perform the work of interstate commerce, whenever such legislation bears, or in the exercise of a fair legislative discretion can be deemed to bear, upon the reliability or promptness or economy or security or utility of the interstate commerce act." (Second Employers' Liability Cases, 223 U. S., 1, 48.)

Recurring now to the language quoted from the stirring address of President Wilson—what application shall we make of these settled rules of law in dealing with the subject brought so forcibly to our attention by him? The question presented is, shall we go to all the various state legislatures with model acts designed to regulate the hours of labor, days of labor, places of labor, and compensation to injured employes, or to those who come after them, or, instead, shall we look to the national legislature for proper national legislation on these subjects? Shall we fritter away our time in piecemeal appeals to the various state legislatures for piecemeal legislation, however model its character, or, instead, shall we look to the national legislature for carefully thought out and comprehensive legislation covering the subject?

The great railways, steamship lines, and manufacturing and distributing corporations all do interstate business. Millions of men and women are engaged with the railways, the steamship lines, the steel companies, the wholesale stores, and the great manufacturing industries of the country. Many of these employes work twelve hours a day, and seven days a week, while many other worthy citizens find it difficult to get any work at all, so unevenly is work distributed. Women and children work hopelessly long days, and too many of them, while other women and children are unable to get any work, because of this unequal distribution. In many places the working conditions are unsafe and unsanitary, while in others they are good.

Is it not plain that all these employers and these laborers should have some more uniform and just rule of law to govern their relations to each other and to their work? Should it not be possible to take all the model laws and from them frame a national act that will cover the permissible hours and days of labor for men, women and children, the permissible sanitary conditions for them, the permissible conditions for them as to safety, and that will prescribe

what compensation shall be received by them in case of injury, or by those who come after them in case of their death?

Should it not be possible to prepare legislation definite and clear enough to enable the injured employe, or his widow or representative, easily to determine what their rights are in order that without the intervention of an insurance company or a lawyer a fair settlement may be made with the employer? After giving a reasonable time in which to make such settlements, and providing that settlements brought about by fraud or unfairness shall be void, should not such legislation provide for a competent adjuster in each federal district, appointed by the judge, who shall take proof as to the facts in case of dispute, and report to the court his opinion as to liability? If a lawyer or a claim agent is engaged, should not his compensation be subject to the action of the court, that the injustice of a 50 per cent contingent fee for merely making a settlement or conducting an easy case shall no longer be possible? If either party is dissatisfied with the report of the adjuster, upon filing exceptions to that report, should the party not have the right to come into the court and try the case out before court and jury in the usual manner?

If we had such a statute applying to all corporations substantially engaged in interstate commerce, and all such corporations were compelled to file within a reasonable time their written assent to its terms of liability or be prohibited from engaging in interstate commerce, it is not difficult to believe that an immense amount of injustice and litigation could be avoided.

Would it not be better to have such simple legislation, laying stress on sanitary conditions and safety, reasonable hours of work, and reasonable compensation in case of injury or death, than it would be to have crude state insurance laws that encourage malingering, enormously increase the expense of taxpayers for needless officials, and fail to put a premium on the side of health and safety?

Doubtless such a statute could not be drawn in a day. It would require the mature consideration of labor leaders and employers of labor, and the most experienced and broad-minded counsel that they could bring to their consideration. There have been objections in the past, and there will be objections in the future, to any such legislation, because of state rights.

Right or wrong, however, the Constitution of the United States, the decisions to which we have called attention, and the business conditions of today, have made it impossible properly to settle this broad question by appealing to first one state and then another. For a long period of years experienced and able lawyers have labored for uniform state legislation on matters so simple that it would seem easy to obtain it, and yet as the result of all these labors there are but few laws that are uniform in different states, and usually these laws are to be found in but very few states.

In the matter of welfare of workers in inter-

state commerce, however, is involved a problem of national concern, and it can be adequately dealt with only by national law. Upon no other basis can the employers or the employees be put on equal terms with each other everywhere in interstate commerce. If the relation of employers and employees to each other in interstate

commerce is thus regulated by national law, the states, in self-defense, will be compelled to adopt substantially the same regulations. It is only just and right that a subject of national importance and scope should be settled by national law; and it is doubtful if it will ever be settled right by any legislation short of that.

## WOMEN'S TRADE UNIONS'

FRANCES SQUIRE POTTER

The first women trade unionists in America were conscious daughters of one revolution and the mothers of a greater one. Naturally their organization arose in New England, the theater of the early industrial movement. They were characterized by a New England feeling. The textile workers were American girls, the daughters of farmers. A strong religious note pervaded their resolutions and other official utterances. There was a remarkable repetition of the declarations and phrases which had been common fifty years before upon the lips of the revolutionary orators and patriots.

The movement for organization among them from the time of the formation of a union by the tailoresses of New York in 1825 through the dominant period of the Knights of Labor is outlined by John B. Andrews, now secretary of the American Association for Labor Legislation, in Volume X of the Federal Report on the Condition of Woman and Child Wage-Earners in the United States. Mr. Andrews' résumé is clear, concrete, unpretentious and comprehensive. It shows a penetrating and orderly grasp of the subject. The writer has an appreciation of the picturesque and a sympathy which is grateful to the layman. These qualities, also enhance the value of his analysis for the scientific reader. There is apparent an understanding of the slow and progressive change of industrial forces which he interprets through an admirable selection of seemingly fragmentary episodes. Mr. Andrews has condensed and selected with skill, yet he knows when to go into detail. The emphasis placed upon the great principles behind the brief successes and the inevitable reverses of women's trade unions make this report an unusually valuable document.

Certain things stay by one after reading Mr. Andrews' report. Among these are: the patience and endurance of women workers; the prevalence of the defensive strike against longer hours, cut wages, and worse things; the dramatic coming together of the ardent and ignorant altruist from without the ranks of labor, and the definite, practical worker; the well-intentioned but one-sided vision of the altruist so obsessed with the woman side of the movement that she could organize women as strike breakers in a man's strike, and the more enlightened leadership of a Leonora Barry, "machine hand," who said "Organize within the industrial hive,

not just as women"; the importance of the press, particularly the labor press; the social evil inevitably keeping pace with economic depression; the growing callousness of the public consciousness from the Puritan days to the present, along with the increase of reform talk.

The account of the first strikes is illuminating when placed side by side with those of today. They were defensive rather than aggressive. They were accompanied by what are generally supposed to be recent devices—parades, mass meetings, ballads and lampoons.

The earliest sustained investigations into the conditions of working women in the United States were made and published by Mathew Carey of Philadelphia in the twenties. Under his inspiration, too, in 1835, the tailoresses and seamstresses of Philadelphia met with the women of other trades, and formed what is, apparently, the first city federation of working women's organizations. The ten years following 1825 saw the organization of several trades besides those of the textile workers. The experiments were sporadic; but even the failures inspire respect because they illustrate the crying out of a live organism against the first pinch of the great competitive forces of industrialism in the machine age.

The second period of the movement, 1840-60, represents the vaguer and wider protest of a nation groping for a remedy against wrongs which were repudiated morally but not understood economically. The struggle between abolitionists and secessionists has drawn attention away from the less spectacular developments appearing in the women's reform associations. These organizations were composed chiefly of textile mill girls but included representatives of cap-makers, shoe-makers, and the intolerably oppressed tailoresses and seamstresses. These are the years of legislative reform and legislative disillusionment for working women. The leaders soon realized the hopelessness of isolated action, and the organizations of Pennsylvania and New England women began to co-operate. The first ten-hour law was passed by the New Hampshire legislature in 1847 with the vitiating clause exempting special contract.

The Civil War accelerated the changes begun earlier. The government, for the first time, employed women in clerkships. War widows took to the needle in such numbers that women who were not "near relations of soldiers" were pushed to the wall by government preference. Women

<sup>1</sup>See Federal Report on Woman and Child Wage-earners in the United States. Prepared under the direction of Charles P. Neill. Vol. X. Women in Trade Unions.

sewing for the contract departments appealed to Lincoln for relief against the sub-contract middlemen. Shortly after began that influx of old world peoples and old world problems which the founders of the republic thought they had left behind them for good when they crossed the Atlantic. Famine drove the immigrants out of Ireland. The year of revolution, 1848, drove them out of western Europe. The Austro-Prussian War drove them out of eastern Europe. For fifty years we have felt the same terror of this inundation, and still they are coming!

In 1869 women were admitted for the first time, upon equal terms, into a men's trade union, when a charter was granted to the women of Typographical Union No. 1 of New York. This event marks a step in the wisdom of both men and women. It was the first perception of the fact that the economic problem is the same for every worker regardless of sex, and that there is but one way to solve it, by making common cause. This third period also saw in the Daughters of St. Crispin, an association of the shoe workers, the rise of the first national organization of women.

The Fourth Period, which began in 1880, is characterized by the dominance of the Knights of Labor. This organization affirmed the solidarity of labor without regard to trades or sex. It was the first time that a general organization invited women into its ranks upon an equal foot-

ing with men. One of the most stirring stories in the annals of the woman's labor movement is that of Mrs. Leonora Barry, lecturer, pamphleteer, organizer, research worker, and consecrated politician.

The report is presented in two divisions. Part II, by W. D. P. Bliss, is a collection of research material upon the history of women in trade unions since the organization of the American Federation of Labor. Up-to-date tables are interspersed and the collection is preceded by the author's exposition of his theory and conclusions. There is a sense of nearness to the materials which indicates a lack of organic grasp of the subject.

Part II gives one the impression of being an accumulation of facts, for later synthesis. There are striking narrations; for example, the episode of the Swedish women of Chicago. One is conscious of the on-coming of the tragedy of labor, which, after all, is not so much its struggle with oppressive external forces as it is the disasters from internal treachery and dissension.

An appendix by Helen Marot gives the key for the interpretation of the Woman's Trade Union movement of today.

The volume as a whole leaves a vivid conception, tempered by a true historical perspective, of the throes of a giant democracy to rid itself of the congestion and fever of an over-speeded, unsystematized, faulty industrial system.

## TIMBER CAMP PLANNING IN ALABAMA

ETHEL ARMES

Kaulton is the name of the first model industrial town to be set up in Alabama by a lumber concern. Saw mill camps are proverbial all over the South for rather sorry conditions, rough shacks, hill-billy folk and hill-billy looks all through. The Kaul Lumber Company has a large saw mill plant in the county of Tuscaloosa—a portion of what is known as the Birmingham district—about a quarter of a mile south of the century-old town of Tuscaloosa, seat of the state university.

The company owns an immense acreage of timber in this section. A tract comprising eighty acres immediately adjoining the plant, thickly wooded in spots and fairly level, was set aside by this company for separate quarters for its white and negro labor, and ground was thus broken a year ago for the town.

The town plan, the work of George F. Miller, of Boston, the landscape architect who designed Corey, is compact, practical and artistic. In form, like a palm-leaf fan, the stem leads out from the saw mill and all the "works" in the form of a tree-lined way to the office and commissary, church and school buildings, fountain and park space, on beyond to the workers' homes.

At the present time, forty-five houses and the hotel have been completed. They are plain, simple houses, an adaptation of the California bungalow type, but with higher ceilings and more

air space. There are four rooms to each house 14 by 18 feet, two chimneys, and double windows. The inn is designed along California-Spanish lines and has twenty rooms. It is built in a square with a patio in the center to be grass plotted and planted with roses and wistaria.

While the sewerage, drainage systems, lighting and water works are not yet completed, each house is designed to permit their installation.

The houses are all standard type, all precisely alike, built of lumber, rough side out. They do not, however, present a uniform appearance because such varying material is used in their construction, and a varying color scheme is employed. A high grade creosoted stain is used in several shades of browns and greens, some yellows and whites, and thus a charming and harmonious effect is obtained. They are further differentiated by various styles of lattice work and grill work on the little front porches, on which it is proposed to have climbing vines and roses. Then, too, the lots vary, being from 57 to 70 feet front, and from 125 to 140 feet deep, while there is a good space between the houses and none of them are "lined up" in stiff rows, but follow a general curvilinear scheme and all slope toward the street.

Water oaks, red elms and Lombardy poplars will be planted on the streets this spring. The original forest trees—second growth at least—

pinus and oaks and some hickory, are retained in every possible instance.

The inn faces a reservation which is planned to be at some future date an athletic field, park and playground. It is the purpose of the company to have their employes develop this feature themselves. "Paternalism" is being strictly avoided.

The Negro camp is across the railroad tracks at some distance from the white camp, and has its own civic center, and town plan, quite as attractive as the white section of Kaulton.

#### NIGHT TELEPHONE OPERATORS

In the December, 1912, Bulletin of the New York Department of Labor, E. B. Patton gives the result of a study of night telephone service. The report shows that 99 per cent of the 10,652 persons employed in the telephone industry in this state are women. Of these 2,677 work at night, the greater proportion in New York city. About 50 per cent work the whole night from 9 P. M. to 6 A. M. Of the 2,230 female operators whose age is reported, almost 73 per cent were under twenty-one years; in New York city less than 15 per cent were twenty-one years or over.

New York city, however, though offending in respect to the employment of extremely young girls at night, has a maximum night shift of only eight hours. Some of the up-state towns work the telephone girls ten and even more hours. The maximum was found to be a night of fourteen hours for eight operators. In all instances time for meals taken in the office is included in these hours. In the cases of excessively long hours, which were, of course, illegal, the country office operator usually sleeps between calls, and is wakened by a buzzer. Weekly hours ranged from thirty-six to ninety-eight. More than a quarter of these girl workers were found to have a seven-day week, all these cases being in the smaller exchanges outside the cities.

The extent to which the girls are exposed to the dangers of the street at night is not great. All but about one hundred of the 1,253 who reported on this matter leave or go to their work by ten o'clock or before. Three operators in New York city go off duty at 12 o'clock, and one in a country town goes on at 5:30 A. M.

In one respect this group of girls appears unusually well protected, for out of the whole group only 6.5 per cent reported that they boarded away from home. This is to be accounted for in part by the fact that the telephone companies, according to the report, give preference to girls living at home, but living at home, in turn, reacts on wages.

The maximum wage among the 1,100 operators, whose earnings were learned, was \$12 a week. This was paid to twenty-six girls in New York city and to one out of town. The minimum salary was \$12 a month which was paid to five village operators: In New York city 82.5 per cent earned \$8 or over a week; none received below \$6. Outside of the city 33 per cent got less than \$6, and only

22 per cent \$8 or more. The wages of a few women in supervisory positions were higher than those of the operators. Most of these received between \$12 and \$15, many of them rising with length of service.

#### CANNERS IN THREE STATES

Three states and possibly more are considering whether canners shall be permitted to exploit woman and child labor *ad libitum*. It is an old question in New York and the method of dealing with it in the past has been to let the canners have their own way. Now, however, the situation is different. After the revelations of the Factory Investigating Commission the canners are in a chastened mood.

When the hearing was held at Albany on February 19 on the thirty-two labor bills, including those extending the protection of the law to women and children employed in canneries, the canning interests proposed but two changes. They urged the committee not to make a corn field legally a factory, and they asked that a lower age limit than fourteen be decided upon for the employment of children in sheds. But they abandoned all their old contentions. They were not only willing that the legislature should fix any age limit below fourteen that it saw fit, but that it should also make any limit that it considered advisable on the daily hours of work.

This development ought to be of some significance to Missouri and California where the canners are not in so contrite a mood. When the eight-hour law for women was enacted in California in 1911 the canning industry was exempted from its operations. It is now proposed in a bill before the legislature to make the law applicable to the growers and canners of fruit. These industries have organized a committee to fight the proposition, and to draw an amendment satisfactory to themselves.

In Missouri the situation is quite similar. The Missouri Valley Canners' Association at its recent annual convention, discussed at length the hardship worked on their industry by the child labor law and by the act limiting the hours of employment for women to nine a day. A committee of three men including the president of the association, R. B. Gillette, was appointed "to take the necessary steps to influence members of the legislature to make the desired changes in the laws." The fact that there will be more than one hundred new canning factories in the state by the time the next crops come on makes it imperative, the canners say, that the legislature grant them relief.

"The canning season is at its height at the farmers' busiest time," said President Gillette. "Consequently, help is always scarce and it is not only necessary to employ children, but the women employes are needed more than nine hours each day. Conditions surrounding the workmen in the canning factory out in the country are different from those met with in the factories in the larger cities. In the country the air is pure and the conditions altogether different from those which the laws were framed to cover. Last season

Missouri cannery lost considerable money because they could not employ children."

It is possible that the answer of the legislature to the cannery's association will be the passage of an eight-hour law. It is probable that an amendment to the nine-hour law extending its operation to women in every field of industry covered by the most progressive labor legislation in other states will go through. Both the eight-hour bill and the amendment mentioned have been introduced and have strong backing—with no contentions among the backers.

#### COMPENSATION AND STATE LINES

A decision which is, in the opinion of H. P. Bradbury, writing in the *Market World and Chronicle*, the "most important legal chapter that has been added to the workmen's compensation question in a long time" has recently been handed down by Justice Cohalan of the New York Supreme Court. This decision was made in the case of Antonio Albanese, a resident of New York, who brought suit under the common law in a New York court for serious injuries sustained in a hoist elevator while in the employ of James Stewart and Company at Fort Lee, N. J. The defendants claimed that the case was governed not by the common law but by the New Jersey compensation law, which operates as a waiver of the common law right and substitutes a liability for the compensation provided therein. To this defense the plaintiff took exception on the ground that the New Jersey law was unconstitutional and opposed to the public policy of New York. He cited the Ives case and contended that inasmuch as the courts of New York had held the New York act to be unconstitutional, they could not enforce a like statute of another state.

The court upheld defendants' contention that the New Jersey act was elective or optional and therefore did not come within the scope of the Ives case holding a compulsory act unconstitutional. The decision thus upholds both the constitutionality of the New Jersey law and the right to recover under that law in a New York court.

Part of the text of Justice Cohalan's decision follows:

"The New Jersey act is not a compulsory statute. It is a so-called optional or elective statute. The act, in section 2, paragraph 9, provides that a contract of hiring shall be presumed to have been made under the act unless a contract of employment or a notice sent by either party to the other shall otherwise provide, and no such contract has been made or notice sent by either party in this case. The statute, therefore, becomes compulsory only in the event that neither party disaffirms it. Following the decision of the United States Supreme Court in the case of *Mondou vs. N. Y., N. H. & H. Ry. Co.*, reported in 223 U. S. 1, upholding the Federal Employers' Liability Acts, the several states have passed legislation embodying provisions similar to those contained in the statute in question. These statutes invariably have been declared constitu-

tional. The accident happened in the state of New Jersey, and as the liability of the defendants is governed by the law of that state, I think that the demurrer should be overruled, with leave to the plaintiff to reply to the defenses set forth in the answer."

A case decided on like grounds in the same court at about the same time is that of Antonio Pensabene, a citizen of New York, whose administrator sought to recover under the New Jersey compensation act for his death in the employ of the L. and J. Auditore Company of New Jersey. The court (Judge Kelby delivering the opinion) decided in that case for the plaintiff on the same grounds as those on which the plaintiff in the Albanese case lost in choosing to sue under the common law of New York.

#### DEPARTMENT STORES AND EARLY CLOSING

Emphasis on the fire danger in department stores was the distinctive feature of last year's annual report of the president of the New York Consumers League. Now the association is urging as thorough an investigation of these dangers as has been made of New York factories. The report this year takes account also of another hazard in the life of the saleswoman—the low wages that make her an easy prey to moral temptation. An investigation of the wages of 334 saleswomen over sixteen years old in stores of all grades throughout the city showed that 60 per cent received \$6.50 or less, and that 33 per cent receive between \$6 and \$6.50. Wages, according to the report, do not increase proportionately with length of service. These figures were gathered as part of a campaign which the league is undertaking for a state minimum wage commission.

In the matter of early Christmas closing the league reports a discouraging showing in New York.

A year ago the large Sixth avenue stores which had previously kept open from six to ten nights preceding Christmas closed at six on all but three evenings. This year, there was apparently no preconcerted arrangement to close early. Twenty-one firms closed at six as usual, other firms kept their stores open from four to ten nights. Some of those uptown kept open until 9, 9:30, 10, 11 and 11:30 P. M., and many employes were detained until a much later hour arranging stock. In a number of stores, employes were obliged to work on Sundays in addition. In the candy department of one of our best known department stores, a saleswoman worked 11½ hours a day or 65 hours during the week before Christmas. Supper was given but no extra pay. In the toy department some girls worked 73, 82 and 88 hours. On Thanksgiving Eve one clerk left the store at 2:30 A. M.

One packer who worked for sixteen years in a fashionable store, said that because of the long hours of work he had never been able to eat dinner with his family in all these years, except on Sunday nights and during three summer months on Saturday nights. The league's investigating committee noted that there was much

late shopping in stores which were supposed to close at 6 P. M. Customers remained after that hour and thus detained employes from twenty minutes to half an hour. Sometimes that meant losing a ferry boat or train, which delayed the evening meal. Merchants advertised that they would send home that same night or on Christmas morning all articles purchased on Christmas Eve, even if purchased as late as 10 P. M. Delivery wagons were therefore seen in the streets on the afternoon of Christmas Day, showing that some delivery clerks lost their holiday because of the procrastination of thoughtless shoppers. "Much of the labor of the world," writes Mrs. Nathan, "would be a real joy instead of a hardship were the hours of labor shorter. Exhaustion, ill-health, poor service are the inevitable results of long hours."

### JOTTINGS

#### PROGRAM FOR BIRMINGHAM WORKERS

John Mitchell, former president of the United Mine Workers of America, was interviewed recently by Ethel Armes for the *Birmingham News*. It will be remembered that the Birmingham coal fields have been largely non-union since the strikes of 1908. Miss Armes summarizes Mr. Mitchell's statements by saying:

That coal should "stand on its own bottom."

That the coal digger should be paid in cash and not in apples and potatoes.

That, while the commissary system may be a necessity in remote districts in Alabama, the abuses of this system should not be further tolerated.

That the semi-monthly pay day will, in great degree, eliminate these abuses.

That the interests of the workingmen and the merchants of the Birmingham district are identical insofar as the abolition of the truck store is concerned.

That the mining camps of Alabama should be thrown open to truck gardeners, peddlers and merchants throughout town and country.

That wages of workingmen should be higher in the Birmingham district if the whole community is to prosper.

That it is the payroll of workingmen—the trade and the citizenship of the great masses—that make a city.

That a system of ethics on the part of great companies; fair dealing and square dealing; good housing and living conditions, must be more general in Alabama and more uniform, if the best results are to be hoped for.

That all employes everywhere throughout this district must be free to trade where they please.

That the simple rights of trade organization among employes should not be denied, inasmuch as they make for associated expression, greater co-operation between employer and employe; necessary changes for good, and insure the personal freedom of the employe and make for industrial peace and prosperity for all concerned.

That the labor movement in America, being the only hope for democracy, will ultimately prevail and quiet the present unrest and discontent.

#### FEDERAL REPORT ON THE COST OF LIVING

In Bulletins 105, 106, 108, 110 of the federal Bureau of Labor, six volumes in the bureau's cost of living series are now available. The bulletins cover the retail prices (1890-1911) of the principal articles of food and of coal and gas for household use gathered from each of thirty-nine of the most important industrial cities in the United States. They also summarize data on cost of living published in the eighteenth annual report of the bureau and in several of its earlier bulletins, and give comparative prices of the principal articles of food for given months in 1911 and 1912. The average increase shown in some of the tables is 15 per cent. The following table is representative:

	Per cent of increase in price	Per cent of decrease in price
Potatoes, Irish .....		23.7
Sugar, granulated .....		20.4
Flour, wheat .....	0.6	
Milk, fresh .....	3.3	
Butter, creamery .....	6.5	
Ham, smoked .....	7.8	
Hens .....	8.7	
Corn meal .....	9.3	
Bacon, smoked .....	11.6	
Eggs, strictly fresh .....	13.8	
Rib roast .....	16.5	
Lard, pure .....	17.2	
Strloin steak .....	19.4	
Round steak .....	20.1	
Pork chops .....	22.1	

The bureau purposes to issue a report covering prices for the first six months of 1912 and thereafter to publish a current price report every two months, based upon monthly price lists sent in by 675 retail merchants, 140 bakeries, 165 coal dealers and 60 gas companies.

#### STEEL CORPORATION PENSION FUND

The second annual report of the United States Steel and Carnegie Pension Fund covering the year 1912 has been issued. The number of beneficiaries on December 31, 1912, was 1,843 as against 1,606 on December 31, 1911. During 1912, 363 beneficiaries were added, and 126 were discontinued. The corresponding figures for 1911 were 565 and 111 respectively. The average age of the cases added in 1912 was 63.69 years, while the average for the previous year was 66.66. The average period of service of the cases added in 1912 was 29.14 years as against 40.03 years for those added during the preceding twelve months. The average pension received by the new cases of 1912 is \$20.30 a month. In 1911, it was forty-five cents more. The total amount expended for pensions in 1912 shows a considerable increase. The sum was \$358,780.92 in 1912 while in 1911 it was \$281,457.37.

#### WAGE INCREASES IN STEEL INDUSTRY

The United States Steel Corporation on February 1, raised its rate for common labor in the Pittsburgh district from 17½ cents to 20 cents an hour. On March 1, the Cambria Steel Company of Johnstown, Pa., advanced the common labor rate from 15 to 17 cents an hour. Other independents at Youngstown, O., and elsewhere have also announced wage advances.

## COMMUNICATION

### MOTHERS' PENSIONS

TO THE EDITOR:

You will, of course, be glad to publish this statement of mine:

Soon after I succeeded in getting the Mothers' Pension Law enacted in Illinois people all over the United States, including governors, legislators, social workers and philanthropists, began to write me asking for full information about this new law.

These requests increased from month to month until they numbered thousands.

Not being a rich man myself I could not afford to hire stenographers and pay postage for carrying on this voluminous correspondence.

Judge McKenzie Cleland and I then formed the Mothers' Pension League for the purpose of gathering and distributing authentic information on the mothers' pension movement all over the United States.

People interested are asked to pay one dollar, which money is all used in paying for printing, postage, stenographers and incidental expenses for carrying on this work.

No officer of this league has ever received any money or personal profit in any way from the funds of this league.

The league employs efficient women in many cities to assist in carrying on this work.

People who are opposed to pensions for mothers of dependent children are constantly circulating misstatements.

For instance, Mr. C. C. Carstens of the Massachusetts Society for the Prevention of Cruelty to Children, made a report of his opinion in reference to the mothers' pension system in Chicago. The writer talked with Mr. Carstens the next day, and he said that the so-called synopsis of his report which was published in the newspapers was not a correct synopsis of his report, and he had repudiated it by telegram.

This league endeavors to correct false statements that are given to the press by the enemies of mothers' pensions.

The Mothers' Pension League is furnishing to its members and to the public generally authentic information and furnishing as much information as its funds will permit.

I pay all of my own traveling expenses and I have traveled almost constantly for six months, campaigning in many states for the cause of mothers' pensions.

The only place where I have campaigned where I did not personally pay my own expenses was in Philadelphia the first week of this year, where my expenses were paid by the Philadelphia *Evening Telegraph*.

The first day in Philadelphia I discovered that the Pennsylvania legislature had enacted a Mothers' Pension Law in 1907—and for the past six years the organized charity people had been using it to get money out of the public treasury

to pay for the keeping of children after taking them away from their own mothers.

Although this Pennsylvania Mothers' Pension Law said that the money could be paid "to any person or family," it had never been paid to any mother. Evidently she was not considered "a person or a family."

The money, to the extent of \$17,000 a year, had been paid out of the public treasury to a corporation; evidently they considered that a corporation is "a person or a family." When I showed these facts to the people of Philadelphia they demanded that their Pension Law be construed correctly, and they then and there put into correct operation their Mothers' Pension Law.

HENRY NEIL.

Chicago.

[Comment on this letter will be found on page 849 of this issue.—Ed.]

## JOTTINGS

### A STRAW IN PRISON REFORM

A private letter from a person living near the Clinton, N. Y., State Prison says:

"At the last electrocution you will be happy to know that the 'local sports,' against whose presence at the function we had protested, were shut out. They were preparing an auto trip and junket, as they had been in the habit of having previously, but the warden sent word that they would not be invited."

### INTER CITY NEIGHBORHOOD WORKERS' CONFERENCE

New York and Boston neighborhood workers are the latest to arrange for an inter city conference which will discuss ways of improving the training of social workers. The decision to take this step is an indication of a growing recognition of the identity of certain of the problems which face our larger cities. St. Paul and Minneapolis, Baltimore and Washington were the first to recognize this by joint discussion of their social problems. Now New York and Boston have followed their example and the practice bids fair to spread still farther.

The conference will last three days, March 29 to 31 and will discuss such subjects as standards and stipends for work and workers and the value of federation in relation to standards of work. The Boston settlements are preparing to receive their visitors on Friday, March 28. Miss M. deG. Trenholme of the East Side House, 540 East 76th Street, is in charge of the arrangement in New York city.

### KENNEDY LECTURESHIP ANNOUNCEMENT

The New York School of Philanthropy announces Homer Folks, secretary of the State Charities Aid Association and of the New York State Public Health Commission, as the eighth Kennedy lecturer. His predecessors, since the lectureship was established in 1906, have been Simon N. Patten of the University of Pennsylvania, President Arthur T. Hadley of Yale, Jeremiah W. Jenks of Cornell, Edward T. Devine,

Henry R. Seager and Frank J. Goodnow of Columbia, and R. Fulton Cutting of New York.

Mr. Folks is to lecture on state and social welfare. The series of lectures which begins March 31 will cover state treatment of the insane and the feeble-minded, public health, poverty and crime. The substance of the courses given by the Kennedy lectures of the School of Philanthropy has been published in the Social Progress Series of the Macmillan Company.

Mr. Folks, this year's lecturer, has been commissioner of public charities of New York City, president of the New York State Probation Commission and of the National Tuberculosis Society and vice-president of the National Child Labor Committee. There is no charge for admission to the lectures but tickets for reserved seats will be issued. Applications for seats should be sent to the New York School of Philanthropy, 105 East 22d Street, New York.

## CALENDAR OF CONFERENCES

### CONFERENCES

#### MARCH AND APRIL CONFERENCES

**EDUCATION**, Society for Advancement of, in the South. Chattanooga, April, 1913. Sec'y, H. E. Bierley, Chattanooga, Tenn.

**HOUSING**, New Jersey State Conference on. City Hall, Newark, March 28, three sessions. Chairman, W. L. Kinkead, 315 East 34th St., Paterson.

**IMMIGRATION**, Pacific Coast Conference on. San Francisco, April 14 and 15. Sec'y, Charles W. Blanpied, San Francisco.

**MARKETING AND FARM CREDITS**, First National Conference on. Chicago, April 8-10. Sec'y, Charles W. Holman, 1408 Steger Building, Chicago.

**SOUTHERN SOCIOLOGICAL CONGRESS**, Atlanta, Ga., April, 25-29, 1913. Gen. Sec'y, J. E. McCulloch, Nashville, Tenn.

**YOUNG WOMEN'S CHRISTIAN ASSOCIATION** of the United States of America. Fourth Biennial Convention of. Richmond, Va., Apr. 9-15, 1913. Gen. Sec'y, Mabel Cratty, 600 Lexington Ave., New York.

#### LATER MEETINGS

##### INTERNATIONAL

**BLIND**, Fourth Triennial International Conference on the. London, England, 1914; probably July 20. Sec'y, Henry Stainsby, 208 Great Portland St., London, W.

**CHILDREN'S WELFARE**, International Congress for. Amsterdam, Netherlands, 1914. President, Dr. Treub, Huygenstraat 106, Amsterdam.

**HOUSING**, International Congress on. The Hague, Holland, September 8-13, 1913. Sec'y, M. O. Velghe, director general Ministry of Agriculture, Brussels. Executive secretary section for United States, William H. Tolman, 29 West 39th Street, New York.

**INFANT MORTALITY**, English-speaking conference on. London, England, August 4 and 5, 1913. Under auspices of the British National Association for the Prevention of Infant Mortality and for the Welfare of Infancy, London.

**PRISON CONGRESS**, Quinquennial. London, Eng., 1915. Sec'y, P. Simon Van der Aa, Groningen, Holland.

**SCHOOL HYGIENE**, Fourth International Congress on. Buffalo, N. Y., Aug. 25-30, 1913. Sec'y Gen., Dr. Thomas A. Storey, College of the City of New York.

**STUDENT CHRISTIAN FEDERATION**, WORLD'S, Lake Mohonk, N. Y., June 2-8, 1913. Gen. Sec'y, John R. Mott, 124 East 28th St., New York.

**TOWN PLANNING AND ORGANIZATION OF MUNICIPAL LIFE**, First International Congress on Art of. Ghent, Belgium, Summer 1913. General Sec'y, Paul Saintenoy, Brussels.

**UNEMPLOYMENT**, International Association for Fight Against. Ghent, Belgium, 1913. American Corres. Officer, John B. Andrews, 1 Madison Ave., New York.

**YOUNG MEN'S CHRISTIAN ASSOCIATION**, International Conference of. Cincinnati, May 15-18, 1913.

##### NATIONAL

**BOYS**, General Assembly of Workers with. Culver, Ind., May 17-30, 1913. Information may be secured from the Boys' Work Dept., Y. M. C. A., 124 E. 28th Street, New York.

**CHARITIES AND CORRECTION**, National Conference of. Seattle, Wash., July 5-12, 1913. Sec'y, Alexander Johnson, Angola, Ind.

**CITY PLANNING**, National Conference On. Chicago, May 5-7, 1913. Sec'y, Flavel Shurtleff, 19 Congress Street Boston.

**CONSUMERS' LEAGUE**, National. St. Louis, Mo., April 8 and 9, 1913. Cor. Sec'y, Mrs. Florence Kelley, 106 E. 19th St., New York.

**HOME ECONOMICS**, American Association of. Ithaca, N. Y., June 27-July 4, 1913. Information may be secured from Marguerite B. Lake, Forest Hill, Md.

**INFANT MORTALITY**, American Association for Study and Prevention of. Fourth annual meeting. Kansas City, Mo., Oct. 23-25, 1913. Exec. Sec'y, Gertrude B. Knipp, 1211 Cathedra St., Baltimore.

**JEWISH SOCIAL WORKERS**, National Association of. Atlantic City, May 29-30, 1913.

**MEDICINE**, AMERICAN ACADEMY OF. Thirty-eighth Annual Meeting. Minneapolis, Minn., June 13, 14, 1913.

**MOTHERS**, National Congress of. Boston, May 15-20, 1913. Sec'y, Mrs. A. A. Birney, 806 Loan and Trust Bldg., Washington, D. C.

**OFFICIALS OF CHARITIES AND CORRECTION**, American Association of. Fourth Annual Meeting. Springfield, Ill. June 24-26, 1913. Sec'y, W. T. Cross, Columbia, Mo.

**PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA**. Richmond, Va., May 6-10, 1913. Sec'y, H. S. Braucher, 1 Madison Avenue, New York.

**PRISON ASSOCIATION**, AMERICAN, Indianapolis, Ind., Oct. 11-16, 1913. Sec'y, Joseph P. Byers, Trenton, N. J.

##### STATE AND LOCAL

**BAPTIST CONVENTION**, NORTHERN, Detroit, Mich., May, 1913. Cor. Sec'y, Rev. W. C. Bitting, St. Louis.

**CHARITIES AND CORRECTIONS**, Arkansas Conference of. Little Rock, Ark., May 13-15, 1913. Sec'y, Murray A. Auerbach, Little Rock.

**CHARITIES AND CORRECTION**, Ohio State Conference of. Akron, O., October, 1913. Sec'y, H. H. Shirer, 1010 Hartman Bldg., Columbus, O.

**CHARITIES AND CORRECTION**, New York City Conference on. May 14-15, 1913. Sec'y, John B. Preest, 287 Fourth Avenue, New York.

**WOMEN'S CLUBS**, New Jersey Federation of Atlantic City, May 2 and 3, 1913. Sec'y, Mrs. Joseph M. Middleton, 46 Prospect St., Trenton.

### EXHIBITIONS

#### LOCAL

**CHILD WELFARE EXHIBIT**, New Britain, Conn., April 25-May 2. Sec'y, E. W. Pelton.

**CHILD WELFARE EXHIBIT**, Rochester, N. Y., April 5-12. Sec'y, Adeline B. Zachart.

**CHILD WELFARE EXHIBIT**, High School, Newport, R. I., March 24-29. Chairman, Harriet E. Thomas, 263 Thames Street.

**CHILD WELFARE EXHIBIT**, Atlanta, Ga., April 28-May 3. Chairman, Walter E. Rich, Atlanta.

**TAXATION IN NEW JERSEY**. Charts prepared by the Bureau of Municipal Research will be shown at the New Jersey Federation of Women's Clubs, Atlantic City, May 2 and 3. Sec'y, Mrs. Joseph M. Middleton, 46 Prospect St., Trenton, N. J.

#### NATIONAL

**CONSERVATION EXPOSITION**, NATIONAL, Knoxville, Tenn., Sept.-Oct., 1913.

#### INTERNATIONAL

**PANAMA-PACIFIC EXPOSITION**, San Francisco, Cal., Feb. 20-Dec. 4, 1915. Social Economy Department—Frank A. Wolff, Washington, D. C.

**PANAMA-CALIFORNIA EXPOSITION**, San Diego, Cal., Jan. 1-Dec. 31, 1915. Director of Exhibits, E. L. Hewett, San Diego.

**STUDENT CHRISTIAN FEDERATION WORLD'S**, Lake Mohonk, N. Y., June 2-8, 1913. Exhibits including "social study and service." Gen. Sec'y, John R. Mott, 124 East 28th Street, New York.

**SCHOOL HYGIENE**, Fourth International Congress on. Buffalo, N. Y., Aug. 25-30, 1913. Chairman, Committee on Scientific Exhibit, Dr. Fletcher B. Dressler, Bureau of Education, Washington, D. C.

(Continued from p. 871.)

tion on industrial education in Philadelphia to commit itself in favor of the Illinois scheme.

The only serious danger is that a number of sympathetic and otherwise intelligent persons should be misled, and on the basis of a justified enthusiastic support of the principle of industrial education (with whatever supplementary agencies that may be found necessary) jump to the support of this scheme, not realizing what is really involved in it. Such persons should first inform themselves as to what is actually being done already in this direction in the more progressive public schools, and should then devote their spare energies to backing up and furthering these undertakings, and to creating a public opinion that will affect the more backward and conservative public school systems. The problem is a difficult one, but many intelligent, though unadvertised, attempts are already making for its solution; and its difficulty is no reason for permanently handicapping the interests of both common school education and a democratic society by abruptly going back upon what, with all its defects, has been the chief agency in keeping alive a spirit of democracy among us—the American public school system.

### SCHOOL SOCIAL CENTERS

Three hundred and thirty-eight schools in 101 cities of the United States were used as social centers during the past season, according to a report compiled by Clarence Arthur Perry for the Russell Sage Foundation. In forty-four of these cities social centers were directed by paid workers. New York had forty-eight such centers and Chicago sixteen, while Philadelphia, Boston, Columbus, Detroit, Jersey City, Louisville, Rochester, and Trenton are also among the cities included in this list. There is wide variation in the length of the season, from five or six weeks in some localities to the full school term in others. In fact, little uniformity prevails as to what constitutes a social center. Mr. Perry presents in the report a tentative definition of a social center as follows:

"A community may be said to have a school-house social center if one of its school buildings is thrown open to the public on one or more fixed nights a week for at least twelve weeks a year, for activities of a social, recreational, or civic character, regularly directed by one or more trained leaders."

The report also presents data on the growing use of school buildings for political meetings. In Cleveland, Ohio, meetings were held in the schools to discuss the new constitutional provisions that were before the people for adoption.

The use of schools as polling places is another recent development. Thirty schools in Los Angeles were used for this purpose in 1911. In the past year Milwaukee began using the basements of school buildings as polling places. Definite adoption of the idea of schools as polling places is reported from Boston; Berkeley and Long Beach, Cal.; Grand Rapids, Madison, and Salt Lake City.

### "CONTROL" OF VOCATIONAL EDUCATION

A tentative statement of "principles and policies" drawn up some time ago by the National Society for the Promotion of Industrial Education, of which C. A. Prosser is secretary, and just approved by the board of managers, takes the position that the control of vocational education ought not to be entrusted to the regular school authorities. Professor Dewey (see page 870) takes a different view of the matter. Says the statement:

"Efficiency in vocational education requires different methods of school administration, different courses of study, different qualifications of teachers, different equipment, different ways of meeting the needs of pupils, and a much greater flexibility in adapting means to ends than is possible of development under the ordinary routine of the public school system.

"For these reasons, whether administered by regular public school authorities or a separate board of control, and whether conducted in a separate building or under the same roof as the regular school, the work in vocational education should be carried on separately and independently from that of general education, so that it may be left free to realize the dominant aim of fitting for useful employment. This requires a separate organization, under a separate head or a distinctive management, and separate equipment, course of study, pupils, and teachers who shall have had extended practical experience in the industries or occupations they are employed to teach."

## THE MORAL EDUCATION OF SCHOOL CHILDREN

By

Charles K. Taylor, M. A.

**W**E are talking a great deal, these days, concerning unclean politics, the lack of a spirit of true citizenship, the dishonest relations between politics and business, concerning unclean business itself, and even concerning the individual lives of a large number of our people.

And the more we discuss the general problem of morality in all these wide fields, the more we are becoming sure that it is, after all, a matter of education, and school education at that.

This book gives a clear summary of the whole question, and then takes up a practical outline for moral education—an outline found successful and practical in a number of different types of schools.

Then, finally, the problem of working children is considered in its relation to what the school can still do for them.

"This book should be in the hands of every teacher in the state."—*Judge William Staake, of Philadelphia.*

"You have undertaken a pioneer work; I am sure it will be helpfully suggestive to teachers who realize their need of help."—*Mrs. Fanny L. Bachmund, Teachers' College, St. Louis, Mo.*

"There is a lot in it. I think you are feeling toward a kind of basic thing in education."—*John S. Phillips, Editor of The American Magazine.*

## We Believe—

THAT home-making should be regarded as a profession.

THAT right living should be the fourth "R" in education.

THAT health is the duty and business of the individual, illness of the physician.

THAT the spending of money is as important as the earning of the money.

THAT the upbringing of the children demands more study than the raising of chickens.

THAT the home-maker should be as alert to make progress in her life work as the business or professional man.

—American School of Home Economics.

NOTE.—Send for 100-page handbook. "The Profession of Home-making," which gives details of home-study, domestic science courses, etc., it's FREE. Bulletins: "Freehand Cooking," 10 cts.; "Food Values," 10 cts.; "The Up-To-Date Home," 15 cts. Address—A. S. H. E., 519 W. 69th St., Chicago, Ill.

PH.D. IN BIOLOGY, mature woman with ten years experience as College Professor of Biology, including several years of Physiology and Hygiene, and some experience in social work desires position. References. Address 1098 SURVEY.

## THE PITTSBURGH SURVEY

Stands out like Booth's Life and Labour. There's nothing else like it on social, civic, industrial conditions in America. Miss Byington's HOME-STEAD, THE HOUSEHOLDS OF A MILLTOWN, for instance is a concrete study of home life in a milltown—any milltown, almost, on day wages, with a household of children and boarders, the water for the family wash hauled in buckets from a common pump. Scientific enough to be used as a textbook in a course on civics in a New England College, but as readable and humanly interesting a volume as you'll find on any bookshelf. Sent postpaid for \$1.70. The Pittsburgh Survey set of six volumes (four ready now, two to be sent as published) prepaid for \$10. SURVEY ASSOCIATES, Inc., Publishers for the Russell Sage Foundation, 105 East 22d Street, New York.

Writing of The Family and Social Work, by Edward T. Devine, Prof. E.A. Ross of the University of Wisconsin says: "I never saw more instruction and thought provocation regarding any social problem packed into 150 pages." Sent postpaid, 60c.

## THE PITH OF IT

**T**HE state of Washington has just abolished the death penalty for crime. Kansas, Maine, Michigan, Rhode Island, and Wisconsin constitute the small but courageous group of states which have previously done this.

**ILLINOIS'** state-wide investigation of vice by a special committee of the state Senate has led to a nation-wide discussion of the relation between low wages and vice. As yet scarcely a protest has been made against frank handling of the subject. P. 897.

**I**N one district in China which two years ago had 2,000,000 or 3,000,000 starving people, the railroad recently found itself unable to provide freight cars enough to transport all the grain. It is constructive results such as this which make the report of the Central China Famine Relief Committee's operations of a year ago of more than temporary interest. P. 900.

**MICHIGAN** has passed a law authorizing the sterilization of habitual criminals. Eight other states have such laws. The Legislature of Ontario, Canada, is considering a bill which permits operations for the prevention of procreation, on certain inmates of institutions for the care of the insane, feeble-minded and epileptic.

**A** "CONTINUOUS educational campaign in the interests of child conservation and race betterment" has been launched by the National Child Welfare Press Service, Incorporated, of Illinois to operate through the press. P. 896.

**A** REAL official investigation into wages at the time of a strike against a wage reduction has been made for the first time in New York state. Its results have just been issued by the State Bureau of Statistics. The bureau's report furnishes a glimpse of living conditions not only at Little Falls, but among all the textile workers of the Mohawk Valley. P. 899.

**A** DECADE'S advance in the field of Religious Education and Civic Progress as revealed at the recent tenth annual meeting of the Religious Education Association is reviewed by Professor Graham Taylor. P. 902.

**WILLIAM D. HAYWOOD'S** recall from official party position by a referendum of the Socialists as viewed by the press of the nation. P. 909.

**A** GITATION for state funds for mothers has raised the question as to what is adequate relief and whether it should be measured in terms of money or of service. P. 910.

**H**EREAFTER when a man is convicted of family desertion or non-support in the state of Washington he may be compelled to work upon the public roads or highways. Further, it will be the duty of the board of county commissioners to pay a certain sum of money to those dependent on him.

## RELATIVES AND FRIENDS

are the natural sources to which we go first in our efforts to find adequate relief for the families coming under our care.

Only after all such normal sources of aid have been exhausted does the Charity Organization Society appeal to the general public for funds to meet definitely known needs of specific families.

All contributions received for these families are credited to them in individual accounts and used solely to meet the needs specified in the appeals.

# THE COMMON WELFARE

## THE MILBANK MEMORIAL GIFT FOR SOCIAL WELFARE WORK

Financed by the income from \$1,000,000, the New York Association for Improving the Condition of the Poor announces the organization of a new department for preventive and constructive social work. It is to be known as the Department of Social Welfare and its establishment was made possible by the generosity of Elizabeth Milbank Anderson.

In addition to the Milbank Memorial Gift, which will take the form of annual payments of \$50,000 each, the association has also accepted the sum of \$150,000 which Mrs. Anderson has stipulated is to cover "initial or capital charges and the cost of certain experimental and research work."

Mrs. Anderson's offer was made early in the month in a letter to R. Fulton Cutting, president of the association. In this she indicated the objects she had in mind in the following words:

"I am particularly interested in fostering preventive and constructive social measures for the welfare of the poor of this city, as distinguished from relief measures affecting particular individuals and families. . . . I wish to make it clear that the proposed Department of Social Welfare is to concern itself, in so far as it employs funds supplied by me, with a social program based upon preventive and constructive measures.

"Generally speaking, therefore, this program should include those activities which are calculated to prevent sickness and thus relieve poverty, such, for example, as the promotion of cleanliness and sanitation and the securing of a proper food supply. In this connection your association will doubtless find it advisable, in some cases, to co-operate with public authorities, and with existing agencies having similar objects in view where such agencies are practicing approved methods in fulfilling their purposes, while in other cases it may probably be necessary to establish the work as a new enterprise.

"With the funds at your disposal I would expect you to create the proposed department of social welfare, and to distribute the enterprise to be conducted under its supervision among at least three sub-departments or committees, one dealing with matters pertaining to public health and hygiene, one dealing with matters pertaining to the welfare of school children, and one with matters pertaining to the food supply of the working classes of this city."

In announcing the acceptance of the gift by the board of managers, John A. Kingsbury, general agent of the association, said:

"Mrs. Anderson's gift makes it possible for the association to bring its work nearer to the original purpose as expressed in the constitution; namely, the elevation of the moral and physical condition of the indigent and, so far as compatible with these objects, the relief of their necessities."

A tentative program of the social work to be undertaken by the new department has been outlined and it is expected to have the work organized about the first of May. The Committee on Public Health and Hygiene will continue the public bath work which the association started in 1891. It will have supervision over the Milbank Memorial Baths in East 38th Street, and will aim to popularize the public bathing facilities throughout the city. A study will be made by the committee of the present needs of the city in regard to public comfort stations and public laundries in the congested districts. An allied activity will be an educational campaign in New York for the extermination of common disease carriers, such as the house fly and the roach.

The Committee for the Welfare of School Children will make inquiries concerning the extension and improvement of the present system of medical inspection of children and of the clinic facilities for the treatment of the physical defects of pupils especially of the teeth. It will work for the installation in each school of sanitary drinking fountains and improved methods of cleaning the school rooms. Mrs. Anderson has asked the association to make in connection with its school work a thorough investigation of the ventilation of the schools and other public buildings of New York. For this purpose research and experimental work will be conducted under the direction of a committee of experts to be selected by the association.

The association through its Committee on the Welfare of School Children, also intends to extend and broaden the serving of hot lunches to school children approximately at cost. The School Lunch Committee, which had been about to discontinue, next fall will be able to conduct its work in fourteen instead of seven schools.

The feasibility of establishing public bake shops in New York will also be considered by the

committee. In her letter to Mr. Cutting, Mrs. Anderson said:

"In connection with this enterprise I would like an inquiry to be made regarding the feasibility of establishing a public bake shop, to which those who have no facilities for baking bread or roasting meats could bring their uncooked food and at a nominal cost receive the benefit of this service. . . . I understand that this idea has never been attempted in this country, but is in successful operation abroad."

The program for the Committee on Food Supply so far as it has been outlined includes an investigation concerning the scientific production of food, its purchase in larger quantities, its scientific storage, its efficient and honest handling and the latest facts as to relative food values. The object of this inquiry will be to ascertain whether the cost of food to the consumer cannot be reduced, and its nourishing qualities increased.

This latest gift to the New York Association for Improving the Condition of the Poor is the largest it has ever received. In the opinion of the Board of Managers its special importance lies in the fact that

"the establishment and successful operation of the several activities will inevitably lead to general recognition of their social value. It is believed that as the social value of any new activity is thus demonstrated it will naturally lead to the adoption of that particular activity on a much broader scale, possibly by the municipality itself, than would be possible if its extension were dependent upon any one individual or association."

#### **PUBLICITY CAMPAIGN FOR CHILD WELFARE**

Organized under the laws of Illinois, the National Child Welfare Press Service, Incorporated, is launching a new educational campaign. It plans "to operate and conduct, through the press, a continuous educational campaign in the interests of child conservation and race betterment." The service expects to disseminate not only through the newspaper and magazine press but through other avenues of publicity, editorial and news matter contributed by recognized authorities on child welfare subjects.

The present officers are James L. Clark, chairman of the Board of Directors; Rev. J. P. Dy-sart, vice chairman; Richard Norse, secretary and treasurer; Dimmitt C. Hutchins, councillor, and H. Wirt Steele, editorial director. The articles of incorporation provide for a board of thirty members.

The organization of the service and its present program was endorsed by a meeting of the Children's Home Societies held in Des Moines, Ia., early in the year. The co-operation of the executives of Children's Aid Societies was also

promised at a conference held somewhat later in New York. It is felt by those interested in the organization of this new service that many lines of work for children in the United States are so uncorrelated as to produce confusion in the public mind. The program for publicity in the immediate future embraces such subjects as eugenics; parental care; hygiene; dietetics; housing; education; treatment of dependent, defective and delinquent children; recreation, and child labor.

To start this program, it is planned to furnish a series of fifty half-page illustrated stories to representative newspapers throughout the country for simultaneous publication. The series is to be run in such sequence as to give newspaper readers the whole story of the efforts now being made in America to conserve child life.

The founders of the service believe that it will go far toward building up co-operation and co-ordination of the various agencies dealing with children throughout the country. They believe that it will foster higher standards of child-caring work. It is announced that the service will not attempt to exploit any particular children's agency nor any special kind of child-helping work, but will confine its efforts to the dissemination of information as to what is going on in this field of activity throughout the country and abroad.

The organization has begun to establish its connections with a view to learning the status of children's work in the various states, in order that local programs of publicity may be prepared consistently throughout the country. It is thought that this will help to bring the legislation and practices in the several states into conformity with the best standards. The service, according to its founders, will always stand for the interests of the child as paramount to the interests of any agency or any group of agencies dealing with children.

It is also planned to make the service as useful as possible to executives in child welfare work. They will be invited to call upon the editorial director at any time for advice and help in preparing and conducting local publicity campaigns of all kinds.

The promised co-operation of the new Federal Children's Bureau is counted upon, and the promoters of the service claim that the bureau's work, in turn, will gain not only wider publicity for its investigations and findings, but publicity of a kind and in a form that is not always easily obtainable by a government department or bureau at Washington.

The executive office of the service is located in the Hearst Building in Chicago, and the editorial department in room 26, Law Building, Baltimore.

## THE VICE INVESTIGATION BY THE ILLINOIS SENATE

Illinois' state-wide investigation of vice by a special committee of the Senate headed by the lieutenant-governor,<sup>1</sup> is being vigorously pushed in Chicago, Peoria, and other cities. Public hearings are being held and widely reported, to which employers of girls and women in department stores, mail order and supply houses, are subpoenaed to testify regarding the wages they pay; the hours and conditions of labor; and the profits of their business. They have also been asked for estimates of the cost of living among their employees, and their opinion as to the relation between the rate of wages and moral standards.

Almost without exception the employers met the investigating commission in good spirit and promptly furnished the facts and figures requested. Some of them admitted that low wages occasionally account for the demoralization of employees. But others stoutly denied any perceptible effect of the rate of pay on moral standards and asserted that a high integrity prevailed among their women workers. It was claimed that girls learning a business while living at home could not expect as high a minimum wage as those living away from home. Therefore some employers decline to hire girls living away from home whose services are not worth at least \$8 a week. When pressed to say whether wages could not be raised to meet the minimum cost of living without materially reducing dividends, some of the largest employers admitted that this could be done out of the surplus reserved for the development of the business.

The other witnesses subpoenaed consisted almost entirely of the inmates and keepers of vice resorts which were raided in some instances for the purpose of securing testimony. The assistant superintendent of the Peoria State Hospital is said to have substantiated the statements of the women that low wages are a chief contributing cause of immorality by showing the relation of heredity, environment and morality.

The chairman of the commission, Lieutenant-Governor O'Hara, has entered into communication with the governors and legislatures of all the states. He is urging country-wide co-operation in investigating vice conditions and legislation on the minimum wage and other measures deemed necessary to protect the moral standards of working girls and women. Assurances are said to have been received from two-thirds of the states that such co-operation would be given. The commission visited President Wilson on March 22 and urged that a national conference be called by the President. The only opposition so far publicly expressed in Illinois was that of the

secretary of the Illinois Manufacturers' Association at one of the hearings. Then and subsequently, in a paper which he personally owns and edits, he charged that the investigation was prompted by revenge upon merchants for failing to advertise in a newspaper with which the lieutenant-governor was formerly connected as a reporter. The secretary of the association was arrested and admitted to bail on a charge of criminal libel.

## NATION-WIDE ATTENTION TO VICE AND LOW WAGES

Press, pulpit and organizations without number all over the country have taken up the discussion of vice in relation to wages. Almost the last vestige of the old "conspiracy of silence" concerning vice would seem to have been swept away. As yet scarcely a protest has been made against frank handling of the subject.

Editorial expression has ranged all the way from vigorous approval of the Illinois commission and the acceptance of the testimony as showing that low wages cause vice, to just as energetic dissent from that contention. But nearly all welcome the stirring of the public mind and conscience. Scarcely a phase of the problem has been left untouched. The "responsibility of men" for the evil, the "low ebb of home life and protection," the share of dance halls in recruiting the ranks of "the fallen," the need for protecting young boys, and the assertion that to believe low wages are responsible for vice means "casting suspicion on honest girls"—all sides of the problem have received attention. Remedial efforts varying from photographing all men visiting disorderly houses to the minimum wage have been suggested.

Columns upon columns have been filled with letters from newspaper readers giving their views of the problem. These often comment upon the demand for efficient domestic servants and discuss the whole subject with an inference that no girl need complain of having to choose only between hunger and shame.

Other readers answer, pointing out sympathetically some of the real objections girls have to this work, and they contend further, with statistics to back up their assertion, that the occupation has apparently supplied a disproportionately large number of prostitutes. To cap the climax there have been the pitiful and tragic letters purporting to come from girls of the underworld.

Perhaps the most definite result of the whole discussion thus far has been to give an impetus to the agitation for minimum wage legislation. This has been felt particularly in the states where bills are pending and in others it has stimulated the introduction of bills.

In Chicago, Chief Justice Harry Olson of the Municipal Court has announced that a division to

<sup>1</sup>THE SURVEY, March 8, p. 812.

be known as the Morals Court will be established on April 1. This is in line with one of the main recommendations of the Chicago Vice Commission.

Some newspapers assert that political capital is being sought by those directing the Chicago investigation. However that may be, the Woman's Trade Union League in Chicago is taking advantage of the popular interest in working girls' wages to push efforts to organize department store employes into unions.

Employers, in a number of instances since the start of the Illinois investigation, have announced a new minimum wage for girls in their employ. The management of one large store in Chicago issued a statement that henceforth no girl will receive less than \$4 a week. The amounts most frequently mentioned in the Illinois hearings as the least a girl not living at home could manage on were around \$8 or \$9 a week. On March 19, Cyrus H. McCormick, president of the International Harvester Company, announced that beginning March 24 the minimum wage for girls and women employed anywhere in the United States by the company would be \$8 a week. The minimum has been \$5 a week for apprentices. It is reported that the wages of about 800 girls are affected by this action.

#### CHANGES IN NEW YORK PRISON DEPARTMENT

Newspaper interest in the removal recently of the superintendent of the New York state prison department and that of his sales agent a fortnight earlier seems to have been directed more at the political aspects of the upheaval than at its possible effects on prison administration. The ousting of Joseph F. Scott, head of the department, formerly superintendent of Elmira Reformatory, came after Mr. Scott had replied to charges preferred against him by Governor Sulzer. Frederick H. Mills, who, as sales agent was responsible for the development of the prison industries in New York, had previously been removed by Superintendent Scott at the demand of the governor. Both positions are now filled by temporary appointees and incoherency in the work of the prison department is the result.

People interested in prison administration throughout the country have followed these events closely because of the wide reputation enjoyed by Mr. Scott as a reformatory head. Coming to Elmira as superintendent in 1903, after eleven years' experience as head of the Massachusetts state reformatory, he raised the New York institution once more to the standards of excellence set up by Zebulon R. Brockway but allowed to lapse during the three years that had intervened after Mr. Brockway's retirement. In Massachusetts Mr. Scott had come under the

influence of the ideals of Colonel Gardiner Tufts, superintendent, who possessed in large measure the evangelical spirit and believed strongly in reformation through spiritual experience. At Elmira Mr. Scott came into contact with somewhat different traditions. Mr. Brockway had endeavored to intellectualize reformation and had built up a regime calculated to affect character through discipline and education. With this spirit Mr. Scott was in hearty accord. So effective was he in restoring the institution to its former excellence that in his book *Fifty Years of Prison Service*, published last year, Mr. Brockway spoke of him as "a man of high character, good capabilities, and large experience" and declared that his appointment "undoubtedly saved the reformatory from impending collapse."

Especially notable in Mr. Scott's work at Elmira was his perfecting of the military and gymnastic discipline begun by Mr. Brockway. He possessed in remarkable degree also the power to lift up others through the influence of his personality. The psychology of reformatory management was perhaps his strongest point. Due to the efforts of Mr. Brockway and Mr. Scott, the phrase "Elmira system" has come into use as denoting the highest type of reformatory work for youths.

Interest in the other vacancy in the prison department, that of sales agent, has transcended personal relations. Nearly a year ago *THE SURVEY*<sup>1</sup> pointed out the anomaly of a situation which allowed the man responsible for extending the market for prison products to be interested also in a private manufacturing concern which could compete with the prison industries in selling to state institutions. Mr. Mills was formally charged with this division of allegiance in January.<sup>2</sup> His resignation was sent to Mr. Scott but not acted upon. Thereupon a committee of inquiry appointed by Governor Sulzer to investigate the work of the superintendent of prisons was directed to bestow some of its attention on Mr. Mills' record also. Further facts were uncovered, chief among which was that as the representative of the Hamlin Supply Company Mr. Mills had used the "name of one Brown" to make large sales of supplies to state institutions, when such supplies could have been furnished by the prison industries which it was his duty to develop. At this discovery Governor Sulzer demanded and secured the removal of Mr. Mills. The state use system of prison industries in operation in New York is quite generally regarded as the most hopeful method yet devised of making the work of prisoners truly reformatory. Its advocates have felt that the plan was more or less on trial in that state and that the measure of its success there would largely determine the extent of its

<sup>1</sup>See *THE SURVEY*, April 13, 1912, page 94.

<sup>2</sup>See *THE SURVEY*, January 25, page 537.

adoption elsewhere. With Mr. Mills out of office many of them are breathing more freely over its chance of development.

The report of the Committee on Inquiry, made public March 10, contained ten accusations against Superintendent Scott. Using these largely as a basis Governor Sulzer a few days later preferred six formal charges against him. In the first he is accused of "intentionally and willfully neglecting and refraining from dismissing" Mr. Mills until Governor Sulzer demanded it. The second specification sets forth that in selecting a superintendent for the State Hospital for the Criminal Insane at Matteawan he passed over on the civil service list a man thoroughly experienced and appointed one who was known to lack experience.

The third charge declares that Superintendent Scott failed to remove or investigate the conduct of officials at Matteawan who made alterations in the hospital record of Harry K. Thaw. The fourth and fifth specifications call the superintendent to account for permitting unusual liberties to be extended to Thaw and for not exercising a proper supervision over the institution where he is detained. The last charge has to do with the failure of Superintendent Scott to dismiss an employe who had used offensive words about the governor in the presence of the superintendent and newspaper reporters.

Mr. Scott was given twenty-four hours in which to file a written answer to these charges. He did so and twelve minutes after the expiration of the allotted time the governor officially opened the public hearing of the case in his offices. Mr. Scott was not present. The governor declared that the written answer was unsatisfactory and shortly afterward sent notice of his removal to the superintendent.

After meeting every specification in detail Mr. Scott said in his formal answer:

"I have conducted the office of superintendent of state prisons conscientiously, honestly and economically and in a manner which has been for the best interests of the state, and which has received general approbation, wherefore I respectfully ask that the charges be dismissed."

In a statement given to the press later he said:

"I have been accused by a clique of self-styled medical experts of organizing Matteawan State Hospital in the interests of Harry K. Thaw. I deny these accusations as absolutely false. The men who have made them in the past and who ever may make them in the future will have an opportunity of proving them in a court of law."

Mr. Scott is quoted as having declared that the real reason for Governor Sulzer's desire to get rid of him was that he had refused to name as warden of Auburn Prison a man designated by the governor. This story was figured promi-

nently in the press also. That the affair has many political interweavings is shown by the fact that nearly all the papers regard it as a further breaking of Tammany traces by the governor.

Persons engaged in prison reform in the state differ greatly in their estimates of the justice of the charges made against Mr. Scott. The most lenient view, perhaps, is that he has been lax with his subordinates, allowing them too much responsibility and exercising too little supervision over them, but that his own integrity can not be questioned.

Governor Sulzer has sent the name of John B. Riley to the Senate as Mr. Scott's successor. Mr. Riley is a county judge of Clinton County. He was formerly United States consul at Ottawa.

## TWO REPORTS ON THE LITTLE FALLS STRIKE

Two reports on the textile industry at Little Falls were issued last week by the New York State Department of Labor. One covered the intervention by the Bureau of Arbitration in the strike which lasted from early in October to the end of December. The other was a study of wages and the cost of living by the Bureau of Labor Statistics.

The report of the Bureau of Statistics presents the results of the first real investigation into wages at the time of a strike against a reduction which has been made in New York by any bureau of the Labor Department. The pay-rolls of the mills for the first four weeks in September, 1912, were taken for study, this being prior to the wage reduction of 10 per cent which precipitated the strike.

The report shows that about 49 per cent of the male employes received \$9 a week or less, and that about the same proportion of female workers received \$7.50 a week or less. Those whose wages were not above \$6 constituted 30 per cent of the women and 10 per cent of the men. The report describes the living conditions of the operatives. Much congestion was found and the houses in which the workers live are characterized as being poor.

The Bureau of Labor Statistics report makes no remedial suggestions, but declares that "the one outstanding and unavoidable conclusion of this report is that there is need of a thorough general investigation of wages and cost of living among the textile workers of the Mohawk Valley."

Employers testified before the Bureau of Arbitration that the wages in Little Falls are the same as are paid in other textile mills in the Mohawk Valley. Since the workers won their strike against a reduction they are, presumably, now receiving the same wages as were found to have been the rule in September.

## FAMINE RELIEF WORK IN CHINA

ERNEST P. BICKNELL

Usually an official statement of temporary relief work published long after public interest in the special emergency has subsided is a good example of what not to read. The report of the Central China Famine Relief Committee's operations in the famine district in China between October 1, 1911, and June 30, 1912, is, however, an exception.

Headquarters for the committee were established in Shanghai and the membership included many well-known Americans, other foreign residents of China and prominent native citizens. Among the American members were Bishop F. R. Graves and Rev. E. C. Lobenstine who were respectively chairman and secretary. Two of the six articles in the committee's program were:

"That relief be given only in return for work done, except in the case of those incapacitated for work.

"That in the selection of work, preference be given to such work as will help the locality permanently, and as tends to prevent the recurrence of famine conditions, and that each piece be complete in itself."

This program was closely followed. District sub-committees, made up of foreign and native residents, had immediate charge of the relief works and distribution. Under them were the superintendents of the working forces.

In May, 1912, 110,000 famine sufferers were in the employ of the relief committee. As but one member of a family was engaged, it is estimated that this work supported about 550,000 persons. The character and extent of the operations are indicated by the following statistics:

Dykes built or repaired.....	129 miles
Canals " " ".....	63 "
Ditches " " ".....	1124 "
Roads repaired.....	163 "
Cubic yards of earth moved.....	10,155,000

It was reckoned that the amount of work performed daily by a famine sufferer was about two-thirds as much as a coolie does under normal conditions. In Hankow 2,000 women from the famine district were employed for two months in making garments of which 64,000 were distributed. A single extract from the report must suffice to show how the work was conducted. It is a description of the dyke building:

"Now come with me to the works. First in number and importance are the dirt-pushers [I translate the Chinese term], who dig the earth from rectangular pits and push it on their wheelbarrows to the new dykes. They number 3,400 and work in groups of about ten men each and are paid by the job in this way. As soon as a pit reaches a depth of four or five feet it is measured by the foreigner in charge and the

head man of the ten is given a ticket which is really an order on the office for the value in grain of the work done. Measuring these pits takes almost all one foreigner's time, and as two-thirds of the workmen are dirt-pushers, the foreigner has in his direct control that fraction of the whole. The dirt-pushers receive 450 cash per fang of 100 cubic feet. In this and the following statements it should be remembered that it takes about 2,500 cash to make a gold dollar.

"Next in numerical strength are the 'small workmen,' of whom we have about 1,000. Their work is to carry water from the canal to the dyke in order that the latter may be pounded firm the more easily. Also many of them receive the earth as it comes on to the dyke, break it up, level it and dig small holes into which the water may be poured. They are paid in grain at the rate of 150 cash per man per day.

"Now we come to the pounders. They number 750 and were divided in groups of ten. Each group has a stone weighing about 100 pounds, circular, a foot in diameter, and eight inches thick. To each stone are attached ten ropes, one for each of the ten men, and when the men all pull in unison the stone rises above the level of their heads and then comes down with a thud. The dyke is built in layers which are one foot thick after they are pounded. Each layer is pounded until it is of the consistency of rubber and is then tested in this unique way. An iron rod is driven down and into the small hole thus made water is poured from a tea-kettle. If the water does not soak away the layer has been pounded sufficiently. These pounders are skilled workmen and were originally paid 250 cash worth of grain per man per day, but they proved to be so lazy that we had to invent a sort of sliding scale of wages. So we considered 1,200 square feet as a full day's work, and if a gang pounds that amount each man is given 250 cash; if they pound 1,100 square feet, 240 cash; 1,000 square feet, 230 cash; 1,300 square feet 260 cash, and so on. Now they are not lazy.

"We have thirty skilled workmen who trim the edges of the dyke and give it a finished appearance. Also there are sixty overseers who understand the work. They keep an eye on the stone men and test their work as described above, see that the dirt-pushers place the dirt in the proper place and direct the stream of water carriers as they come. Both these classes of workmen receive 250 cash worth of grain a day."

In 1911 the American Red Cross sent C. D. Jameson, a well-known engineer, to study the conditions which cause the frequent floods in Central China, and to suggest a system of prevention. Mr. Jameson, who was an adviser of the relief committee, praises the thoroughness of the operations and the judgment and ability of the missionaries who were in charge of much of the work. These missionaries proved themselves untiring and practical men and capable administrators. They gave from twelve to fifteen hours daily to their unpaid tasks.

As part of the relief operations an interesting

The Famine Colonization Association was organized by Mr. Joseph Bailie, Professor of Mathematics in the University of Nanking, with a view to enable the destitute to earn their own living through cultivation of waste lands. Being practical as well as unselfish, this scheme has secured the hearty endorsement and promised support of the undersigned.

ENDORSEMENT OF THE FAMINE COLONIZATION ASSOCIATION BY CHINESE OFFICIALS

experiment in colonization was tried under the leadership of Prof. Joseph Bailie of the University of Nanking. With the co-operation of Dr. Sun Yat-sen, at that time provisional president of China, Professor Bailie secured a tract of waste land at the foot of Purple Mountain near Nanking, moved some of his more trustworthy workers on to it, built huts and began its cultivation. To quote from the report:

"A school was started for the children, so that they would be cared for while the men and women were at work. The land was gradually broken up, drainage ditches were dug, and potatoes and strawberries, wheat and other cereals were planted. A large number of fruit trees were set out. Some of these were Chinese but many were obtained from Japan and other countries. The land is now being used as an experiment farm and as a testing school for the men. The soil is of a poor quality, and is in many ways unsatisfactory; but Professor Bailie is persevering in the faith that he will succeed, not only in doing a piece of work which will be deeply interesting to the officials and gentry near the city of Nanking, but will prove of value to the larger enterprise which he still expects to see carried through."

Of the possibility of preventing the recurrent floods which have caused sixty-five famines in this region, including that of 1911, in the last 800 years, Mr. Jameson has this to say:

"There are no engineering difficulties in the

way of controlling the rivers, lowering the flood-level and reclaiming the waste land in North Kiangsue and North Anhwei; it is purely a question of money and time. Under the present conditions, at least three crops out of five are lost over an area of some 30,000 square miles. The soil of this area is exceedingly rich, the climate such that two crops a year should be possible when the conservancy and reclamation work had been completed. Not only will heavy crops be possible over this whole section year by year, but some millions of acres (English), which now are absolutely worthless, will be available for cultivation. All of this makes the expenditure of the necessary money justifiable from a commercial standpoint."

In its report the relief committee brings out strongly the fact that the construction and repair of dykes, canals and ditches carried on under its direction is not adequate to prevent disastrous floods in future. A permanent solution is aimed at in the plan prepared by Mr. Jameson.

A letter received a few weeks ago from Dr. John C. Ferguson, an American who has lived many years in China, shows how the land has prospered since the famine. Late in 1912 Dr. Ferguson passed through a part of the territory in which the relief operations were carried on in 1911 and the first half of 1912. He found that the land had produced generous crops and that the people had large quantities of grain for

market. Commenting upon this fact Dr. Ferguson said:

"The railroad provided a sufficient number of freight cars to handle the amount of freight which they thought would be likely to come to them for transportation, but the number has proved inadequate. After using all available cars which the railroad can supply, this district cannot get transportation for all the grain which it has on hand ready for shipment and sale.

"During the famine we had large distribution centers at Lungwai Kwan, Pengpu, Nan Suchow and Fuli Tsi. At these four railway stations a week ago I saw large heaps of grain on the platforms waiting for cars. The assistant traffic manager of the railroad, Mr. Wa, who was on the train with me, gave me the amount of grain at each of these places now awaiting shipment. The amount totalled 19,500 tons.

"This is all from the district which two years ago had two or three million people starving and freezing. These people were not demoralized by the help so freely given them but, on the contrary, this help only enabled them to show their wonderful power of recuperation."

### THE RE-ELECTION OF RYAN

JOHN A. FITCH

At the recent convention at Indianapolis of the Structural Iron Workers' Union Frank M. Ryan, under sentence as a conspirator in the illegal transportation of explosives, and now at liberty under heavy bonds pending an appeal, was re-elected as president of the organization.

After making all possible allowances for personal devotion, for belief that the Indianapolis trial was improperly conducted, even for belief in Ryan's innocence of the charge under which he was convicted, there can be found no adequate justification for this action. If the best case in the world could be made for Ryan, if his innocence could be established and if the trial where he was found guilty could be shown to have been shamelessly misconducted, still his re-election would be without a reasonable foundation. For incontrovertible evidence—evidence not assailed even now by Ryan's friends—introduced at the Indianapolis trial establishes beyond a doubt that if Ryan was not guilty he is too easily misled, too blindly trustful of others, too willing to let others use his signature and too careless in his own use of the English language, to be either a safe man or a competent man to lead a great labor organization.

But the case against Ryan is not so mild a one as this. He is not merely suspected of a crime and so entitled to a presumption of inno-

cence—he has been found guilty of one by a jury of twelve men after being defended by able counsel, and if there were irregularities in the trial, as alleged, the burden of proving them is clearly on the appellants. Ryan is entitled to his appeal, but it is with a fair presumption of guilt, not of innocence, that he now faces the public.

By this act of returning to office a man presumably guilty of favoring and assisting in the use of dynamite in the destruction of property erected by non-union labor, the union has gone far toward placing its entire membership under suspicion of approving the dynamite campaign. The strong vote against Ryan proves that the suspicion does not justly apply to all. But if the union as an organized body cares to remove this stigma it must unmistakably and soon repudiate the action of the majority of its delegates in convention.

### TEN YEARS OF PROGRESS IN RELIGIOUS EDUCATION

GRAHAM TAYLOR

Seven years ago, after the death of its founder, William Rainey Harper, the Council of the Religious Education Association convened in executive session in Cleveland to decide upon the future policy of the organization. Recently the decennial convention was held in the same city, and 1,600 members were registered. Great audiences at the general sessions taxed the capacity of Gray's Armory to hold them, while thirty or more section meetings were held in churches, association buildings and hotels.

Every point of progress emphasized in the secretary's decennial review was accentuated by this annual meeting. Both phases of endeavor embraced within the title of the association had been broadening and deepening in significance during the last decade, until the full measure of meaning was revealed at this session. "Religious" has attained in this connection a meaning as broad as education itself, and indicates the whole educational idea, spirit and purpose, not merely instruction in certain texts and tenets. "Education" has likewise grown the larger for including the realm of religion. "Association" has come to stand on these occasions not only for a hope and aim, but for a fact. Educators representing both the state and the church, the public schools and the whole range of privately controlled institutions from the academy to the university are now actually co-operating for common aims.

The topic of the entire convention is itself a waymark of the decade's advance—Religious Education and Civic Progress.

Of the many vital themes discussed at the gen-

eral and sectional meetings, none elicited as keen interest or called forth as significant opinions and action as the discussion of Social Education in the High School at four preliminary sessions called by the council.

It rallied some of the foremost high school principals, university professors, city superintendents of schools, and other prominent educators, including the United States Commissioner of Education. They exchanged not only opinions, but experience, on such issues as the study of public morality in high schools, vocational and moral guidance, sex instruction and methods of social training.

But the interest centered upon the North Dakota Plan of High School Bible Study. It was presented by Prof. Vernon P. Squires, of the department of English in the University of North Dakota, who proposed and carried it through in that state. He described the plan as follows:

"The State High School Board, which has general supervision over the high school work of the state, has authorized a syllabus of Bible study, just as in other branches of study, showing the general nature and scope of the work to be covered. Upon the basis of this syllabus an examination is given at the time of the regular state examinations. These examination papers, like those in other subjects, are marked by skilled readers appointed by the board, and to the successful examinees credit is assigned to the extent of a half-unit, out of the sixteen ordinarily required for high school graduation, a course of at least ninety recitation hours being a condition for credit.

"The Bible work differs, however, from the work in other subjects in one essential respect. The study is not pursued in the school house, or during school hours. It is carried on privately, or in special outside classes, usually in connection with the various Sunday schools or young people's societies. These classes are taught by the local pastor, priest or rabbi, or by some layman interested. The study, moreover, is not required of any individual or of any school; it is purely elective. The examination is confined to literary and historical questions. Individual preceptors are at liberty to combine with this study as much purely religious instruction as they see fit. But the state recognizes the literary and historical study of the Bible as worthy of academic credit, leaving with the church the responsibility for instruction."

The idea of this plan suddenly occurred to Professor Squires while the question of Bible study in the public schools was being discussed at the conference of the State Educational Association in 1911. Its presentation met with immediate and unanimous approval. A committee to formulate a syllabus was appointed. The syllabus, after hearty endorsement by high school principals, city superintendents and the State

Educational Association, was adopted by the State High School Board.

A number of classes were organized in the churches of the state last autumn. Too brief a time had elapsed for many pupils to have completed the course before the January examinations, but fourteen papers from six different schools were submitted to the state examiner. Although all of them had been graded above the passing mark by the local instructor, three were rejected by the official reader and eleven were passed.

Speaking for the teachers, one of them said:

"We in North Dakota feel that the plan is sound in theory, and the brief experience we have had with it justifies our faith in it as a practical means for getting boys and girls of high school age interested in the careful study of the Book of Books."

It is claimed that the plan prevents including religious instruction either in the syllabus or the examination of the state; avoids suspicion of sectarianism, as any version of the Bible may be used; averts partisanship by omitting all references to theories of authorship, chronology, inspiration and authenticity; and helps dignify and standardize the work of the Sunday school by giving it some of the discipline and academic credit of the day school, besides justly recognizing the study of the Bible as a subject worthy of scholarly effort.

The general secretary of the North Dakota Sunday School Association, after traveling over the state, reports that he found large numbers of classes doing good work under strong leadership. Inquiries have reached him from twenty different states, evincing interest in the plan throughout the country. The syllabus may be obtained either from the office of the State High School Board or that of the North Dakota Sunday School Association. Both are at Grand Forks, N. D.

The Religious Education Association adopted this guarded endorsement of the plan:

"We look with favor upon any endeavor to bring together the day school and the church in the study of the Bible, but we hold fast to our declared principle of absolute separation of the church from the taxing power."

The only undercurrent against the endorsement of this plan was the fear that it might prove to be a wedge in the insistent attempt to secure state credits for teaching not under state control. This might then be used as a claim for state subsidies to schools providing such instruction.

*Religious Education*, the monthly journal of the association (332 South Michigan Avenue, Chicago) will publish all the contributions made by eminent educators and publicists at this convention.

## BOOKS

### SOCIAL RELIGION

By SCOTT NEARING. The Macmillan Company. 227 pp. Price \$1.00; by mail of THE SURVEY \$1.08.

The expansion of an address before the Friends' General Conference, this volume has both the interest and the fault of oral utterance—intensity of feeling and disproportion in statement. On the social side of every subject discussed, it is the one-sided plea of an advocate before a supposedly uninformed and unconvinced, if not indifferent, jury of church people. On the religious or church aspect of each subject it is a protest against the indifference of the church, everywhere taken for granted, from which appeal is taken to the ideals of the religion of Christ. On both sides criticism abounds without trace of the critical method in reaching conclusions or citing statistics to support them.

Flashlight snap-shots of social and industrial conditions are vivid if not glaring insights into concrete situations at their worst. But they are all in shadow, scarcely at all relieved by any reference to relieving agencies and legislation, or to the gradual improvements thus and otherwise being brought about. So also Christ's ideals are held up entirely apart from their loyal adherents to whom their emphasis, interpretations and application are due.

Disparity between wages and cost of living is well stated, but without reference to the declaration of advanced social faith by the Federal Council of the Churches of Christ or to the movement for a minimum wage. Child labor is justly condemned but with no reference to the National Child Labor Committee and the co-operation of the churches with it. The ravages of vice are painted not any too darkly, but no account is taken of the country-wide declaration of war by the churches and civic authorities against the conditions which produce and promote the social evil. Industrial casualties and occupational diseases are none too grimly described, but with no allusion to the new measures taken by employers and state legislatures for safety and indemnity—or the part church people are taking in them.

The inexcusable Cherry mine fire is described (the number of the dead is stated to be 360; it was 258), but there is no intimation of the most generously just reparation ever made to the sufferers from such a disaster, creditable alike to the St. Paul Coal Company and the state of Illinois, as well as to representatives of the churches who were among the first to minister to the stricken families and were the last to leave them.

To depict conditions at their worst, without even intimating either that they have not come to be so bad everywhere, or that successful efforts are being made to improve them is surely to depress and paralyze rather than to encourage effort or hope for bettering them. To magnify

Christian ideals heaven-high and to minimize almost to nothing the awakening social vision and rapidly spreading social undertakings of the churches is surely not the way to seek or gain the recognition and realization of "social religion."

The more's the pity that so earnest an appeal for a social religion should be raised "without the walls of the church" and the cry lifted, "will the church hear us"? And this when there are more social idealism, sympathy and endeavor within the churches than ever before, when they need the loyalty and help of just such men as the writer of this book and those whose knowing or unknowing, mute or murmuring plea for religious guidance and power he voices.

GRAHAM TAYLOR.

### THE CIVIC THEATRE

By Percy Mackaye. Mitchell Kennerley, 308 pp. Price \$1.25; by mail of THE SURVEY \$1.34.

"For the very reason that our people are perhaps the busiest in the world, it becomes a national concern that their leisure be filled with joyous regenerative influences."

Thus writes Percy Mackaye in his luminous little volume.

As yet the civic theatre in America, is a dream awaiting fulfillment. Repertory theatres we have had, experiment theatres, educational theatres, and municipal stock companies; but these are all small and sporadic growths as compared to Mr. Mackaye's comprehensive plan for a theatre publicly and permanently endorsed, freed of all commercial pressure, and making that public which supports it, not alone spectators of, but also participants in, its artistic activities. What a tremendous educative and artistically expansive force such an institution would exercise is hardly to be compassed by the imagination.

That the present day commercial theatre is a failure in every respect except its commercialism, is generally conceded by thinking men. For this condition Mr. Mackaye holds responsible not the manager, but the public, which, through lack of education and ideals, demands the worst and trashiest. The way to educate, as Mr. Mackaye sees it, is to give the public, at a price within its reach, the best.

The small city of Rochester, Minn., has in the summer months a very fine symphony band, made up of the best musicians from American musical centres, which eschews "rag" and trashily popular selections and plays only good music. At first the crowds accepted the unfamiliar with doubt; now they demand high standards and are content with nothing less. This is incidentally submitted as support to Mr. Mackaye's argument.

Meantime, as he points out, the commercialized theatre viewed as a social institution goes far to reduce our educational system to an absurdity.

Here is an organization involving hundreds of millions of our people's dollars, scores of millions of our people's souls, the education of their youth, the alleviation of their toil, the monopoly of their scant leisure hours—and behold, the people support this colossal organization on a basis which compels it to copy, rather than counteract, the defects in their civilization.

Millions upon millions, in private endowment and public taxes, are poured into educational institutions to counteract our national defects; while simultaneously millions upon millions, in individual subscriptions, are poured into the theatres to copy them. Tens of thousands of universities, colleges, schools are busy awakening in our American youth civic ideals; while simultaneously the titanic caricature of a university is busy putting them to sleep. Strangest of all, the prophets and leaders and supporters of true education ignore the very existence of its caricature.

By way of establishing the higher ideals the author suggests that the theatres be endowed, wherever possible, under the trusteeship of the universities. Would such an institution drive out and supplant the theatres of today? Mr. Mackaye thinks not. But it would, he maintains, compel the abandonment of the worst features of the modern stage, and bring about a universally higher standard of dramatic ethics and dramatic art.

To attempt to render in a brief review, the substance of a book as close-packed with inspiration, suggestion, and vision as this, is futile. I shall attempt merely to outline in the most general way, the plan as carefully worked out by the author. The main points are as follows:

Permanent endowment by public funds, not mere occasional subsidy of city, state and national theaters.

Participation in the acting, by the public, under the leadership of a permanent staff of artists.

Price of admission sufficiently low to make the theater available to all wage earners, the scale running from 5 to 25 cents.

Correlated with these institutions, a chain of privately endowed university theaters.

One national theater at Washington.

Organization and correlation of the arts of the theater, and general co-operation between all these bodies.

With the development of such a plan Mr. Mackaye looks forward to this future.

"From ocean to ocean, a mighty chain of theaters, state and municipal. Forty or more state theaters—from the Theater of California to the Theater of Massachusetts—publicly endowed on the precedent of Wisconsin University. A thousand municipal theaters—from the Theater of San Francisco to the Theater of Boston—publicly endowed, on the precedent of the College of the City of New York. Leading and harmonizing these, one national theater at Washington, endowed by the federal government. All these,

organized by civic leaders, safeguarded to perform their highest functions, directed by experts in theatrical art, dedicated to cultivating—creatively in artists, critically in audiences—the liberal art of a drama of democracy."

There are appendices full of valuable and practical suggestions for those interested in the organization of masques, pageants and other public spectacles.

SAMUEL HOPKINS ADAMS.

#### THE WOMAN MOVEMENT

By Ellen Key. G. P. Putnam's Sons. 224 pp. Price \$1.50; by mail of THE SURVEY \$1.61.

#### THE BUSINESS OF BEING A WOMAN

By Ida M. Tarbell. The Macmillan Company. 242 pp. Price \$1.25; by mail of THE SURVEY \$1.33.

#### THE BOOK OF WOMAN'S POWER

Introduction by Ida M. Tarbell. Macmillan Co. 285 pp. Price \$1.25; by mail of THE SURVEY \$1.33.

#### WHY WOMEN ARE SO

By Mary Roberts Coolidge. Henry Holt and Co. 371 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

#### THE ADVANCE OF WOMAN

By Jane Johnstone Christie. J. B. Lippincott. 333 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

#### WOMAN IN MODERN SOCIETY

By Earl Barnes. B. W. Huebsch. 257 pp. Price \$1.25; by mail of THE SURVEY \$1.34.

#### WOMAN IN THE MAKING OF AMERICA

By H. Addington Bruce. Little, Brown and Co. 257 pp. Price \$1.50; by mail of THE SURVEY \$1.60.

As an articulate cause, the woman movement is still far behind the labor movement. But feminism is fast learning to express itself; its literature is rapidly increasing. Some of this literature, as must be expected, shows the crudities and sincerities of work struck off in the heat of action rather than in the repose of achievement. To borrow a phrase from Earl Barnes's book, the movement "is educating itself in public."

Here are seven books on the subject which have appeared in scarcely more than a year. Written from varying points of view and representing the greatest diversity of temperament and metier on the part of the authors, they all agree in addressing the middle class woman and in using the terms of life which she best understands. Except Miss Tarbell, who says that she does not herself see the necessity of giving the vote to women, their authors all advocate the extension of the franchise to women.

In her latest book, Ellen Key has given her personal observations on fifty years of the woman movement, a period spanned by her own memory. It is by no means a dispassionate history of events, but a personal interpretation of the external achievements of the movement and its influence on the spiritual nature of the modern woman. It reviews in turn the effects of the growth of feminism on the lives of single women and of daughters, upon men and women in general, and upon marriage and motherhood. The chapters contain by way of illustration many transcripts from domestic life in Sweden which give them a homely; familiar flavor.

Writing from the standpoint of her sixty-three years, Ellen Key seems genuinely to express the motherly spirit which she has so long expounded as a theory. What the older leaders see in the younger women, she says, is "a more universal development than in themselves, because these young girls have been developed through active consumption of power which was spared to the older women, although they must have summoned much passive energy in order to maintain their personality against convention. The young girls find often in these older women a fine understanding, which they richly reciprocate. Such terms of friendship are the most beautiful which the present has to offer: they resemble the meeting of the morning and evening red in the bright midsummer nights of the North."

\* \* \*

The *Business of Being a Woman* was written, as the introduction states, in the belief that the "great problem of human life is to preserve faith in and zest for everyday activities." The first of the nine essays analyzes the *Uneasy Woman* as the author sees her. The word "uneasy" is used interchangeably with "militant," an instance of the question-begging which characterizes the entire book.

According to Miss Tarbell, it is the uneasy American woman who is to blame for most of our common faults in domestic as well as in public life. She is not only responsible for mismanaging her raiment, her furniture, her servants and her daughters, but to her door, also, can be traced most of our notorious national faults, such as trusts, corruption in politics, popular contempt for labor, and inflexibility of the school system. "What the *Uneasy Woman* forgets," says the author, "is that no two children are born alike."

In many ways Miss Tarbell seems to follow the trend of the woman movement. Her attitude certainly cannot be called opposition. Her relation to the militant movement is more like that of the "slow-moving vehicle" which "must keep near the curb" to the swifter conveyances which go speeding past in the center of the street. Both, however, are going in the same direction.

\* \* \*

The *Book of Woman's Power* contains a series of about seventy-five quotations on varying aspects of woman's relation to society, with an introduction by Miss Tarbell. The introduction states the author's belief in "unconscious living" as the best answer to the woman question. The book has been compiled by a very eclectic hand. Distinguished suffragists like J. S. Mill, Professor Ward, Olive Schreiner, and Jane Addams have been levied upon for what might be called, considering the anti-suffrage tenor of the book, their least representative opinions.

\* \* \*

The best book for American readers on woman in the nineteenth century is Mrs. Coolidge's *Why Women Are So*. It is a refreshingly straightforward piece of writing, easy to read and well-

stocked with information on the history of the movement in this country. We are given, by the way, a valuable and entertaining picture of middle class manners in nineteenth century America. Evidently the book was written by a person who knows from parlor to kitchen the sort of home in which most of us have grown up.

The intention of the writer is, as she states in the Hypothesis at the beginning, to show that "sex tradition rather than innate sex-character have produced what is called 'feminine' as distinguished from womanly behavior." The author defends her case by pointing out how the conduct of women has been formed through the laws of imitation and suggestion from without rather than from within. Even more convincing than her scientific arguments are the shrewd observation, good sense, and mother-wit which she brings to bear upon her subject.

\* \* \*

The *Advance of Woman*, by Mrs. Christie, contains an array of facts gathered by much diligent reading from biology, ancient and modern history, and particularly from the history of Christianity. The intention is to show the advance of woman hitherto and to justify the present trend of events in the woman movement. Although this book, considered from the standpoint of literary art, shows many crudities, as a contribution to the subject it well repays a reading. Incidentally, the publication of a work with such apparent faults of literary workmanship means that the public demand for books of this nature is very large.

\* \* \*

In *Woman in Modern Society* Mr. Barnes makes a strong plea for equality of the sexes in society. The relation of the modern woman to education, to culture, to property, to industry, to political life, and to the family is discussed in different chapters.

Perhaps the best things the author has to say are on education, a problem to which he has given much thought. But education as he sees it "is co-terminous with life." He would not only have co-educational schools for boys and girls, but he would also have women share with men the responsibilities of government, and men share with women the work of teaching the young. "The foster parents of the nation's children must be both men and women." Mr. Barnes recommends strongly the employment of married women as teachers in preference to an exclusively celibate teaching force.

\* \* \*

In *Woman in the Making of America* the author gives an account of the significant contribution made by a long line of distinguished women to the nation's history. As the procession of American womanhood, mainly of the hardy type of Hannah Duston and her successors, passes in review before us, Mr. Bruce pays a sincere if rather conventional tribute to each successive group. The beginning and development of the club movement for women is also reviewed.

KATHARINE ANTHONY.

**THE SEXUAL LIFE OF THE CHILD**

By Albert Moll. Macmillan Co. 339 pp. Price \$1.75;  
by mail of THE SURVEY \$1.88.

**SEX EDUCATION**

By Ira S. Wile. Duffield and Company. 150 pp. Price  
\$1.00; by mail of THE SURVEY \$1.05.

By Edith B. Lowry, M.D. Forbes and Co., Chicago.  
Price \$.50; by mail of THE SURVEY \$.55.

**HIMSELF: TALKS WITH MEN CONCERNING THEMSELVES**

By E. B. Lowry, M.D., and Richard J. Lambert, M.D.  
Forbes and Co. 216 pp. Price \$1.00; by mail of THE  
SURVEY \$1.10.

Dr. Paul has translated into simple and readable English this latest book by Dr. Moll on the sex life of boys and girls. The book is scientific in the finest sense and written in a style easily followed by laymen. It is dignified, sincere, frank and sane. It is a welcome addition to the growing literature prepared for persons who wish to make a careful study into the normal and abnormal facts of the sex life of children. It supplements Havelock Ellis' *Studies in the Psychology of Sex* with the results of many years of research into the psychology and pathology of sex in the pre-adolescent and adolescent periods.

After dealing with the reproductive organs and processes, Dr. Moll analyzes the sexual impulse and tells of the various stimuli to and deterrents of sexual manifestation. The chapter on Sexual Education should be read by all those who desire to see the facts about the physical life presented properly for children of different ages. In comparatively few pages Dr. Moll presents the conclusions which are to be found in Dr. Stanley Hall's work on Adolescence only after diligent search. We are told that the power of example in the home and among older friends is much more effective than formal teaching. Courses of study may conflict "with what the child sees every day in the conduct of his relatives and companions." The facts about the physical life must be given both by precepts and by example in wholesome ways through many years. Since children's natural curiosity about these fundamental things will surely be satisfied, information must be given to forestall possible dangers, evils and the disillusionments of later life. Girls must learn for themselves modesty and reserve; boys self-control and respect. Self-protection is developed in American schools through co-education and common games.

One of the conclusions reached by Dr. Moll is that "For effecting enlightenment regarding the processes of the individual sexual life, school is unsuitable; this matter can best be undertaken by some private person and above all by the mother. Choice of a time for this last phase of the sexual enlightenment must be guided in part by the questions of the child, in part by the child's physical maturity, but more

especially by the indication of psycho-sexual development." The process of general education will be slow, in the judgment of Dr. Moll, "because the very persons to whom, today, we have to look to effect the sexual enlightenment of children are themselves to a great extent also in need of enlightenment."

The writer is both an unsparing critic of the unthinking or hypocritical attitude of religious people and a firm believer in the value and power of religious education. He has in mind "that religious education, which has an internal reality and arises spontaneously out of the demands of morality, based upon the internal and everlasting truths of religion."

\* \* \*

Dr. Wile writes from an extended knowledge of both fact and method in sex education. His purpose is sincere, his facts are scientific, his style is lucid. His little book, *Sex Education*, is intended primarily for adults. In short, terse statements, he states the arguments for certain ways of instructing children. Parents will find here the reasons for home instruction and for the presentation of sex information in a normal, natural way through the pre-adolescent period. The responsibility for the instruction of girls is placed upon the mothers and that of the boys on the fathers. In rapid succession, under the three ages of mythology, chivalry and civic awakening, the manner of presentation is discussed. Dr. Wile also emphasizes the differences in the power of the sex impulse between males and females. He indicates clearly that the former are the ones to be closely watched for abnormalities, indiscretions and excesses.

A vast amount of material is included in a few pages. It is questionable whether the ordinary father or mother will derive definite and precise assistance in meeting the changing problems of the lives of their boys and girls from reading Dr. Wile's analysis. They will, however, receive a normal point of view and the frame work of a right method.

The chapters at the end of the book will be of decided assistance to parents who desire accurate statement of parts and functions and also a bibliography of educational and social books dealing with sex matters.

\* \* \*

Dr. Mosher's *Health and Happiness* is made up of a series of letters written during summer holidays to a group of girls of adolescent age. They deal with personal hygiene, and present physiological facts in a clear-cut way. The book contains a short chapter on the sex problems of adolescence.

\* \* \*

*Confidences*, by Dr. Edith Lowry, is a little booklet of ninety-four pages written to acquaint girls ranging from ten to fourteen with the facts about hygiene and reproduction. It aims also to point the way for mothers. The approach is through nature study and biology. It uses a method which has been accepted among edu-

cators but treats so many subjects lightly and rapidly that the impressions are not clear. Mothers would be involved in untimely explanations if the facts presented were properly amplified. No mother, in a limited time, can cover naturally the variety of ideas prescribed in the book. She will much more wisely meet questions with honest, simple answers and allow true explanations to follow budding curiosity.

\* \* \*

The book entitled *Himself*, written by Dr. Lowry and Dr. Richard J. Lambert, deals with sex hygiene for men. It is written in a straightforward and clear manner with many topics in short compass. There is neither articulation between the various subjects discussed nor exhaustive treatment. It has evidently been prepared by doctors who lay great stress upon physical facts and little upon subtle, moral and far-reaching causes.

Books on sex hygiene and sex education are in demand. They handle subjects which have been taboo. The reader follows every statement carefully and accepts the conclusions without much verification. It is necessary, therefore, that the writer should have a high purpose, a sincere manner, a conservative point of view and accuracy.

One of the problems confronting scientific, social and moral workers in the realm of sex is the limitation of offspring. Dr. Lowry's statements about prevention of conception of the tubercular, the weak-minded and the syphilitic, the regulation of the number of children of the poor, and instruction by nurses in methods of prevention should be withheld until the subject is fully discussed by those most skilled and most competent to deal with it. Modern science has not yet decided upon the effects of vasectomy, nor has it stated satisfactorily the classes of degenerates, insane, and epileptic people who should be sterilized. The chapter dealing with the recent law in Indiana and action in other states should be much expanded or treated differently.

ORRIN G. COCKS.

#### TRAINING THE BOY

By William A. McKeever. The Macmillan Co. 368 pp. Price \$1.50; by mail of *THE SURVEY* \$1.61.

The motto of this book, stated in the preface, is "Train the whole boy, and not merely a part of him,"—and throughout it breathes the author's "profound faith in the common boy—and that means practically all the boys."

The book is in five parts—Industrial, Social, Habit, Vocational and Service Training. It is a clear and comprehensive setting forth of the art of character building, and plainly shows this to be not the work of days or weeks, but of careful and thoughtful, persistent and sympathetic effort through all the years of infancy, boyhood and adolescence. This effort must be co-operative on the part of parents, teachers and all who have to do with the young, but the author lays its burden largely on the shoulders of the fathers, where doubtless it was meant to be, but whence it is all too often and too easily shifted.

In general, he claims that "any boy may be so trained and directed as to attain to mastership and happiness in his vocational life."

"This newer ideal of fondness and mastership in the chosen calling must be exalted earnestly by all who hope to succeed in training boys."

Certain "fundamental training practices" growing out of boy nature must form part of the development of every boy if we would help him to a successful career. These are play, industry, sociability, citizenship and social service. The chapter on methods of vocational guidance insists upon training in honesty, also upon teaching a boy to earn money, to use it and to save it, as all-important, but really says little as to guiding choices—what we most need to know, perhaps.

In the chapter on vocational training schools a good idea is given of the work being done in Boston, of trade schools, apprenticeship schools, and the many special schools now open to boys. There is also a chapter on getting started in business.

Part V, or Service Training, covers an important field, only lately receiving adequate attention. It discusses preparation for citizenship, for social service, for home life, for marriage and parenthood and for the religious life.

The book is illustrated and has a remarkably good index with bibliographies scattered throughout at the close of each chapter. This makes it excellent for reference. It is a business-like, concrete, helpful discussion written with great sympathy and understanding, and the best thing about it is its hopefulness.

CHARLOTTE S. THURSTON.

#### OLD HOMES OF NEW AMERICANS

By FRANCIS E. CLARK. Houghton Mifflin Co. 285 pp. Price \$1.50; by mail of *THE SURVEY* \$1.61.

This little volume, by the founder of the Society of Christian Endeavor, is overflowing with good-will for our neighbors of the dual monarchy and for all that is picturesque and heroic in their present lives and past achievements. It frankly owes a great part of its substance to other writers, but it is entwined and made real by the note of personal observation and the first-hand appreciations of the traveler.

The book is slight and far from absolutely accurate. Since America is so hard beset by the faults of superficiality, haste and lack of scrupulous regard for fact in its writers one is tempted to emphasize this criticism. It is to be said, on the other hand, that this readable and even entertaining account of the background of some of our largest and most misunderstood immigrant groups may render real service if it reaches the readers whom Dr. Clark has in mind, the provincial-minded Americans who still cherish the outgrown mood of contempt for all that is foreign. The pictures are interesting whether of places or people. In the introduction we have Mr. Schauffer's fine verses *Scum o' the Earth* which themselves would make the book worth owning.

EMILY GREENE BALCH.

## TREND

THE Bulletin of the Chicago School of Sanitary Instruction reprints the following Ten Commandments of the Housing Committee of the Chicago Woman's Aid Association:

1. Thou shalt honor thy city and keep its laws.
2. Remember thy cleaning day and keep it wholly.
3. Thou shalt love and cherish thy children and provide for them decent homes and playgrounds.
4. Thou shalt not keep thy windows closed day or night.
5. Thou shalt keep in order thy alley, thy back-yard, thy hall and stairway.
6. Thou shalt not kill thy neighbor's bodies with poisonous air, nor their souls with bad companions.
7. Thou shalt not let the wicked fly live.
8. Thou shalt not steal thy children's right to happiness from them.
9. Thou shalt bear witness against thy neighbor's rubbish heap.
10. Thou shalt covet all the air and sunlight thou canst obtain.

On the reverse side of the card is a diagram graphically setting forth these facts:

Good housing promotes: Health, life, mortality, success, ambition.

Bad housing promotes: Failure, stupidity, crime, disease, death.

\* \* \*

OFFICIAL figures were given out by the Socialist Party on March 15 on the recall of William D. Haywood as a member of the Executive Committee. More than a fourth of the party membership was represented in the vote cast, the number being 33,500, and the result was two to one against Haywood.

Press comment has been for the most part congratulatory. The *Pittsburg Dispatch* says the party has by this means "eliminated the teachings of industrial anarchy," and the *New Orleans Statesman*, in the same vein, defines sabotage as "nothing but anarchy in its defiance of law and the constitutional authorities." The *Birmingham (Ala.) News* believes that the vote shows that "Haywood's utterances in favor of direct action, the strike and sabotage are not endorsed by the party membership," and the *Springfield (Ind.) Republican* calls it a "milestone in the history of Socialism." In this the *New York World* concurs, believing that now the Socialist Party can "honestly appeal to public opinion as a party that recognizes the rules of orderly government and rejects the theory that the lawless shall gain power by intimidation and terrorism."

The *Detroit Tribune* recognizes in the unpromising position taken by Haywood that unwillingness to adopt opportunist tactics, which it believes to be the weakness of European Social-

ism. The repudiation of Haywood will, however, the *Tribune* believes, "place the party squarely in the field as favoring progressive or evolutionary Socialism." Says the *Tribune*:

"So long as Ettors, Giovannittis and Haywoods could balk compromise, and with their shrieks for violence bring discredit upon the constructive evolutionary socialists, just so long the other parties of this country had little or nothing to fear from the socialist program. But now that the socialist party has deliberately purged itself of the 'direct action' group of obstructionists, it is likely to become a more formidable contender with the other political parties."

The *Washington Herald* believes that the vote has settled the question of whether the party shall stand for political action or for "blood letting," and the *Springfield (Conn.) Republican* that it settles the struggle between "revolution by legitimate acquirement of political power—through majority rule and revolution by means of terrorism which impatient and reckless minorities have occasionally employed to bend majorities to their rule." The *Independent* (New York) comments on the large majority in favor of recall, and expresses the belief that "the more extreme Syndicalists will now forsake the party for the Syndicalist League."

The *Christian Science Monitor* believes that not only in the Socialist Party are Haywood's ideas unpopular, but that he is not succeeding in making these ideas prevail among the working class outside of the party, as it is "doubtful if the class war theory of social evolution is getting a firm grip on American workmen."

In contrast to these comments, the *Milwaukee Free Press* and the *Chicago Post* place most emphasis on the size of the minority.

What the *Free Press* says is tinged by its long warfare against the local Socialist movement in Wisconsin under Berger. The latter has been one of the leaders within the Socialist ranks in the fight against Haywood and the I. W. W.; but the *Free Press* is not disposed to let the chance go by to hold the political actionists and the party as a whole responsible for the action and teachings of the faction they are in the process of disciplining and throwing out:

"The Socialist Party is reaping the just retribution for its incendiary methods of propaganda. Holding to political action and denouncing anarchy in principle, the propagandists of this party have characteristically appealed to class prejudice, incited to class hatred, and, in their eagerness for votes, toyed with the most dangerous human passions—passions that crave an outlet in violence and catastrophe. . . .

"The Bergers, who see the writing on the wall, may become hoarse in their appeals to reason and their exposition of the beautiful philosophy of Socialism. The Spargos may develop writer's cramp in pointing out the terrible pitfalls of industrial unionism.

But the dragon's teeth have been sown and the brood of anarchy is growing within the ranks of Socialism."

The *Chicago Post* believes that the fundamental struggle among the Socialists is not against industrial action, but rather against a tendency to belittle political action in its favor. "Privately," says the *Post*, "the Socialists are more or less deliberately making room in their equipment for these new weapons, but the foot comes down hard when any one . . . begins to emphasize the virtues of the new weapons at the expense of the old." The real test of strength between the two wings of the party, the *Post* holds, is yet to come, and this "trial will be of considerable interest." At the present moment, however, the *Post* believes that the recall can be counted on to help the party increase its "remarkable middle class vote."

The membership of Local Denver to which Haywood belongs, and in which charges for his expulsion from the party, on the same grounds as the recall, have been introduced, has recently passed the following resolution of confidence, which was published in the *International Socialist Review*:

"Whereas, Comrade Wm. D. Haywood is a member of the 2nd Ward Branch of the Socialist party of Denver,

"And, whereas the New York State Committee of the Socialist party has instituted a referendum for his recall from the National Executive Committee of the Socialist party, declaring that Comrade Haywood never advocated the use of the ballot by the workers, but advocated sabotage instead,

"And, whereas Comrade Haywood during the miners' strike in Colorado constantly warned the strikers to beware of violence,

"And, whereas Comrade Haywood has been a Socialist for many years and has delivered many addresses in Denver, in which he always advocated the use of the ballot by the workers,

"Therefore, be it resolved that we value Comrade Haywood as a Socialist and comrade and respect his position on Industrial Unionism."

The attitude of those Socialists who formed the two-thirds majority in the national referendum is best represented by the *Call*, the New York Socialist daily, which says, in part, in its editorial comment:

"Probably there has never been a time in which the members acted more deliberately than in this. There was little rancor, malice or hate in the recall. On the contrary, there was a deep feeling of personal regard for Comrade Haywood. There was a recognition of the value he might be—and should be—to the revolutionary movement. There was also the recognition that Comrade Haywood had so little consideration for the democratically expressed verdict of the party that he not only ignored it and held it

up to scorn and ridicule, but frequently went out of his way to defy, antagonize and frustrate what was manifestly the will of the great majority of his comrades."

## COMMUNICATIONS

### MOTHERHOOD AND PENSIONS

#### TO THE EDITOR:

With indications that the "public" is being swayed by appeals to protect motherhood through pensions, the presentation of *Motherhood and Pensions* by Miss Richmond is a relief. Aside from the economic waste of human energy which a "pension" system may induce, it is likely to lessen individual initiative, to reduce its possible recipients to the condition of petitioners for favors, and hence to weaken the social structure.

It is unfortunate that our city, state and national treasuries bear so impersonal a relation to the members of society. Intelligent citizens know that the poor and ignorant pay an indirect tax out of all proportion to their resources, that this condition is fostered by those who have in hand larger resources, and that poverty and ignorance are necessary factors in the explanation of human energy. The poor and the ignorant are paying the price of that which is to be returned to them as pensions.

If the time, money and energy now being used to establish pensions could be directed into the establishment of fair conditions of industry, of sanitary conditions of living, of greater opportunities to acquire knowledge, of equal privileges and duties for men and women, might not the nation's integrity be better safeguarded?

GRACE PUTNAM POLLARD.

[President Liberal Union of Minnesota Women.]  
Minneapolis.

### SERVICE IN CHARITY WORK

#### TO THE EDITOR:

A bishop has said that the modern organized charity movement is destined to fail because it is concerned with material things while the real needs of humanity lie deeper.

He misinterprets modern organized charity. It is precisely because the modern charity movement is not chiefly concerned with material things that it will not fail. Modern organized charity puts the emphasis upon personal service, which is essentially spiritual and not material.

And it is here again that the real difference lies between the "charity experts" and the advocates of "mothers' pensions." The latter declare that the "relief" given by private charities is not adequate. By "adequate" they evidently mean that "relief" in itself might be sufficient to remove all need and all cause of need and that if such "adequate relief" were given for a time all poverty would disappear.

One of the best answers I have heard to this material argument came from an unexpected source. It was before a senate committee at a

<sup>1</sup>See THE SURVEY, March 1, 1913, p. 774.

hearing on a proposed "mothers' pension" or "funds to children's act." A senator wanted to know if it were possible to change environment with money.

Money may be used in some cases to help change environment, but its comparative value for such purpose may be estimated in the significance which the world's greatest moral and spiritual leaders have attached to it.

And the danger of any fund, *per se*, public or private, is that it shall at once become the thing of paramount importance. All other needs are lost sight of in presence of the opportunity to satisfy the universal need for money. The multitudes come then and the mission of one who might have done something to elevate humanity is submerged in the routine of distributing things. So those who come receive things only and they come for nothing else.

Now your practical man will decry such preachment and will want to know what all that has to do with the case of the poor mother whose children are about to be torn from her side. Our answer is that human nature is fundamentally the same and what would apply to a single individual in respect to the danger of a known, always available relief fund would apply equally to another, even to a mother and to her children. Can we protect humanity physically while at the same time we undermine its moral integrity? Or do we suppose that the only need or the real need in poverty is for a little cash?

Truly, as Mr. Hard says, this whole question of pensions to the poor "is a matter of moral, or speaking even more broadly, of esthetic, perception." Or let us say spiritual,—that is a better word.

We social workers are ourselves to blame for teaching the public that relief might be adequate. Some have even claimed that it was so, not only for certain instances, of which they have proudly boasted, but over the community as a whole. Is relief ever adequate? We have used the term to signify that a certain amount was adequate for a certain time; that is, it would furnish groceries, and coal and other necessities for a week. But if we have provided these for a family and the next day the husband and wife are arrested and charged in police court with drunkenness and disorderly conduct, was our relief adequate?

A friendly visitor finds a mother and two children deserted by the father. The father is arrested and sent to the reformatory and the visitor helps the mother to work out a plan whereby she may keep the children with her; but the next week the mother places the children in an orphan asylum. Was that relief adequate?

A father is out of work, his family is in distress. Relief is given for a few weeks until the father can be found another position. Then, of course, the relief stops. But in a few weeks the father is out of work again. Was that adequate relief which we gave?

Relief really is never adequate unless it removes the cause of the trouble. It is in this sense that the public understands the word, and it is the only honest sense in which we have any right to use it. In speaking of adequate relief we must

know that parents have the moral strength to do their part. Relief can be adequate for a mother only when she has the determination and will power to make some effort for her own salvation. Lacking this, any amount of material aid given in that home can do only harm. And in adequate relief we establish a social order in which an industrious father is not thrown out of work, but is able continuously to make enough to support his own family.

And for any one to claim that he or his organization gives all the relief that is needed in his community, when individuals are suffering and dying all about him because of poverty and neglect, is the consummation of ignorance, or stupidity or dishonesty.

Since we social workers ourselves have introduced the term adequate relief and have taught the public to believe that it might be so, let us not blame any one but ourselves if we find certain advocates of mothers' pensions demanding that we give adequate relief to mothers.

The best part of our charity is the personal service which we give. That service has a double benefit; it really saves some individuals and some families here and there; and it helps to keep the city acquainted with itself. It compels us to know conditions and knowing them to find some remedy.

Such personal service is essentially religious, and our cause suffers often because we do not more boldly assert that fact. It is not the religion of any sect, its creed is as broad as humanity. It is a kind of civic religion, promoting the day of universal brotherhood and democracy.

FRANK D. LOOMIS.

[General Secretary Children's Aid Association.]  
Indianapolis.

## SEX HYGIENE

TO THE EDITOR:

After reading *Post Graduates of the Hired Man in THE SURVEY* for March 8, I am impelled to contribute a fragment of personal testimony.

I am associated with Charles Keen Taylor of the University of Pennsylvania in developing, under the auspices of the Home and School League of Philadelphia, a system of moral education in the public schools of this city. He works with the boys, while I work with the girls.

In the individual and really "friend-to-friend" talk that I plan with each girl, I ask three questions, if I find that the girl has reached the age of puberty. One is "Did you know of this event of your life before its happening?" The next question is, "Who told you of it?" To which the reply is, nine times out of ten, "a girl," or "the girls, I know." My next question is, "From whom would you rather first know this great thing in your life?" And not once has the answer failed to be, "My mother."

Possibly, if the mothers who read *THE SURVEY* should read this, they would find something more of the depths of the daughter-heart, than they have dared (?) to seek.

FRIEDA E. LIPPERT.

Philadelphia.

## NEW YORK FIRE BILLS

TO THE EDITOR:

Allow me to set aright Lawrence Arnold Tanzer, legislative draftsman for the Factory Investigating Commission, who finds it hard to comprehend my statement in your issue for February 22, that the commission's bills will not affect materially the fire hazard conditions which the commission was appointed remedy.

Mr. Tanzer bases his difficulty in understanding my contention upon his interpreting these bills as largely following my own recommendations. It is because they follow my recommendations *largely*, and not specifically, that Mr. Tanzer has been misled.

Mr. Tanzer says that my proposed bill, prohibiting the erection of factory buildings which cannot be emptied in three minutes is impractical. I have grown accustomed to statements of this kind during the past eight or nine years. During this time, while I was urging legislation for compulsory fire drills in factories, manufacturers, commissions, legislative draftsmen and legislators have said that such legislation would be impractical. Nevertheless, under pressure of public sentiment such a law is now in effect in Pennsylvania, New Jersey and New York.

It stands to reason that if factories are to be safe they should be designed and built safe. Architects and builders should not be allowed to continue to design and construct buildings with inadequate exit facilities, as they have in the past, and which have to be altered so as to be safe only after a fire panic proves their defectiveness. People in other professions are restrained by law from unloading upon the unsuspecting public goods which are not what they purport to be.

There is a general consensus of opinion among people with whom I have conferred that no one should be detained in a building more than three minutes after it gets on fire. I have reconstructed plenty of factories previously unemptiable in such an emergency, so that they are now readily emptied in less than three minutes.

The bill I have been advocating would prohibit the construction of any factory building which could not be emptied within this time limit. I shall leave this question to the intelligence of the public, satisfied that, when they want safety in factories, legislative draftsmen, commissions and legislators will get busy and devise and pass a bill which will be effective.

Now as to my criticism of the bills. Mr. Tanzer says I do not make my objections specific, and therefore may mislead those who have not read them. Let me say that they do *largely* follow my recommendations, but in each case there is a string attached which nullifies it or weakens it so that it is of little value.

Bill No. 7 was passed last year, requiring that cuttings and waste materials shall be removed from the factory building daily. This bill was very good, evidently too good to let stand, for it was dragged out of the statute books this year and amended so as to allow the cuttings and

waste materials, if a string is tied around them (*i. e.*, "are baled"), to be removed from the building only once a month.

Bill No. 8 calls for fire alarm signal systems and fire drills in factory buildings. These drills may take all day long to get the people out of a building. They do not act as a test of the exit facilities and simply tend to preserve present unsafe conditions by permitting unsafe buildings to be constructed and then establishing drills to enable the people to get out of them. Such drills are worse than useless, as they establish in the minds of the occupants of the buildings a false idea of security.

Bill No. 9 requires automatic sprinklers to be installed in every factory building over seven stories in height, in which wooden flooring or wooden trim is used. In the direction of protecting property this bill is apparently good as far as it goes, although favoring one fire retarding apparatus to the exclusion of every other; but taken in conjunction with the next (Bill No. 10) it is vicious. It will inflict a great hardship upon many building owners by putting them to great expense without an adequate return.

Bill No. 10 enters into the construction of buildings for the purpose of making them safe for their occupancy. I stated in my report that a stairway of standard type with a height between ceiling and floor of ten feet, has twenty steps, which if wide enough for people to come down single file will accommodate one person on every other step, and therefore have a capacity of ten people. Likewise a stairway with a height between ceiling and floor of twelve feet will in the same manner have a capacity of twelve people. Any more people getting on these stairs will jam them.

These are plain facts, but the commission by fiat increased both of these capacities to fourteen. Winders actually reduce the capacity of a stairway 50 per cent, but the commission established the legal reduction at 10 per cent.

The number of people which I stated in my report can be safely crowded into a given space on a floor is one for every three square feet (*i. e.*, a space say 22 inches by 19 inches) but the commission voted that if a sprinkler system would be installed 50 per cent more people can get into it. Sprinkler systems have never been considered life saving devices, and, like all other automatic devices, they frequently do not operate at all. When they do operate it is at a temperature and in an atmosphere filled with smoke and flames which human beings cannot stand. The latter always have to make their escape in advance of the operation of such a system; but with the additional occupancy allowed, there would be no place for the people to escape to, owing to the congestion of the exit facilities. These bills were supposed to reduce present congestion in factories, but instead they establish it by law.

Bill No. 1 authorizes the appointment of an Industrial Board, which Mr. Tanzer says is intended to consider the important details which I have stated are defects and omissions in the legislation proposed. This is my whole conten-

tion, that the Factory Investigating Commission has failed to serve its purpose and is now turning its problems over to an Industrial Board empowered to employ experts to solve it for them. Nearly two years have been spent getting this far. Now the long suffering public is asked to put up more money and wait indefinitely for another political board to employ experts to study the situation over again. The question is, how long will the public stand this sort of circumlocution?

H. F. J. PORTER.

[Secretary Efficiency Society; former expert New York Factory Investigating Commission.]

New York.

## PARTNERSHIPS OF INDUSTRY

TO THE EDITOR:

I was delighted to find in *THE SURVEY* for February 8 two articles on the questions of arbitration and the partnerships of industry. It is well that the article on partnership comes from one who has tried it so long and is pleased with it. His statement that "Nothing is more discreditable to a class of reformers than the cynical charge that profit sharing aims at advantage over employees. On the contrary it is always the opening wedge to a genuine mutual interest and understanding" has truth in it.

Some fifty years ago I urged in the labor papers that the main cause of industrial evils was the universal practice of recognizing the right of capital to take all net gain, and urged the wage workers to adopt co-operative arrangements which would limit the gains of capital and divide profit or net gain equitably among all the parties to producing it.

I am disappointed at the general ignorance at this late day, of so many wage workers and their leaders who persist in thinking that their whole trouble is with their employers and that all they need is more wages when the fact is that wages entering into the cost of products make the cost of living increase faster than the rise in wages, leaving workers in worse condition than before. It is also to be deeply deplored that the employers as a body have never thought out the capital and labor problem, and as a rule persist in resorting to the lash of the despot in place of reason and justice.

The world's best thinkers point to a joint partnership between capital and labor as the best foundation for the industrial future. Cairns fully and clearly pointed out that the only way by which labor can improve its condition is to secure a share of the profit or net gain of industry. Professor Ely of the University of Wisconsin is the only man, so far as I know, who has republished this statement of Cairns.

I am surprised, considering the increased interest that is now shown in the welfare of the wage workers by the educated classes over what was the case forty or fifty years ago, to find so little said on these questions of the true relations of capital and labor, especially when I think of the great good that would result from their consideration and public discussion. I sin-

cerely hope that the writers for *THE SURVEY* will pay more attention to these subjects.

The questions most important to be considered at this time in my judgment are voluntary arbitration, partnerships of industry in all production and Rochdale co-operation on the part of all in distribution. On these lines *THE SURVEY* has the power to do a vast amount of good.

In England the co-operators aimed at getting rid of the employing capitalist class, but changed conditions in this country call for a union of employer and employee. Labor needs the capital and business knowledge of the employer and the employer needs the good will and knowledge of labor. How to secure this is the question. We have to look to the educated class to help this along.

THOMAS PHILLIPS.

Clementon, N. J.

## SHOPPERS' PUZZLE

TO THE EDITOR:

Members of the St. Louis Consumers' League are seeking the solution of the following problem: Last summer a new large department store kept open on Saturday afternoons. This violation of the established custom of giving the Saturday half-holiday was discussed by the Consumers' League. It was decided that two members of the league call upon the head man of the local shop (which, by the by, is but one of a chain of stores established in various cities under one firm) and ask him why his concern did not conform to custom. The man told the women that such a bulk of business was done in their men's furnishing department on Saturday afternoons that the stockholders would never agree to Saturday closing, as that would reduce dividends. He said further that social harm would be done should his place close because then a number of mushroom men's furnishing shops would spring up to take up their abandoned business and general industrial conditions would be worse in these shops than in his—and as many people would be employed Saturday afternoons. He remarked, too, that all the existing men's furnishing shops kept open. To the suggestion that the men's furnishing department alone be kept open, his reply was that the construction of the store and the established machinery for doing business made this impracticable.

The Consumers' League added to this information their own observation that working men did have to have Saturday afternoons for their shopping or else shop at night. To promote night buying seemed no remedy. Employers rightly would not allow men time off during the day to shop without docking wages. So gloomily the Consumers' League looks forward to the coming summer and fears that other department stores will fall in line with the new place and keep open summer Saturday afternoons.

Do *SURVEY* readers wish to start a contest for the best answer to this modern industrial puzzle?

ALTHEA S. GROSSMAN.

St. Louis.

## JOTTINGS

### LINKING SCHOOLS WITH HOMES

How a boy in his institution in succession prepares the ground, plants radishes, cultivates them, takes them to school and paints them, and then eats them, was told by R. R. Reeder, superintendent of the New York Orphanage at Hastings-on-Hudson at a conference held in New York early in March under the auspices of the New York Child Welfare Committee. His point was that in this way the boy extracted the greatest possible benefit, both as education and nutriment, from the radish. A girl, he said, chooses the cloth, cuts it, sews the pieces together into a dress, takes the dress to school and paints it, and then puts it on and wears it.

Both the correctional and educational value of industrial training for boys and girls in institutions was emphasized. Stress was laid on need for close correlation between the work of the institutional school and the industrial department, as suggested in the method outlined by Dr. Reeder. Incidentally, Arthur D. Dean, head of the division of vocational schools of the New York State Department of Education, remarked that there never can be as much correlation between the family and the public school as is possible between the institutional school and the home life of the institution child. The institution, he said, is both school and home in one. Dr. Reeder was among those who thought that nevertheless there is opportunity for the public school to link itself much more closely to the family life of children than it has yet attempted. Giving credit in school for industrial and domestic work done at home was among the methods discussed for bringing this about.

### UNIFORM CHILD LABOR LAW FOR NEW JERSEY

A difference of opinion between the educational authorities and the commissioner of labor of New Jersey has delayed the passage of a bill to end a baffling inconsistency in the laws affecting the issuance of working papers. The labor commissioner has the power to issue working papers to any child of fourteen who applies for them and can prove his age. The educational officials on the other hand are required to enforce school attendance up to the age of seventeen if the child has not completed the grammar grades. The variance between these two statutes has caused confusion because a child who has secured working papers may in many cases be seized by the truant officers and returned to school.

A bill is pending to reduce the age of compulsory education to sixteen and to ensure co-operation between the two departments. The stumbling block has been as to which department should have the right to issue the working papers. The commissioner of labor because he has always had the power wished to keep it but the school authorities felt that they were in closer touch with the children. The outcome it is expected will be a compromise. The com-

missioner of labor has already said that he is willing to have the working papers issued by the school authorities provided that the original documents or attested copies are filed with the Bureau of Labor at Washington.

### UNEMPLOYMENT IN ENGLAND

While the number of men who demanded employment in England last year was 20,000 fewer than in 1911, the requests for aid to emigrate increased by 1,500. This part of the service cost \$2,000,000.

### GALSWORTHY ON THE EAST SIDE

What are the dramatic capacities latent in the second generation which should be added to the sum of American life? That is a question confronting New York's East Side and all immigrant quarters.

The Dramatic Club of the Henry Street Settlement gives one of the fragmentary answers. Last year they put on *The Shepherd*, Mrs. Dargan's tragedy of the Russian revolution. This year the play selected was Galsworthy's *Silver Box*, with its story of the isolation and lack of understanding between social classes. The club itself is the reverse of this, as the producing directors and the young Russian people who put in all their spare hours on rehearsals meet on an equal footing. Besides the social element introduced into settlement life by such a club, there is the opportunity to bring out latent talent for dramatic expression, as in the case of one of the main characters in this play, who out of work hours, is taking courses in the drama at Columbia. The audience was keenly appreciative of the social and philosophical aspects of the play, and the library records of that section of the city go to show that the interest is an all-the-year-round one.

### SCHOOLMEN FOR CHILDREN'S JUDGES

A juvenile court whose judges must be school principals or superintendents is the proposal now before the New York Legislature. Its purpose is to bring school room and court room into closer co-operation. The new court is to be known as the "children's bureau of the city of New York," and the judges will be called directors. A director must have had eight years' experience as principal or superintendent in the public schools of New York, or ten years elsewhere or in public institutions to which children may be committed.

The bureau, if created, is to have all the jurisdiction now vested in the inferior criminal courts with reference to violations of the compulsory education and child labor laws, and to charges of juvenile delinquency and improper guardianship. It may investigate, try, hear, determine and punish all such offenses.

Friends of the present juvenile court are for the most part opposed to this suggestion and it is not thought likely that the bill will pass. The chief objection is that principals and superintendents usually do not have much direct contact with children and so are not fitted to sit in judgment on youthful waywardness.

sociation of Societies for Organiz-  
ing Charity.

John Ihlder,  
Field Secretary National Housing  
Association.

## INTRODUCTORY

### SURVEY ASSOCIATES, INC.

The Survey Associates is a membership corpo-  
ration, chartered November 4, 1912, under the laws of  
the state of New York.

Its stated purpose is "to advance the cause of con-  
structive philanthropy by the publication and circulation  
of books, pamphlets, and periodicals, and by conducting  
any investigations useful or necessary for the preparation  
thereof."

To the Survey Associates, Inc., is turned over the  
publication of THE SURVEY magazine, the mainte-  
nance of the Survey Press service, and other activities  
heretofore carried on under Charities Publication Com-  
mittee. The latter has been a constituent committee  
of the Charity Organization Society of the City of New  
York, and action effecting this change was taken by the  
Central Council of the Society, June 12 last.

Henceforward co-operating subscribers to THE  
SURVEY (those who contribute \$10 or more annually)  
may be elected voting members of Survey Associates,  
Inc. Contributors of \$100 or more in any one year,  
so elected, become continuous members.

The following directors were named in the act of  
incorporation:

Jane Addams  
Robert S. Brewster  
Robert W. de Forest  
Edward T. Devine  
John M. Glenn  
Julian W. Mack

V. Everit Macy  
Charles D. Norton  
Simon N. Patten  
Frank Tucker  
Paul M. Warburg  
Alfred T. White

The directors serve for three-year terms, and are  
divided into three classes, so that one-third of them  
come up for election each year. The Charity Organi-  
zation Society of the City of New York will nominate  
one director in each class. The first annual meeting  
will be held Monday, October 27, 1913.

At the organization meeting of the board of direc-  
tors of the Survey Associates on November 11, 1912,  
Robert W. de Forest was elected president, John M.  
Glenn, vice president, Frank Tucker, treasurer, and  
Arthur P. Kellogg, secretary.

Charities Publication Committee continues as a  
National Council, larger and more widespread in mem-  
bership than is possible for the board of direction with  
its monthly meetings.

Reginald Randolph

## TO SURVEY READERS AND SURVEY ASSOCIATES:

**T**HIS report must attempt a two-fold part:

First: An announcement to readers and subscribers that THE SURVEY has, in the last analysis, been turned over to them—a call upon them for an increased measure of that backing and vigorous personal interest which have made it a living thing these fifteen years past. Through action of the Charity Organization Society of the City of New York, the Survey Associates has been incorporated as a non-commercial membership organization open to the co-operating subscribers of THE SURVEY; and the magazine and its related activities have become in fact—what they have long been in spirit—a mutual enterprise.

Second: An acknowledgment in behalf of the new régime, of its indebtedness to the parent society for the valuable equity thus transferred, and for a final appropriation which, with exceptional gifts from friends and well-wishers during the summer and early fall, has cleared THE SURVEY from all overhanging obligations and enabled it to enter upon this new stage of its development four-square with the world.

To all who have borne a hand—our thanks.

To all who lend a hand—greeting.

**T**HE Survey Associates, Inc., thus becomes an adventure in co-operation.

Perhaps no more active question confronts journalism than how to free the periodicals of the United States—with their great powers for good or evil—from any dominance by the advertising pages. Only this fall, the editor of one national weekly,—most conspicuous heretofore for its independence in this respect,—has retired for this assigned cause. The editor of another and older weekly proposes the foundation of an endowed journal. It is only a war scare, he points out, that justifies a newspaper in sending a capable man half around the globe; it is only the circulation-getting quality in an investigation

which enables a periodical to go at it adequately. Therefore he argues for an income not only independent of business receipts, but ample enough to finance deliberate and inductive staff research into civilization in process, outside those limited fields where gathered fact has a marketable news or magazine value.

These references will give the reader some inkling of why it is—the point will be taken up more in detail later—that THE SURVEY appeals for \$20,000 above commercial receipts in order to do a creditable year's work in a field where the editorial procedure is continually one of intruding upon inertia and neglect and of bringing human values out from beneath the surface of things.

They will show why, also, in the publication world, THE SURVEY is watched as an experiment of unusual interest. It needs extra-commercial receipts to pay for rapid staff research and reporting in a field of exacting technique; to set forth its findings graphically, and at convincing length; to gain a hearing for them among wider and wider groups of readers; and, through its press service, to make them over into the common knowledge. It does not look to an endowment fund for these extra-commercial receipts, but to the voluntary contributions—\$10, \$50, \$100 and \$1000—from its readers. Will they back it up?

[Our financial appeal is printed on the back cover.]

**B**UT interesting as THE SURVEY is as an experiment in co-operative journalism, we are more concerned with its wider and deeper aspects. In 1910-11, 293 readers became co-operating subscribers at \$10 each; in 1911-12, 646; in 1912-13 we look for 800. 101 others, the past year, have given larger amounts. Sheerly as a membership body, the Survey Associates at the very start, ranks well up among the national organizations which carry forward constructive social work.

At a time when great trusts in philan-

thropy are being organized—the Rockefeller Foundation, the Russell Sage Foundation, the Carnegie Foundation—thrusting great resources into the future, it seems eminently opportune and far-sighted thus to create in the Survey Associates a human balance, a company of thinking, criticising, doing Americans whose strength will come from the passing from man to man of ideas and experience, method and good-will.

The transition in organization from old to new involves no violent break with the past, nor change of scope or purposes. It merely means that the magazine and other activities carried on under Charities Publication Committee have increasingly become national, and that a point has been reached where far-seeing stewardship calls for a natural, self-dependent organization which can project the work twenty-five years into the future.

IT was in 1897 that the parent society started *Charities* as a weekly medium through which its members could be kept informed of the social needs of New York, and of the movements leading to their improvement. From the first, in text and in spirit, it broke away from the narrow limits customary to institutional bulletins, and from the first it has had a message for other cities and societies facing similar problems. It has been published under various names; it has grown in scope with the growth of the co-operative efforts of which it has been the interpreter; but it has been marked throughout with a rare unity and distinction, due to the consecutive editorship of its founder, Edward T. Devine, whose practical service as general secretary of the Society has lent the force of achievement to printed words, and whose constructive vision has given them life and fire. Under his editorship, with the backing in purse and purpose of some of those longest in the councils of the Society—backing which naturally won for itself co-operative support from other quarters—the magazine became and has continued the largest single contribution of the New York organization to the national field.

In launching THE SURVEY as an independent undertaking, that contribution has been carried through a further and logical stage.

It has been launched at a period of exceptional opportunities for service. There has perhaps never been a twelve-month in the history of the magazine which has been

marked by more important developments in the national field, in which staff and Committee have borne a hand.

## FEDERAL INQUIRY INTO JAILS

AT the December session of Congress there is every prospect of an appropriation for a special inquiry under the Department of Justice into the condition of jails, as potential houses of detention for federal prisoners, and into our general methods for treating delinquents. Reforms must, of course, come largely in the states and in the counties, but such an independent inquiry, removed from the entanglements of local politics, should be as far-reaching as the work of the English Poor Law Commission.

In the fall of 1910, THE SURVEY published a special number, interpreting the meeting for the first time in this country of the International Prison Congress. This international body was instituted by an American, Dr. E. C. Wines. In the forty years of its existence, its membership, composed of official delegates from the great governments, has come more and more to respond to the principles of those pioneer American penologists who, in the 70's, took issue with old statutes founded on vengeance and punishment, and taught the new law of social offence and personal rehabilitation.

This quinquennial session saw the triumph of these American principles. They were embodied in recommendations as to the indeterminate sentence, probation and reform, adopted and sent back to the adhering governments.

But the Congress brought to America the leading penologists of our own generation, who measured not merely our modern reformatories, but the general run of American jails, prisons and penitentiaries, against the principles which the penologists of the New World have stood for in the councils of the nations. In the eyes of the most progressive of the foreign delegates, many of our conditions were still those of the dark ages. Mrs. Lowell long since noted that the American Revolution practically cut off the new continent from John Howard and his prison reforms. Our petty offenders are jailed in lock-ups which correspond to those of Eighteenth Century England.

A departmental editor of THE SURVEY, the late Samuel J. Barrows, was in 1905 elected president of this international body, the first American to hold such office.

Perhaps it may be counted a piece of loyalty to him that THE SURVEY brought out with discriminating frankness the sobering message which these European leaders left with the American people—not in their official resolutions, but in quietly expressed personal judgments.

Later, through Senator Root, the situation was placed before the Federal Department of Justice as the proper subject for a governmental inquiry. Attorney-General Wickersham responded favorably to the suggestion and recommended it strongly in his annual report and at Congressional hearings.

## COMMISSION ON INDUSTRIAL RELATIONS

ONE of the most significant acts of the present Congress has been the creation of a Federal Commission on Industrial Relations. This is charged with the responsibility of investigating the fundamental relations which we as a self-governing people bear to corporate forms of work. An appropriation of \$100,000 has been voted for its use during the first year.

The Los Angeles confessions last December struck the public between the eyes. A natural reaction of vast numbers of people was to call on Labor to put its house in order. The corresponding reaction of at least some of the more militant unionists was to cite counter abuses at the hands of Capital—the old cry of “You’re another”. THE SURVEY sought to glean some light where there was mostly heat, by publishing a symposium on “The Larger Bearings of the McNamara Case”.

This suggested to a group of social workers in New York—headed by Rabbi Stephen S. Wise and the Rev. John Haynes Holmes—the desirability of some public expression from those who were neither in the ranks of employers nor of the employed. At a meeting, with Miss Jane Addams in the chair, discussion focussed not on the dynamiter, but on the worker who would not dynamite; on what channels for self-expression are open to wage-earners who through collective effort seek to better their condition. At the suggestion of a member of the staff of THE SURVEY, a public letter to the President was drawn up, urging him to recommend the creation of a federal commission of inquiry.

Many of the leading social workers and economists of the country signed this letter. It was presented at the White House on December 30; and on February 2 President Taft, in a message to Congress, strongly urged legislation to this end. As the Children’s Bureau Bill had been hanging fire for six years, it was felt that organized effort and education would be needed to secure prompt action.

The editor of THE SURVEY was the unanimous choice of the petitioners to act as chairman of a legislative committee, and for the succeeding five months the heavy work of organizing, interesting the general public, and carrying on a congressional campaign, was shouldered by Mr. Devine. The Survey Press Bureau undertook the work of publicity. [See p. 8.] Congressman Hughes in the House, and Senator Borah in the upper chamber actively sponsored the necessary legislation. Several thousand letters were sent out; testimony was offered at a widely attended hearing of the House Labor Committee, Congressman Wilson chairman; and a majority of the members of both houses were personally interviewed. Allen T. Burns, secretary of the Pittsburgh Civic Commission, was secured on leave of absence, as Washington representative, and a gift of \$5000 from Mr. Adolph Lewisohn, supplemented by later gifts from Mrs. Emmons Blaine and Mr. Julius Rosenwald, financed the work.

The bill passed on August 20, creating a commission of nine members, to be appointed by the President, and composed of 3 employers, 3 workers, and 3 representatives of the general public. It was

signed by the President August 23. To quote Mr. Taft:

“Industrial relations concern the public for a double reason. We are directly interested in the maintenance of peaceful and stable industrial conditions for the sake of our own comfort and well-being; but society is equally interested, in its sovereign civic capacity, in seeing that our institutions are effectively maintaining justice and fair-dealing between any classes of citizens whose economic interests may seem to clash. . .

“ . . . Unquestionably the time is now ripe for a searching inquiry into the subject of industrial relations which shall be official, authoritative, balanced and well rounded, such as only the federal government can successfully undertake. The present widespread interest in the subject makes this an opportune time for an investigation, which in any event cannot long be postponed. It should be non-partisan, comprehensive, thorough, patient, and courageous.”

## OCCUPATIONAL STANDARDS

At Cleveland in June, representatives of a dozen national organizations in the field of constructive philanthropy united in a program of industrial minimums, which they set forth as a joint working platform with respect to labor conditions. These planks included the 48-hour week for women and the six-day week for men, the prohibition of child labor, of night work for women and of the 12-hour day for men, minimum wage boards, workmen’s compensation for accident and disease, and kindred proposals.

More especially the platform advocated and defined a sphere of governmental control with respect to physical conditions of work in a more clear-cut way than had hitherto been done. This was embodied in three working principles as follows:

### THE INDUSTRIAL MINIMUM

“The community has a right to complete knowledge of the facts of work.

“On the basis of these facts and with the recent discoveries of physicians and neurologists, engineers and economists, the community can formulate minimum occupational standards below which, demonstrably, work is prosecuted only at a human deficit.

“The community should bring all industrial conditions which fall below such standards within the scope of governmental action and control, in the same way that subnormal sanitary conditions are subject to public regulation, and for the same reason—because they threaten the general welfare.”

In 1910 the National Conference of Charities and Correction, meeting at St. Louis under the presidency of Miss Addams, devoted the work of one of its major committees to this subject of occupational standards. This was inherently an endeavor, on

the one hand, to bring together the proposals of the various propagandic organizations which have urged different phases of industrial reform (such as the prolongation of childhood, the elimination of night work for women, and the prevention of industrial accidents) and, on the other hand, to bring to bear upon these proposals the information and interest of charitable agencies.

It was held that:

"More than on the manufacturers themselves, more than on the wage-earners themselves, the responsibility for bearing testimony as to the human wear and tear of industry rests upon those who carry on our hospitals, reformatories, charitable societies, courts and children's institutions; from them, if from any one, must law-makers and industrial leaders learn where lines must be drawn, if the business world is not to throw back upon family and state, burdens which would be seen to be exorbitant, were they not scattered among a thousand hospitals and among the budgets of a hundred types of philanthropic agencies."

The work was carried forward on a three-year basis; the first year under the chairmanship of Paul U. Kellogg, of THE SURVEY; the second year, under that of Mrs. Florence Kelley, secretary of the National Consumers' League (a contributing editor); and the third year under Owen R. Lovejoy, secretary of the National Child Labor Committee.

In September, 1910, THE SURVEY published a special number blocking out the field. The final report by Mr. Lovejoy at Cleveland last June was signed not only by the representatives of philanthropic bodies, but by men identified with employers' associations and trade unions. Specific planks were offered under each of the following heads: wages, hours, safety and health, housing, term of working life, compensation and insurance; Mr. Lovejoy presenting in printed form a mass of evidence under each head, American and foreign laws and the pronouncements of existing organizations.

In enunciating the principle of the *industrial minimum*, the committee was employing a governmental principle already adopted in the field of sanitary conditions. We have come to recognize a public element in congregate dwellings. With the aid of sanitarian and plumber, architect and engineer, we have worked out certain standards of building and maintenance below which health is endangered. And we have come to regard it as the proper province of government to step in, regulate and control cess-pool or cellar or dark interior bedroom or any other condition that falls below those standards.

The National Conference does not adopt resolutions. An all day's meeting adjourned as a session of the conference, and as individuals, with only minor changes, adopted the program.

Subsequently, steps were taken to put its findings before the platform committees of the various political parties; the Progressive Convention at Chicago drafted them into its proposals for "social and industrial justice"; and they became issues around which waged much of the most stirring discussion of the campaign. To quote Col. Roosevelt:

"Wherever such standards are not met by given establishments, by given industries, are unprovided for by a legislature, or

are balked by unenlightened courts, the workers are in jeopardy, the progressive employer is penalized, and the community pays a heavy cost in lessened efficiency and in misery.

"The first charge on the industrial statesmanship of the day is to prevent human waste. The dead weights of orphanage and depleted craftsmanship, of crippled workers and workers suffering from trade diseases, of casual labor, of insecure old age, and of household depletion due to industrial conditions are, like our depleted soils, our gashed mountainsides and flooded river bottoms, so many strains upon the national structure, draining the reserve strength of all industries, and showing beyond all peradventure the public element and public concern in industrial health. . . We hold that under no industrial order, in no commonwealth, in no trade, and in no establishment should industry be carried on under conditions inimical to the social welfare. The abnormal, ruthless, spendthrift industry or establishment tends to drag down all to the level of the least considerate."

## MEN AND RELIGION MOVEMENT

MAGAZINE and committee co-operated at many points with the Men and Religion movement which ranged the country during the winter months of 1911-12.

It need scarcely be pointed out that this movement, which based its primary effort upon public education rather than upon inspiration or conversion, became more and more imbued with the social spirit as it proceeded, breaking crusts in city after city, dislodging inertia, and leading at one point or another to a new view of religious responsibility. In the words of one southern pastor, "the church now has a definite stewardship for anything that takes place in the town, from what is to be found in the tin cans in the alley to the kind of chimneys in the tower."

A special fund was raised which enabled THE SURVEY to send copies of its issues every week for a period of three months to the committees which were organized in the different centers—a total of some 7,000 names.

Through its news columns and occasional articles, THE SURVEY kept abreast of what happened during the tours of the various teams, and published in a special number the gist of the sermons of an entire week given by Raymond Robins, whose message of social service became the striking feature of the campaign.

The present year, THE SURVEY is publishing a special department, Church and Community, in charge of Prof. Taylor, which will seek to record the results of the movement as they manifest themselves from town to town, and to interpret the work of the half dozen social service commissions instituted by different denominations.

## BUREAU OF SURVEYS: BIRMINGHAM NUMBER

EVER since the Pittsburgh Survey was carried through in 1907-8 by Charities Publication Committee, inquiries as to how to go about similar community inventories have been coming in from east, west, north and south,—to THE SURVEY, to the various departments of the Russell Sage Foundation, and to other bodies. Surveys in Buffalo, Syracuse, at various points in New England and elsewhere, have further tried out the survey as an organized method of social discovery.

The Russell Sage Foundation has instituted this fall a Department of Surveys and Exhibits, with headquarters at 31 Union Square West, New York City, which will seek to define and spread the survey idea, collect and keep within easy reference information on survey experience, send members of its staff to communities to make an initial diagnosis of their needs, and stand ready to counsel and advise them with respect to major lines of investigation.

The department has been placed under the direction of Shelby M. Harrison, who as a member of THE SURVEY staff was in charge of the field work for our special Birmingham number published last January. This number portrayed the communal problems of the industrial districts of the New South with graphic directness, vision and fearlessness. Like THE SURVEY'S work in Pittsburgh, it was a forerunner of the community inventories which, under the promptings of this new national bureau, will become a factor in American city building.

Here was a city coming to its majority in a decade when sanitation and town planning are widely recognized activities, when the technique of preventive medicine and of constructive philanthropy have reached a stage of precision, and when a new city can ward off in advance many of the conditions which are entrenched in our older towns.

None the less, here was a community which, in its councilmanic system (just abolished), its stunted health authority, its sheriff's fee system, its chain gangs and convict mines, its absence of factory inspection and compulsory education, its lack of adequate hospital facilities, is not as yet using modern implements to serve its social needs.

What Birmingham does will influence this whole Piedmont industrial district—will influence the whole South.

One testy resident was for hanging the members of the SURVEY staff, once our findings were out. But that was not the spirit in which they were published, nor in which they were received by the progressive element in the community. What Bir-

mingham's social and civic pioneers were doing was emphasized as strongly as what the town had left undone. One report became the basis of a vigorous pronouncement by a grand jury; a second led to the establishment of semi-monthly pay by the largest employing corporation in the district; a third has influenced the convict labor situation, and dealt a hard blow to the iniquitous fee system; a fourth has helped to institute a sanitary survey by the coal operators' association of all the mining settlements of Alabama. This sanitary survey—the first ever carried on on a state-wide scale in an American mining district—has already produced tangible results.

## LABOR CONDITIONS IN THE STEEL INDUSTRY: THE CABOT FUND

In a very different field, changes are taking place in which investigations made by THE SURVEY in the Pittsburgh steel district have played a part. The steel industry is basic. It includes the largest employing corporation in the United States. It is an industry in which, for better or for worse, the employers are wholly in control; therefore responsibility for the conditions of work is not divided; it cannot be escaped by managers and owners. And those conditions of work present great raggedness in occupational standards—unexampled schemes for the prevention of accidents on the one hand, and the 12-hour day on the other. In the general forward movement in the industry, THE SURVEY has attempted to follow an even course as critic and interpreter, voicing above all the needs of vast numbers of inarticulate and isolated workers.

In 1910-11, and again in 1911-12, Charities Publication Committee was in receipt of a special fund from Charles M. Cabot, a Boston stock-holder of the U. S. Steel corporation, which enabled us to commission John A. Fitch to visit the principal steel centers. His findings have been published in the magazine as the leading series of 1911-12.

Meanwhile Mr. Cabot, in his individual capacity, secured action at the annual meeting of the U. S. Steel Corporation calling for the appointment of a stock-holders' committee to investigate labor conditions. This committee engaged William H. Matthews, formerly headworker of Kingsley House, Pittsburgh, as secretary, and made report in the spring of 1912.

Its three most notable findings were: first, to clamp in the policy of a six-day working schedule for the members of all crews, a policy which had advanced by great strides since the investigations of the Pittsburgh Survey; second, to provoke the appointment of an Administration Committee to consider the shortening of the 12-hour day; and third, to call for regular publicity as to labor conditions, such as will give the stockholders of the corporation as complete facts as to work as its reports already afford in the matter of finances.

In its regular issues THE SURVEY has been quick

to bring out favorably and at length, various advances in labor conditions in steel making, such as accident relief, and sanitary and welfare committees instituted by the Steel Corporation, and by the American Iron and Steel Institute. At the same time, its current investigations have been a lively

factor in getting this new hearing for those terms of work which our Pittsburgh inquiries showed all too clearly undermined and battered down life in the milltowns, and which Mr. Fitch's inquiries in Bethlehem, Lackawanna, Pueblo and Birmingham have shown to be national in extent.

## PUBLICATION MATTERS

**W**HILE THE SURVEY can play a constructive part in various movements for the improvement of social conditions, it is primarily a publication enterprise. Its function is the scientific one of getting at the facts of living conditions and the journalistic one of putting those facts before the public.

Now, it is often possible to work out large and definite reforms internally, by getting a group of forceful men around a table and convincing them that so and so is the right thing to do. This is a legitimate method of philanthropic work and of social reform. But it is not the method of THE SURVEY. THE SURVEY'S method is one of induction and graphic portrayal, of truth plus publicity; it is another and separate implement for social advance, and its usefulness would be negated were we to fail to hold to its distinctive function.

The philosophy of THE SURVEY is to set forth so far as it is able all the facts that bear on a problem, to bring out the judgments of those who know them first hand, and to rely upon the common understanding, the common forethought, the common purpose of the people of a city or state or trade or profession as the first great resource to be drawn upon in working that problem out.

Thus conceived, THE SURVEY and its allied activities become distinctive and powerful implements of democracy.

### PRESS SERVICE

THE SURVEY'S widest audience is reached through its Press Service which distributes, in co-operation with 125 newspapers in 39 states, a weekly article on some subject within our field.

This last year's newspaper clippings, pasted up in column form after the fashion of the space writer who submits his bill for a "string," would extend over a mile and a quarter.

Our clipping books show 5,750 articles, news items, notes and editorials. This, despite the com-

petition of political news in a presidential year, is an increase of 15 per cent.

As in years past, in co-operation with the National Consumers' League, we carried on an early shopping campaign during the holiday season of 1911, which elicited articles, advertisements and cartoons in papers all over the country.

Eighteen of the co-operating newspapers gave evidence of their appreciation of THE SURVEY'S Press Service by contributing \$392.50 toward enabling the Survey Associates to start with a clean slate.

The newspapers handling the weekly signed articles (see page 14) have an aggregate circulation of three and a half million copies. Between 20 and 30 editors of religious, labor, trade and social journals personally and regularly bear a hand in getting into paper and ink, articles which may be a factor in directing public opinion. Half a dozen news bureaus and press associations co-operate, and articles on special subjects are the frequent subject of requests for use in local campaigns.

The special series of articles and news bulletins used in the campaign for the Hughes-Borah bill brought the movement for a Federal Commission on industrial relations before the readers of 50 of the leading dailies, consecutively, for a period of ten weeks. The series included:

- A Communication to President Taft.
- Federal Commission on Industrial Relations.  
Edward T. Devine.
- Congress Considering Industrial Investigation.  
A Federal Commission on Industrial Relations.  
Paul Kennaday.
- What's Under the Lid at Lawrence?  
Walter E. Weyl.
- Our Haphazard Ways of Settling Strikes.  
Shelby M. Harrison.
- Cardinal Gibbons For Industrial Inquiry.
- Work-Relationships and the Democracy.  
Paul U. Kellogg.
- A Promising Basis for Industrial Peace.  
Allen T. Burns.
- The Canadian Industrial Disputes Act.  
Ethelbert Stewart.

The Press Service is non-commercial; the theory being that it is a piece of co-operation in which the authors of articles form one group of collaborators; the newspapers who spread the material broadcast a second; and THE SURVEY the third. The cost in 1911-12 was \$4600.39.

### BOOK DISTRIBUTION

**A**T the other end of the scale from the press service is our work of book distribution—of getting a reading for that more

developed and exhaustive treatment of social fact and practice which today finds expression in volume form. We act as publishers for the Russell Sage Foundation and serve our magazine readers in executing orders for the books of other publishers. Sound literature to the bulk of 14,418 covers was thus distributed in 1911-12.

During the year we brought out three volumes for the Sage Foundation:

Fatigue and Efficiency.

By Josephine Goldmark.

The Delinquent Child and the Home.

By Sophonisba P. Breckinridge and Edith Abbott.

Saleswomen in Mercantile Stores.

By Elizabeth B. Butler.

Under its own imprint the Committee has published:

The Spirit of Social Work.

By Edward T. Devine.

Fifty Years of Prison Service, the Autobiography of Zebulon R. Brockway.

Miss Goldmark's book, which has run through its first edition in four months, has been widely recognized as one of the most important volumes of the year. It has collected the opinion and experience of the entire civilized world as to the physiological effect of hours and conditions of work upon women, and has put the discussion of legal regulation upon a new and profoundly significant plane of recorded scientific fact. The book comprises the greater part of the briefs prepared by Miss Goldmark and submitted by Mr. Louis D. Brandeis in the defense of the 10-hour laws for women before the Supreme Courts of Illinois and Ohio, and before the United States Supreme Court in the famous case of *Curt Muller v. the State of Oregon*.

While without question a book of this calibre would have gained a wide reading if put out by commercial publishers the success of THE SURVEY'S book department in getting it before physicians and lawyers, employers and labor men, illustrates the special capacity and justification for this branch of our work.

Of the books distributed in 1911-12, 6,514 were Russell Sage Foundation Publications, 3,218 bore the Committee's imprint, and 4,686 were those of other publishers. In addition, there were more than 1000 copies of Dr. S. A. Knopf's *Essay on Tuberculosis*, which was recently brought out in its seventh American edition. Our "best sellers" of the year were books by associate editors of THE SURVEY: "The Spirit of Social Work," by Mr. Devine, which has run into its third edition in eleven months; and "A New Conscience and an Ancient Evil," by Miss Addams, of which 1562 copies have been sold among SURVEY readers.

In all (since 1908) the Committee has sold 24,532 volumes of the Russell Sage Foundation Publications (31 titles) and 7,226 of its own imprint (6 titles). (For full list see page 23.)

Quite apart from its distributing activities, THE SURVEY Magazine carries on a Book Review department which attempts to give the gist of books

published and to exercise a cumulative influence on accuracy and literary form.

During the year, over 257 titles were entered in this department and 156 reviewed. At a time when there is a great outpouring of books in the social field, THE SURVEY has for three years past been fortunate in having as a voluntary member of its staff, a contributing editor versed both in literature and in social work.

## MAGAZINE CIRCULATION

BUT it is in the middle field—in printing and circulating a current medium for the exchange of ideas and information—that the chief publication work of THE SURVEY lies. Throughout the winter months last year 1000 new readers were added each thirty days. Twenty-nine hundred were added by the Leap Year Leap alone. It will perhaps give an idea of what even a small circulation—such as THE SURVEY'S—mounts up to in the course of a year, to note that adding one week's edition onto another, over one million copies (1,141,450 to be specific) were sent out through the New York Post Office in 1911-12. Some of the great periodicals, of course, weigh in as many as that in a single edition; but it is to be said that every copy of THE SURVEY carries with it almost a personal message and relation. Only by sheaves of correspondence—spontaneous letters from every part of the country—could an estimate be placed on the reaction which its publication means to those most directly concerned in social welfare in state and nation.

During 1911-12 the subscription list of THE SURVEY grew 5295 net—more than twice the net gain of the year before—as measured on the last day of the year, September 30. On that date, 1912, the yearly subscribers numbered 19,890, of whom 10,527 were new names; 9,363 were renewals.

The total circulation, of course, has been much in excess of the subscription list. The largest edition was 26,500; the smallest 18,000; the average for the 52 issues of the year 21,951 against 16,863 in 1911-12. The average for the monthly magazine issues has been 23,433.

The difference between total circulation and subscriptions represents copies sold in quantity, a modest exchange list, sample copies and copies for file, most of which are distributed later in bound volumes.

Several issues had considerable independent circulation: 1,500 copies of the Birmingham issue were sold as "singles" in that city; 1000 copies of the issue containing Col. Church's article on Andrew Carnegie's Dumfriesline Trust were distributed in Scotland; 500 copies of the Men and Religion issue were sent out to 500 workers in the movement; 1600 copies of the symposium on the McNamara confession were bought by individual readers in every state in the union. Smaller quan-

titles—a dozen, 50, 100—were bought and sent out weekly, almost daily, by social organizations and individuals as propaganda, and about 50 articles were ordered reprinted as pamphlets for similar use.

All of these do missionary work—in parsonage, newspaper office, woman's club, college seminar, debates in Congress and in many state legislatures.

## THE LEAP-YEAR LEAP

The chief single element of growth in yearly subscribers was through the Leap-Year Leap. 540 persons enlisted in this plan to give to THE SURVEY not money but service—the extra day of the leap year 1912, in securing five new subscribers. Their names are printed on page 16. 2759 subscriptions were thus received. The “leapers” included a minister in a middle-western village who, in a single morning, trebled the number of subscribers in his town; an Eastern millionaire who personally solicited and secured the subscriptions of thirty-five of his friends; a woman who left her bread baking in a hot oven, canvassed her neighbors, and returned triumphant with five subscriptions before the loaves had burned. Like the cartoons in “Life,” in which famous men are shown interviewing themselves, the readers of THE SURVEY heartily acknowledge this hearty co-operation of the readers of THE SURVEY.

Next in rank in subscription gains has been a college audience of 1213 students in sociology, economics, civic progress and related courses, many of whom stood a weekly quiz on the contents of THE SURVEY. The number was double that of previous years, the gain among theological seminaries being especially marked. This use of THE SURVEY as a text-book was suggested and first tried out by Prof. Frank A. Fetter, of Cornell, now of Princeton.

A noteworthy incident of the year was the subscription for 100 of his fellow townsmen by a Pennsylvanian who believed that in no other way could he more substantially promote a local understanding of social and civic needs.

The year's record of subscriptions written, compared with the year before:

	New	Renewal	Total	Receipts
1911-12	10527	9363	19,890	\$34,555.31
1910-11	5855	8740	14,595	25,046.57

## SERVICE TO READERS

The most serious circulation problem confronting THE SURVEY is the fact that against these gains in new subscriptions and receipts there has been a considerable increase in the number of discontinuances: 5632 compared with 3625 in 1910-11. We

renewed, that is, between 62 and 63%—a fair proportion among high class periodicals, but one such as demands radical consideration in a magazine office accustomed as THE SURVEY'S has been to phenomenal records in holding readers. It is a situation due to growth among ever widening circles and creates the problem—an editorial and educational problem as well as one of circulation—of how to hold the attention and serve the needs of the important groups outside our ever renewing core.

As new national and local movements in philanthropy develop and mature, the demands on space for recorded experience, for the discussion of method, for the interpretation and criticism of facts, for stimulus, are ever and ever greater. While it was fairly possible ten years ago for us to enter into the details of particular branches of social work with the closeness of a professional journal, the difficulty of so doing becomes each year more real.

THE SURVEY no longer attempts to be a trade journal for those deep in particular lines—such as child-saving societies, playground workers, prison administrators and the like. Book publication, pamphleteering and specialized journals serving these needs have developed amazingly in ten years. Our effort is:

To publish *fifty-two* weekly issues of chronicle and comment which will set forth the trend in THE SURVEY'S field and the current vigorous thinking of those who are “facing hard facts for the sake of the future.”

To expand *twelve* issues into illustrated magazine numbers which will strike and win the attention of general readers.

And to publish in *mid-monthly* departments a review of each of the major fields of philanthropic concern—civics, industry, health, social agencies in general—so that the reader, engrossed in any part of any field, can with a minimum of effort keep abreast of allied subjects.

In this way we hope to enlist, hold and serve both general reader and professional worker.

As we are able to raise special funds to add pages to the mid-monthly number, we shall be able to round out the elementary departments named. For example, it is hoped this year to maintain a department on “Church and Community,” and to deal more adequately with what has been called “Social Invention in Industry.” A department on social work in small towns and rural districts has been urged; and a department on family rehabilitation, one which would discuss case work—whether that of charitable agent, probation officer, or hospital social service visitor—would, we feel, meet a need midway between the technique of the Bulletin of the Charity Organization Department of the Russell Sage Foundation, and the general columns of THE SURVEY. Such departments cost in printing expenses something like \$1500. Why it is not feasible to add them unless special funds are in hand from those most directly interested in each field will appear from what follows.

## BUDGET

**D**URING the past summer we were faced with a possible deficit in our general funds of upwards of \$6000,—the result in part of obligations overhanging from previous years. Through the vigorous and generous response of readers of the magazine, of friends of the Publication Committee, of the co-operating newspapers, and of the parent society, this deficit has been cleared (see pages 18 and 22) and as has already been noted, Survey Associates, Inc., starts out free of debt.

But for the new year, as for past years, we appeal for contributions (p. 24) as an important source of income in addition to commercial receipts. This appeal is not to make up current deficit, in the ordinary sense that that term would be applied by a struggling newspaper which failed to make ends meet, but to secure money for the deliberate uses of the enterprise in the same way that a college secures money over and above tuition fees.

A careful analysis of production costs for a recent twelve months period showed that while our net income per \$2 subscriber, from subscriptions, was \$1.72, the cost of printing, press work, paper, ink, engravings and stencils per subscriber amounted to \$1.62. This left ten cents margin per subscriber from subscription receipts, or scarcely enough all added together to pay our rent, much less moderate office and editorial expenses.

A curtailment of size of regular issues is not feasible as a way for striking a better balance, for the number of text pages published annually has not been increased in the past five years, despite the greatly increased demands on space. Nor, with such a ratio between printing costs and subscription price, does increased circulation offer a way out, save as advertising receipts gradually respond. These increased \$1000 in 1911-12. **THE SURVEY** has no clientele of trade purchasers (like an engineering journal) and the net income per page from a general circulation, small in comparison with popular periodicals, is reduced still further by our standards of acceptance.

To meet this situation, we have been actively considering raising the regular subscription rate to \$3.00 per year. This might, however, cut off our ability to enlist readers and to hold those groups of people whom it is most important to inform. It has seemed good sense up till now to make decisions on an educational basis during this formative period; that is, to curtail routine expense at every possible point—change of type this fall is resulting in an important economy—and to go on shouldering what remains of conventional publication expenses above business receipts as part of our philanthropic outlay. [Such also must we consider money spent in extending circulation.]

But **THE SURVEY** would be rendering a rather stupid stewardship if it limited its work to conventional publication lines. It would be throwing away opportunity after opportunity for service. We are

endeavoring to develop a staff which can gain a hearing for things which the newspapers do not regard as news; which can take the findings of public and private investigations, lift them out of formal reports and make them strike home. This means technique, time, expense; a staff which can scrutinize, digest, weigh, edit, the great bulk of social, civic, sanitary and industrial experience within the limits of a compressed weekly journal; one which can independently diagnose the facts in a controversial situation, and get prompt information while events are in process. The city room of the newspaper and the economics seminar of the college must both contribute to our equipment.

## BASIS FOR APPEAL

**W**E need money, then, for organized social discovery—for interpreting the findings and work of a great number of other organizations; for investigating where no other agencies are available, or where we must look to self-dependent sources. We need it for printers' ink and paper, so that this experience and information can be set forth at serviceable length (even if it eats up subscription receipts), and so that it can be put in graphic form and phrase that will make it articulate.

We need money to get a hearing for these things before a thousand new people a month; to spread them broadcast through our press service. Some of these activities are wholly non-commercial; all of them are bound up in the educational working scheme of **THE SURVEY**. It is on the basis of this educational working scheme that we have successfully appealed to philanthropic fund and private contributors in the past, and that we appeal again today.

It has been to this educational working scheme that the New York Charity Organization Society has for years past appropriated \$3,000 annually to its constituent committee—an appropriation which it is felt it will not be legitimate to continue to an outside membership corporation. To them and to all contributors to our work in 1911-12 our heartfelt acknowledgments.

If commercial receipts keep up the rate of increase which has marked the publication year just ended, the \$20,000 in contributions appealed for in this report will clear the items of expenditures carefully estimated for this year's budget.

## EDITORIAL CHANGES

**O**NE of the largest contributions to **THE SURVEY** has not been mentioned—the contributions of unpaid articles, and volun-

tary editorial service. The names of contributors of articles are published on p. 13. Acknowledgment is also due many whose unsigned material has been of large usefulness in the course of the year.

Two important editorial changes should be noted—last spring, the addition of Miss Jane Addams, of Hull House, as an associate editor on a voluntary basis; this fall, the resignation of Mr. Devine as editor and the appointment of Paul U. Kellogg to succeed him. The change vests executive and editorial responsibility in members of the staff giving full time to the magazine. Mr. Devine this year assumes the directorship of the New York School of Philanthropy. With Professor Taylor and Miss Addams, he continues as an associate editor and active member of the working group of THE SURVEY.

## HISTORY OF THE SURVEY

IN closing this report, which in a sense marks the final rendering by the Charity Organization Society of the City of New York of its stewardship in this field of philanthropic publication, work based on that clause of its charter which empowered it to "promote social reform," it may be appropriate to note important waymarks in the development of THE SURVEY as a co-operative journal.

*The Charities Review* was founded as a monthly by the Society in 1891, and bore the imprint of such editors as John H. Finley, now president of the College of the City of New York; Paul Leicester Ford, author of "The Honorable Peter Stirling"; Frederick Howard Wines; and Herbert S. Brown.

With *The Review*, in March, 1897, was merged *Lend-A-Hand*, which had been

founded in 1886 by Edward Everett Hale, best known for his "Man without a Country."

The tap root of the present journal lay not so much, perhaps, in these stately monthly reviews, comparable in the practical field to the university quarterlies, as in *Charities*, which was founded as a weekly by Mr. Devine in 1897.

With *Charities* (upon which had fallen in 1901 the mantle of *The Charities Review*) was merged in 1905 *The Commons*, which had been published at the Chicago neighborhood house of that name under the editorship of Prof. Taylor. For seven years the magazine has maintained offices in Chicago as well as in New York.

In 1906, *Jewish Charity*, edited by Dr. Lee K. Frankel, was merged, and the combined periodicals continued under the joint name of *Charities and The Commons*, until April, 1909, when the name was changed to THE SURVEY.

In 1905 the Central Council of the New York society announced the appointment of a Publication Committee, organized to "give national breadth and effect to the work of the magazine." Robert W. de Forest, president of the society, whose personal support and interest had made possible both the *Charities Review* and *Charities*, became chairman of the new committee, and the membership has included residents of New York, Boston, Chicago, Philadelphia, Baltimore, San Francisco and Washington. The roster of contributors and co-operating subscribers has grown steadily to more than 700. Responsibility for the continuance of the journal will depend upon those who, by their gifts and co-operation, have manifested conviction and interest in the venture for from one to fifteen years. The Survey Associates become then a natural and stable membership base for the work ahead.

1912	Zebulon R. Brockway	Fifty Years of Prison Service	2.00

## FINANCIAL APPEAL

THE SURVEY enters upon its new stage of development clear of all overhanging deficits. On the other hand, Survey Associates, Inc., has, as a philanthropic corporation, no capital to invest in extending the magazine and its educational work.

To meet current outlay in these directions during the publication year 1912-13, the Survey Associates need (above receipts from business and other sources) the sum of \$20,000

(For list of contributors in 1911-12, see pages 18-21)

### CO-OPERATING SUBSCRIPTIONS

[\$10 each]

During the past year, the number of co-operating subscribers has jumped from 293 to 646—more than doubling. It has been this widespread and democratic backing to the work of magazine and committee which has justified the parent society in putting the enterprise on a co-operative basis. Under the new form of organization these co-operating subscribers will make up the great body of the membership.

Our appeal for 1912-13 is to 800 readers of THE SURVEY to enlist as co-operative subscribers at \$10 each.

### LARGER CONTRIBUTIONS

While the number of co-operating subscribers has increased by leaps and bounds, we must look to those of larger means and constructive vision for the balance of our budget.

Our appeal is for \$12,000 in sums of from \$10 to \$1000. It is through such sustained and generous support that the educational work of THE SURVEY has developed beyond the limitations of advertising and subscription receipts. This development has been demonstrably practical and effective.

### ENDOWMENT FUND

The Survey Associates are in position to administer a short-term endowment fund, to be applied during this period of growth to their general work, or to certain well-defined lines of activity which would amply justify philanthropic investment. We believe there are few opportunities for a large gift to show such imagination, provoke such co-operation and exert so practical an influence for the well-being of America.

(For audited financial statement 1911-12, see page 22; for discussion of budget, see page 11)

Checks should be drawn to Frank Tucker, Treasurer, Survey Associates, Inc., 105 East 22d Street, New York City.
